The Roman, called alſo *Julian calendar*, from its reformer Julius, is diſpoſed into quadriennial periods; whereof the three firſt years, which he called *communes*, conſiſt of three hundred ſixty-five days; and the fourth, *biſſextile*, of three hundred ſixty-ſix; by reaſon of the ſix hours, which in four years make a day, or ſomewhat leſs; for in one hundred thirty-four years an intercalary day is to be retrenched. On this account it was, that pope Gregory XIII. with the advice of Clavius and Ciaconius, appointed, that the hundredth year of each century ſhould have no biſſextile, excepting in each fourth century: that is, a ſubtraction is made of three biſſextile days in the ſpace of four centuries; by reaſon of the eleven minutes wanting in the ſix hours whereof the biſſextile conſiſts. See BISSEXTILE.

This reformation of the *calendar*, or the new ſtile, as we call it, commenced on the fourth of October 1582, when ten days were thrown out at once; ſo many having been introduced into the computation ſince the time of the council of Nice, in 325, by the defect of eleven minutes.

CALENDAR, *Julian Chriſtian*, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the ſolar cycle; and the new and full moons, eſpecially the paſchal full moon, with the feaſt of Eaſter, and the other moveable feaſts depending thereon, by means of golden numbers, rightly diſpoſed through the Julian year. See CYCLE, and *Golden* NUMBER.

In this *calendar*, the vernal equinox is ſuppoſed to be fixed to the twenty-firſt day of March; and the cycle of nineteen years, or the golden numbers, conſtantly to indicate the places of the new and full moons; yet both are erroneous. And hence aroſe a very great irregularity in the time of Eaſter. To ſhew this error the more apparently, let us apply it to the year 1715. In this year, then, the vernal equinox falls on the tenth of March; and therefore comes too early by eleven days. The paſchal full moon falls on the ſeventh of April; and therefore too late, with regard to the cycle, by three days. Eaſter, therefore, which ſhould have been on the tenth of April, was that year on the ſeventeenth. The error, here, lies only in the metemptoſis, or poſt-poſition of the moon, through the defect of the lunar cycle. If the full moon had fell on the eleventh of March, Eaſter would have fallen on the thirteenth of March; and therefore the error, ariſing from the anticipation of the equinox, would have exceedingly augmented that ariſing from the poſt-poſition. Theſe errors, in courſe of time, were ſo multiplied, that the *calendar* no longer exhibited any regular Eaſter. Pope Gregory XIII. therefore, by the advice of Aloyſius Lilius, in 1582, threw ten days out of the month of October, to reſtore the equinox to its place, viz. the twenty-firſt of March; and thus introduced the form of the Gregorian year, with ſuch a proviſion, as that the equinox ſhould be conſtantly kept to the twenty-firſt of March. The new moons and full moons, by advice of the ſame Lilius, were not to be indicated by golden numbers, but by epacts. The *calendar*, however, was ſtill retained in England, without this correction: whence there was a difference of eleven days between our time and that of our neighbours. But by 24 Geo. II. cap. 23. the Gregorian computation is eſtabliſhed here, and accordingly took place in 1752.

CALENDAR, *Gregorian*, is that which, by means of epacts, rightly diſpoſed through the ſeveral months, determines the new and full moons, and the time of Eaſter, with the moveable feaſts depending thereon, in the Gregorian year.

The Gregorian *calendar*, therefore, differs from the Julian, both in the form of the year, and in that epacts are ſubſtituted in lieu of golden numbers: for the uſe and diſpoſition whereof, ſee EPACT.

Though the Gregorian *calendar* be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Caſſini imagine, it is impoſſible ever to bring the thing to a perfect juſtneſs.) For, firſt, the Gregorian intercalation does not hinder, but that the equinox ſometimes ſucceeds the twenty-firſt of March, as far as the twenty-third; and ſometimes anticipates it, falling on the nineteenth; and the full moon, which falls on the twentieth of March, is ſometimes the paſchal; yet not ſo accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the twenty-ſecond of March, the paſchal; which yet, falling before the equinox, is not paſchal. In the firſt caſe, therefore, Eaſter is celebrated in an irregular month; in the latter, there are two Eaſters in the ſame eccleſiaſtical year. In like manner, the cyclical computation being founded on mean full moons, which yet may precede or follow the true ones by ſome hours, the paſchal full moon may fall on Saturday, which is yet referred by the cycle to Sunday; whence, in the firſt caſe, Eaſter is celebrated eight days later than it ſhould be; in the other it is celebrated on the very day of the full moon, with the Jews and Quartodeciman heretieks; contrary to the decree of the council of Nice. Scaliger and Calviſius ſhew other faults in the Gregorian *calendar*, ariſing from the negligence and inadvertency of the authors: yet is this *calendar* adhered to by the Romaniſts throughout Europe, &c. and uſed wherever the Roman breviary is uſed.

CALENDAR, *reformed*, or *corrected*, is that which, ſetting aſide all apparatus of golden numbers, epacts, and dominical letters, determines the equinox, with the paſchal full moon, and the moveable feaſts depending thereon, by aſtronomical computation, according to the Rudolphine tables.

This *calendar* was introduced among the proteſtant ſtates of Germany, in the year 1700, when eleven days were at once thrown out of the month of February; ſo that in 1700, February had but eighteen days: by this means, the corrected ſtile agrees with the Gregorian. This alteration in the form of the year, they admitted for a time; in expectation that, the real quantity of the tropical year being at length more accurately determined by obſervation, the Romaniſts would agree with them, on ſome more convenient intercalation.

CALENDAR, *conſtruction of a*, or *almanac*. 1. Compute the ſun's and moon's place for each day of the year; or take them from ephemerides. 2. Find the dominical letter, and, by means thereof, diſtribute the *calendar* into weeks. 3. Compute the time of Eaſter, and thence fix the other moveable feaſts. 4. Add the immoveable feaſts, with the names of the martyrs. 5. To every day add the ſun's and moon's place, with the riſing and ſetting of each luminary; the length of day and night; the crepuſcula, and the aſpects of the planets. 6. Add, in the proper places, the chief phaſes of the moon, and the ſun's entrance into the cardinal points; i. e. the ſolſtices and equinoxes; together with the riſing and the ſetting, eſpecially heliacal, of the planets, and chief fixed ſtars: means for each of which will be found under the proper heads.

The duration of the crepuſcula, or the end of the evening and beginning of the morning twilight; together with the ſun's riſing and ſetting, and the length of days, may be transferred from the *calendars* of one year, into thoſe of another; the differences in the ſeveral years being too ſmall to be of any conſideration in civil life. Hence it appears, that the conſtruction of a *calendar* has nothing in it of myſtery, or difficulty; if tables of the heavenly motions be at hand. See ALMANAC.

Some divide *calendars* or *almanacs* into public and private, perfect and imperfect; others into heathen and Chriſtian.

Public *almanacs* are thoſe of a larger ſize, uſually hung up for common or family uſe; private are thoſe of a ſmaller kind, to be carried about either in the hand, inſcribed on a ſtaff, or in the pocket; perfect, thoſe which have the dominical letters as well as primes, and feaſts inſcribed on them; imperfect, thoſe which have only the primes and immoveable feaſts. Till about the fourth century, they all carry the marks of heatheniſm; from that age to the ſeventh, they are generally divided between heatheniſm and Chriſtianty.

Almanacs are of ſomewhat different compoſition, ſome containing more points, others fewer. The eſſential part is the *calendar* of months and days, with the riſings and ſettings of the ſun, age of the moon, &c. To theſe are added various parerga, aſtronomical, aſtrological, meteorological, chronological, and even political, rural, medical, &c. as calculations, and accounts of eclipſes, ſolar ingreſſes, aſpects, and configurations of the heavenly bodies, lunations, heliocentrical and geocentrical motions of the planets, prognoſtics of the weather, and predictions of other events, tables of the planetary motions, the tides, terms, intereſt, twilight, equation, kings, &c.

CALENDAR, *Gelalean*, or *Jellalæan*, is a correction of the Perſian *calendar*, made by order of ſultan Gelaleddan, in the 467th year of the Hegira; of Chriſt 1089. See EPOCHA and YEAR.

CALENDAR is alſo applied to divers other compoſitions reſpecting the twelve months of the year.

In this ſenſe, Spencer has given the Shepherd's *Calendar*; Evelyn, and Miller, the Gardener's *Calendar*, &c.

CALENDAR is uſed for the catalogue, or faſti, anciently kept in each church, of the ſaints, both univerſal, and thoſe particularly honoured in each church; with their biſhops, martyrs, &c. *Calendars* are not to be confounded with martyrologies, for each church had its peculiar *calendar*; whereas the martyrologies regarded the whole church in general; containing the martyrs and confeſſors of all the churches. From all the ſeveral *calendars* were formed one martyrology: ſo that martyrologies are poſterior to *calendars*. See MARTYROLOGY.

CALENDAR is alſo extended to an orderly table, or enumeration of perſons or things.

Lord Bacon wiſhes for a *calendar* of doubts. A late writer has given a *calendar* of the perſons who may inherit eſtates in fee-ſimple.

CALENDAR, *Kalendarium*, originally denoted among the Romans, a book containing an account of monies at intereſt, which became due on the calends of January; the uſual time when the Roman uſurers let out their money. Senec. de Benef. lib. vii. c. 10. Idem, lib. i. c. 2. Ejuſd. Epiſt. 14. Idem, Ep. 87. Fab. Theſ. p. 413.

CALENDAR *months*, the ſolar months, as they ſtand in the Calendar, viz. January 31 days, &c.

CALENDAR, *aſtronomical*, an inſtrument engraved upon copper-plates, printed on paper, and paſted on board, with a braſs ſlider which carries a hair, and ſhews by inſpection, the ſun's meridian altitude, right aſcenſion, declination, riſing, ſetting, amplitude, &c. to a greater exactneſs than our common globes will ſhew.

CALENDAR *of priſoners*, is a liſt of all their names, with their ſeparate judgments in the margin, which the judge ſigns, and the execution of which is committed to the reſpective ſheriff. In the caſe of a capital felony, the words "hanged by the neck" are annexed to the priſoner's name, inſtead of "*ſuſ. per coll.*" for *ſuſpendatur per collum*, which was the ancient form. Judge Blackſtone well obſerves, that the execution of a man ſeems to be too important and terrible a taſk to depend on a marginal note. Blackſt. Com. vol. iv. p. 396.

CALENDAR-*glaſs*, *vitrum calendare*, a name formerly given by ſome writers to a thermometer, or graduated tube, whereby to meaſure the degrees of heat.

CALENDAR-*brothers*, *fratres calendarii*, a ſort of devout fraternities, compoſed of eccleſiaſtics as well as lay-men; whoſe chief buſineſs was to procure maſſes to be ſaid, and alms diſtributed, for the ſouls of ſuch members as were deceaſed. They were alſo denominated *calend-brothers*, becauſe they uſually met on the *calends* of each month, though in ſome places only once a quarter.

CALENDARIUM *feſtum*. The Chriſtians retained much of the ceremony and wantonneſs of the calends of January, which for many ages was held a feaſt, and celebrated by the clergy with great indecencies, under the names *feſtum kalendarum*, or *hypodiaconorum*, or *ſtultorum*, that is, the feaſt of fools: ſometimes alſo *libertas decembrica.* The people met maſked in the church, and in a ludicrous way proceeded to the election of a mock pope, or biſhop, who exerciſed a juriſdiction over them ſuitable to the feſtivity of the occaſion: fathers, councils, and popes long laboured to reſtrain this licence, to little purpoſe. We find the feaſt of the calends in uſe as low as the cloſe of the fifteenth century. Du-Cange.

CALENDER, a machine uſed, in the manufactories, for preſſing certain ſtuffs, ſilks, and even linens; to make them ſmooth, even, and gloſſy. It is alſo uſed for watering, or giving the waves to tabbies and mohairs.

The word is formed from the French *calandre*, or Spaniſh *calandra*, which ſignify the ſame; and which ſome derive further from the Latin *cylindrus:* becauſe the whole effect of the machine depends upon a cylinder. Borel derives the name from that of a little bird, of the ſwallow kind; on account of the agreement between the feathers of the bird, and the impreſſion of the machine.

The *calender* conſiſts of two large wooden rollers, round which the pieces of ſtuff are wound: theſe are put between two large, cloſe, poliſhed planks of wood, the lower ſerving as a fixed baſe, and the upper moveable, by means of a wheel like that of a crane; with a rope, faſtened to a ſpindle which makes its axis: this upper part is of a prodigious weight, ſometimes twenty or thirty thouſand pounds. It is the weight of this part, together with its alternate motion, that gives the poliſh, and makes the waves on the ſtuffs, by cauſing the cylinders on which they are put to roll with great force over the loweſt board. The rollers are taken off, and put on again, by inclining the machine.

At Paris they have an extraordinary machine of this kind, called the *royal calender*, made by order of M. Colbert; the lower table or plank of which is made of a block of ſmooth marble, and the upper lined at bottom with a plate of poliſhed copper.

This is called the great *calender*; they have alſo a ſmall one with two tables of poliſhed iron or ſteel.

There are alſo *calenders* without wheels, which are wrought by a horſe harneſſed to a wooden bar, which turns a large arbor placed upright; at the top of which, on a kind of drum, is wound a rope, the two ends of which being faſtened to the two extremities of the upper plank of the engine, give it motion. But the horſe *calender* is in leſs eſteem than the wheel kind, as the motion of this latter is more equable and certain.

We read of *calendering* worſteds. To improve linen farther, the drapers get ſeveral ſorts of their cloths *calendered*; whereby their threads are made to lie flatter and ſmoother.

Calender alſo denotes the workman who manages the machine above deſcribed; applying the cloth or ſtuff underneath, after having firſt wound it on the rollers.

Calenders is alſo the name of a ſort of Derviſes ſpread through Turky and Perſia, whoſe order is not in general eſteem among the Mahometans, as being reputed leſs abſtemious and ſtrict in morals than ſome other orders. They derive their name from Calenderi, their founder. See Dervis.

CALENDS, Calendæ, in the *Roman Chronology*, the firſt day of every month.

The word is formed from καλεω, *I call*, or *proclaim*; becauſe, before the publication of the Roman Faſti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the *Rex Sacrificulus*; upon which a ſacrifice being offered, the pontiff ſummoned the people together in the capitol, and there, with a loud voice, proclaimed the number of *calends*, or the day whereon the nones would be; which he did by repeating this formula, as often as there were days of *calends*; *Calo Juno Novella.* Whence the name *calendæ* was given thereto, from *calo*, *calare.* This is the account given by Varro. Plutarch, and after him Gaza, derive the word from *clam*; *Quia luna calendis clam ſit:* but this is far fetched. Others derive the appellation hence: that the people being convened on this day, the pontifex called, or proclaimed the ſeveral feaſts or holidays in the month; a cuſtom which continued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the faſti, or calendar, to be ſet up in public places, that every body might know the difference of times, and the return of the feſtivals.

The *calends* were reckoned backwards, or in a retrograde order: thus, v. g. the firſt of May being the *calends* of May; the laſt, or thirtieth of April, was the *pridie calendarum*, or ſecond of the *calends* of May; the twenty-ninth of April, the third of the *calends*, or before the *calends:* and ſo back to the thirteenth, where the ides commence; which are, likewiſe, numbered invertedly to the fifth, where the nones begin; which are numbered after the ſame manner to the firſt day of the month, which is the *calends* of April. See Ides, and Nones.

The rules of computation by *calends*, are included in the following verſes:

Prima dies menſis cujuſque eſt dicta calendæ:
Sex Maius nonas, October, Julius, & Mars;
Quatuor at reliqui: habet idus quilibet octo.
Inde dies reliquos omnes dic eſſe calendas;
Quas retro numerans dices à menſe ſequente.

To find the day of the *calends* anſwering to any day of the month we are in; ſee how many days there are yet remaining of the month, and to that number add two: for example; ſuppoſe it the twenty-ſecond of April; it is then the tenth of the *calends* of May. For April contains thirty days: and twenty-two taken from thirty, there remains eight; to which two being added, the ſum is ten.

The reaſon of adding *two* is, becauſe the laſt day of the month is called *ſecundo calendas*, the laſt but one *tertio calendas*, &c.

The Roman writers themſelves are at a loſs for the reaſon of this abſurd and whimſical manner of computing the days of the month: yet it is ſtill kept up in the Roman chancery; and by ſome authors, out of a vain affectation of learning, preferred to the common, more natural, and eaſy manner.

Calends, *Kalendæ*, are alſo uſed in *Church-Hiſtory* to denote conferences anciently held by the clergy of each deanry, on the firſt day of every month, concerning their duty and conduct, eſpecially in what related to the impoſition of penance. Du-Cange.

Calends *of January*, in *Roman Antiquity*, was a ſolemn feſtival conſecrated to Juno and Janus; wherein the Romans offered vows and ſacrifices to thoſe deities, and exchanged preſents among themſelves, as a token of friendſhip.

It was only a melancholy day to debtors, who were then obliged to pay their intereſts, &c. Hence Horace calls it *triſtes calendæ.* Lib. i. Serm. Sat. 3.

CALENDULA, in *Botany*, the herb, or flower popularly called marygold, uſed in the ſhops as a cardiac and alexipharmic, of like, though of inferior virtue to ſaffron.

Calendula, in *Ornithology*, a ſpecies of the motacilla in the order of *paſſeres*, found in Penſylvania.

CALENTES, in *Logic*, a ſort of ſyllogiſm in the fourth, commonly called *Galenical* figure, wherein the major propoſition is univerſal and affirmative; and the ſecond or minor, as well as the concluſion, univerſal and negative.

This is intimated by the letters it is compoſed of, where the A ſignifies an univerſal affirmative, and the two E's as many univerſal negatives. E. gr.

CA	*Every affliction in this world is only for a time.*
LEN	*No affliction, which is only for a time, ought to diſturb us.*
TES	*No affliction ought to diſturb us, which happens in this world.*

The Ariſtotelians not allowing the fourth figure of ſyllogiſms, turn this word into celantes, and make it only an indirect mood of the firſt figure.

CALENTURE, an inflammatory fever, frequent at ſea, attended with a delirium; wherein the patients imagine the ſea to be green fields; and, if not prevented, will leap over-board.

The word *calenture* is Spaniſh, *calentura*, and ſignifies a heat, fever, or ague; from the Latin *calere*, *to be hot.*

Calentures are chiefly found in ſailing towards the Weſt Indies, as they approach the tropic. Thoſe affected with them have a fierce look, and are very unruly, being ſo eager to get to their imaginary cool verdure, and ſo ſtrong, that ſix men ſometimes ſcarce ſuffice to detain them. The diſeaſe chiefly ſeiſes the young and ſtrong, eſpecially of a ſanguine complexion; the pulſe is extremely low. When taken in time, it rarely proves mortal.

The ſeat of this diſorder is in the ſtomach, and its principal ſource ſeems to be the eating ſalt proviſions for a long time together.

The firſt ſtep toward a cure is the giving a briſk vomit; this has the immediate effect of diſpelling the fancy of the green leaves and trees in the water; after this, ſalt of wormwood, a little diaſcordium, and conſerve of roſes vitriolated are proper, and bleeding in the arm; and if that does not take effect, the opening of the temporal artery is proper: a thin diet and cream of tartar in water-gruel, after theſe things, generally remove the remains of the diſeaſe.

When they are ſeiſed with this violent heat and diſorder, which for the moſt part happens in the night, they ſteal privately over-board into the ſea, imagining themſelves to be going into the green fields. *Calentures* happen oftener by night than by day, becauſe ſhips are more cloſely ſhut up by night, and are leſs airy than they are in the day-time. Phil. Tranſ. abr. vol. iv. by Dr. Oliver.

CALESIAM, in *Botany*, H. M. *Arbor baccifera racemoſa, vitis floribus acinis oblongis compreſſis monopyrenis.* It is a very tall and beautiful tree; the wood is of a dark purple colour, ſmooth and flexible; the flowers grow in cluſters at the ends of the boughs, very like the flowers of vines, and are ſucceeded by berries in cluſters, like grapes or currants, full of a ſucculent and inſipid pulp, encloſing a ſtone having a white inſipid kernel.

It grows common in Malabar, bears fruit once a year, and is fruitful from ten years ſtanding to fifty and upward: of the wood they make ſheaths for knives and ſwords.

The bark pulveriſed and made into an ointment with butter, cures the *ſpaſmus cynicus*, and convulſions excited by great wounds; it heals alſo malignant ulcers, and mitigates the pain in the gout. The juice of the bark cures *aphthæ*; and taken inwardly, is a remedy for the dyſentery. The bark of this tree with that of the codampulli reduced into a powder, purges the belly, and carries off pituitous and atrabilious humours. Half a tea-cup full of the decoction of the leaves and bark in water, is uſually given to women juſt before their labour, to promote an eaſy delivery.

CALF, *Vitulus*, in *Zoology*, the young one of a cow, an animal too well known to need a particular deſcription.

There are two ways of breeding *calves* that are intended to be reared; the one is to let the *calf* run with its dam all the year round: this is the method in the cheap breeding countries, and is generally allowed to make the beſt cattle. The other way is to take them from the dam after they have ſucked about a fortnight; they are then to be taught to drink flat milk, which is to be made but juſt warm for them, it being very dangerous to give it them too hot.

The beſt time of weaning *calves* is from January to May; they ſhould have milk for twelve weeks after, and a fortnight before that is left off, water ſhould be mixed with the milk in larger and larger quantities. When the *calf* has fed on milk about a month, little whiſps of hay ſhould be placed all about him in cleft ſticks, to induce him to eat. In the beginning of April they ſhould be turned out to graſs; only for a few days they ſhould be taken in for the night, and have milk and water given them; the ſame may alſo be given them in a pail ſometimes in the field, till they are ſo able to feed themſelves that they do not regard it. The graſs they are turned into muſt not be too rank, but ſhort and ſweet, that they may like it, and yet get it with ſome labour.

Calves ſhould be always weaned at graſs, for if it be done with hay and water, they often grow big-bellied on it, and are apt to rot. When thoſe among the males are ſelected which are to be kept as bulls, the reſt ſhould be gelt for oxen: the ſooner the better. Twenty days old is a very good time, or any thing between that age and ten days. About London, almoſt all the *calves* are fatted for the butcher. The reaſon of this is, that there is a good market for them; and the lands here are not ſo profitable to breed upon as in cheaper countries. The way to make the *calves* fat and fine is, the keeping them very clean, giving them freſh litter every day, and the hanging a large chalk-ſtone in ſome corner where they can eaſily get at it to lick it, but where it is out of the way of being fouled by their dung and urine. The coops are to be ſo placed as not to have too much ſun upon them, and ſo high above the ground that the urine may run off. They alſo bleed them once when they are a month old, and a ſecond time before they kill them; this is a great addition to the beauty and whiteneſs of their fleſh: the bleeding is by ſome repeated much oftener; but this is ſufficient.

Calves are very apt to be looſe in their bowels; this waſtes and very much injures them. The remedy is, to give them chalk ſcraped into milk, pouring it down with a horn. If this does not ſucceed, they give them bole armenic in large doſes, and uſe the cold bath every morning. If a cow will not let a ſtrange *calf* ſuck her, the common method is to rub both her noſe and the *calf*'s with a little brandy: this generally reconciles them, after a few ſmellings.

Calves, beſide their fleſh, afford two ſorts of commodities for trade, namely, the hide and the hair.

Calf-*ſkins*, in the leather manufacture, are prepared and dreſſed by the tanners, ſkinners, and curriers, who ſell them for the uſe of the ſhoe-makers, ſadlers, bookbinders, and other artificers, who employ them in their ſeveral manufactures.

Calf-*ſkin dreſſed in ſumach*, denotes the ſkin of this animal curried black on the hair ſide, and dyed of an orange colour on the fleſh ſide, by means of ſumach, chiefly uſed in the making of belts.

The Engliſh *calf-ſkin* is much valued abroad, and the commerce thereof very conſiderable in France and other countries; where divers attempts have been made to imitate it, but hitherto in vain.

What is like to baffle all endeavours for imitating the Engliſh *calf* in France is, the ſmallneſs and weakneſs of the *calves* about Paris; which, at fifteen days old, are not ſo big as the Engliſh ones when they come into the world.

Calf, *ſea*, in *Zoology*. See Sea-*calf*.

Calf, among *Sportſmen*, is uſed for a male hart, or hind of the firſt year.

Calf alſo denotes the young of the whale.

Calf's *ſnout*, in *Botany*. See Snap-dragon.

CALI is uſed to denote pot-aſhes, or the ſalt of the plant kali.

CALIBER, or **Caliper**, in a general ſenſe, notes the extent of any round thing in thickneſs, or diameter.

In which ſenſe we ſay, a column is of the ſame *caliber* as another, when they are both of the ſame diameter.

Caliber more particularly denotes the bore, or width of a piece of ordnance, or other fire-arms; or the diameter of the mouth thereof; or of the ball it carries.

The *caliber* is the rule by which all the parts of a cannon, or a mortar, as well as of its carriage, are proportioned.

Caliber-*compaſſes*, a ſort of *compaſſes* made with arched legs, to take the diameter of convex or concave bodies.

Caliber-compaſſes are chiefly uſed, by gunners, for taking the diameters of the ſeveral parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular, and move on an arch of braſs, whereon are marked the inches, and half-inches; to ſhew how far the points of the *compaſſes* are opened aſunder.

Some are alſo made for taking the diameter of the bore of a gun, or mortar.

The gaugers alſo ſometimes uſe *calibers*, to embrace the two heads of any caſk, in order to find its length.

The *caliber*, uſed by carpenters and joiners, is a piece of board notched triangular-wiſe in the middle, for the taking of meaſure.

Caliber, **Caliber**-*rule*, or *Gunner's* **Callipers**, is an inſtrument, wherein a right line is ſo divided, as that the firſt part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the firſt, as the diameters of balls of two, three, four, &c. pounds, are to the diameter of a ball of one pound. The *caliber* is uſed by engineers, from the weight of the ball given, to determine its diameter, or *caliber*; or *vice verſa*.

The gunner's *callipers* conſiſts of two thin plates of braſs joined by a rivet, ſo as to move quite round each other: its length from the centre of the joint is between ſix inches and a foot, and its breadth from one to two inches: that of the moſt convenient ſize is about nine inches long. Many ſcales, tables, and proportions, &c. may be introduced on this inſtrument; but none are eſſential to it, except thoſe for taking the *caliber* of ſhot and cannon, and for meaſuring the magnitude of ſaliant and entering angles. The moſt complete *callipers* is exhibited *Tab. Gunnery, fig.* 2. the furniture and uſe of which we ſhall now briefly deſcribe. Let the four faces of this inſtrument be diſtinguiſhed by the letters A, B, C, D: A and D conſiſt of a circular head and leg; B and C conſiſt only of a leg.

On the circular head adjoining to the leg of the face A are diviſions denominated *ſhot diameters*; which ſhew the diſtance in inches and tenths of an inch of the points of the *callipers* when they are opened; ſo that if a ball not exceeding ten inches be introduced between them, the bevil edge E marks its diameter among theſe diviſions.

On the circular bevil part E of the face B is a ſcale of diviſions diſtinguiſhed by *lb. weight of iron ſhot.* When the diameter of any ſhot is taken between the points of the *callipers*, the inner edge of the leg A ſhews its weight in avoirdupoiſe pounds, provided it be lb. ½, 1, 1½, 2, 3, 4, 5¼, 6, 8, 9, 12, 16, 18, 24, 26, 32, 36, or 42; the figures neareſt the bevil edge anſwering to the ſhort lines in the ſcale, and thoſe behind them to the longer ſtrokes. This ſcale is conſtructed on the following geometrical theorem, viz. that the weights of ſpheres are as the cubes of their diameters.

On the lower part of the circular head of the face A is a ſcale of diviſions marked *bores of guns*; for the uſe of which, the legs of the *callipers* are ſlipped acroſs each other, till the ſteel points touch the concave ſurface of the gun in its greateſt breadth; then the bevil edge F of the face B will cut a diviſion in the ſcale ſhewing the diameter of the bore in inches and tenths.

Within the ſcales of *ſhot* and *bore* diameters on the circular part of A, are diviſions marked *pounders*: the inner figures ½, 1½, 3, 5¼, 8, 12, 18, 26, 36 correſpond to the longeſt lines; and the figures 1, 2, 4, 6, 9, 16, 24, 32, 42 to the ſhort ſtrokes. When the bore of a gun is taken between the points of the *callipers*, the bevil edge F will either cut or be near one of theſe diviſions, and ſhew the weight of iron ſhot proper for that gun.

On the upper half of the circular head of the face A are three concentric ſcales of degrees; the outer ſcale conſiſting of 180 degrees numbered from right to left, 10, 20, &c. the middle numbered the contrary way, and the outer ſcale beginning at the middle with 0, and numbered on each ſide to 90 degrees. Theſe ſcales ſerve to take the quantity of an angle, either entering or ſaliant. For an entering, or internal angle, apply the legs of the *callipers* ſo that its outward edges coincide with the legs of the given angle, the degree cut by the bevil edge F in the outer ſcale ſhews the meaſure of the angle ſought: for a ſaliant, or external angle, ſlip the legs of the *callipers* acroſs each other, ſo that their outward edges may coincide with the legs forming the angle, and the degree marked on the middle ſcale by the bevil edge E will ſhew the meaſure of the angle required. The inner ſcale will ſerve to determine the elevation of cannon and mortars, or of any oblique plane. Let one end of a thread be fixed into the notch on the plate B, and any weight tied to the other end: apply the ſtrait ſide of the plate A to the ſide of the body whoſe inclination is ſought; hold it in this poſition, and move the plate B, till the thread falls upon the line near the centre marked *Perp.* Then will the bevil edge F cut the degrees on the inner ſcale, ſhewing the inclination of that body to the horizon.

On the face C near the point of the *callipers* is a little table ſhewing the proportion of troy and avoirdupoiſe weights, by which one kind of weight may be eaſily reduced into another.

Near the extreme of the face D of the *callipers*, are two tables ſhewing the proportion between the pounds weight of London and Paris, and alſo between the lengths of the foot meaſure of England and France.

Near the extreme on the face A is a table containing four rules of the circle and ſphere; and geometrical figures with numbers annexed to them: the firſt is a circle including the proportion in round numbers of the diameter to its circumference; the ſecond is a circle inſcribed in a ſquare, and a ſquare within that circle and another circle in the inner ſquare: the numbers 28, 22 above this figure exhibit the proportion of the outward ſquare to the area of the inſcribed circle; and the numbers 14, 11 below it ſhew the proportion between the area of the inſcribed ſquare and the area of its inſcribed circle. The third is a cube inſcribed in a ſphere; and the number $89\frac{1}{3}$ ſhews that a cube of iron, inſcribed in a ſphere of 12 inches in diameter, weighs $89\frac{1}{3}$. The fourth is a ſphere in a cube, and the number 243, expreſſes the weight in pounds of a ſphere inſcribed in a cube whoſe ſide is 12 inches: the fifth repreſents a cylinder and cone of one foot diameter and height: the number in the cylinder ſhews, that an iron cylinder of that diameter and height weighs 364.5 lb. and the number 121.5 in the cone expreſſes the weight of a cone, the diameter of whoſe baſe is 12 inches, and of the ſame height: the ſixth figure ſhews that an iron cube, whoſe ſide is 12 inches, weighs 464 lb. and that a ſquare pyramid of iron, whoſe baſe is a ſquare foot and height 12 inches weighs $154\frac{2}{3}$ lb. The numbers which have been hitherto fixed to the four laſt figures were not ſtrictly true; and therefore they have been corrected in the figure here referred to; and by theſe the figures on any inſtrument of this kind ſhould be corrected likewiſe.

On the leg B of the *callipers*, is a table ſhewing the weights of a cubic inch or foot of various bodies in pounds avoirdupoiſe.

On the face D of the circular head of the *callipers* is a table contained between five concentric ſegments of rings: the inner one marked *Guns* ſhews the nature of the gun, or the weight of ball it carries; the two next rings contain the quantity of powder uſed for proof and ſervice to braſs guns, and the two outermoſt rings ſhew the quantity for proof and ſervice in iron cannon.

On the face A is a table exhibiting the method of computing the *number of ſhot or ſhells* in a triangular, ſquare, or rectangular pile. Near this is placed a table containing the principal rules relative to the *fall of bodies*, expreſſed in an algebraic manner: nearer the centre we have another table of rules for raiſing water, calculated on the ſuppoſition, that one horſe is equal in this kind of labour to five men, and that one man will raiſe a hogſhead of water to eight feet of height in one minute, and work at that rate for ſome hours. N. B. Hogſheads are reckoned at ſixty gallons.

Some of the leading principles in gunnery, relating to *ſhooting* in cannon and mortars, are expreſſed on the face B of the *callipers*. Beſides the articles already enumerated, the ſcales uſually marked on the SECTOR are laid down on this inſtrument: thus, the line of inches is placed on the edge of the *callipers*, or on the ſtrait borders of the faces C, D: the logarithmic ſcales of numbers, ſines, verſed ſines, and tangents, are placed along theſe faces near the ſtrait edges: the line of lines is placed on the ſame faces in an angular poſition, and marked *Lin.* The lines of plans or ſuperfices are alſo exhibited on the faces C and D, tending towards the centre, and marked *Plan.* Finally, the lines of ſolids are laid on the ſame faces tending towards the centre, and diſtinguiſhed by *Sol.* See farther on the conſtruction and uſe of this inſtrument, Robertſon's Treatiſe of Mathematical Inſtruments, &c. Appendix.

CALICAPHA, in *Botany*, a name uſed by ſome authors for the white-thorn.

CALICULARIS, in *Botany*, a name given by ſome authors to the common *hyoſciamus* or HENBANE.

CALIDRIS, *Bellonii*, *Jonſt.* in French, *Chevalier*; in *Ornithology*, a water-fowl of the bigneſs of a pigeon, well feathered, with a long red bill, blackiſh toward the upper part; its head, neck, wings and tail of an aſh colour; its belly white; with very long legs.

Becauſe its body is high mounted, and its walk ſwift, it is called the *chevalier*; as though it were mounted on horſeback. It lives about meadows, pools, and rivulets; its fleſh is delicious, and of a good ſmell: there are ſeveral ſorts of them, which differ in colour.

They contain much volatile ſalt, with oil ſomewhat exalted, and reſtorative, and corroborative.

CALIDUCTS, from *calor*, *heat*, and *duco*, *I lead*; a kind of pipes, or canals, diſpoſed along the walls of houſes and apartments; uſed by the ancients for the conveyance of heat to ſeveral remote parts of the houſe, from one common furnace.

The ancient *caliducts* ſeem both for thrift and uſe preferable to the German ſtoves; and might even challenge the advantage over our own faſhion, were it not that the very ſight of a fire adds ſomething of luſtre to a room.

CALIETA, in *Botany*, a name uſed by ſome authors for a ſort of yellow *fungus* common about the roots of trees, as the juniper, &c.

CALIGA, in *Roman Antiquity*, was the proper ſoldier's ſhoe, made in the ſandal faſhion, without upper leather to cover the ſuperior part of the foot, though otherwiſe reaching to the middle of the leg, and faſtened with thongs. The ſole of the *caliga* was of wood, like the Sabot of the French peaſants, and its bottom ſtuck full of nails; which clavi are ſuppoſed to have been very long in the ſhoes of the ſcouts and ſentinels; whence theſe were called by way of diſtinction, *caligæ ſpeculatoriæ*; as if by mounting the wearer to a higher pitch, they gave a greater advantage to the ſight: though others will have the *caligæ ſpeculatoriæ* to have been made ſoft and woolly, to prevent their making a noiſe. Plin. Nat. Hiſt. lib. ix. cap. 18. lib. xxxiv. cap. 14. Hard. Suet. in Calig. cap. 9. & cap. 52.

From theſe *caligæ* it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common ſoldier.

A ſort of *caligæ* was alſo worn by monks, and biſhops, when they celebrated maſs pontifically. Du-Cange.

CALIGATI, an appellation given by ſome ancient writers to the common ſoldiers in the Roman armies, by reaſon of the *caliga*, which they wore.

The *caliga* was the badge, or ſymbol of a ſoldier; whence to take away the *caliga* and belt, imported a diſmiſſion or caſhiering.

CALIGO, or CALIGATIO, in *Medicine*, an opacity, or cloudineſs of the anterior ſurface of the cryſtalline, cauſing a dimneſs or ſuffuſion of ſight.

The *caligo* is the ſame with what the Greeks call αχλυς, ACHLYS.

CALIMUS. See CALLIMUS.

CALIN, the name of a ſort of mixt metal, ſeemingly compoſed of lead and tin. It is prepared by the Chineſe, and they make ſeveral utenſils of it, as tea-caniſters, coffee-pots, and the like. In ſome places alſo they cover their houſes with it as we do with lead.

CALIPH, CALIF, KALIPH, denotes a ſucceſſor of Mahomet, in the ſpiritual as well as temporal empire erected by that legiſlator.

The word is originally Arabic, *khalifah*; which properly denotes a ſucceſſor, or heir.

After the death of Mahomet, Abubeker having been elected by the muſſulmans to ſupply his place, he would take no other title but that of *khalifah reſſoul allah*, i. e. *vicar of the prophet*, or *meſſenger of God.* Omar, coming afterwards to ſucceed Abubeker, repreſented to the Mahometan chiefs, that if he took the quality of vicar, or ſucceſſor of Abubeker, the vicar or ſucceſſor of the prophet, the word vicar would, in courſe of time, come to be repeated and multiplied without end: upon which, at the motion of Mogairah, Omar took the title of *emir moumenin*, that is, *lord*, or *prince of the believers*; an appellation accepted and borne by all the legitimate *caliphs*, or ſucceſſors of Mahomet, from that time: not but they ſtill retained the title *caliph*, without other addition. The *caliphs* in the Mahometan, bear a near affinity to the popes in the Chriſtian religion.

At one of the windows of the *caliph's* palace, there hung always a piece of black velvet, twenty cubits long, which reached to the ground, and was called the *caliph's* ſleeve; which the grandees of his court never failed to kiſs, with great reſpect, every day.

The honours paid the *caliphs* were exceſſive, and bred a pride in them, of which they ceaſed not to give marks even when their authority was at the loweſt. They affected great ſplendor and magnificence in every thing. Abulpharagius relates, that the *caliph* Motazem had no leſs than a hundred women in his ſeraglio, and three hundred eunuchs to keep them.

But this ſplendor was much diminiſhed during the reign of the Bonides in Perſia; who ſtript them of every thing, taking from them their vizirs, and leaving them no higher officer than a ſecretary to take care of their affairs.

The *caliphs* loſt their authority, and almoſt their name, in that deluge of deſtruction by the Tartars, who over-run all the Eaſt. Since the deſtruction of the *caliphate*, the Mahometan princes have a particular officer appointed in their reſpective dominions, who ſuſtains the ſacred authority of *caliph*. In Turky he goes under the denomination of *mufti*, and in Perſia under that of *ſadne*.

CALIPPIC *period*, in *Chronology*, a ſeries of ſeventy-ſix years, perpetually recurring; which elapſed, the middle of the new and full moons, as its inventor Calippus, an Athenian, imagined, return to the ſame day of the ſolar year.

Meton, an hundred years before, had invented the *period*, or cycle, of nineteen years (ſee *Metonic* CYCLE); aſſuming the quantity of the ſolar year $365\textit{d.}\ 6\textit{h.}\ 18'\ 56''\ 50^{3}\ 31^{4}\ 34^{5}$; and the lunar month, $29\textit{d.}\ 12\textit{h.}\ 45'\ 47''\ 26^{3}\ 48^{4}\ 30^{5}$: but Calippus, conſidering that the Metonic quantity of the ſolar year was not exact, multiplied Meton's *period* by 4, and thence aroſe a *period* of 76 years, called the *Calippic*. The *Calippic period*, therefore, contains 27759 days: and ſince the lunar cycle contains 235 lunations, and the *Calippic period* is quadruple of this, it contains 940 lunations. This period began in the third year of the 112th Olympiad, or the 4384th of the Julian period.

It is demonſtrated, however, that the *Calippic period* itſelf is not accurate; that it does not bring the new and full moons preciſely to their places: $8\textit{h.}\ 5'\ 52''\ 60'''$, being the exceſs of 940 lunations above 76 ſolar years; but brings them too late, by a whole day, in 225 years.

CALIX, or CALYX. See CALYX, and CHALICE.

CALIXTINS, a name given to thoſe, among the Lutherans, who follow the ſentiments of George Calixtus, a celebrated divine, and profeſſor at Helmſtadt, in the duchy of Brunſwick, who died in 1656: he oppoſed the opinion of St. Auguſtin, on predeſtination, grace, and free-will, and endeavoured to form an union among the various members of the Romiſh, Lutheran, and reformed churches; or, rather, to join them in the bonds of mutual forbearance and charity. See SYNCRETISTS.

The *Calixtins* are eſteemed a kind of SEMI-PELAGIANS.

CALIXTINS alſo denote a ſect in Bohemia, derived from the Huſſites, about the middle of the fifteenth century, who aſſerted the uſe of the cup, as eſſential to the euchariſt.

And hence their name; which is formed from the Latin *calix*, a *cup*. See CALYX.

The *Calixtins* are not ranked by Romaniſts in the liſt of heretics, ſince in the main they ſtill adhered to the doctrine of Rome. The reformation they aimed at terminated in the four following articles. 1. In reſtoring the cup to the laity. 2. In ſubjecting the criminal clerks to the puniſhment of the civil magiſtrate. 3. In ſtripping the clergy of their lands, lordſhips, and all temporal juriſdiction. 4. In granting liberty to all capable prieſts to preach the word of God. See TABORITES.

CALKING, or CAULKING, in *Sea-language*, &c. See CAUKING.

CALKING, in *Painting*. See CALQUING.

CALKINS, or CALKERS, a part prominent from a horſe-ſhoe, intended to ſecure the beaſt from ſliding.

The *calkins* are the end or extremity of horſe-ſhoes, turned or bent downwards, and forged to a ſort of point, to make the beaſt ſtep more ſafe and ſteady on the ice.

The inconvenience of *calkins* is, that they hinder the horſe from treading evenly on the ground, and thus occaſion wrenches of the foot, or ſtrains of the ſinews; eſpecially in ſtony ways, where the hardneſs of the bottom will not ſuffer the *calkins* to penetrate: add, that they are apt to make a horſe cut.

Calkins are either ſingle or double, i. e. at one end of the ſhoe, or at both; the latter are reputed leſs hurtful, as they allow the creature to tread more even; ſome are made large and ſquare; the beſt are in form of the point of a hare's ear.

CALL, in *Hunting*, a leſſon blown upon the horn, to comfort the hounds.

Among *Fowlers*, it means the noiſe or cry of a bird, eſpecially to its young, or its mate in coupling time.

One method of catching partridges, is by the natural *call* of a hen trained for the purpoſe, which drawing the cocks to her, gives opportunity for entangling them in a net.

Calls are alſo a ſort of artificial pipes, made to catch ſeveral ſorts of birds, by imitating their notes.

Different birds require different ſorts of artificial *calls*; but they are moſt of them compoſed of a pipe or reed, with a little leathern bag or purſe, ſomewhat in form of a bellows; which, by the motion given thereto, yields a noiſe like that of the ſpecies of bird to be taken.

The *call* for partridges is formed like a boat, bored through, and fitted with a pipe or ſwan's quill, &c. to be blown with the mouth, to make the noiſe of the cock partridge, which is very different from the *call* of the hen.

Calls for quails, &c. are made of a leathern purſe in ſhape like a pear, ſtuffed with horſe hair, and fitted at the end with a bone of a cat's, hare's, or coney's legs, formed like a flageolet: they are played by ſqueezing the purſe in the palm of the hand, at the ſame time ſtriking on the flageolet part with the thumb to counterfeit the *call* of the hen quail.

CALL, in *Sea-language*, a ſort of whiſtle, or pipe, of ſilver or braſs, uſed by the boatſwain and his mates to ſummon the ſailors to their duty, and to direct them in their ſeveral employments. It is ſounded to various ſtrains, adapted to the different exerciſes, as hoiſting, heaving, &c. and the *piping* of it ſerves the ſame purpoſes among ſailors, as the beat of the drum among ſoldiers.

CALL, among *Miners*. See TELAUGIA.

CALL *of the houſe*, in a parliamentary ſenſe, has been ſometimes practiſed, to diſcover whether there be any in the houſe not returned by the clerk of the crown; but more frequently to diſcover what members are abſent without leave of the houſe, or juſt cauſe.

In the former caſe, the names of the members being called over, every perſon anſwers to his name, and departs out of the houſe, in the order wherein he is called. In the latter, each perſon ſtands up uncovered, at the mention of his name.

CALL *of the plaintiff, in Law*. See NON-SUIT.

CALLA, *African arum*, in *Botany*, a genus of the *gynandria polyandria* claſs of plants: the *ſpatha* is plain, the *ſpadix* is covered with ſmall flowers: it has neither calyx nor petal, and the fruits are berries containing many ſeeds.

CALLAF, in *Botany*, a low, ſhrubby tree, growing in the Eaſt; of ſmooth wood, and leaves ſomewhat reſembling the cherry-tree, ſerrated on the edges, and growing out from the extremities of the branches, which are ſtrait, without joints, flexible, and of a yellowiſh colour. The flowers, which are produced before the leaves, come forth very thick in December, at equal diſtances; and are a ſort of oblong, downy, little balls, of a whitiſh yellow, or true yellow colour, and of a fragrant ſmell. It has a place in the gardens of the nobility, on account of its incomparable fragrancy; and is cultivated with great care by the peaſants, for the profit they make of its flowers.

An excellent water is prepared from the flowers, eſpecially at Damaſcus, which is of ſo ſtrengthening a virtue, that we have nothing to compare with it; for by the extraordinary ſweetneſs of its ſmell, it wonderfully relieves perſons under a lipothymy. The Moors uſe this water both internally and externally, in burning and peſtilential fevers; it refrigerates and moiſtens. An oil alſo is made of the flowers, which is ſerviceable for many purpoſes.

CALLARIAS, by ſome called *aſellus callarius*, in *Ichthyology*, a fiſh of the truttaceous kind, called by Aldrovandus *tinca marina*, and by Rondeletius and Geſner *phycis*. It uſually grows to about a foot in length, and is in ſhape ſomething flattiſh; it is covered with ſmall ſcales, and is of a greyiſh colour, but ſomewhat purple on the head; its tail is roundiſh, not forked; it is a very well taſted fiſh, and is common in the Mediterranean, and brought to market at Rome, Venice, &c.

CALLENDER, in *Manufactures*. See CALENDER.

CALLIBER, or CALIPER. See CALIBER.

CALLIBLEPHARA, from καλλος, *beauty*, and βλεφαρον, *eye-lid*, in the *Medicinal Writings of the Ancients*, a name given to certain compoſitions intended to make the eye-lids beautiful; and as the eye-lids are ſubject to be deformed ſeveral ways, there were ſeveral different ſorts of theſe medicines.

CALLICARPA, in *Botany*. See JOHNSONIA.

CALLICHTHUS, in *Zoology*, a name given by ſome writers to the *anthias*, a ſmall fiſh caught in the Adriatic, and ſuppoſed to be a certain token of there being no voracious fiſhes near the place where it is found; it is called alſo *ſacer piſcis*, the *holy fiſh*, and is a very beautiful fiſh.

CALLICO, in *Commerce*, a ſort of cloth reſembling linens made of cotton.

This name is taken from that of *Callicut*, a city on the coaſt of Malabar, being the firſt place at which the Portugueſe landed when they diſcovered the India trade. The Spaniards ſtill call it *callicu*.

Callicoes are of divers kinds, plain, printed, painted, ſtained, dyed, chints, muſlins, and the like, all included under the general denomination of *callicoes*.

A great naturaliſt has ſuggeſted that the Indian *callico* is made of the fibres of nettle ſtalks; but this is not confirmed: on the contrary, there are *callicoes* alſo made in the iſland of Candia, which, it is known, are made of cotton.

The printing of *callicoes* was firſt ſet on foot in London about the year 1676.

By an act of parliament made in 1722, the uſe of dyed, painted, or printed *callicoes* is forbid, either in apparel or furniture, on the forfeiture of five pounds to the informer for every offence; and drapers ſelling ſuch *callico* forfeit 20 *l.* 7 Geo. I. Stat. 1. cap. 7. § 2. but this prohibition does not extend to *callicoes* dyed blue.

The deſign of this prohibition was to promote the conſumption of our own manufactures. But its chief effect has been to promote the uſe of printed linen. Upon the act's taking place, the *callico*-printers fell to work to imitate the Indian *callicoes*, by making the ſame ſtamps and impreſſions, and with the ſame beauty of colours upon linen. This fell chiefly on Scots and Iriſh linen, the manufacture of which have been hereby greatly increaſed, many hundred thouſand ells thereof being yearly imported from thoſe countries, and printed or ſtamped in England.

CALLIDRYS, in *Zoology*, a name given by Bellonius, and ſome other authors, to a water-bird, known among us by the name of the REDSHANK.

CALLIDRYS *nigra*, in *Zoology*, the name of a bird, deſcribed by Bellonius, and ſuppoſed by ſome to be that bird which we call the KNOT.

CALLIDRYS. See CALIDRIS.

CALLIGONUM, in *Botany*, a genus of the *polyandria digynia* claſs; the calyx has four leaves; the plant has neither petal nor ſtyle; the fruit is briſtly, with a ſingle ſeed.

CALLIGRAPHUS anciently denoted a copyiſt, or ſcrivener, who tranſcribed fair, and at length, what the notaries had taken down in notes, or minutes.

The word is compounded of καλλος, *beauty*, and γραφω, *I write*. The minutes of acts, &c. were always taken in a kind of cypher, or ſhort-hand; ſuch as the notes of Tyro in Gruter: by which means the notaries, as the Latins called them, or the σημειογραφοι and ταχυγραφοι, as the Greeks called them, were enabled to keep pace with a ſpeaker, or perſon who dictated. Theſe notes, being underſtood by few, were copied over fair, and at length, by perſons who had a good hand, for ſale, &c. and theſe were called *calligraphi*; a name frequently met with in the ancient writers.

CALLIGRAPHY, the art of fair writing.

Callicrates is ſaid to have written an elegant diſtich on a ſeſamum ſeed. Junius ſpeaks of a perſon, as very extraordinary, who wrote the apoſtles creed, and beginning of St. John's Goſpel, in the compaſs of a farthing. What would he have ſaid of our famous Peter Bale, who in 1575, wrote the Lord's prayer, creed, ten commandments, and two ſhort prayers in Latin, with his own name, motto, day of the month, year of the Lord, and reign of the queen, in the compaſs of a ſingle penny, inchaſed in a ring and bordure of gold, and covered with a cryſtal, all ſo accurately wrought, as to be very legible?

CALLIMUS, in *Phyſiology*, a ſtony ſubſtance found in the cavity of the ÆTITES, or eagle ſtone.

The word is alſo written *calimus*, and in ſome copies of Pliny *calainus*; which latter reading Salmaſius receives. The *callimus* fills the hollow of the ætites, much as the yolk does the white of an egg.

The GEODES, inſtead of a *callimus*, or ſolid ſtone, have a looſe, ſandy, chalky, or earthy ſubſtance, and the ENHYDRI a liquid ſubſtance.

CALLION, in *Botany*, a name given by Pliny, and ſome other authors, to the *alkekengi*, or *winter*-CHERRY. Some of the Greeks called it alſo *cyſtis*.

CALLIONYMUM, in *Botany*, a name given by ſome authors to the LILLY *of the valley*.

CALLIONYMUS, in *Ichthyology*, a name uſed by Appian, and ſome other authors, for the fiſh called the *uranoſcopus*, or the ſtar-gazer.

In the Linnæan ſyſtem, it is a genus of the order of *jugular* fiſhes, comprehending three ſpecies.

CALLIOPE, the chief of the nine Muſes, called by Horace *Regina*. The diſtinguiſhing office of this muſe was to record the worthy actions of the living; and accordingly ſhe is repreſented with tablets in her left hand.

CALLIPÆDIA, the art of getting or breeding fine and beautiful children.

The word is formed from καλος, *fair*, and παις, *puer*, either boy or girl.

We find divers rules and practices relating to this art, in ancient and modern writers.

The Jews are ſaid to have been ſo ſolicitous about the beauty of their children, that care was taken to have ſome very beautiful child (ſuch as was Jochanan, the diſciple of Judah, author of the Miſchna) placed at the door of the public baths, that the women at going out, being ſtruck with his appearance, and retaining the idea, might all have children as fine as he.

The Chineſe take great care of their breeding women, to prevent uncouth objects of any kind from ſtriking their imagination.

Callipædia, nevertheleſs, ſeems to have been firſt erected into a juſt art by Claude Quillet de Chinon, a French abbot, who, under the fictitious name of Calvidus Lætus, has publiſhed a fine Latin poem, in four books, under the title of *Callipædia, ſeu de pulchræ prolis habendæ ratione*; wherein are contained all the precepts of the art. Paris, 1656, 8vo. & Lond. 1708, 8vo.

CALLISIA, in *Botany*, a genus of the *triandria monogynia* claſs, with a three-leaved calyx, three petals, a double anthera, and bilocular capſule.

CALLISTIA, in *Antiquity*, a Leſbian feſtival, wherein the women preſented themſelves in Juno's temple, and the prize was aſſigned to the faireſt.

The word is formed from καλλος, *beauty*, q. d. beauty's rewards. The like conteſt of beauty was held at the feſtival of Ceres Eleuſinia, among the Parrhaſians, firſt ſet on foot by Cypſelus, whoſe wife Herodice was honoured with the firſt prize. Another obtained among the Elians, where the conteſt was among the men, the moſt beautiful of whom was preſented with a ſuit of armour, which he conſecrated to Minerva, to whoſe temple he walked in proceſſion, adorned with ribbons, and crowned with a myrtle garland. Pott Arch. Græc. lib. ii. cap. 20.

CALLITRICHE, in *Botany*, a genus of the *monandria digynia* claſs: it has no calyx, two petals, and the capſule has two cells, with four ſeeds.

CALLITRICHUS, in *Zoology*, a ſpecies of MONKEY, with a black, flattiſh face, white hairs on the ſides, and black ears, and the upper parts of the body are covered with ſoft hair, of a yellowiſh green colour, whence it is called the green monkey; and the lower parts with hair of a ſilvery colour. It is about the ſize of a ſmall cat.

CALLOSUM *corpus*, in *Anatomy*, denotes a part in the medulla of the brain of a white colour, and a texture ſomewhat harder and more compact than the reſt; approaching to that of a *callus*.

The *corpus calloſum* runs along the whole tract of the *falx*; at the extremity next the cerebellum it ſends out two proceſſes, whoſe juncture conſtitutes the *fornix*; under which lies the *ſeptum lucidum*.

The *corpus calloſum* is an aſſemblage of bundles of fibres ſpringing from the glands, which compaſs the cineritious part, and ſerve as excretory ducts thereto: theſe fibres as deſcending towards the *medulla oblongata*, all meet there; and ſerve to connect the lobes of the brain. Signior Lanciſi makes the *corpus calloſum* to be the immediate ſeat of the ſoul. See BRAIN.

CALLOUS, *Calloſus*, ſomething of the nature or conſiſtence of a CALLUS.

Phyſicians ſpeak of *callous* nodes or excreſcences, *callous* ulcers, and the like.

CALLOUS *eggs*, *ova calloſa*, the longer and better ſort, ſuppoſed to contain male chicks; having a denſer white, and richer flavour than the reſt. See EGG.

CALLUS, or CALLOSITY, in a general ſenſe, denotes any cutaneous, fleſhy, or bony hardneſs, whether natural or preternatural.

In which ſenſe, *clavi*, or corns, are a ſpecies of *callus*. See CLAVUS.

CALLUS is alſo frequently uſed for a kind of node, which joins the extremities of a fractured bone.

The formation of a *callus* ſeems to be as follows: the juice that feeds the bone, running along its fibres, becomes extravaſated in the place where thoſe fibres are broken: ſo that ſtopping, and gathering together round the extremities of the fracture, it there dries, knits, and hardens, to a conſiſtence like a ſtrong glue; leaving only a little inequality in the place where it is formed.

But as the new fleſh in wounds will frequently ſprout up too faſt, ſo will alſo the *callus* in fractures; and by this means render the limb uneven and deformed. The only methods that can be taken to prevent the *callus* from exceeding its due bounds, are to make the bandage ſomewhat tighter than ordinary, and wet it with ſpirit of wine; for by this means the *callus* is not only often kept within its due bounds, but the induration of it is alſo much forwarded; but when once the *callus* is indurated, we have no medicines by which it can be taken down or deſtroyed. Heiſter.

Calluſes frequently grow ſo firm as to ſupply the place of whole bones. In the Philoſophical Tranſactions we have an inſtance of a *callus* ſupplying the place of the *os humeri*, taken out upon its being carious, by Mr. Fowler; and another of a *callus* ſupplying the place of the *os femoris*, and the perſon continued as ſtrong as ever, and walked without any lameneſs.

Callus is alſo a hard, denſe, inſenſible knob, or ſubſtance, riſing on the hands, feet, &c. by much friction, and preſſure againſt hard bodies.

Mr. Lewenhoek examining the *callus* formed on the hands and feet, obſerved that it was a ſubſtance compoſed of ſeveral layers of particles ſo looſely connected, that it was a wonder they could hang together; on putting a piece of this into fair water, after it had ſtood a conſiderable time to ſteep, he found that the particles of which it was compoſed, would eaſily ſeparate from one another with a little touch of a quill, and theſe ſeparated particles put into a drop of water, and examined before the microſcope, were found to be all of the ſame regular ſhape, which was like that of a weaver's ſhuttle, being broad in the middle, and pointed at each end, with a line in the middle like thoſe upon the uppermoſt, or outſide ſkins of fruits, or of our bodies, but generally irregular. Theſe pieces were thick in proportion to their ſize; and when they are put into water, and ſeparated again, they naturally form a great number of other particles, all of which are of the ſame regular figure with the original piece. Phil. Tranſ. N° 373. p. 160.

By this we ſee the reaſon of the increaſe in thickneſs of the ſkin of the hands of thoſe who labour hard, and of the feet of ſuch people as walk much, which is wholly owing to the addition of vaſt numbers of theſe ſhuttle-like particles, which form combinations together; but theſe ſo looſely, that it is no wonder they are ſo eaſily ſeparated on moiſtening.

The people who labour ever ſo hard will have no *callus* upon their hands, if they waſh them often; the waſhing the hands daily rubs off a great quantity of theſe particles or ſcales, if they may be ſo called; but they are quickly renewed.

Callus is by ſome alſo applied to thoſe knots, or tophaceous NODES, generated in the joints of gouty patients. See TOPHUS.

Callus is alſo eſpecially uſed to denote a hardneſs of the eye-brows, occaſioned by the congeſtion of an acid, or tartareous juice therein.

Paracelſus alſo gives the denomination *callus*, to an abſceſs or ulcer, cauſed by the acrimonious, or arſenical quality of the nutritious juice, and exciting a vehement itching.

CALLYCHTHIS, in *Ichthyology*, the name of a broad and flat ſea-fiſh, brought to market at Rome under the name of the *lampuga*, and commonly called the STROMATEUS; and by the Venetians the *licette*.

In the Linnæan ſyſtem, it is a ſpecies of the SILURUS.

CALLYONYMUS. See CALLIONYMUS.

CALM, in *Sea Language*, that ſtate of the air and water when there is no wind ſtirring.

They ſay a flat *calm*, a dead or ſtark *calm*. A *calm* is more terrible to a ſea-faring man than a ſtorm, if he has a ſtrong ſhip, and ſea-room enough; for under the line exceſſive heat ſometimes produces ſuch dead *calms*, that ſhips are obliged to ſtay two or three months without being able to ſtir one way or other.

Two oppoſite winds will ſometimes make a *calm*. This is frequently obſerved in the gulf of Mexico, at no great diſtance from the ſhore, where ſome guſt or land-wind will ſo poiſe the general eaſterly wind, as to produce a perfect *calm*.

Calms are never ſo great on the ocean as on the Mediterranean, by reaſon the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the *calm* is ſometimes ſo dead, that the face of the water is as clear as a looking glaſs; but ſuch *calms* are almoſt conſtant preſages of an approaching ſtorm. On the coaſts about Smyrna, a long *calm* is reputed a prognoſtic of an earthquake.

When a ſhip is cloſe under the lee of another, the windward veſſel is ſaid to *becalm* the leeward.—A ſhip is alſo ſaid to be *becalmed* when near the land, which keeps the wind from it.

It is not uncommon for the veſſels to be *calmed*, or *becalmed*, as the ſailors expreſs it, in the road of the conſtant levantine winds, in places where they ride near the land. Thus between the two capes of Cartooche toward the main, and cape Antonio in Cuba, the ſea is narrow, and there is often a *calm* produced by ſome guſt of a land-wind, that poiſes the levantine wind, and renders the whole perfectly ſtill for two or three days.

In this caſe, the current that runs here is of uſe to the veſſels, if it ſets right; when it ſets eaſterly, a ſhip will have a paſſage in three or four days to the Havannah; but if otherwiſe, it is often a fortnight or three weeks ſail; the ſhip being embayed in the gulf of Mexico.

When the weather is perfectly *calm*, no wind at all ſtirring, the ſailors try which way the current ſets, by means of a boat which they ſend out, and which will ride at anchor, though there is no bottom to be found, as regularly and well as if faſtened by the ſtrongeſt anchor to the bottom. The method is this: they row the boat to a little diſtance from the ſhip, and then throw over their plummet, which is about forty pounds weight; they let this ſink to about two hundred fathom; and then, though it never reaches the bottom, the boat will turn head againſt the current, and ride as firmly as can be.

Calm *Latitudes*, in *Sea Language*, are ſituated in the Atlantic ocean, between the tropic of Cancer, and the latitude of 29° N. or they denote the ſpace that lies between the trade and variable winds, becauſe it is frequently ſubject to *calms* of long duration.

CALOGERI, Καλογεροι, or CALOYERS, monks, or religious, in Greece, both male and female; inhabiting, particularly, mount Athos, but diſſeminated alſo throughout all the churches of the Eaſt. They follow the rule of St. Baſil, and make vows like the weſtern religious. Tournefort ſays, the females are moſt of them only a more moderate ſort of Magdalens, who, as they grow old, make a vow to practiſe thoſe virtues they had much neglected in their youth; and retire into convents to lead a life ſomewhat leſs ſcandalous than before, under the eyes of a ſuperior or *hegumeniſſa*, who is far from being too ſevere.

The *caloyers*, in ſome places, are divided into cœnobites, anachorites, and aſcetics, or hermits; the life of which laſt is the moſt ſevere and recluſe.

The Turks alſo uſe the word *caloyers* for their derviſes, or religious muſſulmen. See DERVIS.

CALOMEL, in *Pharmacy*, a name given to *mercurius dulcis*, ſublimated; or, it is a combination of the marine acid, with as much mercury as that acid is capable of corroding and uniting with. The denomination *calomel* rather ſeems to have firſt belonged to the Æthiops mineral; from καλος, *pulcher*, *fair*; and μελας, *niger*, *black*; becauſe white or pale bodies, rubbed herewith, become black.

Calomel is the *panchymagogum* of Quercetanus. It is an effectual purge, and given not only to adults, but even to children, to carry off the ſlimy humours from whence the worms ariſe. *Calomel*, rubbed with ſulphur of antimony, is alſo found a powerful alterant. See MERCURY, and PLUMMER's *Æthiops*.

CALONDRONIUS, a name given by the writers of the middle ages to a ſtone of which they have left us no deſcription, but only a large account of its great virtues, in giving chearfulneſs to the perſon who wears it, and preventing the power of magic and enchantments.

CALOPHYLLUM, in *Botany*, the name given by Linnæus to a genus of plants of the *polyandria monogynia* claſs, called by Plumier *calaba*, the characters of which are theſe. The cup is coloured and deciduous, and conſiſts of one leaf divided into four acute ſegments; the flower conſiſts of four roundiſh, hollowed, and expanded petals; the ſtamina are numerous capillary filaments, ſhorter than the flower; the antheræ are roundiſh; the germen of the piſtil is roundiſh; the ſtyle is ſimple, and of the length of the ſtamina; the ſtigma is headed; the fruit is a large, globoſe, unilocular drupa; and the ſeed is a large pointed nut, of a roundiſh figure.

CALOTTE, a CAP, or coif of hair, ſattin, or other ſtuff; uſed firſt for neceſſity, but now become an eccleſiaſtical ornament, in France, &c.

It was firſt worn by cardinal Richelieu: the red *calotte* is a badge of a cardinal.

Calotte, in *Architecture*, a round cavity, or depreſſure, in form of a cup, or cap, lathed and plaiſtered, uſed to diminiſh the riſe, or elevation of a chapel, cabinet, alcove, &c. which, without ſuch an expedient, would be too high for other parts of the pile.

CALQUING, or CALKING, a term in *Painting*, &c. uſed where the back-ſide of any deſign is covered with black lead, or red chalk; and the ſtrokes or lines traced through on a waxed plate, wall, or other matter; by paſſing lightly over each ſtroke of the deſign with a point, which leaves an impreſſion of the colour on the plate or wall. This method of *off-tracing* may likewiſe be performed by pricking the original print, or drawing and tranſmitting a coloured powder through the punctured holes, in order to mark the outlines on a new ground; or, by diſſolving part of the printing ink by means of ſoap, and impreſſing it in that ſtate on a freſh ground. See DESIGNING.

CALTHA, in *Botany*. See *Marſh*-MARYGOLD.

CALTROP, or CALTHROP, an inſtrument with four iron points, each three or four inches long, diſpoſed triangularwiſe; ſo that there are always three points bearing on the earth, the fourth being in the air.

Several of theſe, fixed in the ground, or thrown into breaches where the cavalry is to paſs, ſtick into the horſes feet, and embarraſs them.

CALTROPS, *Tribulus*, in *Botany*, a genus of the *decandria monogynia* claſs. Its characters are theſe: the empalement of the flower is cut into five acute parts; there are five oblong blunt petals to the flower, which ſpread open; and ten ſmall awl-ſhaped ſtamina, terminated by ſingle ſummits, and an oblong germen the length of the ſtamina, having no ſtyle, but crowned by a headed ſtigma. The germen turns to a roundiſh, prickly fruit, divided into five capſules, armed with three or four angular thorns on one ſide, joining together. The cells are tranſverſe, and contain two or three pear-ſhaped ſeeds. There are three ſpecies, natives of warm countries. It derives its name from the form of its fruit, which reſembles thoſe inſtruments of war that were caſt in the enemy's way, to annoy their horſes.

This plant, taken inwardly, is a vulnerary; and is ſaid to be of ſervice in a diarrhœa, and the ſtone.

CALTROPS, *water*. See TRAPA.

CALVARIA, or CALVA, the ſcalp, or upper part of the HEAD; ſo called from its growing bald firſt. See BALDNESS.

The external parts of the *calva* are the *ſynciput*, *occiput*, *vertex*, and temples; all inveſted with the hair, and the common integuments of the body.

The *calvaria* in adults conſiſts of eight bones, one of the forehead, another of the *occiput*, two of the *ſynciput*, two of the temples, and two others common alſo to the upper jaw, viz. the *cuneiforme* and *ſpongioſum*.

CALVARY, a term uſed in catholic countries for a kind of chapel of devotion, raiſed on a hillock near a city; in memory of the place where Jeſus Chriſt was crucified near Jeruſalem.

The word comes from the Latin *calvarium*, and that from *calvus*, *bald*; the top of that hillock was bare, and deſtitute of verdure; which is alſo ſignified by the Hebrew word *golgotha*.

Such is the *Calvary* of St. Valerian, near Paris; which is accompanied with ſeveral little chapels, in each whereof is repreſented in ſculpture one of the myſteries of the paſſion.

CALVARY, in *Heraldry*, a croſs ſo called, becauſe it reſembles that on which our Saviour ſuffered: it is always ſet upon ſteps.

CALVINISM, the doctrine and ſentiments of Calvin, one of the principal reformers in the ſixteenth century, a native of Noyon in France, and afterwards paſtor and profeſſor of divinity at Geneva, and of his followers, with regard to matters of religion.

Calviniſm ſubſiſts in its greateſt purity in the city of Geneva; and from thence it was firſt propagated into Germany, France, the United Provinces, and England. In France it was aboliſhed by the revocation of the edict of Nants, in 1685. It has been the prevailing religion in the United Provinces ever ſince the year 1571. The theological ſyſtem of Calvin was adopted, and made the public rule of faith in England, under the reign of Edward VI. and the church of Scotland was modelled by John Knox, the diſciple of Calvin, agreeably to the doctrine, rites, and form of eccleſiaſtical government, eſtabliſhed at Geneva. In England it has declined ſince the time of queen Elizabeth; though it ſtill ſubſiſts, ſome ſay a little allayed, in the articles of the eſtabliſhed church; and in its rigour in Scotland. See REFORMATION and *Reformed* CHURCH.

The diſtinguiſhing theological tenets of *Calviniſm*, as the term is now generally applied, reſpect the doctrines of PREDESTINATION, or *particular* ELECTION and REPROBATION, *original* SIN, *particular* REDEMPTION, *effectual*, or, as ſome have called it, *irreſiſtible* GRACE in *regeneration*, JUSTIFICATION *by faith*, PERSEVERANCE, and the TRINITY. See each of theſe articles. See alſo ARMINIANS.

Beſides the doctrinal part of Calvin's ſyſtem, which, ſo far as it differs from that of other reformers of the ſame period, principally regarded the abſolute decree of God, whereby the future and eternal condition of the human race was determined out of mere ſovereign pleaſure and free-will; it extended likewiſe to the diſcipline and government of the Chriſtian church, the nature of the Euchariſt, and the qualification of thoſe who were intitled to the participation of it. Calvin conſidered every church as a ſeparate and independent body, inveſted with the power of legiſlation for itſelf. He propoſed that it ſhould be governed by preſbyteries and ſynods, compoſed of clergy and laity, without biſhops, or any clerical ſubordination; and maintained, that the province of the civil magiſtrate extended only to its protection and outward accommodation. In order to facilitate an union with the Lutheran church, he acknowleged a real, though ſpiritual, preſence of Chriſt, in the Euchariſt, that true Chriſtians were united to the man Chriſt in this ordinance, and that divine grace was conferred upon them, and ſealed to them, in the celebration of it; and he confined the privilege of communion to pious and regenerate believers. See EUCHARIST, &c. and LUTHERANISM.

In France the *Calviniſts* are diſtinguiſhed by the name of *Huguenots*; and, among the common people, by that of *Parpaillots*. In Germany they are confounded with the Lutherans, under the general title *Proteſtants*; only ſometimes diſtinguiſhed by the name *Reformed*.

CALVINISTS, *Crypto*, a name given to the favourers of *Calviniſm* in Saxony, on account of their *ſecret* attachment to the Genevan doctrine and diſcipline. Many of them ſuffered by the decrees of the convocation of Torgaw, held in 1576. See *Form of* CONCORD.

The *Calviniſts* in their progreſs have divided into various branches, or leſſer ſects.

CALVITIES, or CALVITIUM. See BALDNESS.

CALUMET, among *Travellers*, a myſtic kind of pipe uſed by the American ſavages as the enſign of peace, and for religious fumigation.

The *calumet* is a ſort of tobacco pipe, made of red, black, or white marble. The ſhank is decorated with rounds of feathers, and locks of hair, or porcupines quills: in it they ſmoke in honour of the ſun. F. Lafitau will have it to be the original CADUCEUS of Mercury, of which that uſed by the Greeks and Romans, with its wings and its ſerpents, was only the copy.

The *calumet* is the ſymbol and ſecurity of traffic; by it they pronounce life and death, peace and war: they alſo aſcribe to it a power of raiſing the ſouls of the dead.

CALUMNY, the crime of accuſing another falſely and knowingly of ſome heinous offence. *Calumnia eſt malitioſa & mendax informatio.*

It is an ancient maxim, which experience ſhews us to be too well founded: *Audacter calumniare, ſemper aliquid hærebit.*

CALUMNY, *oath of*, *Juramentum*, or rather *Juſjurandum calumniæ*, among civilians and canoniſts, was an oath which both parties in a cauſe were obliged to take; the plaintiff, that he did not bring his charge, and the defendant, that he did not deny it with a deſign to abuſe each other, but becauſe they believed their cauſe was juſt and good; that they would not deny the truth, nor create unneceſſary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refuſed this oath, the complaint or libel was diſmiſſed; if the defendant, it was taken *pro confeſſo*.

This cuſtom was taken from the ancient athletæ, who, before they engaged, were to ſwear they had no malice, nor would uſe any fraudulent or unfair means for overcoming the other.

The *juramentum calumniæ* is much diſuſed, as a great occaſion of perjury.

Anciently the advocates and proctors alſo took this oath; but of late it is diſpenſed with, and thought ſufficient that they take it once for all at their firſt admiſſion to practice.

CALUMNIÆ, *judicium*, was an action brought againſt the plaintiff in a court for a falſe and malicious accuſation.

When an accuſer did not prove his charge, nor ſeemed to have ſufficient or probable grounds for bringing any, the judges in pronouncing ſentence uſed the formula *calumnioſus es*; which gave the defendant a right to bring an action of *calumny*; the penalty of which was *frontis inuſtio*, or burning on the forehead.

CALX literally ſignifies LIME; a ſort of ſtone burnt or calcined in a kiln for that purpoſe, to be uſed in the making of mortar, &c.

It is alſo made of the bones of large fiſhes, and from the ſhells of buccinæ, oyſters, and the like, burnt. This is more particularly called *calx peregrinorum* and *calx manica alba*.

CALX, in *Chemiſtry*, is a kind of aſhes, or fine friable impalpable powder, which remains of metals, minerals, &c. after CALCINATION by fire, SOLUTION by acid menſtrua, or DETONATION by nitre; by means of which all metallic ſubſtances, except gold, ſilver, platina, and mercury, may be deprived of their phlogiſton, and conſequently of their metallic properties, acquiring at the ſame time an acceſſion of air which becomes fixed in them during the reduction; and thus loſe their fuſibility, become more fixed, and leſs ſoluble in acids.

Calxes differ from aſhes not only as the former is the effect of calcination, and the latter of mere burning, but as the former is of a more ſolid conſiſtence than the latter; and that the bodies reduced to a *calx*, as metals and minerals, may frequently be reſtored out of theſe *calxes*; which can never be done out of the aſhes of wood and other bodies conſumed by BURNING.

Calxes are divided into *reducible* and *irreducible*, *fixed* and *volatile*. Chemiſts ſpeak of fire retained and fixed in all *calxes*, and of fixed ſalt p. 56, ſeq. from *calxes*. Hiſt. Acad. Scienc. an. 1712. procurable Hiſt. Acad. Scienc. lib. iv. ſect. 6. c. 3. See Fire and Salt.

Many metals and ſome minerals, whoſe parts are moſt homogeneous, do not appear to loſe their nature with their form. Thus gold, ſilver, and quickſilver, cannot be ſo deſtroyed by CALCINATION, but that they may eaſily be revived. So out of *calx* of tin, the tin itſelf may be reſtored; and the like holds of the *calx* of lead, though the moſt impure of all metals; and even of antimony, the firſt ſubſtance of which may be extracted either from its *calx*, or even glaſs. See Revivification.

Paracelſus calls the bolar and argillaceous earths, *calces terræ*. See Bole and Chalk.

The ſame author alſo gives the denomination *calx* to the chalky matter formed in the joints of gouty perſons.

Calx *antimonii*, a name given in the late London diſpenſatory to the preparation of ANTIMONY, called before *antimonium diaphoreticum*.

Calx *of braſs*, is called ÆS USTUM.

Calx *jovis*, the *calx* of TIN, called PUTTY.

Calx *lunæ*, the *calx* of SILVER.

Calx *martis*, the crocus or ſaffron of IRON.

Calx *mercurii*, precipitated MERCURY.

Calx *nativa*, in *Natural Hiſtory*, a native marley earth, which, without burning, has ſome of the qualities of the artificial lime, and was called by the ancients, *gypſum tymphaicum*.

It is a hard, dry, and ſomewhat coarſe earth; it never conſtitutes a ſtratum of itſelf, but is ſometimes found in the fiſſures of other ſtrata, and ſometimes lying looſe upon or among the laxer ſtrata of gravel and the like. It is uſually found in maſſes of two, three, or four inches in diameter, of irregular ſurfaces, and generally flattiſh It is found in ſome parts of England, and appears to have been well known to the ancients, and in common uſe among them.

Calx *ſaturni*, is ceruſs calcined with ſpirit of vinegar, or in the ſun. See Ceruſſe.

Calx *ſaturni*, is alſo uſed for MINIUM or *red* LEAD.

Calx *ſolis*, denotes calcined GOLD.

Calx *veneris*, VERDEGRISE.

Calx *viva*, quick-lime, that on which no water has been caſt ſince its burning, in oppoſition to *calx extincta*, that ſlacked by the affuſion of water. See Lime.

Calx *viva philoſophorum*, denotes that made of quickſilver.

Calx, in *Anatomy*. See Calcaneum.

CALYBITES, the inhabitant of a cottage, an appellation given to divers ſaints on account of their long reſidence in ſome hut, by way of mortification.

The word is formed from καλυπτω, *tego*, *I cover*; whence καλυϐη, *a little cot*.—The Romiſh church commemorates St. John the *calybites* on the 15th of December.

CALYCANTHEMI, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

CALYCISTÆ, among the *Botanical Authors*. See Botany.

CALYCULUS, in *Ancient Naturaliſts*, denotes a SILIQUA or ſeed-caſe.

CALYCULATED, an appellation given by ſome naturaliſts to the fruits of thoſe trees which have the CALYX of their flower non-deciduous, and whoſe FRUIT ſtands as in a cup. Phil. Tranſ. Nº 204. p. 928. See Plant, Tree, &c.

CALYPTRA, from καλυπτω, *I hide*, among *Botaniſts*, a thin membranous involucrum, uſually of a conic figure, which covers the parts of fructification. The capſules of moſt of the MOSSES have *calyptræ*.

CALYX, or Calix, in a general ſenſe, denotes a CUP. See Chalice.

Calyx, in *Botany*, is ſometimes applied to a FLOWER whoſe body, or even a part of it, is formed in manner of a cup or *chalice*: ſuch is that of a tulip, &c.

Pliny defines the *calyx* the cavity in the middle of a flower, wherein the ſtamina and apices are contained. Auſonius calls it *calathus*.

Calyx is more particularly uſed for that outward greeniſh cover, which encompaſſes and defends the petals and other parts of a flower; ſerving alſo as a baſis or ſupport to the whole. In which ſenſe, *calyx* is the ſame with what is otherwiſe called *perianthium*, and by Dr. Grew the *empalement* or *flower-cup*.

The *calyx* is that ſet of leaves which involves the petala, as the petala do the immediate organ of generation.

The *calyx* is in ſome plants of one entire piece; as in pinks, &c. and in ſome is divided into ſeveral; as in roſes, &c.—Saffron has no *calyx*; its flower comes out of the earth before its leaves.

The cups of flowers are very various in their ſtructure, and are diſtinguiſhed by the names of AMENTUM, CALYPTRA, GLUMA, INVOLUCRUM, PERIANTHIUM, SPATHA, and VOLVA.

Botaniſts diſtinguiſh two ſorts of *calices*, one external, called the *calyx* of the flower, by the ancients *perianthium*, as encompaſſing the flower and ſeed; the other internal, called the *calyx* of the fruit, by the ancients *pericarpium*, as being the capſule which encompaſſes the fruit, and is itſelf encompaſſed by the petala.

The external *calyx* may alſo be divided into two ſorts, one which ſurrounds the flower, another which ſuſtains it, different from the pedicle; in that this latter ſpreads itſelf underneath the flower to give room for the nutritious juice to riſe more freely; the cavity of the pedicle enlarged, is reputed part of the *calyx* both external and internal.

Calyx, *auctus*, in *Botany*, a term uſed by authors to expreſs one kind of the perianthia of the compound flowers. A cup is thus called when it conſiſts of a ſingle and equal ſeries of ſcales, which are of an oblong figure, and ſurround the flowers; and another ſmall ſeries of ſcales, which only ſurround theſe, cloſe to the baſe.

The ancients have often uſed the word *calyx* to expreſs the roſe when in the bud, and not yet ſhewing its petals, except between the ſegments of the cup.

Calyx, in *Ancient Aquæducts*, denoted a brazen module or cup, put over a head or caſtellum, to which pipes were fitted.

CAMÆA, in *Natural Hiſtory*, the name of a genus of the ſemipellucid gems, the characters of which are theſe: they are obſcurely tranſparent ſtones approaching to the onyx ſtructure, being compoſed of zones, and formed on a cryſtalline baſis, but having their zones very broad and thick, and laid alternately on one another with no other matter between them.

Of this genus we have four known ſpecies.

CAMAHA, in the *Materia Medica*, a name given by Avicenna and others to the large truffles found in the deſarts of Numidia, and many other parts of Africa, in great abundance. Theſe are white on the outſide; the modern Africans call them *terſon*, and are very fond of them; they eat them ſtewed with milk, water, and ſpices, and account them wholeſome and nutritive.

CAMAIEU, or Camayeu, a word uſed to expreſs a peculiar ſort of onyx: alſo by ſome to expreſs a ſtone, whereon are found various figures, and repreſentations of landſcapes, &c. formed by a kind of *luſus naturæ*; ſo as to exhibit pictures without painting.

The word comes from *camehuia*, a name the Orientals give to the onyx, when they find, in preparing it, another colour; as who ſhould ſay, *a ſecond ſtone*.

It is of theſe *camaieux* Pliny is to be underſtood when he ſpeaks of the manifold picture of gems, and the party-coloured ſpots of precious ſtones: *Gemmarum pictura tam multiplex, lapidumque tam diſcolores maculæ.* Plin. Hiſt. Nat. lib. ii. c. 93.

Camaieu is alſo applied by others to thoſe precious ſtones, as onyxes, cornelians, and agats, whereon the lapidaries employ their art to aid nature, and perfect thoſe repreſentations. See Camæa.

Camaieu is alſo frequently applied to any kind of gem, whereon figures may be engraven either indentedly, or in relievo.

In this ſenſe the lapidaries of Paris are called in their ſtatutes, *cutters of camayeux*.

A ſociety of learned men at Florence undertook to procure all the *cameos* or *camayeux*, and intaglios in the great duke's gallery to be engraven; and began to draw the heads of divers emperors in *cameos*.

Camaieu is alſo uſed for a painting, wherein there is only one colour; and where the lights and ſhadows are of gold, wrought on a golden, or azure ground.

When the ground is yellow, the French call it *cirage*; when grey, *griſſaile*. This kind of work is chiefly uſed to repreſent baſſo relievos: the Greeks call pieces of this ſort μονοχρωματα.

CAMALDULIANS, Camaldunians, or Camaldolites, an order of religious, founded by Romuald, an Italian fanatic, in 1023, in the horrible deſart of Camaldoli, otherwiſe called Campo-Malduli, ſituate in the ſtate of Florence, on the Appenines.

Their rule is that of St. Benedict; and their houſes, by the ſtatutes, are never to be leſs than five leagues from cities. The *Camaldulians* have not borne that title from the beginning of their order; till the cloſe of the eleventh century they were called *Romualdins*, from the name of their founder. Till that time, *Camaldulian* was a particular name for thoſe of the deſart Camaldoli; and D. Grandi obſerves, was not given to the whole order, in regard it was in this monaſtery that the order commenced, but becauſe the regulation was beſt maintained here.

Guido Grandi, mathematician of the great duke of Tuſcany, and a monk of this order, has publiſhed *Camaldulian* Diſſertations, on the origin and eſtabliſhment of it. The *Camaldolites* were diſtinguiſhed into two claſſes, of which the one were COENOBITES, and the other EREMITES.

CAMARA, a name given by Plumier to an American ſpecies of LANTANA.

CAMAROSIS, from καμαροω, *I arch over*, in *Architecture*, denotes an elevation with an arch or vault.

CAMAROSIS, among *Phyſicians*, denotes a FRACTURE of a bone, wherein the two broken ends riſe and form a kind of *camera*, or arch.

This is alſo called *camaroma*, and by modern Latin writers *cameratio*, ſometimes *fornicatio*.—It is commonly reſtrained to fractures of the ſkull.

CAMBAYES, in *Commerce*, cotton cloths made at Bengal, Madraſs, and ſome other places on the coaſt of Coromandel. They are proper for the trade of Marſeilles, whither the Engliſh at Madras ſend great numbers of them. Many are alſo imported into Holland.

CAMBER-*beam*, in *Building*, a piece of timber cut archwiſe, or with an obtuſe angle in the middle, commonly uſed in platforms; as church-leads, and on other occaſions, where long and ſtrong beams are required. A *camber-beam* is much ſtronger than another of the ſame ſize; ſince being laid with the hollow ſide downwards, as they uſually are, it repreſents a kind of arch.

CAMBERED-*deck*, in *Ship-building*. See DECK.

CAMBIO, an Italian word which ſignifies *exchange*; commonly uſed at Provence, and in ſome other countries, particularly Holland.

CAMBIST, a name given in France to thoſe who trade in notes and bills of exchange. The word *cambiſt*, though a term of antiquity, is even now a technical word, of ſome uſe among merchants, traders, and bankers. Some derive it from the Latin *cambium*, or rather *cambio*.

CAMBLET, or CHAMBLET, a ſtuff ſometimes of wool, ſometimes ſilk, and ſometimes hair, eſpecially that of goats, with wool or ſilk: in ſome, the warp is ſilk and wool twiſted together, and the woof hair.

The true or oriental *camblet* is made of the pure hair of a ſort of goat, frequent about Angora, and which makes the riches of that city, all the inhabitants whereof are employed in the manufacture and commerce of *camblets*.

It is certain we find mention in middle age writers of ſtuffs made of camel's hair, under the denominations of *cameletum* and *camelinum*, whence probably the origin of the term; but theſe are repreſented as ſtrangely coarſe, rough, and prickly, and ſeem to have been chiefly uſed among the monks by way of mortification, as the hair-ſhirt of later times. Du-Cange, Gloſſ. Lat.

We have no *camblets* made in Europe of the goats hair alone; even at Bruſſels, they find it neceſſary to add a mixture of woollen thread.

England, France, Holland, and Flanders, are the chief places of this manufacture. Bruſſels exceeds them all in the beauty and quality of its *camblets*: thoſe of England are reputed the ſecond.

CAMBLETS, *figured*, are thoſe of one colour, whereon are ſtamped various figures, flowers, foliages, &c. by means of hot irons, which are a kind of moulds, paſſed, together with the ſtuff, under a preſs. Theſe are chiefly brought from Amiens and Flanders: the commerce of theſe was anciently much more conſiderable than at preſent.

CAMBLETS, *water*, thoſe which, after weaving, receive a certain preparation with water; and are afterwards paſſed under a hot-preſs, which gives them a ſmoothneſs and luſtre.

CAMBLETS, *waved*, are thoſe whereon waves are impreſſed, as on tabbies; by means of a calender, under which they are paſſed and repaſſed ſeveral times.

The manufacturers, &c. of *camblets*, are to take care they do not acquire any falſe and needleſs plaits; it being almoſt impoſſible to get them out again. This is notorious, even to a proverb: we ſay, a perſon is like *camblet*, he has taken his plait.

CAMBNITES *lapis*, a name given by the *Writers of the Middle Ages* to a ſtone, of which they record virtues which appear to favour too much of imaginary ones, ſuch as the curing the dropſy by being tied to the arm: it ſeems to have been only a cloudy and leſs valuable kind of brown cryſtal.

CAMBOGIA, in *Botany*, a genus of the *polyandria monogynia* claſs; the corolla is made up of four petals, the calyx has four leaves, and the fruit is a kind of apple containing eight cells, with ſingle ſeeds.

CAMBRASINES, in *Commerce*, fine linen made in Egypt, of which there is a conſiderable trade at Cairo, Alexandria, and Roſetta, or Raſchit. They are called *cambraſines*, from their reſemblance to cambrics.

CAMBRIC, in *Commerce*, a ſpecies of linen made of flax, very fine and white; the name of which was originally derived from the city of Cambray, where they were firſt manufactured. They are now made at other places in France.

The manufacture of *cambrics* hath long ſince proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute leſs than 200,000*l.* per annum to the intereſt of France. This proved motive ſufficient to induce the parliament of Great Britain to enact many ſalutary laws to prevent this great loſs of our wealth. See 18 Geo. II. c. 36. and 21 Geo. II. c. 26. See alſo ſtat. 32 Geo. II. c. 32. and 4 Geo. III. c. 37. which regulates the *cambric* manufactory, not long ſince introduced into Winchelſea in Suſſex; but very ſoon aboliſhed. The *cambrics* now allowed in this country are manufactured in Scotland and Ireland. Any perſons convicted of wearing, ſelling (except for exportation), or making up for hire any *cambric* or French lawns, are liable to a penalty of 5*l.* by the two firſt ſtatutes cited above.

CAMBRIDGE *Manuſcript*, a copy of the Goſpels and Acts of the Apoſtles in Greek and Latin. Beza found it in the monaſtery of Irenæus at Lyons in the year 1562, and gave it to the univerſity of Cambridge in 1582. It is a quarto ſize, and written on vellum; ſixty-ſix leaves of it are much torn and mutilated, ten of which are ſupplied by a later tranſcriber. Beza conjectures, that this *manuſcript* might have exiſted ſo early as the time of Irenæus: Wetſtein apprehends, that it either returned or was firſt brought from Egypt into France; that it is the ſame copy which Druthmar, an ancient expoſitor who lived about the year 840, had ſeen, and which, he obſerves, was aſcribed to St. Hilary; and that R. Stephens had given a particular account of it in his edition of the New Teſtament in 1550. It is uſually called Stevens's ſecond manuſcript. Mill agrees with F. Simon in opinion, that it was written in the weſtern part of the world by a Latin ſcribe, and that it is to a great degree interpolated and corrupted: he obſerves, that it agrees ſo much with the Latin Vulgate, as to afford reaſon for concluding, that it was corrected or formed upon a corrupt and faulty copy of that tranſlation. From this and the CLERMONT copy of St. Paul's Epiſtles, Beza publiſhed his larger Annotations in 1582. See Wetſtein's Prolegomena to his folio edition of the New Teſt. vol. i. p. 28. Kuſter's edition of Mill's Teſtament, Proleg. p. 132. Mill Præfat. in New Teſt. Amſt. 1735.

CAMEA. See CAMÆA.

CAMEHUIA. See CAMAIEU.

CAMEL, *Camelus*, in the Linnæan ſyſtem of *Zoology*. This is a diſtinct genus of animals; the great character of which is the want of horns, which all the other genuſes of the *pecora* have: they have ſix cutting teeth in the lower jaw and none in the upper; and the upper lip is divided like that of a hare. The hoofs are ſmall.

The word is formed from the Greek καμηλος, which ſignifies the ſame; and, according to Nicod, from the Hebrew *gamal*; but according to others from καμπυλον, on account of the bunch on his back.

There are four ſpecies of *camels*: 1. The *camel*, with one bunch on its back, called the DROMEDARY. 2. The Bactrian *camel*, with two bunches. 3. The Peruvian *camel*, called GLAMA, and by ſome *elaphocamelos*, with a pectoral bunch. And, 4. The PACOS, uſually called the Indian or Peruvian ſheep, without any bunch at all.

The dromedary is chiefly uſed for riding; the Bactrian *camel*, or that with two bunches on its back, for travelling with loads.

The *camel* is a domeſtic beaſt of burden, of a gentle diſpoſition, much uſed for carriage in divers parts of Aſia; and making the chief riches of the Arabs.

In Perſia they only diſtinguiſh two ſorts of *camels*, viz. the ſouthern, which are ſmaller, and not fit to carry above ſeven hundred weight; and the northern, which are bigger, and able to carry twelve or thirteen hundred weight.

The name *camel*, among us, is vulgarly reſtrained to that ſort which has but one bunch on the back; the appellation *dromedary* being given to thoſe which have two. In this we follow the example of Solinus, contrary to Pliny, Ariſtotle, and the generality of ancient naturaliſts.

The bunch on the *camel*'s back is not formed by the cavity of the *ſpina dorſi*, but is uſually ſaid to be a callous ſort of fleſh. The academiſts of Paris found it mere hair; and that when this was preſſed cloſe down, the creature appeared no more bunch-backed than a ſwine.

Pliny affirms, that the *camel* can endure four days without drink; whence Perſius gives it the appellation *ſitiens*. They can live on the little ſhrubs which the deſerts produce, and are ſatisfied for a whole day with half a gallon of beans and barley, or balls made of the flour. The fleſhy foot of the *camel* is formed for travelling on the hot ſands, which would parch and deſtroy the hoof. Pococke's Deſcript. of the Eaſt, vol. i. p. 208. Shaw's Travels, p. 239.

Camel's milk is ſaid to be ſovereign againſt the dropſy, for which purpoſe the Arabs drink a pint per day for three weeks.

Native *ſal* AMMONIAC is commonly ſuppoſed to be the urine of *camels*.

The Turks reckon the fleſh of the young *camel* delicious food; but prohibit the uſe of it to Chriſtians, leſt the breed ſhould be deſtroyed.

Camels caſt their hair in the ſpring, which is gathered up with great care, on account of the traffic thereof, which is very conſiderable. When left bare of hair, they pitch them over to defend them from the flies.

They ſpin the *camel*'s hair and weave it into ſtuffs: it is ſometimes alſo uſed with other hairs in making of hats. The beſt hair is that from the *camel*'s back.

Camels are chiefly uſed in CARAVANS; and they travel for fifteen or ſixteen hours without ſtopping, at the rate of two miles and a half an hour. They are very apt to ſlide; for which reaſon, in paſſing ſlippery ways, their leaders ſtrew carpets under them, ſometimes to the number of a hundred, one before another.

The *camel* that carries Mahomet's ſtandard, which the caravan of pilgrims offer yearly on the tomb of their prophet, is exempted the reſt of its life from all ſervices. It is even pretended that this happy beaſt will riſe again at the general reſurrection, and enjoy the pleaſures of paradiſe.

On medals, the *camel* is the ſymbol of Arabia, when found on the coins of any other nation. Thus, on a medal of the gens Plautia, we find a woman's head with a mural crown, *A. Plautius Æd. Cur. S. C.* and on the reverſe, *Judæus*; and in the exergue, *Bacchius*; the device, a man on his knees holding with his right hand a *camel* by the bridle, and, with the left, a branch of palm. It alſo denotes alliance with Arabia.

CAMEL, in *Mechanics*, a kind of machine uſed in Holland for raiſing or lifting ſhips.

The *camel* was invented by a burgomaſter of Amſterdam, towards the cloſe of the laſt century. It took the denomination from its heavineſs or ſtrength.

Its uſe is to raiſe veſſels, in order to bring them over the Pampus, which is at the mouth of the river Y, where the ſhallowneſs of the water hinders large ſhips from paſſing.

CAMEL's *hay*, *fænum camelorum*, an appellation given to the plant *ſcænanthus*, or *juncus odoratus*. See SCÆNANTH, and ISCHÆMUM.

CAMELEON, CHAMÆLEON, in *Natural Hiſtory*, a little animal, famous among the ancient and modern writers, for a faculty it is ſuppoſed to have, of changing its colour, and aſſuming thoſe of the objects near it.

It is a ſpecies of the LIZARD, with a ſhort, round, incurvated tail, and two or three toes joined together.

There are four diſtinct varieties of this animal: 1. The Arabian kind, which is ſmall, and hardly exceeding the green lizard in ſize: this is of a whitiſh colour, variegated with yellowiſh and reddiſh ſpots. 2. The Ægyptian, which is twice as large as the Arabian, and is of a middle colour between the whitiſh hue of the Arabian and a fair green: this changes its colour to a paler or deeper yellow. 3. The Mexican. And, 4 a kind ſometimes ſhewn about as a ſight, and met with by J. Faber Lynceus at Rome, which differed from all the others. The Arabian and Mexican *cameleons* ſeldom exceed ſix inches in length; the Ægyptian is nine or more. The head is very like that of ſome fiſhes, and is joined almoſt immediately to the breaſt, the neck being extremely ſhort, and having at the ſides two cartilaginous eminences, in the manner of fiſhes. It has a creſt ſtanding up in the middle of the forehead, and two others over the eyes, and between the creſt there are two remarkable depreſſions; the noſe and mouth running from the eyes with a double edge to the end of the ſnout, reſemble thoſe of a frog: at the extremity of the noſe there are two perforations, which ſeem to ſerve as noſtrils; the mouth being always kept cloſe ſhut, and the creature appearing to have no power of reſpiring but by means of theſe. Its mouth is furniſhed with teeth, or rather with continued denticulated bones. Theſe are of no ſervice to the creature in eating, ſince it preys on flies, and ſwallows them whole; but may ſerve for its defence in holding faſt a ſtick in its mouth, which, according to Ælian, this creature does, placing the ſtick croſs-ways, to prevent its being ſwallowed by ſerpents.

The ſtructure and motion of this creature's eyes is very ſurpriſing; they are very large, and ſet in large cavities, appearing to be large ſpheres, of which one half ſtands out of the head, and is covered with a thin ſkin, perforated with a ſmall hole at the top, through which is ſeen a very vivid and bright pupil, ſurrounded with a yellow iris; this hole is properly a longitudinal ſlit, which the creature opens more or leſs wide at pleaſure, and the eye ſeems fixed to this eye-lid, ſo as to follow all its motions, not turning round within it, as in other creatures. The motion of the eyes of this creature is not leſs ſingular than their ſtructure, ſince it can turn them ſo as to ſee what paſſes either far backward, on either ſide, or directly behind it, without at all moving the head, which is fixed to the ſhoulders; and the creature can give one eye all theſe motions, while the other is perfectly ſtill. The trunk of the body is properly all breaſt, for the creature has no belly, its ribs being continued to the *ilia*; the feet have all five toes, two behind, and three before, the hinder ones being as large as the others. This creature moves as ſlow as the tortoiſe, which appears very ſingular, as its legs are ſufficiently long, and it has no great weight of body to carry; but it is ſaid, that on trees, in its wild ſtate, it moves very nimbly. Its tail, when inflated, is round as that of a rat or ſnake; when empty, it is very lank, and has three longitudinal ridges running along it, which are owing to the apophyſes of the ſpine. This tail is a great ſafety to the creature on trees, as it twiſts it round the branches when in any danger of falling. See *Tab. of Quadrupeds and Serpents*, N° 29.

The accounts given by the ancients, and later writers, of the long hollow tongue of the *cameleon*, which it can dart with ſuch celerity to take flies, by means of a ſpongy nodule at the end, is found, on experience of thoſe who have kept the creature alive, to be true. M. de la Hire thinks that it is provided with two kinds of muſcles, the one circular and the other longitudinal, by the action of the former of which it is extended, and contracted by that of the latter. Thoſe among the former, therefore, who ſuppoſed the *cameleon* lived on the air only, were greatly miſtaken; ſome, of late, have alſo favoured this opinion, becauſe of the long time the creature will live without food; but this is the caſe with all the ſerpent kind alſo, which yet we know to eat ſolid food when they can get it.

The tongue is half the length of the animal; conſiſting of a white fleſh, round as far as the tip, which is flat and hollow; ſomewhat like an elephant's *proboſcis*, or trunk; and accordingly, ſome call it a *trunk*.

The thickneſs of its body is not to be determined, as the creature alters that at pleaſure, whilſt it more or leſs inflates its body; and this inflation not only goes through the whole body, but into the legs and tail. This inflation is not at all like the breathing of other animals, for the body when thus puffed out will remain ſo two hours, only gradually and inſenſibly ſinking all the time, and afterwards will be inflated again, but much more quickly than it ſubſided. It is able a long time to continue either of theſe ſtates, but more frequently remains empty for a conſiderable ſpace, in which time, though it appeared before in good caſe, it looks miſerably lean and lank, and its back-bone may be clearly ſeen, its ribs counted, and even the large tendons of the feet diſtinctly obſerved by the naked eye through the ſkin. The back-bone, however, is not ſerrated, as many have affirmed, but makes, in this its lean ſtate, a plain ſharp ridge, and the whole animal looks ſo miſerably meagre, that it has not unaptly been called a living ſkin.

Naturaliſts are very little agreed, as to the reaſon or manner of its change of colour: ſome, as Seneca, maintain it done by ſuffuſion; others, as Solinus, by reflection; others, as the Carteſians, by the different diſpoſition of the parts that compoſe the ſkin, which give a different modification to the rays of light. Kircher aſcribes the change of colour in the *cameleon* to the power of imagination in the animal, becauſe it loſes it when dead: others, as Dr. Goddard, aſcribe the change to the grains of the ſkin; which, in the ſeveral poſtures, he thinks, may ſhew ſeveral colours; and, when the creature is in full vigour, may have, as he terms it, *rationem ſpeculi*; that is, the effect of mirrors, and reflect the colours of bodies adjacent.

The animal having it in its power to fill the ſkin more or leſs, has it in its power not only to alter the tone and texture of the fibres, upon which their reflexive quality, in a great meaſure, depends; but alſo to bring parts into ſight which before lay concealed, or to conceal ſuch as before lay open: and it is more than probable, that the parts which are ordinarily covered, are of a ſomewhat different colour from thoſe conſtantly open to the air.

On theſe principles, probably, all the phænomena in the *cameleon*'s colour may be ſolved. The animal, it is evident, has a power to reflect different-coloured rays from the ſame parts; alſo to make certain parts reflect, and to prevent others reflecting: and hence that variety, that medley of colours.

See an account of a particular ſpecies of *cameleon*, by Dr. Parſons, Phil. Tranſ. vol. lviii. N° 29 an. 1768.

Matthiolus relates ſeveral ſuperſtitious notions of the ancients touching the *cameleon*. Pliny aſſures us, that Democritus had compoſed a whole book of ſuch follies. This is not the only animal poſſeſſed of the property of changing its colour; Grew mentions another ſort of lizard, which, when he ſwells with anger, changes his colour from green to a kind of ruſſet. The like is ſaid of the *naque mouſche*, an inſect in the iſland of Nevis.

CAMELEON, CHAMÆLEON, in *Aſtronomy*, one of the conſtellations of the ſouthern hemiſphere, near the pole, and inviſible to us.

The ſtars in this conſtellation, according to Sharp's Catalogue, are ten; their magnitude, ſituation, longitude, and latitude, are as follow.

Situation of the ſtars.	Signs.	Longitud.			Latitude.			Magnitude

CAMELITA *bos*, in *Natural Hiſtory*. See BISON.

CAMELLIA, in *Botany*, a name given by Linnæus to a genus of plants mentioned in Kempfer's Japan, under the name of *tſubaki*. It belongs to the claſs of *monadelphia polyandria*. The characters of the genus are theſe: the perianthium is compoſed of ſeveral leaves, and is of a roundiſh figure, and imbricated, being formed of a number of roundiſh ſcales, the internal ones growing gradually larger than the others, and all of them hollowed and deciduous.

The flower is compoſed of five petals of an oval figure, and growing together at the baſe. The ſtamina are a great number of filaments that ſtand erect, and are formed in the lower part into a ſort of corona, which is larger than the ſtyle. They are free at the top, and are ſhorter than the flower; the antheræ are ſimple; the piſtil has a roundiſh germen, the ſtyle is pointed, and of the ſame length with the ſtamina, and the ſtigma is acute and bent; the fruit is a turbinated woody capſule, with ſome furrows on its ſurface.

CAMELOPARDAL, in *Zoology*, an animal of a very ſingular kind, and ſeeming properly to belong to no known genus of animals, but to be perfectly *ſui generis*. It is called *cameloparдalis* by Latin authors, *geraffa* and *zurnapa* by eaſtern nations. Linnæus makes it a ſpecies of the *cervus*, or *ſtag* kind, with ſimple horns, and fore-legs very long. See a letter concerning a ſpecies of this animal found about the Cape of Good Hope, by captain Carteret, in the Philoſophical Tranſactions, vol. lx. Nº 3. an. 1770.

It is not certainly known whether it chews the cud or not; but as its hoofs are cloven, as it has horns on its forehead, as it wants the fore-teeth in its upper-jaw, and feeds on vegetables, it is probable that it does.

It is a ſingular, elegant, and beautiful creature, and is very remarkably tame and tractable, even ſcarce leſs ſo than a ſheep, and ſeems intended by nature for a domeſtic, not a ſavage animal. Its head is wholly of the make of a ſtag's, but differs in ſize, and has two little obtuſe horns, which are not more than ſix fingers-breadth long, and are hairy: the male and female both have theſe, and the latter is diſtinguiſhed by having them ſhorter than the former. Its ears are larger, and like thoſe of the ox-kind; its tongue is alſo like that of an ox, and it wants the fore-teeth in the upper-jaw. Its neck is remarkably long, ſtrait, and ſlender, in a grown animal. The neck is uſually ſeven feet long, and the meaſure from the tail to the top of the head eighteen feet; and when it ſtands erect, its head is ſixteen feet from the ground; it has a ſmall mane; its legs are very ſlender, and the fore-legs very long; the hinder ones very ſhort, ſo that the creature ſeems always to ſtand upright.

Its hoofs are cloven exactly as thoſe of the ox, its tail reaches down to its hams, and is rounded and covered with very thick hairs; the middle of its body is ſlender; it is very like the camel in all its natural properties: when it runs it holds the two fore-feet together, it lies down on the belly, and claps its neck down on the thighs and breaſt in the manner of the camel. As it ſtands it can ſcarce reach to eat the graſs, unleſs its fore-legs are very far expanded, and that is a poſture of great pain to it; ſo that nature ſeems to have allotted it to feed in its wild ſtate on the leaves of trees, which its long neck will very well enable it to get at. It is very beautifully ſpotted all over its body in the manner of the leopard.

The velvety covering of its horns ſeems to make it of the ſtag kind, but its ſhape is wholly different from thoſe of that genus.

It is found in Ethiopia, and other parts of Africa. The horns and hoofs raſped, pulveriſed, and taken inwardly, are good for the epilepſy, ſtop a looſeneſs, and reſiſt poiſon.

CAMELOPARDALUS, in *Aſtronomy*, a new conſtellation of the northern hemiſphere, formed by Hevelius, conſiſting of 32 ſtars firſt obſerved by him, ſituate between Cepheus, Caſſiopeia, Perſeus, the two Bears, and Draco, and containing 58 ſtars in the Britiſh Catalogue.

CAMERA *Æolia*, a contrivance for blowing the fire, for the fuſion of ores, without BELLOWS; by means of water falling through a funnel into a cloſe veſſel, which ſends from it ſo much air or vapour, as continually blows the fire: if there be the ſpace of another veſſel for it to expatiate in by the way, it there lets fall its humidity, which otherwiſe might hinder the work.

This contrivance was named *camera Æolia* by Kircher. Hook, Phil. Coll. Nº 3. p. 80.

CAMERA *lucida*, a contrivance of Dr. Hook for making the image of any thing appear on a wall in a light room, either by day or night.

Opposite to the place or wall where the appearance is to be, make a hole of at leaſt a foot in diameter, or if there be a high window with a caſement of this dimenſion in it, this will do much better without ſuch hole, or caſement opened. At a convenient diſtance, to prevent its being perceived by the company in the room, place the object or picture intended to be repreſented, but in an inverted ſituation. If the picture be tranſparent, reflect the ſun's rays by means of a looking-glaſs, ſo as that they may paſs through it towards the place of repreſentation; and to prevent any rays from paſſing aſide it, let the picture be encompaſſed with ſome board, or cloth. If the object be a ſtatue, or a living creature, it muſt be much enlightened by caſting the ſun's rays on it, either by reflection, refraction, or both. Between this object and the place of repreſentation put a broad convex glaſs, ground to ſuch a convexity, as that it may repreſent the object diſtinctly in ſuch place. The nearer this is ſituate to the object, the more will the image be magnified on the wall, and the further the leſs; ſuch diverſity depending on the difference of the ſpheres of the glaſſes. If the object cannot be conveniently inverted, there muſt be two large glaſſes of proper ſpheres, ſituate at ſuitable diſtances, eaſily found by trial, to make the repreſentations erect. This whole apparatus of object, glaſſes, &c. with the perſons employed in the management of them, are to be placed without the window or hole, ſo that they may not be perceived by the ſpectators in the room, and the operation itſelf will be eaſily performed. Phil. Tranſ. N° 38. p. 741, ſeq.

Camera *obſcura*, or *dark chamber*, in *Optics*, a machine, or apparatus, repreſenting an artificial eye; whereon the images of external objects, received through a double convex glaſs, are exhibited diſtinctly, and in their native colours, on a white matter placed within the machine, in the focus of the glaſs.

The firſt invention of the *camera obſcura* is aſcribed to Baptiſta Porta. See his Magia Naturalis, lib. xvii. cap. 6. firſt publiſhed at Frankfort, about the year 1589, or 1591. The firſt four books of this work were publiſhed at Antwerp in 1560.

Camera *obſcura, the uſe of the*, is manifold: it ſerves to very good purpoſes in explaining the nature of viſion; and hence it is that ſome call it *the artificial eye*. It affords very diverting ſpectacles; both by exhibiting images perfectly like their objects, and each cloathed in their native colours; and by expreſſing, at the ſame time, all their motions; which latter, no other art can imitate. By means of this inſtrument, eſpecially by the third contrivance under-mentioned, a perſon unacquainted with deſigning, will be able to delineate objects with the greateſt accuracy and juſtneſs; and another well verſed in painting, will find many things herein to perfect his art.

Camera *obſcura, the theory of the*, is contained in the following propoſition.

If an object AB (*Tab. Optics, fig.* 16.) radiate through a ſmall aperture C, upon a white wall oppoſite to it; and the place of radiation behind the aperture *b* C *a* be dark; the image of the object will be painted on the wall, in an inverted ſituation.

For, the aperture C being very ſmall, the rays iſſuing from the point B will fall on *b*; thoſe from the points A and D will fall on *a* and *d*: wherefore ſince the rays iſſuing from the ſeveral points are not confounded, they will by reflection exhibit its appearance on the wall. But ſince the rays AC and BC interſect each other in the aperture, and the rays from the loweſt points fall on the higheſt, the ſituation of the object will of neceſſity be inverted.

Hence, ſince the angles at D and *d* are right, and the vertical ones at C are equal; B and *b*, and A and *a*, will be alſo equal; conſequently, if the wall, where the object is delineated, be parallel to it, $ab : AB :: dC : DC$. That is, the height of the image will be to the height of the object, as the diſtance of the image from the aperture is to the diſtance of the object from the ſame.

Camera *obſcura, conſtruction of a*, wherein the images of external objects ſhall be repreſented diſtinctly, and in their genuine colours, either in an inverted, or an erect ſituation. 1. Darken a chamber, one of whoſe windows looks into a place ſet with various objects; leaving only a little aperture open in the one ſhutter. 2. In this aperture fit a lens, either plano-convex, or convex on both ſides; ſo as to be a portion of a large ſphere. 3. At a due diſtance, to be determined by experience, ſpread a paper, or white cloth, unleſs there be a white wall for the purpoſe; for on this the images of the deſired objects will be delineated invertedly. 4. If it be rather deſired to have them appear erect, it is done either by means of a concave lens placed between the centre and the focus of the firſt lens; or by receiving the image on a plane ſpeculum inclined to the horizon under an angle of 45°; or by means of two lenſes included in a draw-tube, in lieu of one.—Note, if the aperture doth not exceed the bigneſs of a pea, the objects will be repreſented, even though there be no lens at all uſed.

To render the images clear and diſtinct, it is neceſſary the objects be illumined by the ſun's light ſhining on the objects from the oppoſite quarter; ſo that, if the proſpect is weſtern, the phænomena will be beſt in the forenoon; if eaſtern, in the afternoon; if northern, when they are the brighteſt, about noon: a ſouthern aſpect is the leaſt eligible of any: they will be ſtill brighter, if the ſpectator firſt ſtay a quarter of an hour in the dark. Care muſt likewiſe be taken, that no light eſcape through any chinks; and that the wall be not too much illumined. Farther, the greater diſtance there is between the aperture and the wall, the larger and more diſtinct will the images be; but the rays becoming, thus, too much dilated, the brightneſs of the image is weakened, till at length it becomes inviſible.

Camera *obſcura, conſtruction of a portable.* 1. Provide a little cheſt, or box of dry wood (*Tab. Optics, fig.* 17.) of the figure of a parallelopiped; its breadth about ten inches, and its length two or more feet, according to the different magnitude of the diameter of the lenſes. 2. In the plane BD fit a ſliding tube EF with two lenſes; or, to ſet the image at a leſs diſtance from the tube, with three lenſes convex on both ſides; the diameter of the two outer, or forwarder, to be $\frac{6}{10}$ of a foot; that of the inner leſs, v. gr. $\frac{4}{10}$. 3. Within the cheſt, at a proper diſtance from the tube, ſet up an oiled paper, perpendicularly, GH, ſo as images thrown upon it may be ſeen through. Laſtly, in I make a round hole, ſo that a perſon may look conveniently through it with both eyes.

If then the tube be turned towards the objects (the lenſes being at their proper diſtance, to be determined by experiment), the objects will be delineated on the paper GH, erect as before.

If the machine be ſo contrived, that a looking-glaſs may paſs from G to C, the image will be reflected upon a rough glaſs plane placed horizontally at AB, with its unpoliſhed ſide upwards, and a copy of it may be ſketched out with a black-lead pencil. The horizontal glaſs plane reſts on two grooves in the ſides of the box, and this, as well as the looking-glaſs, may be lodged in a drawer at the bottom of the machine. This box is covered with an horizontal lid, under which are two wings, which open to right angles at each ſide of it, in order to ſhade the image upon the rough glaſs: oiled paper ſtrained in a frame is ſometimes uſed inſtead of the rough glaſs; a metalline ſpeculum is preferable to the looking-glaſs.

Camera, *another portable*, may be thus made. 1. In the middle of a ciſtula, or cheſt (*Tab. Optics, fig.* 18.) raiſe a little turret, either round or ſquare HI, open towards the object AB. 2. Behind the aperture, incline a little plain mirror *a b*, to an angle of 45°, which may reflect the rays, A *a* and B *b*, upon a lens convex on both ſides G, included in a tube GL; or the lens may be fixed in the aperture. 3. At the diſtance of the focus thereof, place a table covered with a white paper EF, to receive the image *αβ*. Laſtly, in NM make an oblong aperture to look through, and an opening may be made in the ſide of the box for the convenience of drawing.

This kind of *camera* may eaſily be converted into a *ſhew-box*, for viewing prints. Place the print at the bottom of the box, with its upper part inwards, where it is enlightened through the front, left open for this purpoſe, either by day or candle-light; and the print may be viewed through the aperture in HI: the lens uſed in this ſhew-box ſhould be large enough to admit both eyes to ſee the print or picture at once; and it would be convenient to have it moveable, in order to ſuit different eyes. See a variety of contrivances for this purpoſe deſcribed by Mr. Harris, in his Optics, b. ii. § 4. A conſiderable improvement in the *camera obſcura* has been lately made by Mr. Storer, for which he has obtained a patent: this inſtrument, which he calls a *delineator*, is formed of two double convex lenſes and a plane mirror, fitted into a proper box. One lens is placed cloſe to the plane mirror, and making with it an angle of 45°: the other lens is placed at right angles to the former, and is fixed in a moveable tube: if the moveable lens be directed towards the object to be viewed or copied, and moved nearer to or farther from the plane mirror, till the image is diſtinctly formed on a greyed glaſs, laid upon that ſurface of the upper lens which is next the eye, it will be found more ſharp and vivid than thoſe formed in the common *cameras*; becauſe the image is taken up ſo near the upper lens: by increaſing the diameter of the lenſes, and uſing thoſe of a ſhort focus, the effect will be much heightened.

CAMERARIA, in *Botany*, a genus of the *pentandria monogynia* claſs; ſo called by Plumier, in honour of Camerarius, a celebrated botaniſt of Nuremberg. Its characters are theſe: the flower is of one leaf, ſalver-ſhaped, and divided at the top into five acute ſegments; it hath five ſhort inflexed ſtamina. In the bottom of the tube are ſituated two roundiſh germina, which afterward become two long, taper, leafy capſules, filled with oblong cylindrical ſeeds. There are two ſpecies, which are natives of the Weſt Indies; and muſt therefore be kept in a bark ſtove, but in warm weather ſhould have plenty of freſh air.

CAMERARIUS, or *Chamberlain*, an officer who had the care of the DORMITORY in ancient religious houſes.

CAMERLINGO, or CAMARLINGO, the chamberlain of the pope's court, or the perſon who has the adminiſtration of the apoſtolical chamber.

The word imports as much as keeper of the chamber, or treaſurer; though the *camerlingo* has divers other juriſdictions which have no relation to the office of treaſurer. The name anciently denoted a *cubicularius*, or gentleman of the bed-chamber; but this is now expreſſed by *cameriere*.

The *camerlingo* is the moſt conſpicuous officer in the court of Rome; becauſe all the revenues of the holy ſee are managed by the chamber of which he is preſident.

This office was anciently performed by the archdeacon of Rome, a dignity which was ſuppreſſed by pope Gregory VII. as of too great power and intereſt; inſomuch that he could often controul the pontiff himſelf, and generally by his intrigues raiſed himſelf to the papacy. In his ſtead was placed a cardinal, under the title of *camerlingo*, who is aſſiſted in his function by twelve prelates called clerks of the chamber, *clerici di camera*.

The cardinal *camerlingo*, on the death of a pope, does not enter the conclave with the reſt, to aſſiſt at the election of a new one, but ſtays without, keeps poſſeſſion of the pope's apartment in the Vatican, and whenever he goes abroad is attended with the Swiſs guards, like the pope himſelf. He even coins money in his own name, and with his own arms; and, in fine, is a kind of vice-pope, governing the eccleſiaſtical ſtate during the vacancy of the holy ſee.

The cardinals have alſo their *camerlingo*, or treaſurer of their college, diſtinct from that of the pope: the former is elected every year, whereas the latter is for life. The perſon choſe to this office has the receipt of all the revenues belonging to the college, which he is to diſtribute at the end of the year in equal portions to the cardinals then at Rome; thoſe who are abſent having no ſhare therein after they have been ſix months from court.

CAMERONIANS, a ſect or party in Scotland, who ſeparated from the Preſbyterians in 1666, and continued to hold their religious aſſemblies in the fields.

The *Cameronians* took their denomination from Richard Cameron, a famous field-preacher, who, refuſing to accept the indulgence to tender conſciences, granted by king Charles II. as ſuch an acceptance ſeemed an acknowlegment of the king's ſupremacy, and that he had before a right to ſilence them, made a defection from his brethren, and even headed a rebellion, in which he was killed. His followers were never entirely reduced till the Revolution, when they voluntarily ſubmitted to king William.

The *Cameronians* adhered rigidly to the form of government eſtabliſhed in 1648.

CAMERONIANS, or CAMERONITES, is alſo the denomination of a party of Calviniſts in France, who aſſerted, that the cauſe of men doing good or evil proceeds from the knowlege which God infuſes into them; and that God does not move the will phyſically, but only morally, in virtue of its dependence on the judgment of the mind.

They had this name from John Cameron, a famous profeſſor, firſt at Glaſgow, where he was born in 1580, and afterwards at Bourdeaux, Sedan, and Saumur; at which laſt place he broached his new doctrine of grace and free-will, which was followed by Amyraut, Cappel, Bocart, Daille, and others of the moſt learned among the reformed miniſters, who judged Calvin's doctrine on theſe heads too harſh.

The *Cameronians* are a ſort of mitigated Calviniſts, and approach to the opinion of the ARMINIANS. See UNIVERSALISTS, *hypothetical*.

CAMES, a name given to the ſmall ſlender rods of caſt-lead, of which the glaziers make their turned lead.

Their lead being caſt into ſlender rods of twelve or fourteen inches long each, is called the *came*; ſometimes alſo they call each of theſe rods a *came*, which being afterwards drawn through their vice, makes their turned lead.

CAMILLI and CAMILLÆ, in *Antiquity*, boys and girls of ingenuous birth, who miniſtered in the ſacrifices of the gods; and eſpecially thoſe who attended the *flamen dialis*, or prieſt of Jupiter.

The word ſeems borrowed from the language of the ancient Hetrurians, where it ſignified miniſter, and was changed from *caſmillus*.

The Tuſcans alſo gave the appellation *Camillus* to Mercury, in quality of miniſter of the gods.

CAMINI, or *yerva* CAMINI, an American herb, the ſame with what is otherwiſe called PARAGUAY, or *yerva con-pallos*.

CAMIS, or KAMIS, in the *Japoneſe Theology*, denote deified ſouls of ancient heroes, who are ſuppoſed ſtill to intereſt themſelves in the welfare of the people over whom they anciently commanded.

The *camis* anſwer to the heroes in the ancient Greek and Roman theology, and are venerated like the ſaints in the modern Romiſh church.

Beſides the heroes or *camis* beatified by the conſent of antiquity, the *mikaddos*, or pontiffs, have deified many others, and continue ſtill to grant the apotheoſis to new worthies; ſo that they ſwarm with *camis*: the principal one is *Tenſio Dai Sin*, the common father of Japan, to whom are paid devotions and pilgrimages extraordinary.

CAMISADE, in the *Art of War*, an attack by ſurprize, in the night, or at the point of day; when the enemy are ſuppoſed in bed.

The word is ſaid to have taken its riſe from an attack of this kind; wherein, as a badge, or ſignal to know one another by, they bore a ſhift, in French called *chemiſe*, or *camiſe*, over their arms.

CAMISARDS, or CAMISARS, an appellation given by the French to the Calviniſts of the Cevennes, who formed a league, and took up arms, in their own defence, in the year 1688. The etymology of the name is diſputed; but it is moſt probably formed from *camiſade*. See the preceding article.

CAMLET. See CAMBLET.

CAMMOCK, in *Botany*. See REST-*harrow*.

CAMMOROS, in *Botany*, a name given by ſome of the old writers to the poiſonous plant called by the Romans *cicuta*, or hemlock.

Cacomoros was a common name among the Greeks for hemlock; and this *cammoros* is the ſame word, only ſpoke according to the Doric dialect.

As hemlock was a poiſonous plant, it ſoon became a cuſtom to call other poiſonous plants alſo by its name; and *cammoros* became hence a name for the mandrake, and ſome of the nightſhades, with ſome authors. Dioſcorides has called one kind of aconite or wolf's-bane by this name, and others have adapted it to other ſuch plants; but the more judicious have only given it as an additional epithet to theſe, expreſſing their being poiſonous, and have added the peculiar name of the plant before it.

Many of the moderns, and even ſome among the ancients, have erred greatly in confounding the *cammoros* with the *cammaros*, which is an inſect in figure reſembling the root of this aconite.

CAMOCLADIA, in *Botany*, a genus of the *triandria monogynia* claſs: the calyx and corolla are divided into three parts; the drupe is oblong, with a two-lobed nucleus.

CAMOMILE. See CHAMOMILE.

CAMP, a ſpacious poſt, or ſpot of ground, where an army reſts, intrenches itſelf, or plants a piquet-watch, to lodge ſecure either in tents, or barracks.

The *camp* is ſometimes covered by an intrenchment; ſometimes only by the advantages of its poſt: ſometimes it is incloſed with *chevaux de friſe* laid acroſs each other; the ordinary practice of the old prince of Orange.

The chief ſkill of a general lies in the art of encamping well: this the Romans were unacquainted with, till the war with Pyrrhus; from whoſe *camp* they learned to model their own. Till then, they knew not how to poſt themſelves to advantage, nor with any order in their *camp*.

An *encampment*, or *ſtanding camp*, is always to have the advantage of water, forage, or fuel; with the means of covering and retrenching itſelf.

Where the grounds are equally dry, thoſe *camps* are always moſt healthful which are pitched on the banks of large rivers; becauſe in the hot ſeaſon ſituations of this kind have a ſtream of freſh air from the water, ſerving to carry off the moiſt and putrid exhalations. On the other hand, next to marſhes, the worſt *encampments* are on low grounds cloſe beſet with trees: for then the air is not only moiſt and hurtful in itſelf, but, by ſtagnating, becomes more ſuſceptible of corruption. However, let the ſituation be ever ſo good, *camps* are frequently rendered infectious by the putrid effluvia of rotten ſtraw, and the privies of the army; more eſpecially if the bloody flux prevails, in which caſe the beſt method of preventing a general infection is to leave the ground with the privies, foul ſtraw, and other filth of the *camp* behind. This is to be frequently done, if conſiſtent with the military operations; but when theſe render it improper to change the ground often, the privies ſhould be made deeper than uſual, and once a day a thick layer of earth thrown into them till the pits are near full, and then they are to be well covered, and ſupplied by others. It may alſo be a proper caution, to order the pits to be made

made either in the front or rear, as the then ſtationary winds may beſt carry off their effluvia from the *camp*. Moreover, it will be neceſſary to change the ſtraw frequently, as being not only apt to rot, but to retain the infectious ſteams of the ſick. But if freſh ſtraw cannot be procured, more care muſt be taken in airing the tents as well as the old ſtraw.

An army always encamps fronting the enemy, and generally in two parallel lines, about five hundred yards diſtant; the horſe and dragoons on the wings, and the foot in the center. Sometimes three or four brigades encamp between the two lines, and are called the body of RESERVE. The artillery and bread waggons are in the rear of the two lines. See PARK *of Artillery*.

A regiment of foot, conſiſting of ten companies, is allowed, for encampment, one hundred and fifty yards in front, viz. five yards for pitching the tents of the two flank companies, twenty yards for four double rows of tents, thirty-five for the grand ſtreet, and ninety for four ſmaller ſtreets; but when the flank companies are detached, the eight battalion companies require an extent of an hundred and twenty yards, viz. five for two ſingle rows of tents, fifteen for three double rows, and an hundred for four ſtreets: the depth of the *camp* is two hundred and ninety yards: the quarter-GUARD tents are placed in a line with thoſe of the two center companies, fronting each other, and about the diſtance of an hundred yards from the front of the regiment: the officers tents front outwards towards the bell of arms; the bells of arms of the regiment front the poles of the ſerjeants tents; the colours are placed in the center of the grand ſtreet, in a line with the bells of arms: captains and ſubalterns pitch in the rear of their reſpective companies: the captain-lieutenant as captain in the rear of the colonel's company: the field officers front the centers of the two ſtreets on the right and left of the battalion: the colonel fronts the colours, at the diſtance of about an hundred yards: the ſtaff-officers front the ſtreets on the right and left of the grand ſtreet: the bat-men's tents front their horſes: the grand ſutler is placed in rear of the colonel at the diſtance of about fifty yards: the kitchens ſtand ſingly or in pairs behind their reſpective companies; and the front poles of the tents or huts of the petit ſuttlers are in a line with the centers of the kitchens; and the *rear*-GUARD's tents front outwards: when circumſtances admit, the neceſſaries ſhould be an hundred paces behind the rear-guard. If field pieces with artillery-men are attached to the battalions, the intervals are thirty yards. This diſpoſition of encampment is taken from the grand *camp* at Cox-Heath in 1778.

A ſquadron of horſe is allowed thirty paces for its *camp*, and thirty for an interval, or more, if the ground will admit of it. See *Standard*, and *Grand*-GUARD.

The order and contrivance of the Roman *camp* was admirable. Its figure was a ſquare, divided into two principal parts: in the upper part were the general's pavilion, or *prætorium*, and the tents of the chief officers; in the lower, thoſe of the inferior degree were placed.

On one ſide the *prætorium* ſtood the *queſtorium*, or apartment of the treaſurer of the army; and near this the *forum*, both for a market-place, and the aſſembling of councils. On the other ſide of the *prætorium* were lodged the *legati*; and below it, the tribunes had their quarters, oppoſite to their reſpective legions. Aſide of the tribunes were the *præfecti* of the foreign troops, overagainſt their reſpective wings; and behind theſe were the lodgments of the *evocati*, then thoſe of the *extraordinarii* and *ablecti equites*, which concluded the higher part of the *camp*.

Between the two partitions was a ſpot of ground called *principia*, for the altars and images of the gods, and probably alſo the chief enſigns.

The middle of the lower partition was aſſigned to the Roman horſe; next to whom were quartered the *triarii*, then the *principes*, and cloſe by them the *haſtati*; afterwards the foreign horſe, and, laſtly, the foreign foot.

They ſortified their *camp* with a ditch and parapet, which they termed *foſſa* and *vallum*: in the latter, ſome diſtinguiſh two parts, viz. the agger or earth, and the ſudes or wooden ſtakes driven in to ſecure it.

The *camps* were ſometimes ſurrounded with walls made of hewn ſtone; and the tents themſelves formed of the ſame matter.

The Roman *camps* ſometimes gave the origin to cities, which were formed of them, and often took their denomination from thoſe whoſe *camps* they had been. This chiefly happened when any army continued long in a place, eſpecially in the winter, where they were obliged to build many works, and fortify themſelves exactly. Thus the Caſtra Cornelia, a city of Africa, not far from Utica, was originally the *camp* of Cornelius Scipio. Liv. lib. xxix. cap. 35.

Antiquarians obſerve, that all the modern towns among us, whoſe names end in *ceſter*, or *cheſter*, were originally theſe *caſtra hyberna* of the Romans.

In the Grecian *camps*, the moſt valiant of the ſoldiers were placed at the extremities; the reſt in the middle, that the ſtronger might be as a guard to the weaker, and ſuſtain the firſt onſets. Thus Achilles and Ajax are poſted by Homer at the ends of the Grecian *camp* before Troy, as bulwarks on each ſide. Il. λ. ver. 806.

In *camps* for continuance, they erected altars to the gods, places for public aſſemblies, courts of juſtice, and the like.

According to Plutarch, the Lacedæmonians alone had no ſtage-players, buffoons, dancers, or ſongſtreſſes in their *camps*. Yet the Spartan lawgiver allowed his people greater liberty in the *camp* than in the city, to allure them to ſerve with more delight in the wars. Hence their exerciſes were more moderate, their fare leſs hard, and their actions leſs ſeverely noted when in the field than at home; ſo that they were the only people in the world to whom war gave repoſe. Plut. in Cleom. & in Lycurg.

The Spartan *camp* was of a circular figure, which was preſcribed by Lycurgus as the beſt fitted for defence, contrary to the Roman rule, whoſe *camps* were always quadrangular. All angular forms were rejected by Lycurgus, by reaſon the angles are neither fit for ſervice, nor defenſible, unleſs guarded by a river, mountain, wall, or other work.

The magnificence of the Turkiſh court appears more in the *camp* than in the ſeraglio: the tents of the great officers appear ſo many palaces, both for extent, ornament, and coſtly furniture; having all the accommodations both of city and country. Each grandee has two ſets of tents; one of which is advanced a conac, or day's journey, before the other; ſo that leaving one tent in the morning, they find another ready furniſhed in the evening.

In the front of the Turkiſh *camp* are quartered the janizaries, and other foot, whoſe tents encompaſs their aga. In the rear are the quarters of the ſpahis and other horſemen. The body of the *camp* is poſſeſſed by the ſtately tents or pavilions of the *vizier* or general, *reis effendi* or chancellor, *kabija* or ſteward, the *teſterdar baſcha* or lord treaſurer, and *kapiſler kabiaſee* or maſter of the ceremonies.

In the middle of theſe tents is a ſpacious field, wherein are erected a building for the *divan*, and a *haſna* or treaſury.

When the ground is marked out for a *camp*, all wait for the pitching of the tent *lailac*, the place where the courts of juſtice are held; it being the ſituation of this that is to regulate the diſpoſition of all the reſt.

CAMP, *city*, *caſtra urbana*, was a place near the city-wall, not far from the *via nomentana*, where the prætorian guards were encamped; whence it was alſo called the *prætorian camp*, *caſtra prætoria*, or *prætoriana*. The like we alſo read of at Jeruſalem, called by St. Luke abſolutely the *camp*, ϖαρεμβολη. By which we are doubtleſs to underſtand the *caſtra antonia*, which Joſephus tells us, was afterwards uſed as a caſtle.

CAMPS, *mooned*, *caſtra lunata*, thoſe made in figure of a half-moon.

CAMP, *naval*, *caſtra nautica*, or *navalia*, denoted a ſtation of ſhips.

CAMP, *ſtanding*, *caſtra ſtativa*, was that wherein they deſigned to continue longer in a place; and therefore more pains was taken to fortify and regulate it.

The Roman *camps*, in a march, were alſo called in the middle age *manſiones*.

CAMP, *ſummer*, *caſtra æſtiva*, among the Romans, was ordinarily light and moveable; ſo that they might be ſet up or taken down, and removed in a night. In which caſe it was alſo called ſimply *caſtra*.

CAMP, *winter*, *caſtra hyberna*, or winter quarters, were uſually taken up in ſome city or town; or elſe ſo contrived as to make almoſt a town of themſelves.

CAMPS, *tertiated*, *caſtra tertiata*, thoſe which were a third part longer than broad, which Hyginus repreſents as the Roman model. *Caſtra in quantum fieri potuerit tertiata eſſe debebant—ut puta in longum duo millia quadringenti, in latum mille ſexcenti pedes.*

CAMP, *flying*, is a ſtrong body of horſe or dragoons, to which are ſometimes added foot; commanded uſually by a lieutenant-general.

This always keeps the field, making frequent motions both to cover the garriſons in poſſeſſion, and to inſult and keep the adverſary in continual alarm, and oblige him to make diverſions.

CAMP is alſo uſed among the Siameſe and Eaſt Indians, for a quarter of a town aſſigned to foreigners, wherein to carry on their commerce.

In theſe *camps*, each nation forms itſelf a kind of city apart, in which their ſtore-houſes and ſhops are, and the factors and their families reſide.

The Europeans at Siam, and in moſt other cities of the Eaſt, are exempted from this reſtraint, and allowed to live in the cities or ſuburbs, as they find them moſt commodious.

CAMP *colour-men*, are ſoldiers appointed to attend and aſſiſt the quarter-maſter general, in marking out, and keeping the *camp* clean, receiving and diſtributing proviſions, &c.

The *camp colour-men*, are drawn a man out of a company, and are exempt from all other duty during the campaign: each carries either a ſpade or a hatchet.

CAMP *diſeaſes*, *Morbi caſtrenſes*, thoſe chiefly prevalent in armies. Under *camp*, or *field diſeaſes*, come the plague, malignant fever, ſcurvy, flux, &c. Willius, phyſician to the king of Denmark, has a treatiſe on *camp diſeaſes*. See DISEASE, and SOLDIER.

The *camp diſeaſe*, *morbus caſtrenſis*, abſolutely ſo called, is a malignant fever. Dudley Digges died of the *camp* DISEASE, which raged in the garriſon at Oxford, in 1643. On which Ed. Greaves, phyſician to king Charles II. has a treatiſe expreſs under the title of Morbus Epidemicus, or the New Diſeaſe.

The *camp fever* is the ſame with what is otherwiſe called the Hungarian FEVER, and bears a near affinity to the petechial fever. See BILIOUS *fever*.

CAMP *flux*, a name frequently given to the dyſentery; not as if it were of a different kind in armies, but becauſe it is more uſual there than elſewhere.

CAMP *duty*, in its utmoſt extent, includes every part of the ſervice performed by the troops during the campaign. But in a more particular ſenſe, denotes the guards ordinary and extraordinary kept in *camps*.

A great part of the *camp duty* is performed in the ſame manner as that of a garriſon.

CAMP *fight*, or KAMP *fight*, in *Law Writers*, denotes the trial of a cauſe by duel, or a legal combat of two champions in the field, for deciſion of ſome controverſy.

In the trial by *camp fight*, the accuſer was, with the peril of his own body, to prove the accuſed guilty; and by offering him his glove, to challenge him to this trial, which the other muſt either accept of, or acknowledge himſelf guilty of the crime whereof he was accuſed.

If it were a crime deſerving death, the *camp fight* was for life and death: if the offence deſerved only impriſonment, the *camp fight* was accompliſhed when one combatant had ſubdued the other, ſo as either to make him yield, or take him priſoner. The accuſed had liberty to chuſe another to fight in his ſtead, but the accuſer was obliged to perform it in his own perſon, and with equality of weapons.

No women were permitted to be ſpectators, nor men under the age of thirteen. The prieſt and the people who looked on, were engaged ſilently in prayer, that the victory might fall to him who had right. None might cry, ſhriek, or give the leaſt ſign; which in ſome places was executed with ſo much ſtrictneſs, that the executioner ſtood ready with an axe to cut off the right hand or foot of the party that ſhould offend herein.

He that, being wounded, yielded himſelf, was at the other's mercy either to be killed or ſuffered to live. But if life were granted him, he was declared infamous by the judge, and diſabled from ever bearing arms, or riding on horſeback. Veſteg. Reſt. Dec. Intell. cap. iii. p. 51.

CAMP *hoſpital*. See HOSPITAL.

CAMP *law*, a method of deciding controverſies by duel or CAMP *fight*.

CAMPAIGN, a military term, ſignifying the ſpace of time during which armies are maintained, yearly, in the field.

The Germans begin their *campaign* very late; uſually waiting for harveſt: the French are always early, and begin ſometimes in winter, by which they have reaped great advantages.

The beginning of every *campaign* is conſiderably more unhealthy than if the men were to remain in quarters. After the firſt fortnight or three weeks encampment, the ſickneſs decreaſes daily; the moſt infirm being by that time in the hoſpitals, the reſt more hardened, and the weather growing daily warmer. This healthy ſtate continues throughout the ſummer, unleſs the men get wet cloaths or wet beds; in which caſe a greater or leſſer degree of the dyſentery will appear, in proportion to the preceding heats. But the moſt ſickly part of the *campaign* begins about the middle or end of Auguſt, whilſt the days are ſtill hot, but the nights cool and damp, with fogs and dews: then, if not ſooner, the dyſentery prevails; and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the reſt of the *campaign*, and never entirely ceaſes even in winter-quarters till the froſts begin.

At the beginning of a *campaign* the ſickneſs is ſo uniform, that the number may be nearly predicted; but, for the reſt of the ſeaſon, as the diſeaſes are then of a contagious nature, and depend ſo much upon the heats of ſummer, it is impoſſible to foreſee how many may fall ſick from the beginning to the end of autumn. It is alſo obſerved, that the laſt fortnight of a *campaign*, if protracted till the beginning of November, is attended with more ſickneſs than the firſt two months of the encampment: ſo that it is better to take the field a fortnight ſooner, in order to return into winter-quarters ſo much the earlier.

As to winter-expeditions, though ſevere in appearance, they are attended with little ſickneſs, if the men have ſtrong ſhoes, quarters, fuel, and proviſions.

Long marches in ſummer are not without danger, unleſs made in the night, or ſo early in the morning as to be over before the heat of the day.

CAMPANA *floræ*, in *Botany*, a name given by Helwing, and ſome other of the German authors, to the plant we call *pulſatilla*, or the *paſque flower*. It was named *campana floræ*, or Flora's bell, by Helwing, becauſe of its being the ſignal of the approach of ſpring. In the Linnæan ſyſtem, this is a ſpecies of the ANEMONE. Its characters, according to Miller, are as follow: the flower hath a leafy involucrum, ending in many points; it hath two orders of petals, three in each, and a great number of ſlender ſtamina, about half the length of the petals, terminated by erect twin ſummits; and a great number of germina collected in a head. The germina afterward become ſo many ſeeds, having long hairy tails ſitting upon the oblong receptacle. There are four ſpecies.

We generally find the *pulſatilla* on dry and barren places, as ſandy hills, ſterile downs, and the like; but in Pruſſia it is moſt frequent in woods, and among pines and firs, and often is found in a looſe, ſpungy, and wet ſoil. There is in Pruſſia, a very remarkable ſpecies of it, which has a white flower; the leaves are of the jagged kind, and reſemble thoſe of the anemone; and the back part of the petals is tinged with a faint blue.

The whole genus of the *pulſatillas*, are of an acrid and cauſtic quality, approaching to that of the ranunculus; and, if they are given internally, without proper correctors, are poiſonous; but like the colchicum root, and ſome other of thoſe cauſtic plants, when given with proper mixtures, and in proper doſes, it proves a very valuable alexipharmic: externally it is of great ſervice in cleanſing foul ulcers.

CAMPANACEIA, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

CAMPANIAN *diſeaſe*, *Morbus campanus*, in *Antiquity*, is variouſly explained by modern writers. Some will have it only a ſort of tubercles, or warts on the face, to which the people of Campania were liable. Others maintain it to be the venereal diſeaſe; and hence draw an argument againſt the ſuppoſed novelty of that malady. Dacier will have it to be ſomething ſtill worſe; the Campanians, it ſeems, were addicted to a ſort of commerce too abominable to be named, *ore morigeri erant*. Whence it is, Plautus repreſents them as more pathic or paſſive than the Syrians themſelves. Hor. Sat. v. lib. i. ver. 62. cum not. Dacier.

CAMPANIFORMIS *flos*, in *Botany*, the term uſed for a flower reſembling a bell in ſhape, and making the character of one of Mr. Tournefort's genuſes. See *Tab.* I. *of Botany, Claſs* 1. See BOTANY.

CAMPARCIUM. See CHAMPART.

CAMPANOLOGIA, from *campana*, *bell*, and λογος, *ſcience*, the art or ſcience of ringing bells.

CAMPANULA, in *Botany*, the bell-flower, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower is of one leaf, ſhaped like a bell, ſpreading at the baſe. In the bottom is ſituated a five-cornered nectarium, which is joined to the top of the receptacle; it hath five ſhort ſtamina. Below the receptacle is ſituated the angular germen; the empalement afterward becomes a roundiſh angular capſule, which in ſome ſpecies have three, in others five cells; each having a hole toward the top, through which the ſeeds are ſcattered when ripe.

The different ſorts of this plant make beautiful ornaments for chimnies, and other places, being very tall, very much branched, and full of large and beautiful flowers, which retain their beauty a long time.

They are propagated by ſowing their ſeeds in March, in a bed of light and undunged ſoil, or by parting the roots; but the latter method, being the more expeditious, is moſt practiſed. Almoſt every ſlip, taken from the roots in September, and in March, will thrive; but the plants raiſed from ſeeds are ſeen to produce the fineſt flowers: they are very tedious, however, this way, being three or four years before they flower. They ſhould, therefore, be tranſplanted the September after their ſowing into nurſery-beds, which ſhould be of a light ſoil and not wet; they ſhould be ſet here at ſix inches ſquare; and, in froſty weather, the whole beds ſhould be covered with mats, which will greatly ſtrengthen the roots. In the September of the third year, they ſhould be removed into pots, and ſheltered, during the ſevere weather, in glaſs frames; or elſe in wet weather, the pots muſt be turned ſideways; and in very cold, they muſt be ſet under a warm wall, and covered with haum, and ſurrounded with a little dung on the outſides of the pots, to preſerve the roots from the froſts. Theſe plants will often ſucceed without this care, but with it they produce their flowers in ſuch beauty and plenty, as amply to reward it.

Campanula *lychnidea*. See **Convolvulus**.

CAMPANULATA *corolla*, in *Botany*, denotes bell-ſhaped flowers.

CAMPEACHY-WOOD, a kind of wood brought from Yucatan, a province in America, and uſed in dying.

The heart of the tree, which alone is uſed, is at firſt red; after it has been felled ſome time, it becomes black; and, if ſteeped in water, gives a black tincture, which may be uſed in writing.

It is very heavy, and burns admirably, and gives a clear laſting flame. See **Logwood**.

Campeachy-wood, ſeems to be the ſame with what is otherwiſe called **brasil**. It takes the former denomination from the city Campeachy, about which it grows in greateſt plenty.

CAMPESTRE, in *Antiquity*, a ſort of cover for the privities, worn by the Roman ſoldiers in their field exerciſes; being girt under the navel, and hanging down to the knees.

The name is ſuppoſed to be formed from *campus*, the field or place where the Roman ſoldiers performed their exerciſes.

CAMPHOR, or **Camphire**, a vegetable, concrete, tranſparent, friable, inflammable, odoriferous, volatile ſubſtance, of an acrid, aromatic taſte, eaſily ſoluble in ſpirit of wine: procured from a kind of laurel called *laurus camphorifera*, frequent in the iſlands of Borneo, and Japan, and the neighbouring mountainous coaſts of India; reſembling a walnut-tree. See **Bay**-*tree*.

The word comes from the Arabic *capur*, or *caphur*; which ſignify the ſame thing.

All the parts of the tree are impregnated with *camphor*; but it is principally extracted from the roots by diſtillation. Neumann ſays, that it is obtained by diſtilling the roots, and ſometimes the wood, and leaves, with water, in large iron pots, fitted with earthen heads ſtuffed with ſtraw: the *camphor* concretes among the ſtraw in its cryſtalline form; this is called *rough camphor*, and looks like Eaſt Indian ſaltpetre, or common bay-ſalt. In this ſtate it is imported into Europe, in caniſters; and the Dutch take care that it comes all refined by ſublimation, and prepared to our hands.

Camphor, *manner of refining crude*.—It is ſublimed in low flat-bottomed glaſſes placed in ſand: the *camphor* concretes, in the upper part of the belly of the glaſs, into a ſolid cake, which, after the veſſel has been broke, is pared with a knife, and is the refined *camphor* of the ſhops. *Rough camphor* may be commodiouſly and effectually purified by diſſolving it in rectified ſpirit of wine: the ſpirit is recoverable by diſtillation, and the remaining *camphor* may be melted into a cake in the bottom of the veſſel, or of another glaſs. Neumann's Chemical Works, by Lewis, p. 319, 320.

Camphor is neither a ſalt nor a gum, ſince it is not ſoluble in water; nor is it a reſin, ſince it does not yield by diſtillation either a phlegm or oil, or an acid ſpirit, as all reſins do; much leſs does it leave a *caput mortuum* like thoſe bodies. It totally vaniſhes and evaporates in the open air; in hot water, it firſt runs and then evaporates; and in ſpirit of wine, or ſpirit of nitre, it wholly diſſolves. It is no oil, becauſe it is not unctuous to the touch, but is a firm, dry, cryſtallized matter; in its evaporation in the air, it leaves no remainder; and in cloſe veſſels over the fire, it riſes entire without diſtillation, and appears at the top of the veſſel in a dry form. It is ſubject to no ſeparation of parts, and takes no empyreumatic ſmell; in mixing with concentrated ſpirit of nitre, it makes no ebullition, but placidly reſolves into a ſort of oil. This is extremely different from the effect of all vegetable oils, which are known to efferveſce violently with this acid, and ſome even to take fire, and are finally converted by it into a dry reſin. When broken, it appears bright, ſmooth, and ſaponaceous, but not unctuous to the touch; it conſiſts of a copious inflammable principle, a ſmall portion of water, and yet leſs of a very fine and ſubtile earth, mixt intimately together. Act. Eruditor. 1727. p. 524.

The common ways of keeping it from evaporation, are by burying it in linſeed, millet, pepper, or the like; but the rational way is, by keeping it from the external air; this is beſt done by wrapping it up in a paper or bladder, and putting it then into a leaden box, or an earthen, or glaſs veſſel ſet in a cool place. Or it may be preſerved in large quantities, only by papering it up carefully, and putting it in wooden veſſels in a cellar. Notwithſtanding that it is a body ſo nicely and intimately combined, in its own texture, yet it is ready at all times for medicinal uſe; and as it is not eaſy to give it any preparation, ſo it needs none. In its natural ſtate, it readily mixes with all oils and inflammable ſpirits, and this without fear of evaporation; it has no change of colour in ſolution with ſpirit of nitre, but, when diſſolved with oil of vitriol, it becomes brown, and finally red; and if water be added to either of the ſolutions, the *camphor* is precipitated in its proper and ſolid form: it may, however, be abſolutely diſſolved, by long maceration, and frequent drawing over by the retort, with either of theſe menſtruums.

Camphor has various uſes: as in fire-works; in making varniſh, which proves an excellent preſervative of animal and vegetable bodies, as it reſiſts worms and other inſects. The ſubſtance of it alſo laid among clothes, will preſerve them from moths. In the courts of the eaſtern princes, it is burnt, together with wax, to illumine the night. It is exceedingly inflammable, ſo as to burn and preſerve its flame in water; and in burning it conſumes wholly, leaving no *ſcoria* behind: but its principal uſe is in medicine.

Camphor is uſed in medicine as ſedative and antiſeptic; it ſucceeds well in many convulſions and other nervous affections. It is ſucceſsfully uſed as a powerful antiſeptic. The two medicinal preparations of *camphor*, in uſe now in the ſhops, are the ſolution of it in wine and in oil; the one called camphorated ſpirit of wine, the other oil of *camphor*.

The preparation of the firſt is by bare mixture, and requires no diſtillation, whether ſalt of tartar be or be not added to it.

The oil of *camphor* is either prepared by ſolution, or ſublimation; the firſt is, either by diſſolving *camphor* in the nitrous acid, or in ſome expreſſed vegetable oil, or by ſeparating the oil which ſwims upon the ſurface of a ſtrong ſolution of *camphor* in ſpirit of wine. To prepare the other, one part of *camphor* is to be mixed with three parts of bole armenic, and put over the fire in a retort. The ſublimed *camphor* is to be again mixed with freſh bole, and this ſo often repeated till no more *camphor* is found to be ſublimed in the proceſs; from this, the liquid matter, ſeparated by diſtillation, is to be ſeparated, and the oil preſerved.

Camphor may alſo be diſſolved in oil of turpentine, or mixed with Venice ſoap, and thus diſtilled, and, finally, rectified. All theſe oils are ſtrongly empyreumatic, and therefore the *camphor*, in its natural ſtate, is greatly preferable to them all. *Camphor* water, and the flowers of *camphor*, are alſo greatly inferior to the crude ſubſtance. When *camphor* is to be mixed with powders, it ſhould be gently moiſtened, in the rubbing, with ſpirit of wine; when it is to be mixed with aqueous menſtruums, it ſhould be rubbed with blanched almonds, or incorporated with the yolk of an egg.

Dr. Shaw recommends a mixture of nitre and *camphor*, as a quieter, inſtead of opium.

The learned Fr. Hoffman extols the virtues of *camphor* given internally, as a moſt excellent diſcutient, reſiſting putrefaction, and as the chief alexipharmic. He adviſes it in malignant fevers, and in the venereal diſeaſe: in inflammations he adds nitre. See his Diſſertation, *De Camphoræ uſu interno ſecuriſſimo et præſtantiſſimo.*

Camphor is the moſt efficacious diaphoretic known; its great ſubtilty diffuſing itſelf through the ſubſtance of the parts, almoſt as ſoon as the warmth of the ſtomach has ſet it in motion. It is uſed alſo in caries of the bones, as a detergent in wounds, to reſiſt gangrenes, &c. When mixed with the ſubtile parts of cantharides, it prevents their injuring the bladder; its exquiſite fineneſs enabling it to follow them into all the meanders of the veſſels, and to ſheath their aſperities.

Dr. Quincy obſerves, that *camphor* begins to be mixed, and that to good purpoſe, with mercurials, to guard againſt their ſtimulating properties, and to ſend them into the fineſt paſſages, to operate by fuſion, and the force of impuſe. For not only *mercurius dulcis*, or calomel, may be hereby reſtrained from manifeſt operation in the glands about the mouth; but alſo the mineral turbith, which of itſelf acts very ſtrongly by ſtool and vomit, when mixed with *camphor*, will be much leſs felt in thoſe reſpects; and will go into the fartheſt circuit of motion, and promote the cutaneous diſcharge, in a more efficacious manner than any medicine of leſs ſpecific gravity.

M. Lemery endeavoured at a chemical analyſis of *camphor*, but in vain; either its parts were too fine and volatile to be carried to any greater degree of purity or ſubtilty by any chemical proceſs; or it was owing to the cloſe union of its principles, which led him to ſuſpect that it muſt be an oil, and a volatile ſalt, that they could not be ſeparated.

He found, that *camphor* was heavier than ſpirit of wine, of the ſame ſpecific gravity with oil of turpentine, and lighter than oil of olives. Mem. Acad. Paris, 1708.

Camphor, he obſerves, does not diſſolve in aqueous or phlegmatic liquors, but in ſulphureous ones it does; not in alcalines, nor even in ſome acids; but in ſpirit of nitre it diſſolves perfectly, and without commotion. This diſſolution is ordinarily called OIL *of camphor*; and it is to this the medicinal virtue of *camphor* in wounds, gangrenes, and caries, is aſcribed. It is not taken internally, for fear of its ſharpneſs and corroſiveneſs; though M. Lemery has found good effects from two or three drops by the mouth, in obſtructions and fits of the mother: in theſe caſes, indeed, he generally mixed it with as much oil of amber.

There is a common verſe to the diſcredit of *camphor*, as if its ſmell emaſculated:

Camphora *per nares caſtrat odore mares.*

But the proverb, according to Scaliger and Tulpius, is falſe.

Camphor, being boiled in *aqua vitæ*, in a cloſe place, till the whole be evaporated; if a lighted torch or candle be introduced, the air in the whole place will immediately catch fire, and appear in a flame, without doing any damage to the place or the ſpectators.

It has been found in Ceylon, that the root of the tree which yields cinnamon, yields, by inciſion, a matter that has a ſtrong ſmell of *camphor*, and many of its virtues; whence naturaliſts, by miſtake, have ſuppoſed that all *camphor* came from that tree.

Modern chemiſts have diſcovered, that many aromatic plants, as thyme, roſemary, ſage, and almoſt all the labiated kind, yield a ſubſtance of the nature of *camphor*, which may be extracted, although in ſmall quantities.

What is called *artificial camphor*, is prepared with gum ſandarach, and white vinegar diſtilled, kept twenty days in horſe-dung, and afterwards expoſed a month to the ſun to dry; at the end of which, the *camphor* is found, in form of the cruſt of a white loaf.—This is alſo called *juniper gum*, *white varniſh*, and *maſtic*.

CAMPHOR-*julep*. See JULEP.

CAMPHORA, the *camphor-tree*, is a ſpecies of the *laurus* or BAY, which grows naturally in Japan, and ſeveral parts of India. It is a tree of middling ſtature, with oval, ſpear-ſhaped leaves, having three longitudinal veins which unite above the baſe. Theſe are male and female on different trees. The *camphor*-tree requires no artificial heat in winter, but will thrive very well in a warm, dry green-houſe.

CAMPHORATA, a medicinal plant, the *camphoroſma* of Linnæus; called, in Engliſh, ſtinking ground-pine; reputed cephalic and nervine; though little uſed in the modern practice.

It takes the name from its ſmell, which bears ſome reſemblance to that of camphor.

The *camphorata Monſpelienſis*, growing by the road-ſides in Languedoc, and eſpecially about Montpelier, has been lately produced as a ſpecific for the dropſy and aſthma. M. Burlet has given its hiſtory, analyſis, and an account of its virtues. A. D. S. an. 1703. p. 65. H. 53. For its characters ſee CAMPHOROSMA.

CAMPHORATED, denotes a thing tinctured, or impregnated with CAMPHOR.

Spirit of wine *camphorated*, is a remedy frequently applied externally in caſes of inflammations, &c.

CAMPHOROSMA, in *Botany*, a genus of the *tetrandria monogynia* claſs: the calyx is pitcher-ſhaped and indented; there is no corolla, and the capſule contains a ſingle ſeed. See CAMPHORATA.

CAMPICURSIO, in the *Ancient Military Art*, a march of armed men for ſeveral miles, from and back again to the camp, to inſtruct them in the military pace. This exerciſe was nearly akin to the *decurſio*, from which it only differed, in that the latter was performed by horſemen, the former alſo by foot.

CAMPIDOCTORES, or CAMPIDUCTORES, in the *Roman Army*, were officers who inſtructed the ſoldiery in the diſcipline and exerciſes of war, and the art of handling their weapons to advantage. Theſe are alſo ſometimes called *campigeni*, and *armidoctores*.

CAMPIDUCTOR, in *Middle Age Writers*, ſignifies the leader or commander of an army, or party.

CAMPION, *Lychnis*, in *Botany*, a genus of the *decandria pentagynia* claſs. Its characters are theſe: the flower has five petals, whoſe tails are the length of the empalement. It has ten ſtamina, which are alternately ranged, and faſtened to the tails of the petals. In the centre is ſituated an almoſt oval germen: the empalement afterward becomes an oval capſule with one cell, opening with five valves, filled with roundiſh ſeeds. There are eight ſpecies of this plant, which, for the beauty of their flowers, are cultivated in our gardens; they are very hardy plants, and are eaſily propagated either by parting the roots, or by the ſeed. See *Tab. of Botany*, *Claſs* 8.

The roots ſhould be parted in the latter end of Auguſt, or beginning of September, and planted in a light dry ſoil.

If they are to be raiſed from ſeed, they ſhould be ſown in March upon a bed of light freſh earth, and in May the young plants ſhould be removed into another bed of the like earth, at about ſix inches diſtance from each other, and watered and ſhaded till they have taken root; after which they will require no farther care, but to be kept clear from weeds; and at the end of the September following they may be removed, for the laſt time, into the borders where they are to ſtand, and they will flower in the June and July following; when, if their ſeeds are ſuffered to ripen, they will ſow themſelves, and come up without any further trouble.

CAMPION, *viſcous*, or *ſilene*, in *Botany*, a genus of the *decandria trigynia* claſs. Its characters are theſe: the flower has a permanent empalement, which is indented at the top in five parts. It has five plain obtuſe petals, indented at their points, and a nectarium compounded of two ſmall indentures in the neck of each petal, conſtituting a crown to the chaps; and ten awl-ſhaped ſtamina, inſerted alternately to the tail of the petals above each other, terminated by oblong ſummits. In the centre is ſituated a cylindrical germen, ſupporting three ſtyles, which are longer than the ſtamina, crowned by ſtigmas that are reflexed againſt the ſun: the germen afterward becomes a cloſe cylindrical capſule with three cells, opening at the top five ways, encloſing many kidney-ſhaped ſeeds. There are fourteen ſpecies, which are cultivated in gardens, beſide others which are diſregarded.

CAMPION, *wild*. See AGROSTEMA.

CAMPIPARS. See CHAMPART.

CAMPITÆ, in *Church Hiſtory*, an appellation given to the DONATISTS, on account of their aſſembling in the fields for want of churches.

For a ſimilar reaſon, they were alſo denominated *Montenſes* and *Rupitani*.

CAMPIUSA, in *Botany*, a name given by Myrepſus and others to the plant we call SCABIOUS.

CAMPOIDES, in *Botany*, a name given by Rivinus to a plant compriſed by Linnæus under the genus of *ſcorpiurus*, the *ſerpioides* of other authors. See CATERPILLARS.

CAMPUS, in *Antiquity*, a field or vacant plain in a city not built on, left vaeant either on account of ſhews, combats, exerciſes, or other uſes of the citizens.

CAMPUS *Maii*, in *Ancient Cuſtoms*, an anniverſary aſſembly of our anceſtors, held on May-day; where they confederated together for defence of the kingdom againſt all its enemies.

CAMPUS *Martius*, a large plain field in the ſuburbs of ancient Rome, lying between the Quirinal and Capitoline mounts, and the Tyber; thus called becauſe conſecrated to the god Mars, and ſet apart for military ſports and exerciſes, to which the Roman youth were trained; as the uſe and handling of arms, and all manner of feats of activity.

Here the races were run, either with chariots or ſingle horſes; here alſo ſtood the *villa publica*, or palace for the reception of ambaſſadors, who were not permitted to enter the city. Many of the public *comitia* were held in the ſame field, part of which, for that purpoſe, was cantoned out. The place was alſo nobly decorated with ſtatues, arches, columns, porticos, and the like ſtructures.

CAMPUS *Martius* is alſo uſed in a more general ſenſe by *Middle Age Writers*, for any large plain open place near a great city, wherein the inhabitants were trained to the exerciſe of arms. Of ſuch we find mention at Verona, Triers, Dornic, and even Conſtantinople.

Among the French, *campus martius* was an appellation given to the yearly aſſemblies of the people called by the kings, either for enacting new laws, or deliberating on the great affairs of the nation. They were thus denominated, either becauſe uſually held in the month of March, or in imitation of the *campus martius* of the Romans, which was allotted for the like uſe. In after-times, they were called *campus majus*, and, by corruption, *campus madius*, and *magius*, becauſe the time of holding them was altered by Pepin to the month of May.

Under the third line of kings, their aſſemblies took the denomination of ſtates general, *etats generaux*.

Campus *Sceleratus*, a place without the walls of ancient Rome, where the veſtals, who had violated their vow of virginity, were buried alive. Kennet.

CAMSHALL, a word uſed in Zetland to denote the *os ſepiæ*, which is ſometimes found on the ſhores of that iſland. Phil. Tranſ. Nº 473. ſect. 8. See Cuttle-*fiſh bone*.

CAMURI, in *Zoology*, the name of a ſea-fiſh of the *lupus* or *baſſe* kind, common in the ſeas and larger rivers of America. It grows to about two feet long, and a foot thick.

Its head is monſtrouſly large, and its mouth extremely wide; it has a large and ſtrong fin on its back, which is armed with ſharp prickles, and has a furrow in the back behind it, into which the fiſh can lay it down upon occaſion; its ſides are yellowiſh, and its belly white; its fins of a browniſh yellow; and its ſide lines, which run from the gills to the tail, broad and of a fine black. Willughby.

CAMUS, probably derived from καμπτω, *I bend*, a perſon with a low, flat noſe, hollowed or ſunk in the middle.

The Tartars are great admirers of *camus* beauties. Rubruquis obſerves, that the wife of the great Genghis Kan, a celebrated beauty, had only two holes for a noſe.

CAN, in *Sea-Language*.—A pump's *can*, is a ſort of wooden jug or pitcher, wherewith ſeamen pour water into pumps to make them work.

Can-*buoy*. See Buoy.

Can-*hook*, an inſtrument uſed to ſling a caſk by the ends of the ſtaves: it conſiſts of a broad and flat hook fixed to each end of a ſhort rope, and the tackle which ſerves to hoiſt or lower it is faſtened to the middle of the rope.

CANADA *ſtag*, *Cervus Canadenſis*, the ſame with the Virginian deer. See Moose.

CANAL, *Canalis*, in general, denotes a long, round, hollow inſtrument, through which a fluid matter may be conveyed.

In which ſenſe, it amounts to the ſame with what we otherwiſe call a pipe, tube, channel, &c. Thus the *canal* of an aqueduct, is the part through which the water paſſes; which, in the ancient edifices of this kind, is lined with a coat of maſtic of a peculiar compoſition.

Canal more particularly denotes a kind of artificial river, often furniſhed with locks and ſluices, and ſuſtained by banks or mounds. They are contrived for divers purpoſes; ſome for forming a communication betwixt one place and another, as the *canals* between Bruges and Ghent, or between Bruſſels and Antwerp; others for the decoration of a garden, or houſe of pleaſure, as the *canals* of Verſailles, Fontainbleau, St. James's Park, &c. Others are made for draining wet and marſhy lands; which laſt, however, are more properly called water-gangs, ditches, drains, &c.

Egypt is full of *canals*, dug to receive and diſtribute the waters of the Nile, at the time of its inundation. They are dry the reſt of the year, except the *canal* of Joſeph, and four or five others, which may be ranked as conſiderable rivers.

There were alſo ſubterraneous *canals*, dug by an ancient king of Egypt, whereby thoſe lakes, formed by the inundations of the Nile, were conveyed into the Mediterranean.

The *canal of Egypt*, for a communication between the Nile and the Red ſea, was begun, according to Herodotus, by Necus ſon of Pſammeticus, who deſiſted from the attempt on an anſwer from the oracle, after having loſt ſix ſcore thouſand men in the enterprize. It was reſumed and completed by Darius ſon of Hyſtaſpes, or, according to Diodorus and Strabo, by Ptolemy Philadelphus; who relate, that Darius relinquiſhed the work on a repreſentation made to him by unſkilful engineers, that the Red ſea being higher than the land of Egypt, would overwhelm and drown the whole country. It was wide enough for two galleys to paſs a-breaſt; its length was four days ſailing. Diodorus adds, that it was alſo called *Ptolemy's river*; that this prince built a city at its mouth on the Red ſea, which he called *Arſinoe*, from the name of his favourite ſiſter; and that the *canal* might be either opened or ſhut, as occaſion required: policy probably had ſome ſhare in the diſuſe to which it afterwards fell. Diod. Sic. Bibl. lib. i. Strab. Rer. Geog. lib. xvii. Herodot. Hiſt. lib. ii.

It ſeems to have been opened afreſh about the year 635, under the caliph Omar. Elmacin indeed ſays, that a new *canal* was then made for the conveyance of the corn of Ægypt to Arabia; but this is more naturally underſtood of a renewal of the ancient one, the navigation of which, towards the decline of the Roman empire, had been much neglected. The ſame author adds, that it was ſtopped again on the ſide next the Red ſea by the caliph Abugiafar Almanzor II. of the family of Abbas, in the year of the Hegira 150, anſwering to the year of Chriſt 775. There are ſome traces of it ſtill ſubſiſting: M. Boutier, in 1703, diſcovered the end which ariſes out of the moſt eaſterly branch of the Nile. Hiſt. Acad. Scienc. ann. 1703. p. 110, ſeq.

A new *canal* for conveying the waters of the Nile from Æthiopia into the Red ſea without paſſing into Ægypt, was projected by Albuquerque, viceroy of India, for the Portugueſe, in order to render Ægypt barren and unprofitable to the Turks.

M. Gaudereau attributes the frequency of the plague in Ægypt, of late days, to the decay, or ſtopping up of theſe *canals*; which happened upon the Turks becoming maſters of the country.

In China, there is ſcarce a town or village but has the advantage either of an arm of the ſea, a navigable river, or a *canal*, by which means navigation is rendered ſo common, that there are almoſt as many people on the water as the land.

The *great canal of China*, is one of the wonders of art, made about 800 years ago. It runs from north to ſouth quite croſs the empire; beginning at the city Canton. By it all kinds of foreign merchandize entered at that city are carried directly to Pekin, a diſtance of 825 miles. Its breadth and depth are ſufficient to carry barks of conſiderable burden, which are managed by ſails and maſts, as well as towed by hand. On this *canal* the emperor is ſaid to employ 10,000 ſhips, abating one, for a reaſon very peculiar. It paſſes through, or by, 41 large cities; there are in it 75 vaſt locks, and ſluices to keep up the water, and paſs the barks and ſhips where the ground will not admit of ſufficient depth of channel, beſides ſeveral thouſand draw and other bridges.

F. Magaillane aſſures us, there is paſſage from one end of China to the other, the ſpace of 600 French leagues, always either by *canals* or rivers, except a ſingle day's journey by land, neceſſary to croſs a mountain; an advantage which this Jeſuit, who made the voyage himſelf, obſerves is not to be found in any other ſtate of the univerſe. Nouv. Relat. de Chine, chap. 8.

The *canal of Languedoc*, called alſo the *canal of the two ſeas*, as ſerving to join the Mediterranean and Cantabrian ſeas, was firſt propoſed under Francis I. but begun and finiſhed under Louis XIV. By means of it, a ready communication is made between the two fertile provinces of Guyenne and Languedoc. The *canal* is 64 leagues long, extended from Narbonne to Tholouſe, and receiving ſeveral little rivers in the way, ſupported at proper intervals with 104 ſluices. In ſome places it is conveyed over aquæducts and bridges of incredible height, built on purpoſe, which give paſſage underneath to other rivers. What is moſt extraordinary is, that in ſome places, for a mile together, a paſſage is dug for it through the rock. The expence was thirteen millions of livres, of which the king contributed near ſeven millions; the province of Languedoc the reſt.

The *canal of Briere*, called alſo *canal of Burgundy*, begun under Henry IV. and finiſhed in the reign of Louis XIII. makes a communication between the Loire and the Seine, and ſo to Paris; to the great advantage of all this part of France, and even to Burgundy itſelf. This *canal* has 42 ſluices.

The *canal of Orleans* was begun in 1675, for eſtabliſhing a communication between the Seine and the Loire. It is conſiderably ſhorter than that of Briere, having only 20 ſluices.

The *canal of Bourbon* was but lately undertaken; its deſign being to make a communication from the river Oiſe to Paris.

The *new canal of the lake Ladoga*, cut from Volhowa to the Neva, whereby a communication is made between the Baltic, or rather ocean, and the Caſpian ſea, was begun by the czar Peter I. in 1719: by means of it, the Engliſh and Dutch merchandize are eaſily conveyed into Perſia, without being obliged to double the Cape of Good Hope. There was a former *canal* of communication between the Ladoga lake and the river Wolga, whereby timber and other goods had been brought from Perſia to Peterſburg; but the navigation of it was ſo dangerous, that a new one was undertaken.

In England, that ancient *canal* from the river Nyne, a little below Peterborough, to the river Witham, three miles below Lincoln; called by the modern inhabitants *Caerdike*; may be ranked among the monuments of the Roman grandeur, though it is now moſt of it filled up. It was 40 miles long; and ſo far as appears from the ruins, muſt have been very broad and deep; ſome authors take it for a Daniſh work. Morton will have it made under the emperor Domitian. Urns and medals have been diſcovered on the banks of this *canal*, which ſeem to confirm that opinion. Hiſt. Northampton. ch. 10.

The *canal* for ſupplying London with water by means of the New River, was undertaken and begun by Mr. (afterwards Sir Hugh) Middleton, in the year 1608, and finiſhed in five years. This *canal* commences near Ware, in Hertfordſhire, and takes a courſe of 60 miles before it reaches the ciſtern at Iſlington, which ſupplies the ſeveral water-pipes that convey it to the city and parts adjacent. In ſome places it is 30 feet deep, and in others it is conveyed over a valley between two hills, by means of a trough ſupported by wooden arches, and riſing above 23 feet in height. See *New River* COMPANY.

The *Duke of Bridgewater's canal*, projected and executed under the direction of Mr. Brindley, was begun ſoon after he had obtained an act for this purpoſe in 1759. It was firſt deſigned for conveying coals from a mine on his grace's eſtate to Mancheſter, but has ſince been applied to many other uſeful purpoſes of inland navigation. This *canal* begins at a place called Worſley-mill, about ſeven miles from Mancheſter, where the duke has cut a baſon capable of holding all his boats, and a great body of water which ſerves as a reſervoir or head to his navigation. The *canal* runs through a hill by a ſubterraneous paſſage, big enough for the admiſſion of long flat-bottomed boats, which are towed by a rail on each hand, near three quarters of a mile, to the coal-works. There the paſſage divides into two channels, one of which goes off 300 yards to the right, and the other as many to the left; and both may be continued at pleaſure.

The paſſage is, in ſome places, cut through the ſolid rock, and in others, arched over with brick. Air-funnels, ſome of which are near 37 yards perpendicular, are cut, at certain diſtances, through the rock to the top of the hill. The arch at its entrance is about ſix feet wide, and about five feet high from the ſurface of the water; it widens within, ſo that in ſome places the boats may paſs one another, and at the pits it is ten feet wide. When the boats are loaded and brought out of the baſon, five or ſix of them are linked together, and drawn along the *canal* by a ſingle horſe or two mules. The *canal* reaches Mancheſter in a courſe of nine miles; it is broad enough for the barges to paſs or go a-breaſt, and on one ſide there is a good road for the paſſage of the people, and horſes or mules employed in the work. The *canal* is raiſed over public roads by means of arches, and it paſſes over the navigable river Irwell near fifty feet above it, ſo that large veſſels in full ſail paſs under the *canal*, whilſt the duke's barges are at the ſame time paſſing over them. This *canal* joins that which paſſes from the river Merſey towards the Trent, taking in the whole a courſe of 34 miles.

The *Lancaſter canal* begins near Kendal, and terminates near Eccleſton, comprehending the diſtance of 72½ miles.

The *canal* from Liverpool to Leeds is 108⅓ miles: that from Leeds to Selby, 23¼ miles; from Cheſter to Middlewich, 26¾ miles; from the Trent to the Merſey, 88 miles; from the Trent to the Severn, 46½ miles. The Birmingham *canal* joins this near Wolverhampton, and is 24¼ miles: the Droitwich *canal* is 5½ miles: the Coventry *canal*, commencing near Litchfield, and joining that of the Trent, is 36¼ miles: the Oxford *canal* breaks off from this, and is 82 miles. The Cheſterfield *canal* joins the Trent near Gainſborough, and is 44 miles.

A communication is now formed, by means of this inland navigation, between Kendal and London, by way of Oxford; between Liverpool and Hull, by the way of Leeds; and between the Briſtol channel and the Humber, by the junction formed between the Trent and the Severn. Other ſchemes have been projected, which the preſent ſpirit of improvement will probably ſoon carry into execution, of opening a communication between the German and Iriſh ſeas, ſo as to reduce a hazardous navigation of more than 800 miles by ſea, into a little more than 150 miles by land; and alſo of joining the Iſis with the Severn.

There are many obvious advantages which accrue from theſe inland navigations. By diminiſhing the price of carriage, and facilitating the communication between remote parts of the country, they greatly conduce to the improvement and extenſion of our manufactures and commerce. They likewiſe tend, in a variety of ways, to advance and perpetuate the value of eſtates near which they paſs, by the eaſe with which manure may be procured, by the eſtabliſhment of manufactures, and by the cheap conveyance of their produce to large towns and ſea-ports: not to add, that they ſerve as drains for moiſt lands, and that they furniſh a ſupply of water for thoſe that are dry. And beſides, navigable *canals* give employment to the induſtrious labourer, as well as the ingenious artiſan.

We alſo read of divers projects and undertakings of *canals*, which were never atchieved. Demetrius Poliorcetes, Julius Cæſar, the emperors Caligula and Nero, attempted in vain to cut through the iſthmus, whereby Peloponneſus is joined to the reſt of Greece, and make a *canal* of communication between the Ionian and Ægean ſeas. Plin. Nat. Hiſt. lib. iv. cap. 4.

Seleucus Nicanor had a deſign to make a *canal* between the Euxine and Caſpian ſeas. Lucius Verus, who commanded the Roman army in Gaul under Nero, attempted to make a *canal* between the Moſelle and the Rhine.

The Spaniards have ſeveral times had in view the digging a *canal* through the iſthmus of Darien, from Panama to Nombre de Dios, to make a ready communication between the Atlantic and the South ſea, and thus afford a ſtraight paſſage to China and the Eaſt Indies.

CANAL is alſo applied to the furrows on the face of, or underneath a LARMIER; ſometimes alſo called porticos; and fitted up with reeds or flowers. Sometimes to thoſe cavities, ſtraight or winding, made on the caulicoles of a capital. See SOFFITA.

CANALS are alſo uſed for the flutings of a column or pilaſter.

CANAL *of the volute*, in the Ionic capital, is the face of the circumvolutions, incloſed by a liſtel.

CANAL, *Canalis*, in *Anatomy*, a duct, or paſſage, through which any of the juices, or fluids of the body flow.

Under *canals* are included all kinds of veſſels, as arteries, veins, nerves, &c. See ARTERY, VEIN, &c.

The hole or perforation through the *vertebræ* of the neck, whereby the ſpinal marrow communicates with the brain, is by ſome called the ſacred or great *canal*, ἱερα συριγξ.

CANALES *ſemicirculares*, in *Anatomy*, are three *canals* in the labyrinth of the ear; which open by as many orifices into the *veſtibulum*.

They are of three different ſizes, *major*, *minor*, and *minimus*. In different ſubjects, they are frequently different, but are always alike in the ſame: the reaſon, Valſalva ingeniouſly conjectures to be, that as a part of the tender auditory nerve is lodged in theſe *canals*, ſo they are of three ſeveral ſizes, the better to ſuit all the variety of tones; ſome of the *canals* ſuiting ſome tones, and others others. And though there be ſome difference in the form and ſize of theſe *canals* in different perſons; yet, leſt there ſhould be any diſcord in the auditory organs, theſe *canals* are always in exact conformity to one another, in the ſame man.

CANALICIUM *aurum*, or CANALIENSE, that gold whic is dug out of mines, or veins under ground.

CANALICULATE *leaf*, among *Botaniſts*. See LEAF.

CANALICULATE *ſtalk*. See STALK.

CANALIS is uſed by *Surgeons* for an oblong, concave inſtrument, in which to put a broken limb, leg, or thigh. It is made either of braſs, wood, or earthen ware, ſometimes even of ſtraw fitted with linen cloth.

CANALIS, or CANALICULUS *arterioſus*, in *Anatomy*, a veſſel, obſerved in *fœtuſes*, but which, after delivery, grows uſeleſs, and diſappears. It is a little tube, which, joining the pulmonary artery and aorta, ſerves to convey the blood out of one into the other, without paſſing through the lungs. See FOETUS.

Dr. Agricola deſcribes a valve at the entry of the *canalis arterioſus* into the *aorta deſcendens*, compoſed of four ſides. Two of them prevent its being ſhut till after birth, and the other two prevent its being thruſt off from the orifice of the *canalis arterioſus*.

There have been ſome diſputes between Meſſieurs Mery, Buiſſiere, Rohault, and others, about the real uſe of the *canalis arterioſus*, as well as of the *foramen ovale*. See FORAMEN *ovale*.

CANALIS *naſalis*, a kind of *ſulcus* or furrow formed in the *oſſa unguis* and *maxillaria*, whereby a mucous humour is conveyed from the *puncta lacrymalia* to the noſe.

CANALIS *venoſus*, a duct in the liver of a fœtus, whereby a communication is maintained between the porta and cava; which, becoming uſeleſs after the birth, gradually dries up. Drake and Heiſter.

CANALIS, in *Zoology*. See TUBULUS *marinus*.

CANARIA *lappa*, in *Botany*, a name given by the ancient Romans ſometimes to the rough fruit of the common aparine or clivers, and ſometimes to the plant itſelf. Pliny calls the plant *lappa* and *lappago*; and the fruit of it, *lappæ boariæ*, *lappæ canariæ*, and *lappæ caninæ*.

CANARIES, in *Muſic*, an old Engliſh air, having a ſprightly movement of two ſtrains, with eight bars in each; and three quavers in a bar; the firſt pointed.

CANARIUM, from *canis*, *dog*, in *Antiquity*, a Roman ſacrifice, wherein dogs of a red or ruddy colour were ſacrificed, for a ſecurity of the fruits of the earth againſt the raging heats, and diſorders of Sirius in the dog-days.

CANARIUM, in *Botany*, a genus of the *diœcia pentandria* claſs: the calyx has two leaves, and the corolla conſiſts of three petals.

CANARY-*bird*, *Paſſer Canarienſis*, a ſpecies of ſinging-birds, greeniſh yellow in colour, formerly brought only

CAMPUS *Sceleratus*, a place without the walls of ancient Rome, where the veſtals, who had violated their vow of virginity, were buried alive. Kennet.

CAMSHALL, a word uſed in Zetland to denote the *os ſepiæ*, which is ſometimes found on the ſhores of that iſland. Phil. Tranſ. Nº 473. ſect. 8. See CUTTLE-*fiſh bone*.

CAMURI, in *Zoology*, the name of a ſea-fiſh of the *lupus* or *baſſe* kind, common in the ſeas and larger rivers of America. It grows to about two feet long, and a foot thick.

Its head is monſtrouſly large, and its mouth extremely wide; it has a large and ſtrong fin on its back, which is armed with ſharp prickles, and has a furrow in the back behind it, into which the fiſh can lay it down upon occaſion; its ſides are yellowiſh, and its belly white; its fins of a browniſh yellow; and its ſide lines, which run from the gills to the tail, broad and of a fine black. Willughby.

CAMUS, probably derived from καμπτω, *I bend*, a perſon with a low, flat noſe, hollowed or ſunk in the middle.

The Tartars are great admirers of *camus* beauties. Rubruquis obſerves, that the wife of the great Genghis Kan, a celebrated beauty, had only two holes for a noſe.

CAN, in *Sea-Language*.—A pump's *can*, is a ſort of wooden jug or pitcher, wherewith ſeamen pour water into pumps to make them work.

CAN-*buoy*. See BUOY.

CAN-*hook*, an inſtrument uſed to ſling a caſk by the ends of the ſtaves: it conſiſts of a broad and flat hook fixed to each end of a ſhort rope, and the tackle which ſerves to hoiſt or lower it is faſtened to the middle of the rope.

CANADA *ſtag*, *Cervus Canadenſis*, the ſame with the Virginian deer. See MOOSE.

CANAL, *Canalis*, in general, denotes a long, round, hollow inſtrument, through which a fluid matter may be conveyed.

In which ſenſe, it amounts to the ſame with what we otherwiſe call a pipe, tube, channel, &c. Thus the *canal* of an aqueduct, is the part through which the water paſſes; which, in the ancient edifices of this kind, is lined with a coat of maſtic of a peculiar compoſition.

CANAL more particularly denotes a kind of artificial river, often furniſhed with locks and ſluices, and ſuſtained by banks or mounds. They are contrived for divers purpoſes; ſome for forming a communication betwixt one place and another, as the *canals* between Bruges and Ghent, or between Bruſſels and Antwerp; others for the decoration of a garden, or houſe of pleaſure, as the *canals* of Verſailles, Fontainbleau, St. James's Park, &c. Others are made for draining wet and marſhy lands; which laſt, however, are more properly called water-gangs, ditches, drains, &c.

Egypt is full of *canals*, dug to receive and diſtribute the waters of the Nile, at the time of its inundation. They are dry the reſt of the year, except the *canal* of Joſeph, and four or five others, which may be ranked as conſiderable rivers.

There were alſo ſubterraneous *canals*, dug by an ancient king of Egypt, whereby thoſe lakes, formed by the inundations of the Nile, were conveyed into the Mediterranean.

The *canal of Egypt*, for a communication between the Nile and the Red ſea, was begun, according to Herodotus, by Necus ſon of Pſammeticus, who deſiſted from the attempt on an anſwer from the oracle, after having loſt ſix ſcore thouſand men in the enterprize. It was reſumed and completed by Darius ſon of Hyſtaſpes, or, according to Diodorus and Strabo, by Ptolemy Philadelphus; who relate, that Darius relinquiſhed the work on a repreſentation made to him by unſkilful engineers, that the Red ſea being higher than the land of Egypt, would overwhelm and drown the whole country. It was wide enough for two galleys to paſs a-breaſt; its length was four days ſailing. Diodorus adds, that it was alſo called *Ptolemy's river*; that this prince built a city at its mouth on the Red ſea, which he called *Arſinoe*, from the name of his favourite ſiſter; and that the *canal* might be either opened or ſhut, as occaſion required: policy probably had ſome ſhare in the diſuſe to which it afterwards fell. Diod. Sic. Bibl. lib. i. Strab. Rer. Geog. lib. xvii. Herodot. Hiſt. lib. ii.

It ſeems to have been opened afreſh about the year 635, under the caliph Omar. Elmacin indeed ſays, that a new *canal* was then made for the conveyance of the corn of Ægypt to Arabia; but this is more naturally underſtood of a renewal of the ancient one, the navigation of which, towards the decline of the Roman empire, had been much neglected. The ſame author adds, that it was ſtopped again on the ſide next the Red ſea by the caliph Abugiafar Almanzor II. of the family of Abbas, in the year of the Hegira 150, anſwering to the year of Chriſt 775. There are ſome traces of it ſtill ſubſiſting: M. Boutier, in 1703, diſcovered the end which ariſes out of the moſt eaſterly branch of the Nile. Hiſt. Acad. Scienc. ann. 1703. p. 110, ſeq.

A new *canal* for conveying the waters of the Nile from Æthiopia into the Red ſea without paſſing into Ægypt, was projected by Albuquerque, viceroy of India, for the Portugueſe, in order to render Ægypt barren and unprofitable to the Turks.

M. Gaudereau attributes the frequency of the plague in Ægypt, of late days, to the decay, or ſtopping up of theſe *canals*; which happened upon the Turks becoming maſters of the country.

In China, there is ſcarce a town or village but has the advantage either of an arm of the ſea, a navigable river, or a *canal*, by which means navigation is rendered ſo common, that there are almoſt as many people on the water as the land.

The *great canal of China*, is one of the wonders of art, made about 800 years ago. It runs from north to ſouth quite croſs the empire; beginning at the city Canton. By it all kinds of foreign merchandize entered at that city are carried directly to Pekin, a diſtance of 825 miles. Its breadth and depth are ſufficient to carry barks of conſiderable burden, which are managed by ſails and maſts, as well as towed by hand. On this *canal* the emperor is ſaid to employ 10,000 ſhips, abating one, for a reaſon very peculiar. It paſſes through, or by, 41 large cities; there are in it 75 vaſt locks, and ſluices to keep up the water, and paſs the barks and ſhips where the ground will not admit of ſufficient depth of channel, beſides ſeveral thouſand draw and other bridges.

F. Magaillane aſſures us, there is paſſage from one end of China to the other, the ſpace of 600 French leagues, always either by *canals* or rivers, except a ſingle day's journey by land, neceſſary to croſs a mountain; an advantage which this Jeſuit, who made the voyage himſelf, obſerves is not to be found in any other ſtate of the univerſe. Nouv. Relat. de Chine, chap. 8.

The *canal of Languedoc*, called alſo the *canal of the two ſeas*, as ſerving to join the Mediterranean and Cantabrian ſeas, was firſt propoſed under Francis I. but begun and finiſhed under Louis XIV. By means of it, a ready communication is made between the two fertile provinces of Guyenne and Languedoc. The *canal* is 64 leagues long, extended from Narbonne to Tholouſe, and receiving ſeveral little rivers in the way, ſupported at proper intervals with 104 ſluices. In ſome places it is conveyed over aquæducts and bridges of incredible height, built on purpoſe, which give paſſage underneath to other rivers. What is moſt extraordinary is, that in ſome places, for a mile together, a paſſage is dug for it through the rock. The expence was thirteen millions of livres, of which the king contributed near ſeven millions; the province of Languedoc the reſt.

The *canal of Briere*, called alſo *canal of Burgundy*, begun under Henry IV. and finiſhed in the reign of Louis XIII. makes a communication between the Loire and the Seine, and ſo to Paris; to the great advantage of all this part of France, and even to Burgundy itſelf. This *canal* has 42 ſluices.

The *canal of Orleans* was begun in 1675, for eſtabliſhing a communication between the Seine and the Loire. It is conſiderably ſhorter than that of Briere, having only 20 ſluices.

The *canal of Bourbon* was but lately undertaken; its deſign being to make a communication from the river Oiſe to Paris.

The *new canal of the lake Ladoga*, cut from Volhowa to the Neva, whereby a communication is made between the Baltic, or rather ocean, and the Caſpian ſea, was begun by the czar Peter I. in 1719: by means of it, the Engliſh and Dutch merchandize are eaſily conveyed into Perſia, without being obliged to double the Cape of Good Hope. There was a former *canal* of communication between the Ladoga lake and the river Wolga, whereby timber and other goods had been brought from Perſia to Peterſburg; but the navigation of it was ſo dangerous, that a new one was undertaken.

In England, that ancient *canal* from the river Nyne, a little below Peterborough, to the river Witham, three miles below Lincoln; called by the modern inhabitants *Caerdike*; may be ranked among the monuments of the Roman grandeur, though it is now moſt of it filled up. It was 40 miles long; and ſo far as appears from the ruins, muſt have been very broad and deep; ſome authors take it for a Daniſh work. Morton will have it made under the emperor Domitian. Urns and medals have been diſcovered on the banks of this *canal*, which ſeem to confirm that opinion. Hiſt. Northampton. ch. 10.

The *canal* for ſupplying London with water by means of the New River, was undertaken and begun by Mr. (afterwards Sir Hugh) Middleton, in the year 1608, and finiſhed in five years. This *canal* commences near Ware, in Hertfordſhire, and takes a courſe of 60 miles before it reaches the ciſtern at Iſlington, which ſupplies the ſeveral water-pipes that convey it to the city and parts adjacent. In ſome places it is 30 feet deep, and in others it is conveyed over a valley between two hills, by means of a trough ſupported by wooden arches, and riſing above 23 feet in height. See *New River* COMPANY.

The *Duke of Bridgewater's canal*, projected and executed under the direction of Mr. Brindley, was begun ſoon after he had obtained an act for this purpoſe in 1759. It was firſt deſigned for conveying coals from a mine on his grace's eſtate to Mancheſter, but has ſince been applied to many other uſeful purpoſes of inland navigation. This *canal* begins at a place called Worſley-mill, about ſeven miles from Mancheſter, where the duke has cut a baſon capable of holding all his boats, and a great body of water which ſerves as a reſervoir or head to his navigation. The *canal* runs through a hill by a ſubterraneous paſſage, big enough for the admiſſion of long flat-bottomed boats, which are towed by a rail on each hand, near three quarters of a mile, to the coal-works. There the paſſage divides into two channels, one of which goes off 300 yards to the right, and the other as many to the left; and both may be continued at pleaſure.

The paſſage is, in ſome places, cut through the ſolid rock, and in others, arched over with brick. Air-funnels, ſome of which are near 37 yards perpendicular, are cut, at certain diſtances, through the rock to the top of the hill. The arch at its entrance is about ſix feet wide, and about five feet high from the ſurface of the water; it widens within, ſo that in ſome places the boats may paſs one another, and at the pits it is ten feet wide. When the boats are loaded and brought out of the baſon, five or ſix of them are linked together, and drawn along the *canal* by a ſingle horſe or two mules. The *canal* reaches Mancheſter in a courſe of nine miles; it is broad enough for the barges to paſs or go a-breaſt, and on one ſide there is a good road for the paſſage of the people, and horſes or mules employed in the work. The *canal* is raiſed over public roads by means of arches, and it paſſes over the navigable river Irwell near fifty feet above it, ſo that large veſſels in full ſail paſs under the *canal*, whilſt the duke's barges are at the ſame time paſſing over them. This *canal* joins that which paſſes from the river Merſey towards the Trent, taking in the whole a courſe of 34 miles.

The *Lancaſter canal* begins near Kendal, and terminates near Eccleſton, comprehending the diſtance of $72\frac{1}{2}$ miles.

The *canal* from Liverpool to Leeds is $108\frac{1}{3}$ miles: that from Leeds to Selby, $23\frac{1}{4}$ miles; from Cheſter to Middlewich, $26\frac{3}{4}$ miles; from the Trent to the Merſey, 88 miles; from the Trent to the Severn, $46\frac{1}{2}$ miles. The Birmingham *canal* joins this near Wolverhampton, and is $24\frac{1}{4}$ miles: the Droitwich *canal* is $5\frac{1}{2}$ miles: the Coventry *canal*, commencing near Litchfield, and joining that of the Trent, is $36\frac{1}{4}$ miles: the Oxford *canal* breaks off from this, and is 82 miles. The Cheſterfield *canal* joins the Trent near Gainſborough, and is 44 miles.

A communication is now formed, by means of this inland navigation, between Kendal and London, by way of Oxford; between Liverpool and Hull, by the way of Leeds; and between the Briſtol channel and the Humber, by the junction formed between the Trent and the Severn. Other ſchemes have been projected, which the preſent ſpirit of improvement will probably ſoon carry into execution, of opening a communication between the German and Iriſh ſeas, ſo as to reduce a hazardous navigation of more than 800 miles by ſea, into a little more than 150 miles by land; and alſo of joining the Iſis with the Severn.

There are many obvious advantages which accrue from theſe inland navigations. By diminiſhing the price of carriage, and facilitating the communication between remote parts of the country, they greatly conduce to the improvement and extenſion of our manufactures and commerce. They likewiſe tend, in a variety of ways, to advance and perpetuate the value of eſtates near which they paſs, by the eaſe with which manure may be procured, by the eſtabliſhment of manufactures, and by the cheap conveyance of their produce to large towns and ſea-ports: not to add, that they ſerve as drains for moiſt lands, and that they furniſh a ſupply of water for thoſe that are dry. And beſides, navigable *canals* give employment to the induſtrious labourer, as well as the ingenious artiſan.

We alſo read of divers projects and undertakings of *canals*, which were never atchieved. Demetrius Poliorcetes, Julius Cæſar, the emperors Caligula and Nero, attempted in vain to cut through the iſthmus, whereby Peloponneſus is joined to the reſt of Greece, and make a *canal* of communication between the Ionian and Ægean ſeas. Plin. Nat. Hiſt. lib. iv. cap. 4.

Seleucus Nicanor had a deſign to make a *canal* between the Euxine and Caſpian ſeas. Lucius Verus, who commanded the Roman army in Gaul under Nero, attempted to make a *canal* between the Moſelle and the Rhine.

The Spaniards have ſeveral times had in view the digging a *canal* through the iſthmus of Darien, from Panama to Nombre de Dios, to make a ready communication between the Atlantic and the South ſea, and thus afford a ſtraight paſſage to China and the Eaſt Indies.

CANAL is alſo applied to the furrows on the face of, or underneath a LARMIER; ſometimes alſo called porticos; and fitted up with reeds or flowers. Sometimes to thoſe cavities, ſtraight or winding, made on the caulicoles of a capital. See SOFFITA.

CANALS are alſo uſed for the flutings of a column or pilaſter.

CANAL *of the volute*, in the Ionic capital, is the face of the circumvolutions, incloſed by a liſtel.

CANAL, *Canalis*, in *Anatomy*, a duct, or paſſage, through which any of the juices, or fluids of the body flow.

Under *canals* are included all kinds of veſſels, as arteries, veins, nerves, &c. See ARTERY, VEIN, &c.

The hole or perforation through the *vertebræ* of the neck, whereby the ſpinal marrow communicates with the brain, is by ſome called the ſacred or great *canal*, ιερα συριγξ.

CANALES *ſemicirculares*, in *Anatomy*, are three *canals* in the labyrinth of the ear; which open by as many orifices into the *veſtibulum*.

They are of three different ſizes, *major*, *minor*, and *minimus*. In different ſubjects, they are frequently different, but are always alike in the ſame: the reaſon, Valſalva ingeniouſly conjectures to be, that as a part of the tender auditory nerve is lodged in theſe *canals*, ſo they are of three ſeveral ſizes, the better to ſuit all the variety of tones; ſome of the *canals* ſuiting ſome tones, and others others. And though there be ſome difference in the form and ſize of theſe *canals* in different perſons; yet, leſt there ſhould be any diſcord in the auditory organs, theſe *canals* are always in exact conformity to one another, in the ſame man.

CANALICIUM *aurum*, or CANALIENSE, that gold whic is dug out of mines, or veins under ground.

CANALICULATE *leaf*, among *Botaniſts*. See LEAF.

CANALICULATE *ſtalk*. See STALK.

CANALIS is uſed by *Surgeons* for an oblong, concave inſtrument, in which to put a broken limb, leg, or thigh. It is made either of braſs, wood, or earthen ware, ſometimes even of ſtraw fitted with linen cloth.

CANALIS, or CANALICULUS *arterioſus*, in *Anatomy*, a veſſel, obſerved in *fœtuſes*, but which, after delivery, grows uſeleſs, and diſappears. It is a little tube, which, joining the pulmonary artery and aorta, ſerves to convey the blood out of one into the other, without paſſing through the lungs. See FOETUS.

Dr. Agricola deſcribes a valve at the entry of the *canalis arterioſus* into the *aorta deſcendens*, compoſed of four ſides. Two of them prevent its being ſhut till after birth, and the other two prevent its being thruſt off from the orifice of the *canalis arterioſus*.

There have been ſome diſputes between Meſſieurs Mery, Buiſſiere, Rohault, and others, about the real uſe of the *canalis arterioſus*, as well as of the *foramen ovale*. See FORAMEN *ovale*.

CANALIS *naſalis*, a kind of *ſulcus* or furrow formed in the *oſſa unguis* and *maxillaria*, whereby a mucous humour is conveyed from the *puncta lacrymalia* to the noſe.

CANALIS *venoſus*, a duct in the liver of a fœtus, whereby a communication is maintained between the porta and cava; which, becoming uſeleſs after the birth, gradually dries up. Drake and Heiſter.

CANALIS, in *Zoology*. See TUBULUS *marinus*.

CANARIA *lappa*, in *Botany*, a name given by the ancient Romans ſometimes to the rough fruit of the common aparine or clivers, and ſometimes to the plant itſelf. Pliny calls the plant *lappa* and *lappago*; and the fruit of it, *lappæ boariæ*, *lappæ canariæ*, and *lappæ caninæ*.

CANARIES, in *Muſic*, an old Engliſh air, having a ſprightly movement of two ſtrains, with eight bars in each; and three quavers in a bar; the firſt pointed.

CANARIUM, from *canis*, *dog*, in *Antiquity*, a Roman ſacrifice, wherein dogs of a red or ruddy colour were ſacrificed, for a ſecurity of the fruits of the earth againſt the raging heats, and diſorders of Sirius in the dog-days.

CANARIUM, in *Botany*, a genus of the *dioecia pentandria* claſs: the calyx has two leaves, and the corolla conſiſts of three petals.

CANARY-*bird*, *Paſſer Canarienſis*, a ſpecies of ſinging-birds, greeniſh yellow in colour, formerly brought only from the *Canary* iſlands, but of late chiefly from Germany and Switzerland; which laſt, called alſo German-birds, are preferred to the former. The chief place for breeding *canary-birds* is Inſpruck and its environs, from whence they are ſent to Conſtantinople, as well as every part of Europe. They are a ſpecies of the *fringilla.*

Canary-birds are diſtinguiſhed by different names at different times and ages: ſuch as are about three years old are called *runts*; thoſe above two, are named *eriffs*; thoſe of the firſt year under the care of the old ones, are termed *branchers*; thoſe that are new-flown, and cannot feed themſelves, *puſhers*; and thoſe brought up by hand, *neſtlings.*

The *Canary-birds* may be bred with us, and, if treated with proper care, they will become as vigorous and healthful as in the country from whence they have their name. The cages in which theſe birds are kept are to be made of either walnut-tree or oak, with bars of wire; becauſe theſe, being woods of ſtrength, do not require to be uſed in large pieces. The common ſhape of cages, which is cylindric, is very improper for theſe birds; for this allows little room to walk, and without that the birds uſually become melancholy. The moſt proper of all ſhapes is the high and long, but narrow.

If theſe birds eat too much, they grow over-fat, loſe their ſhape, and their ſinging is ſpoiled; or at leaſt they become ſo idle, that they will ſcarce ever ſing. In this caſe their victuals is to be given them in a much ſmaller quantity, and they will by this means be recovered, by degrees, to all their beauty, and will ſing as at firſt.

At the time that they are about to build their neſts, there muſt be put into their cages ſome hay, dried thoroughly in the ſun: with this muſt be mixed ſome moſs dried in the ſame manner, and ſome ſtag's hair; and great care is to be taken of breeding the young, in the article of food. As ſoon as the young birds are eight days old, or ſomewhat more, and are able to eat and pick up food of themſelves, they are to be taken out of the cage in which they were hatched, and each put ſeparately into another cage, and hung up in a room where it may never have an opportunity of hearing the voice of any other bird. After they have been kept thus about eight days, they are to be excited to ſing by a bird-pipe; but this is not to be blowed too much, or in too ſhrill a manner, leſt they ſing themſelves to death.

For the firſt fifteen days the cages are to be covered with a black cloth, and for the fifteen days following with a green one. Five leſſons in a day from the pipe are ſufficient for theſe young creatures; and they muſt not be diſturbed with ſeveral ſounds at the ſame time, leſt they confound and puzzle them: two leſſons ſhould be given them early in the morning, one about the middle of the day, and two more at night.

The genius and temper of the ſeveral birds of this kind are very different. The males are almoſt always melancholy, and will not ſing unleſs they are excited to it by hearing others continually ſinging about them. The male bird of this kind will often murder the female put to him for breeding; and when there are ſeveral females together with the males, they will often do the ſame to one another from jealouſy. It is therefore not eaſy to manage the article of their breeding well in this particular, unleſs in this manner: let two female birds be put into one cage, and when they have lived together ſome time, they will have contracted a ſort of love for one another, which will not eaſily be diſſolved. Put a male bird into the cage with theſe two, and every thing will go well; their friendſhip will keep them from quarrelling about his favours, and from danger of his miſchievous diſpoſition; for if he attacks one of them, in order to kill her, the other will immediately take her part; and, after a few of theſe battles, the male will find that they are together an overmatch for him at fighting, and will then diſtribute his favours to them, and there will not fail of being a young breed or two, which are to be taken away from their parents, and educated as before directed. Some males watch the time of the female's laying, and devour the eggs as faſt as ſhe depoſits them; and others take the young ones in their beak, as ſoon as hatched, and cruſh them to death againſt the ſides of the cage, or ſome other way deſtroy them. When a male has been known once to have been guilty of this, he is to be ſhut up in a ſmall cage, in the middle of the large one in which the female is breeding her young, and thus he will often comfort her with ſinging all day long, while ſhe ſits upon the eggs or takes care of the young ones; and when the time of taking away, to put them into ſeparate cages, is come, the male is to be let out, and he will always after this live in friendſhip with the female.

If the male become ſick during the time of the female's ſitting or bringing up her young, he muſt be removed immediately, and only brought to the ſide of her cage at certain times, that ſhe may ſee him, till he is perfectly cured; and then he is to be ſhut up again in his cage in the middle.

Canary birds are various in their notes; ſome having a ſweet ſong, others a lowiſh note, others a long ſong, which is beſt, as having the greateſt variety of notes: but they ſing chiefly, either the titlark, or nightingale notes. See SONG *of birds.*

CANARY-*graſs.* See PHALARIS.

CANARY-*weed.* See ARCHIL.

CANATTE CORONDE, a name given by the Ceyloneſe to a peculiar kind of cinnamon growing in that iſland: this is eſteemed the ſecond kind in value, and the name they give to it ſignifies bitter and aſtringent cinnamon. The bark of this kind of cinnamon-tree comes off very eaſily, and is of a very fragrant ſmell when freſh, but it has a bitter taſte. It is not very common in the iſland, and is not eaſily diſtinguiſhed on the tree from the beſt cinnamon. The trees which yield the eight different kinds of cinnamon, ſo very various in flavour and virtue, are all ſo like one another, that it requires a great deal of attention to diſtinguiſh them. The root of this kind of cinnamon-tree yields a very fine ſort of camphor. Phil. Tranſ. N° 409.

CANAVAY, in *Natural Hiſtory*, a name given by the inhabitants of the Philippine iſlands to a ſea-bird which is deſcribed as being of the bigneſs of a pigeon, and laying its eggs on the naked rocks, where it ſits and hatches them. Some ſuppoſe this bird no other than the common king-fiſher. But this is ſcarce probable; as we have no account of its being very beautifully coloured; and this is a circumſtance which can hardly have eſcaped thoſe who mentioned it, being ſo very remarkable. It is much more probably ſome ſea-bird wholly unknown in this part of the world.

CANCAMUM, in the *Materia Medica*, a name given by the Greeks to a gum or reſin, and continued down to the preſent age, though not without ſome uncertainty in its ſignification. The Arabian writers in general have looked on the word *cancamum* as a ſynonymous term for gum lack, which the Greeks have called *lancha* and *lacha*, and Avicenna, *loch.*

CANCELIER, in *Falconry*, is when a light-flown hawk, in her ſtooping, turns two or three times upon the wing, to recover herſelf before ſhe ſeiſes.

CANCELLARIUS, in *Antiquity.* See CHANCELLOR.

CANCELLI, in *Building*, lattices, or a ſort of windows made with croſs bars of wood or iron, chequer-wiſe.

The term is alſo applied to the baluſters or rails which compaſs a court of juſtice, a communion-table, or the like.

CANCELLI, in a *Military Senſe*, the ſame with BARRIER.

CANCELLING, in the *Civil Law*, an act whereby ſome former deed is rendered null, and void.—This is otherwiſe called *reſciſſion.*

The word comes from the Latin *cancellare, to encompaſs*, or *pale a thing.*

In the proper ſenſe of the word, *to cancel*, is to deface an obligation, by paſſing the pen from top to bottom, or acroſs it; which makes a kind of chequer lattice, which the Latins call *cancelli.*

CANCELLUS, in *Ichthyology*, the *wrong heir*, is a very ſmall ſpecies of CRAY-*fiſh*, which the French call *hermit*, or *St. Bernard the hermit*, becauſe it ſhuns others, and retires into the firſt ſhell it meets with. Its body is ſomewhat long, but in general, much reſembling a ſpider, except that it is a little thicker. It is found in the ſlime near rocks, encloſed commonly in a ſhell as big as a nut, of a conic figure, thick, very hard, rugged, furrowed, and grey without-ſide, but ſmooth and white within. This ſhell is ſo well adapted to the animal, that it is a hard matter to force it out of its encloſure. Some waſh it, dreſs it, and eat it. It contains abundance of volatile ſalt; it is aperitive, and good for the ſtone. The oil prepared from it is brought from America, and is uſed for the rheumatiſm.

In the American iſlands they find a much larger ſpecies of *cancellus*, being three or four inches long. It is called the *ſoldier*, becauſe it poſſeſſes and fortifies itſelf in a ſhell which is not its own. Its natural ſhell leaving its hinder parts naked, it employs itſelf, as ſoon as it is ſtrong enough, in ſearching out another which may be proportioned to its ſize; into which it ſtuffs its back parts and adjuſts itſelf. But as it grows larger, and finds itſelf confined, it is obliged from time to time to go in ſearch of others: and it is good diverſion for the curious, to obſerve how he ſtops at all the ſhells he meets with, to conſider them; and when he finds one fit for his purpoſe, how he quits his own, and with great precipitation crouds into his new tenement, as if he was aſhamed of being naked: and if two of theſe animals are ſtripped at the ſame time, to enter the ſame ſhell, they fight until the weakeſt gives way.

The inhabitants fiſh for them, ſtring them up by the head, and expoſe them to the ſun, which diſſolves them all but the ſolid parts; which diſſolved ſubſtance or oil is eſteemed excellent for rheumatiſms, to which the ſavages are very ſubject.

CANCER, in *Aſtronomy*, one of the twelve ſigns of the zodiac; ordinarily repreſented on the globe in form of a crab, and in aſtronomical books denoted by a figure much reſembling that of the number ſixty-nine; thus, ♋.

The reaſon generally aſſigned for its name as well as figure, is a ſuppoſed reſemblance which the ſun's motion in this ſign bears to that of the crab-fiſh. As the latter walks backwards, ſo the former in this part of his courſe begins to go backwards, or recede from us, though the diſpoſition of ſtars in this ſign is by others ſuppoſed to have given the firſt hint to the repreſentation of a crab.

The ſtars in the ſign *cancer*, Ptolemy makes 13; Tycho, 15; Bayer and Hevelius, 29; Mr. Flamſtead, no leſs than 83.—Their order, names, places, longitude, latitude, magnitude, &c. in the Britannic Catalogue, are as follows:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.	Latitude.	Magnitude.

CANCER, *Tropic of*, in *Aſtronomy*, a leſſer circle of the ſphere parallel to the equator; and paſſing through the beginning of the ſign *Cancer*. See TROPICS.

CANCER, in *Ichthyology*. See CRAB, and SQUILLA.

CANCER, in *Medicine*, a roundiſh, hard, ragged, immoveable tumour, of an aſh, or livid colour; encompaſſed round with branched turgid veins, full of black foul blood; ſituate chiefly in the glandulous parts: ſo called, as ſome will have it, from the reſemblance which the turgid veins ſhooting from it bear in figure to the crab-fiſh; or, as others ſay, becauſe, like that fiſh, when once it has got hold, it is ſcarce poſſible to drive it away.

A *cancer* differs from a *ſchirrhus*, in that the latter is without pain. See SCHIRRHUS.

Cancers alſo differ from thoſe called ſimply *cancerous ulcers*, or tumours, which, though of a like general nature, vary in many circumſtances.

Cancers appear with ſuch a diverſity, that it ſeems impoſſible to give a definition which ſhall agree to all. Some have a round, unequal, livid, painful hardneſs; others are flat without lividity, and ſometimes indolent. The variety ariſes chiefly from their riſe, and the different parts they are ſeated in; as the breaſt, womb, lips, noſe, eyes, ears, &c. Phil. Tranſ. Nº 260. p. 476.

Some reſtrain *cancers* to thoſe on women's breaſts, which alone exhibit the appearance of crabs; and give the name *carcinoma*, and *cancerous ulcer*, to thoſe on the other parts.

It begins without any pain, and appears, at firſt, like a chich-pea; but grows apace, and ſoon becomes very painful.

The *cancer* ariſes principally on the lax glandulous parts, as the breaſts and emunctories: it is moſt frequent in women, eſpecially ſuch, ſays Stolterſoth, as are barren, or live ſingle. The reaſon of its appearing in the breaſts more than other parts, is, that being full of glands, with lymphatics and blood-veſſels among them, the ſmalleſt contuſion, compreſſion, or punction, extravaſates thoſe liquors; which growing, by degrees, acrimonious, form the *cancer*. Hence it is ſaid that a *cancer* is that in the glands, which a caries is in the bones, and a gangrene in the fleſhy parts. The *cancer*, however, is ſometimes found in other ſoft, ſpongy parts of the body; and there have been ſome found in the gums, belly, neck of the matrix, ureter, lips, noſe, cheeks, abdomen, thighs, and even the ſhoulders.

A *cancer* ariſing on the legs, is called a *lupus*; on the face, or noſe, a NOLI *me tangere*.

Cancers are divided, according to their ſeveral ſtages, into *occult*, and *open* or ulcerated.

CANCERS, *occult*, are thoſe not arrived at their ſtate, or not yet burſt.

It is a famous aphoriſm, that occult *cancers* are better uncured than cured; and that the patient will live longer with them than without them. Hippocr. Aphor. 38. § 6. But phyſicians are not to be deterred by an old aphoriſm; they attempt not only a palliative, but a radical cure: the former partly by externals of the narcotic kind, to allay the pain, and hinder the ſpreading of the *cancer*; partly by internals, the chief of which are the *diaphoreticum Poterii*, martials, ſeveral preparations of earth-worms, and tincture of antimony, but eſpecially the juice of the *ſolanum lethale*, which is a topic of great fame for the palliative cure of *cancers*. It was the great ſecret of Percival Willoughby. Gendron improves it by the addition of *ſaccharum ſaturni*. The true cure of *cancers*, according to this writer, is either by exſection or amputation of the part, or by the application of cauteries. The former may be uſed where the tumour is moveable, and its baſe terminates abruptly, does not adhere to the adjacent parts, and conſequently has ſent no filaments to the ſame; as is the caſe in all *cancers* ariſing from ſchirrhous or ſcrophulous tumours.

But the true *cancers*, he obſerves, are ſeldom extirpated with ſucceſs; and the operation would be leſs in repute, if ſchirrhi, ſtrumæ, and other ſimilar tumours were not frequently miſtaken for *cancers*. Phil. Tranſ. N° 260.

Cancers, *ulcerated*, are known by their roughneſs and fulneſs of holes, through which ouſes a filthy, ſtinking, glutinous matter, frequently yellowiſh; by their pungent pain, which reſembles the pricking with a thouſand pins; and by their blackneſs; the ſwelling of the lips of the ulcer; and the veins about it, which are blackiſh, tumid, and varicous.

Sometimes the extremities of the blood-veſſels are gnawed off, and the blood iſſues out. In a *cancer* of the breaſt, the adjacent fleſh is ſometimes ſo conſumed, that one may ſee into the cavity of the *thorax*. It occaſions a ſlow fever, a loathing, oftentimes faintings, ſometimes a dropſy, and laſtly, death.

The generality of authors aſcribe the cauſe of *cancers* to an acid ferment which firſt coagulates the juices in the glands, and afterwards corrodes and ulcerates the part. Gendron, refuting this theory, ſubſtitutes another; the *cancer*, according to him, is not a diſeaſe of the fluids, but of the ſolids. It ariſes from a diſorder of the lymphatic and excretory veſſels of the glands, which becoming by ſome accident impervious, and ceaſing to filtrate and convey their liquors, by degrees degenerate into a compact horny maſs, capable of germination and ulceration. What ſeems to confirm this origin is, that in grown *cancers* there is always found a hard callous ſubſtance not unlike horn, with blood-veſſels diſſeminated through it, which yet are ſmaller and narrower than before the formation of the hardneſs. This calloſity is found in cutaneous *cancers*, though it there extends itſelf in a different manner, appearing at firſt like a ſmall wart, from which ſpring cutaneous filaments. When the ulceration has made ſome progreſs, theſe appear like pinheads in the fleſh, which are no other than the extremities of the filaments. This ſubſtance, always found in true *cancers*, according to M. Gendron, is the *cancer* itſelf, formed by the tranſmutation of the glandular and lymphatic veſſels. On this principle he reſolves the ſpreading of a *cancer* into a vegetation performed by the conveyance of the nutritious juices through the ramifications of the tumour, as through horns, nails, or the like ſubſtances. The pain proceeds from the compreſſion of the nervous parts, as that in corns, and the lividity from the obſtruction of the blood; not as commonly ſuppoſed from a cauſtic ſalt, which would ſoon cauſe an eſchar. Gend. Recherch. ſur la Nat. &c. des *Cancers*, cap. 3. Act. Erud. Lipſ. an. 1701.

The *cancer* is one of thoſe diſeaſes for which no competent remedy has been yet found, not even when taken early, or in its occult ſtate. The moſt that medicine can do, is to palliate, or keep it back by diet and general remedies. Le Clerc, Treat. Chir. Operat. chap. viii. p. 198, ſeq. where the operation of cutting off a cancerous breaſt is deſcribed.

However, in the Memoirs of the Royal Academy of Sciences, mention is made of the radical cure of three inveterate *cancers*, by an infuſion of the leaves of plumbago in olive oil; theſe *cancers* had been deemed incurable by reaſon of their adherence to bony parts. Mem. Acad. Sc. 1739.

Cancers are ſometimes internal. We have hiſtories of two ſuch in the Philoſophical Tranſactions, from which Dr. Burton endeavours to deduce the diagnoſtics of a *cancer* within the abdomen. N° 464.

Cancers, *to prevent*.—When there is danger of an approaching *cancer*, the acrimony of the blood is, if poſſible, to be corrected by the uſe both of internal and external remedies, and a ſtrict regimen in regard to diet is to be obſerved. Broths and ſoups made of the fleſh of young animals, and with proper herbs boiled in them, as ſcorzonera, and the others of that tribe, are very beneficial in theſe caſes; the moſt wholeſome drink is either fair water, or a decoction of China root, or ſarſaparilla, or the like; and when the pains are violent from the ſchirrhus, which is now threatening to become a *cancer*, white poppy ſeeds may be added in conſiderable quantities to the decoction, and it may be ſweetened with a proper quantity of ſyrup of diacodium. Two or three times a day alſo ſhould be taken a doſe of Gaſcoin's powder, ſalt of wormwood, native cinnabar, crude and diaphoretic antimony; adding to each doſe, as there ſhall be occaſion, half a grain of laudanum, to aſſuage the violence of the pain. Great benefit is alſo ſometimes received in this caſe by taking either the powder or juice of millepedes, with ſperma ceti.

Purges alſo of the mercurial kind frequently do great ſervice, as does alſo bleeding and cupping frequently in the ſpring and autumn. A thin plate of lead well impregnated with quickſilver may alſo be very conveniently worn on the part with great advantage; for this method cannot but weaken the ſenſe of pain, and may often prevent a *cancer*.

If the application of the plate of lead ſhall prove inſufficient, plaſters and ointments compoſed of ſuch ingredients as are known to aſſuage pains may alſo be applied; the following are of this kind, and are frequently found of ſervice. Take of the *unguentum diapompholygos*, two ounces; of opium, half a ſcruple; mix theſe into an ointment, and frequently rub the part affected with it; or take of an amalgama of quickſilver and lead two ounces, mix this with a ſufficient quantity of ointment of roſes, or any the like unguent, then ſpread a part of it on a linen rag, and apply it in the manner of a plaſter to the part: or take litharge vinegar, an ounce; expreſſed oil of henbane ſeeds, poppy ſeeds, and the infuſed oil of roſes, of each two ounces; mix them by a long and continued ſtirring together into an ointment, adding toward the end of the operation purified opium from ſix to ten grains, as the urgency of the ſymptoms may require; this is to be ſpread in like manner on linen rags, and applied at times to the part.

If the daubing of theſe ointments is diſliked, a refrigerent plaſter may be uſed in their ſtead; ſuch is the lead plaſter of Mynſycht, and plaſters of red lead, or pompholyx, or the excellent plaſter made by the following preſcription: take of the freſh and depurated juices of henbane, garden-poppy, and water-hemlock, of each four ounces; boil theſe to a thickneſs over a gentle fire, adding toward the end of the boiling eight ounces of white wax, and one ounce of oil of roſes, and make the whole into a plaſter: or take of ſugar of lead, of ceruſe of the amalgamation of quickſilver and lead, and of the expreſſed oil of henbane ſeed, and infuſed oil of roſes, of each two ounces; make theſe into a plaſter. If the pains are very violent, a ſmall quantity of opium may be added to either of theſe plaſters. Heiſter's Surg. 223.

Soultzer, phyſician to the duke of Saxe-Gotha, after obſerving that an effectual cure for a *cancer* is ſtill among the *deſiderata* of phyſic, and that mercury, antimony, and all alteratives, as well as the *belladona* and *cicuta*, have generally failed, recommends the following poultice: take carrots freſh gathered, and reduce them to a coarſe powder, ſqueeze out the juice and warm the pulp, and apply it in the form of a thick poultice, ſo that it may touch the ulcers in every part; and let the whole be covered with a warm napkin. The dreſſing muſt be renewed twice in every four hours, and the ulcers cleaned with lint dipped in a warm decoction of hemlock. This application, he ſays, will abate the pain, take away the loathſome ſmell, diminiſh the ſuppuration, and produce the diſcharge of a laudable pus. By continuing the uſe of it, the callous edges of the ulcers will be ſoftened, the tumour diminiſh, and at length diſappear; new fleſh will be generated, a cicatrix will be formed, and the cure completed. The extract of hemlock may be ſafely adminiſtered at the ſame time. See an account of the effects of the *cicuta* and a carrot-poultice upon a *cancer* of the breaſt, in the Med. Obſ. and Inq. vol. iv. art. 31.

The *ſanies* of a *cancer*, when the carrot-poultice has failed, has been ſweetened by *fixed air*, applied externally, the pain mitigated, and a better digeſtion produced. Dr. Percival remarks, from repeated trials, that the progreſs of *cancers* ſeems to be checked by the fixed air; but, he adds, it is to be feared, that a cure cannot thus be effected. Prieſtley on Air, vol. I. Appendix, p. 302.

Cancer, in a more vague ſenſe, is extended to all **ulcers** diſpoſed to putridity.

Such are the moſt inveterate, malignant, cavernous, fiſtulous, varicous, and colliquative ulcers. The Arabs call the *elephantiaſis* the univerſal *cancer*. Celſus even ranks the gangrene and ſphacelus in the claſs of *cancers*.

Others include the caries of bones in the number. Ephem. Acad. N. C. dec. 1. an. 1. p. 8.

Cancers are by ſome divided into *primitive* and *degenerate.*

Cancers, *primitive*, are thoſe which come of themſelves, appearing at firſt about the bigneſs of a pea, and only painful at intervals; but growing bigger, and more troubleſome by degrees.

Cancers, *degenerate*, are thoſe which ſucceed obſtinate, ill-managed tumours, or impoſthumes. Theſe commence ulcerated *cancers*, without ever having been occult ones.

Cancer *albus*, the white *cancer*, is uſed by French writers for a white chalky recrement, ſometimes found adhering to the tongue, and internal parts of the mouths of children, and which, unleſs timely bruſhed away, is apt to ulcerate.

In which ſenſe, it ſeems to amount to the ſame with APHTHÆ.

Cancer is alſo applied to a ſpecies of BANDAGE for the head, and divided into ſeveral parts, reſembling the legs of a crab-fiſh.

Cancer, in the *Military Art.* See ARIES.

CANCRIFORM, *Cancriformis*, the ſame with *cancroides*, or *cancerous.*

Wedelius has a diſcourſe of hard rebellious *cancriform* tumours. Ephem. Acad N. C. dec. 2. an. 1. obſ. 12.

CANCRINE *verſes*, the ſame with RETROGRADE.

CANCROMA, in *Ornithology*, a genus of birds of the order of *grallæ*; having a gibbous beak, and the upper jaw in the form of a boat turned upwards. Linnæus reckons two ſpecies, the *cochlearia*, and the *cancrophaga*; the former is found in Guiana, and the latter in the Braſils.

CANDELARES, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

CANDELARIA, in *Botany*, a name by which ſome authors have called the great white MULLEIN.

Candelaria, in *Entomology*, is a ſpecies of inſect, belonging to the genus of *fulgora*, and order of *hemiptera* in the Linnæan ſyſtem. It is common in China.

CANDERROS, in the *Materia Medica*, a name of an Eaſt Indian gum, not much known among us, though ſometimes imported. It has much of the appearance of common amber, only that it wants its yellow colour, being white and pellucid; we ſometimes ſee it turned into toys of various kinds, which are very light, and of a good poliſh. Garcias and ſome other authors tell us, that the people of Borneo, and ſome other places where camphor is produced, have the art of adulterating the crude camphor, which they ſend over to us with large quantities of this gum.

CANDIDATE, a perſon who ſets up for ſome poſt or place, either of honour or profit.

The word is formed of *candidus, white*; on account of a white ſhining garment, *toga candida*, wherein thoſe who aſpired to preferments in ancient Rome, were habited at the time of their appearing for the ſame, eſpecially at the public aſſemblies, in order to diſtinguiſh them from the croud.

The white gown worn by *candidates* was looſe and ungirded, nor was there any cloſe garment under it, which ſome interpret as done with deſign to avoid any ſuſpicion people might have of bribery; though Plutarch rather thinks it done to gain the affections of the people, by ſueing in ſuch an humble garb; or elſe that ſuch as had received wounds in the ſervice of their country, might more eaſily demonſtrate thoſe tokens of their courage and fidelity.

The Roman *candidates* uſually declared their pretenſions a year before the time of election, which was ſpent in making intereſt and gaining friends. Various arts of popularity were practiſed for this purpoſe, and frequent circuits made round the city, and viſits and compliments to all ſorts of perſons, the proceſs of which formed what was called AMBITUS.

Candidati *principis*, were thoſe who were recommended to any offices by the emperors. Alſo an office in the court of the emperor of Conſtantinople, anſwering to a ſecretary of ſtate among us.

The *candidatus principis* was alſo denominated *Quæſtor principis* or *Auguſti.*

Candidate *of baptiſm*, in the *Ancient Church*, was called CATECHUMEN.

Candidates, in the COLLEGE *of Phyſicians*, London, is the order of members out of whom the fellows are choſen.

The *candidates* muſt be natives of England, doctors of phyſic, admitted to the degree in our own univerſities, and ought to have practiſed phyſic four years before they are admitted into the order. The number of *candidates* is never to exceed twelve.

Candidate, in *Academical Orders* or *Degrees*, denotes a perſon to whom, after full examination, and the performance of inaugural exerciſes, licence is granted to take up the higheſt or doctoral dignity when he pleaſes. See DEGREE, DOCTOR, LICENTIATE, &c.

Candidati *milites*, were an order of ſoldiers of tall ſtature, who ſerved as the emperor's body guards, to defend him in fight. They were thus denominated, becauſe cloathed in white, either that they might be the more conſpicuous, and their actions more taken notice of, or becauſe they were conſidered as in the way to higher preferments. Cedrenus obſerves, that it was the younger Gordian who inſtituted the *candidati*, as alſo the *protectores* and *ſcholares*. The *ſcholares* were choſen out of the troops, and conſiſted of perſons who beſt underſtood the art of war; and out of theſe *ſcholares* were choſen the *candidati*, who were ſuch as were talleſt and ſtrongeſt, and had moſt of the martial air; and were proper to inſpire terror, ſays the Chronicon of Alexandria. The *protectores* were a middle order.

CANDLE, a cotton or linen wick, looſely twiſted, and covered with tallow, wax, or ſpermaceti, in a cylindrical figure; which being lighted at the end, ſerves to illumine a place in the abſence of the ſun.

The word *candle* comes from *candela*, and that from *candor*, of *candeo, I burn*; whence alſo the middle-age Greek κανδηλα.

A *tallow candle*, to be good, muſt be half ſheep's tallow and half bullock's; the fat of hogs makes them gutter, give an ill ſmell, and a thick black ſmoke.

Tallow candles are of two kinds; the one *dipped*, the other *moulded:* the firſt, which are thoſe in ordinary uſe, are of an old ſtanding; the latter are ſaid to be the invention of the Sieur le Brez, at Paris. The manufacture of the two kinds is very different, excepting in what relates to melting of the tallow, and making the wick, which is the ſame in both.

Candles, *method of making*. The tallows, being weighed and mixed in their due proportion, are cut or hacked into pieces, to facilitate their melting, and thrown into a pot or boiler, having a cavity of ſome depth running round the top, to prevent its boiling over. Being thus perfectly melted and ſkimmed, a certain quantity of water is thrown in, proportioned to the quantity of tallow; this ſerves to precipitate the impurities of the tallow, which had eſcaped the ſkimmer, to the bottom of the veſſel. The tallow, however, intended for the firſt three dips, muſt have no water; becauſe, the dry wick, imbibing the water readily, makes the *candles* ſpit and crackle in the burning. The melted tallow is now emptied through a ſieve into a tub, having a tap for letting it out, as occaſion requires. The tallow thus prepared, may be uſed after having ſtood three hours; and will continue fit for uſe twenty-four hours in ſummer, and fifteen in winter.

For the wicks, they are made of ſpun cotton, which the chandlers buy in ſkeins; and wind off three or four together, according to the intended thickneſs of the wick, into bottoms, or clues, whence they are cut out with an inſtrument contrived for that purpoſe, into pieces of the length of the *candle* required; then put on the ſticks, or broches, or elſe placed in the moulds, as the *candles* are intended to be either dipped or moulded.

Candles, *making of dipped*. The liquid tallow is drawn off from the tub above-mentioned, into a veſſel called the mould, ſink, or abyſs, of an angular form, perfectly like a priſm, except that it is not equilateral; the ſide on which it opens being only ten inches high; and the others, which makes its depth, fifteen. On the angle, formed by the two great ſides, it is ſupported by two feet, and is placed on a kind of bench, in form of a trough, to catch the droppings, as the *candles* are taken out at each dip. At a convenient diſtance from this, is ſeated the workman, who takes two ſticks, or broches, at a time, ſtrung with the proper number of wicks, viz. ſixteen, if the *candles* are to be of eight in the pound; twelve, if of ſix on the pound, &c. and holding them equidiſtant, by means of the ſecond and third finger of each hand, which he puts between them, he immerges the wicks two or three times for their firſt lay, and, holding them ſome time over the opening of the veſſel to let them drain, hangs them on a rack, where they continue to drain and grow hard. When cooled, they are dipped a ſecond time, then a third, as before; only for the third lay they are but immerged twice, in all the reſt thrice. The operation is repeated more or leſs times, according to the intended thickneſs of the *candles*. With the laſt dip they neck them; i. e. plunge them below that part of the wick where the other lays ended.

It muſt be obſerved, that during the operation, the tallow is ſtirred from time to time, and the ſtock ſupplied with freſh tallow. When the *candles* are finiſhed, their peaked ends, or bottoms, are taken off; not with any cutting inſtrument, but by paſſing them over a kind of flat brazen plate, heated to a proper pitch by a fire underneath; which melts down as much as is requiſite.

Candles, *method of making mould*. Theſe *candles* are made in moulds of different matters: braſs, tin, and lead, are the moſt ordinary. Tin is the beſt, and lead is the worſt. Each *candle* has its mould, conſiſting of three pieces, the neck, ſhaft, and foot: the *ſhaft* is a hollow metal cylinder, of the diameter and length of the *candle* propoſed: at the extremity of this is the *neck*, which is a little metallic cavity, in form of a dome, having a moulding within ſide, and pierced in the middle with a hole big enough for the wick to paſs through. At the other extremity is the *foot*, in form of a little tunnel, through which the liquid tallow runs into the mould. The neck is ſoldered to the ſhaft, but the foot is moveable, being applied when the wick is to be put in, and taken off again when the *candle* is cold. A little beneath the place where the foot is applied to the ſhaft, is a kind of ſtring of metal, which ſerves to ſupport that part of the mould, and to prevent the ſhaft from entering too deep in the table to be mentioned hereafter. Laſtly, in the hook of the foot, is a leaf of the ſame metal, ſoldered within ſide, which advancing into the centre, ſerves to keep up the wick; which is here hooked on, preciſely in the middle of the mould. The wick is introduced into the ſhaft of the mould by a piece of wire, which being thruſt through the aperture of the hook, till it come out at the neck, the wick is tied to it; ſo that in drawing it back, the wick comes along with it, leaving only enough a-top for the neck; the other end is faſtened to the hook, which thus keeps it perpendicular. The moulds, in this condition, are diſpoſed in a table pierced full of holes, the diameter of each being about an inch: theſe holes receive the moulds inverted, as far as the ſtring in the foot. Being thus placed perpendicularly, they are filled with melted tallow (prepared as before) drawn out of the tap into a tin pot, and thence poured into the foot. After the moulds have ſtood long enough to cool, for the tallow to have arrived at its conſiſtence, the *candle* is taken out, by taking off the foot, which brings the *candle* along with it. Thoſe who aim at perfection in their work, bleach or whiten their *candles*, by faſtening them on rods or broches, and hanging them out to the dew, and earlieſt rays of the ſun, for eight or ten days: care being taken to ſcreen them in the day-time from the too intenſe heat of the ſun; and in the night from rain, by waxed cloths.

Candles, *wax*, are made of a cotton or flaxen wick, ſlightly twiſted, and covered with white or yellow wax. —Of theſe there are ſeveral kinds; ſome called *tapers*, uſed to illumine churches, and in proceſſions, funeral ceremonies, &c. and others uſed on ordinary occaſions.

For the firſt kind, their figure is conical, ſtill diminiſhing from the bottom, which has a hole to receive the point in the candleſtick, to the top, which ends in a point: the latter kind are cylindrical. The firſt are either made *with a ladle*, or *with the hand*.

Candles, *wax, manner of making with the ladle*. The wicks being twiſted, and cut off at the proper length, a dozen of them are tied by the neck, at equal diſtances, round an iron circle, ſuſpended directly over a large baſon of copper tinned, and full of melted wax: a large ladle full of this wax is poured gently, by inclination, on the tops of the wicks, one after another; ſo that running down, the whole wick is thus covered; the ſurplus returning into the baſon, where it is kept warm by a pan of coals underneath it. They thus continue to pour on the wax, till the *candle* arrive at its deſtined bigneſs: ſtill obſerving, that the three firſt ladles be poured on at the top of the wick, the fourth at the height of $\frac{3}{4}$, the fifth at $\frac{1}{2}$, and the ſixth at $\frac{1}{4}$; by which means the *candle* arrives at its pyramidal form. The *candles* are then taken down hot, and laid aſide of each other, in a feather-bed folded in two, to preſerve their warmth, and keep the wax ſoft: they are then taken and rolled, one by one, on an even table, uſually of walnut-tree, with a long ſquare inſtrument of box, ſmooth at the bottom. The *candle* being thus rolled and ſmoothed, its big end is cut off, and a conical hole is made in it.

Candles, *wax, manner of making by the hand*. The wick being diſpoſed, as in the former, they begin to ſoften the wax, by working it ſeveral times in hot water, contained in a braſs caldron, tinned, very narrow and deep. A piece of the wax is then taken out, and diſpoſed, by little and little, around the wick, which is hung on a hook in the wall, by the extremity oppoſite to the neck; ſo that they begin with the big end, diminiſhing ſtill, as they deſcend towards the neck. In other reſpects, the method is the ſame here, as in the former caſe; only that they are not laid in the bed, but are rolled on the table, juſt as they are formed. It muſt be obſerved, however, that in the former caſe, water is always uſed to moiſten the ſeveral inſtruments, to prevent the wax from ſticking; and in the latter, lard, or oil of olives, for the hands, table, &c.

Candles, *wax cylindrical*, are made either with the *ladle*, or *drawn*. The firſt kind are made of ſeveral threads of cotton, looſely ſpun, and twiſted together, covered with the ladle, and rolled, as the conical ones, but not pierced.

Candles, *wax, drawn*, are ſo called, becauſe actually drawn, in the manner of wire, by means of two large rollers, or cylinders of wood, turned by a handle, which turning backwards and forwards ſeveral times, paſs the wick through melted wax, contained in a braſs baſon; and at the ſame time through the holes of an inſtrument, like that uſed for drawing wire, faſtened at one ſide of the baſon: ſo that, by little and little, the *candle* acquires any bulk, at pleaſure, according to the different holes of the inſtrument through which it paſſes: by this method, may four or five hundred ells at length be drawn, running. The invention of this was brought from Venice by Pierre Bleſimare, of Paris, about the middle of the laſt century.

The aſcent of the tallow up the wick in a burning *candle*, may be reſolved into the ſame principle of filtration, or attraction, as that of water up a heap of aſhes, or even up a capillary tube. The wick of a *candle* is but ſlightly twiſted, that all its hairs may be eaſily come at; which being very ſmall, and abounding in ſulphur, ſoon take the flame; and the flame by its heat rarifying the air, and diſſolving the tallow underneath, makes the globules thereof aſcend into the rarified ſpaces of the wick, and theſe, with the air about it, prove food for the flame.

The Roman *candles* were at firſt little ſtrings dipt in pitch, or ſurrounded with wax; though afterwards they made them of the papyrus, covered likewiſe with wax; and ſometimes alſo of ruſhes, by ſtripping off the outer rind, and only retaining the pith.—For religious offices, wax *candles* were uſed; for vulgar uſes, thoſe of tallow. Serv. ad Æn. lib. i. v. 731. Plin. Nat. Hiſt. lib. xvii cap. 37. Lord Bacon propoſes *candles* of divers compoſitions and ingredients, as alſo of different ſorts of wicks; with experiments of the degrees of duration, and light of each. Good houſewives bury their *candles* in flour, or bran, which it is ſaid increaſes their laſting, almoſt half.—Some ſpeak of perpetual *candles* made of ſalamander's wood. Bac. Nat Hiſt. Cent. 4. § 369. and Cent. 8. § 774

If any chandlers mix with their wares any thing deceitfully, &c. the *candles* ſhall be forfeited. Stat. 23 Eliz. and a tax or duty is granted on *candles*, by 8 and 9 Anne, cap. 6. made for ſale, of 8*d.* per pound, for thoſe made with wax, and one penny a pound for all other *candles*, beſides the duty upon tallow, by 8 Anne, cap. 9. The makers of *candles* are not to uſe melting houſes, without making a true entry, on pain of 100*l.* and to give notice of making *candles* to the exciſe officer for the duties; and of the number, &c. or ſhall forfeit 50*l.* ſtat. 11 Geo. I. cap. 30. See alſo 23 Geo. II. cap. 21. and 26 Geo. II. cap. 32.

Candles, for which the duty hath been paid, may be exported, and the duty drawn back; but no draw-back ſhall be allowed on the exportation of any foreign *candles* imported. 8 Ann. cap. 9. 23 Geo. II. cap. 21.

It is obſervable, in *Optics*, that the flame of two candles joined, give a much ſtronger light than both of them ſeparate. The obſervation was ſuggeſted by Dr. Franklin. Probably the union of the two flames produces a greater degree of heat, whereby the vapour is attenuated, and the particles of which light conſiſts more copiouſly emitted. Prieſtley's Hiſt. of Viſion, p. 807.

Candles, *medicinal, candelæ fumales*, are compoſitions of odoriferous, aromatic, and inflammable matters, as benzoin, ſtorax, olibanum, turpentine, and the like, mixed up with mucilage of tragacanth, and formed into maſſes in ſhape of *candles*. The *effluvia* and odours whereof, when burnt, are ſuppoſed to be ſalutary to the breaſt, &c.

Candles for caruncles of the urinary paſſage, are made of wax and turpentine melted, and wicks dipt into the ſame, till brought to the due thickneſs; then ſmeared over with an unguent of ceruſs, and precipitate and butter of antimony; to be thruſt up the yard till they reach the *caruncula*. See Bougie.

Candle-*tree*, in the Weſt Indies, a tree of whoſe fruit boiled to a thick fat conſiſtence, are made good *candles*. It ſeems to be the ſame as the

Candle-*berry-tree*, *Myrica*, in *Botany*, a denomination of an aromatic evergreen, from whoſe berries are drawn, by boiling, a green wax, of which *candles* are made. It is alſo called the *Virginia myrtle*. It is a genus of the *dioecia tetrandria* claſs. Its characters are theſe: the male flowers are upon different plants from the female; and are produced in a looſe, oblong, oval catkin, imbricated on every ſide; under each ſcale is ſituated one moon-ſhaped flower, having no petal, but hath four or ſix ſhort ſlender ſtamina, terminated by large twin ſummits, whoſe lobes are bifid. The female flowers have neither petal nor ſtamina, but an oval germen ſupporting two ſlender ſtyles, crowned by ſingle ſtigmas. The germen afterward becomes a berry with one cell, encloſing a ſingle ſeed. There are ſeveral ſpecies.

The firſt ſort grows naturally upon bogs in many parts of England, particularly in the northern and weſtern counties; as alſo in Windſor Park, and near Tunbridge Wells. This riſes, with many ſhrubby ſtalks, near four feet high, which divide into ſeveral ſlender branches, garniſhed with ſtiff ſpear-ſhaped leaves of a light green, ſmooth, and a little ſawed at their points, emitting a fragrant odour when bruiſed.

Moſt of the other ſorts grow naturally in North America, where, as is before obſerved, the inhabitants get a ſort of green wax from the berries, which they make into candles. The method is deſcribed by Mr. Cateſby, in his Natural Hiſtory of Carolina.

Candle-*wood*, ſlips of pine about the thickneſs of the finger, uſed in New England, and other colonies, to burn inſtead of *candles*, giving a very good light.

The French inhabitants of the iſland of Tortuga uſe ſlips of yellow ſantal wood for the ſame purpoſe, and under the ſame denomination of *bois de chandelle*, which yields a clear flame, though of a green colour.

Candle, *ſale*, or *auction by inch of*. See Inch *of Candle*.

There is alſo a kind of *Excommunication by inch of* Candle; wherein the time a lighted *candle* continues burning, is allowed the ſinner to come to repentance; but after which he remains excommunicated to all intents and purpoſes.

CANDLEMAS, a feaſt of the church, held on the ſecond of February, in memory of the Purification of the Bleſſed Virgin.

It takes its name either from the number of lighted candles uſed by the Romiſh church, in the proceſſions of this day; or becauſe, before *maſs*, the church conſecrated *candles* for the whole year. This ceremony was prohibited in England, by an order of council in 1548.

Candlemas is alſo called, in ancient writers, *Hypapante*; and among moderns, the *Purification*.

Some will have this feaſt to have been inſtituted by pope Gelaſius, in lieu of the heathen lupercalia; and that proceſſion was thereon made with lighted *candles* round the fields and grounds, by way of exorciſm. Hence Bede ſays, "It is happy for the church to have changed "the luſtrations of the heathens, held in the month of "February, around the fields, for the proceſſions with "hallowed *candles*, in remembrance of that divine light "wherewith Chriſt illuminated the world, whence he "was ſtiled by Simeon, *a light to lighten the Gentiles*." Others aſcribe the origin of *Candlemas* to pope Vigilius, in the year 536, and ſuppoſe it ſubſtituted for the feaſt of Proſerpine, held with burning tapers by the heathens in the beginning of February.

CANDLESTICK, a houſhold utenſil, contrived to hold one, or more lighted candles. Larger, and more ſtately *candleſticks*, contrived for holding a great number of candles, are called *branches* and *girandoles*; and when made of glaſs, *luſtres*.

The *golden candleſtick* was the richeſt utenſil in the Jewiſh tabernacle. It was made of ſolid gold, and weighed a talent; and, according to Cumberland, the value of it, excluſive of the workmanſhip, was 5076 pounds. It contained ſeven lights, ſix branching out in three parts from the upright ſtem, and one on the top of it.

This ſacred utenſil was, after the Babyloniſh captivity, placed in the Temple; and when the Temple was deſtroyed, it was depoſited in the Temple of Peace built by Veſpaſian; and the repreſentation of it ſtill remains on the triumphal arch, at the foot of mount Palatine, on which Veſpaſian's triumph is delineated.

Candlestick, *water*, a kind of jet or fountain raiſed on a foot which ſupports a little baſon reſembling the diſk of a *candleſtick*, down which the water falls into another larger baſon.

CANDO, Cundi, or Condi, in *Commerce*, a long meaſure uſed in ſeveral parts of the Eaſt Indies, particularly at Goa, the capital of the Portugueſe ſettlements there. Silk and woolen ſtuffs are meaſured by the *varre*, and linen by the *cando*. The *cando* uſed in Pegu is equal to the Venetian ell.

CANDOU, in *Botany*; *Purchaſii*, *Jonſt. Dendrol. Arbor Maldivenſis*, a tree much like the cork-tree, and of the height of the walnut-tree. The trunk is fungous, and lighter than cork; the bark whitiſh, and it bears no fruit.

CANDY, in ſpeaking of Sugar, denotes a preparation of that ſubſtance, made by melting, and cryſtallizing it ſix or ſeven times over, to render it hard and tranſparent.

Candying makes an operation in *Pharmacy*, as well as confectionary; thoſe ſimples which are preſerved in ſubſtance by boiling in ſugar being ſaid to be *candied*: though the performance of it is now transferred to the confectioner from the apothecary, to whom originally it belonged.

Candy *carrot*. See Spignel.

Candy *tuft-tree*. See Iberis.

Candy *lion's foot*. See *Candia* Lion's *foot*.

CANE, in *Commerce*, the ſame with reed, called among botaniſts arundo. See Bamboe and Reed.

Canes make a conſiderable article in commerce. There are imported two ſorts, viz. *walking*, and *rattan canes*.

Canes, *walking*, are ſaid by Bradley to be joints of the roots of a ſort of reed, called *canna Indica*. This plant ſhoots in joints about three or four feet long, near the ſurface of the ground, and at every knot produces great numbers of fibres, by which it receives its nouriſhment. The joints are made ſtrait by the fire, which occaſions thoſe ſhades or clouds frequently ſeen in them. Bradley thinks the *cane-tree* might be propagated here by planting ſome of the roots with their knots in artificial bogs, &c.

Canes may be ſtained like tortoiſe ſhell, by a mixture of aqua fortis and oil of vitriol, laid on them at ſeveral times, over live coals, to cauſe it to penetrate the deeper, and afterwards giving them a gloſs with a little ſoft wax, and a dry cloth. Boyle.

Canes, *rattan*, are a ſmaller ſort brought from China and Japan, very tough; which being ſplit, are uſed for making of *cane* chairs. They are the produce of a reed called *rottang Malabarica minor*, or leſſer rattan. Theſe when dry, being ſtruck againſt each other, will give fire, and are uſed accordingly in ſome places in lieu of flint and ſteel. Being twiſted together they make cordage of them. The Chineſe and Japaneſe veſſels are ſaid to have their cables made of them, which are leſs liable to rot in the water than hemp. Phil. Tranſ. N° 244. p. 326. and N° 267. p. 717.

Cane, *ſugar*. See Sugar-*cane*.

Cane, *dumb*. See Wake-*robin*.

Cane, *fiſhing-rod*. See Reed.

Cane, *Indian*. See Canna.

Cane-*apple*, in *Natural Hiſtory*, a name given by the common people of Ireland to the *arbutus*, or ſtrawberry-tree. See Arbutus.

Cane, Canna, a long meaſure, frequent in Italy, Spain, and the ſouth parts of France; of greater or leſs length, according to the places where it is uſed.

At Naples, the *canna* is equal to ſeven feet $3\frac{1}{2}$ inches, Engliſh meaſure; the *canna* of Tholouſe, and the upper Languedoc, is equal to the *vara* of Arragon, and contains five feet $8\frac{2}{3}$ inches; at Montpellier, in Provence, Dauphine, and the Lower Languedoc, to ſix Engliſh feet $5\frac{1}{2}$ inches.

CANELLA *alba*, in *Botany*, the ſame with what is otherwiſe called cortex *winteranus*.

CANENTES, in *Natural Hiſtory*, a name uſed by ſome of the older writers for a ſpecies of foſſile ſhell not known to us in its recent ſtate, but deſcribed by Klein under the name of the *tubulus marinus concameratus*, and by other of the late authors under thoſe of *polythalamium* and *orthoceratites*.

CANEPHORÆ, Κανηφοροι, from κανης, a *reed*, and φερω, *I bear*, in *Antiquity*, were two virgins of quality at Athens, kept in Minerva's temple in the Acropolis, who at the feaſt of the Panathenæa, carried baſkets on their heads with ſomething ſecret or myſterious therein, and delivered to them by the prieſteſs.

The baſkets were uſually crowned with flowers, myrtles, &c.—The *Canephoræ*, in theſe ceremonies, always marched the firſt, the prieſt next, and the choir of muſic followed.

The learned are at variance about the contents of the baſkets borne by the *Canephoræ*. Some will have it, that neither they, nor the prieſteſs herſelf, knew what was in them. Others conjecture that they contained the things neceſſary for ſacrifice, &c.

There were alſo *Canephoræ* in the ceremonies of Ceres and Bacchus. Thoſe in the Bacchanalia carried golden baſkets, in which were divers ſorts of firſt fruits, &c. Among ancient monuments, we find mention of divers figures of *canephoræ*. In that famous cornelian called Michael Angelo's ring, there are three *Canephoræ* with their baſkets on their heads.

The appellation *Canephoræ* was alſo given to virgins at Athens, when, becoming marriageable, they preſented certain baſkets full of little curioſities to Diana, in order to procure leave to quit her train, and change their ſtate of life.

CANEPHORIA was a ceremony, which made part of a feaſt celebrated by the Athenian virgins on the eve of their marriage-day. The *Canephoria*, as practiſed at Athens, conſiſted in this; that the maid, conducted by her father and mother, went to the temple of Minerva; carrying with her a baſket full of preſents, to engage the goddeſs to make the marriage happy; or rather, as the ſcholiaſt of Theocritus has it, the baſket was intended as a kind of honourable amends made to that goddeſs, the protectreſs of virginity, for abandoning her party; or it was a ceremony to appeaſe her wrath.

CANES, in Egypt and other Eaſtern countries, a poor ſort of buildings for the reception of ſtrangers and travellers. People are accommodated in theſe with a room at a ſmall price, but with no other neceſſaries; ſo that, excepting the room, there are no greater accommodations in theſe houſes than in the deſerts, but that there is a market near.

CANES *Venatici*, in *Aſtronomy*, the *Grey-hounds*, two new conſtellations, firſt eſtabliſhed by Hevelius, between the tail of the Great Bear, and Bootes' arm, above the Coma Berenices. The firſt is called *aſterion*, being that next the Bear's tail; the other *chara*. They comprehend 23 ſtars, of which Tycho only obſerved two. The longitudes and latitudes of each are given by Hevelius.

In the Britiſh Catalogue they are 25. See the following table.

Situation of the ſtars.	Signs.	Longitud.			Latitude.			Magnitude

CANGA, in the *Chineſe Affairs*, a wooden clog borne on the neck, by way of puniſhment for divers offences.

The *canga* is compoſed of two pieces of wood notched, to receive the criminal's neck; the load lies on his ſhoulders, and is more or leſs heavy according to the quality of his offence. Some *cangas* weigh 200 pounds; the generality from 50 to 60 pounds. The mandarins condemn to the *canga*. Sentence of death is ſometimes commuted for by the penalty of the *canga*.

CANI, *grotto del*. See GROTTO *del Cani*.

CANIA, in *Botany*, a name given by Pliny, and ſome other authors, to the common ſtinging nettle.

CANICULA, in *Zoology*, the name by which Ariſtotle, and ſince him Rondeletius, Aldrovandus, and ſome others, have called the CATULUS.

CANICULA was alſo uſed by Pliny, and the old Romans, for that fiſh which the Italians expreſs by the ſame ſort of diminutive name, at this time the *lamiola*. It is the *galeus* CANIS of authors, the fiſh we in Cornwall call the *tape*. It is a ſpecies of SQUALUS, called by Artedi the *ſqualus*, with the noſtrils placed near the mouth, and with ſmall foramina near the eyes.

CANICULA is a name given to one of the ſtars of the conſtellation CANIS *major*; called alſo ſimply the *Dog-ſtar*; by the Greeks, *Σειριος*, *Sirius*.

Pliny and Galen alſo give the appellation Procyon to the *canicula*; though, in propriety, PROCYON is the name of another ſtar, in the Leſſer Dog.

Canicula is the tenth in order in the Britannic Catalogue; in Tycho's and Ptolemy's it is the ſecond. It is ſituate in the mouth of the conſtellation, and is of the firſt magnitude; being the largeſt, and brighteſt, of all the ſtars in the heavens. Its longitude, latitude, &c. ſee among thoſe of the other ſtars of CANIS *major*.

From the riſing of this ſtar, that is, its emerſion from the ſun's rays, which now happens about the twenty-ſixth day of Auguſt, the ancients reckoned their *dies caniculares*, or dog-days.

The Egyptians and Ethiopians began their year at the riſing of *canicula*; reckoning to its riſe again the next year, which is called the *Annus Canarius*.

CANICULAR *days*, properly denote a certain number of days, preceding and enſuing the heliacal riſing of *Canicula*, or the Dog-ſtar, in the morning.

Some authors tell us, from Hippocrates and Pliny, that the day the *Canicula* riſes, the ſea boils, wine turns ſour, dogs begin to grow mad, the bile increaſes and irritates, and all animals grow languid; and that the diſeaſes ordinarily occaſioned in men by it, are burning fevers, dyſenteries, and phrenſies.

The Romans ſacrificed a brown dog every year to *Canicula* at its riſing, to appeaſe its rage. They ſuppoſed *Canicula* to be the occaſion of the ſultry weather, uſually felt in the dog-days; Homer's Il. lib. xxii. v. 22. but by miſtake: in five or ſix thouſand years more, *Canicula* may chance to be charged with bringing froſt and ſnow; for it will riſe in November or December; and he actually riſes with the ſun on different days, in different horizons.

However, the almanac-makers uſually mark the beginning of the *canicular* days about the 30th of July, and their end about the 7th of September.

CANICULAR *year*, denotes the Egyptian natural year, which was computed from one heliacal riſing of *canicula* to the next.

This is alſo called *annus canarius*, and *annus cynicus*; by the Egyptians themſelves the *Sothic year*, from *Soth*, a denomination given by them to Sirius. Some alſo call it the *heliacal year*.

The *canicular* year conſiſted ordinarily of 365 days, and every fourth year of 366 days, by which it was accommodated to the civil year. The reaſon of their choice of *canicula* before the other ſtars, to compute their time by, was not only the ſuperior brightneſs of that ſtar, but becauſe its heliacal riſing was in Egypt a time of ſingular note, as falling on the greateſt augmentation of the Nile, the reputed father of Egypt. Epheſtion adds, that from the aſpect of *Canicula*, its habit and colour, the Egyptians drew prognoſtics concerning the riſe of the Nile; and, according to Florus, predicted the future ſtate of the year. So that the firſt riſing of this ſtar was yearly obſerved with great attention. Bainbrigge, Canicul. cap. 4. p. 26.

CANICULUM, or CANICULUS, in the *Byzantine Antiquities*, a golden ſtandiſh, or ink-veſſel, decorated with precious ſtones, wherein was kept the ſacred *encauſtum*, or red ink, wherewith the emperors ſigned their decrees, letters, &c.

The word is by ſome derived from *canis* or *caniculus*; alluding to the figure of a dog, which it repreſented; or rather becauſe it was ſupported by the figures of dogs. By Salmaſius from *κανιον*, an *inkhorn*.

The *caniculum* was under the care of a particular officer of ſtate, hence called *caniclinus* or *canicleus*, who was in great requeſt. Du-Cange will have the *caniclinus* to have been the ſame with the LOGOTHETA.

CANICUM, in *Botany*, a name given by Avicenna, and ſome other authors, to the ſmall celandine, or PILEWORT.

CANINA *lappa*, in *Botany*, a name given by ſome of the old Roman authors to the fruit of the aparine or gooſegraſs. They are called by others *lappæ boariæ*, and *lappæ canariæ*, and the plant *lappa* and *lappago*. See CLEAVERS.

CANINANA, in *Zoology*, the name of a ſpecies of ſerpent found in America, and eſteemed one of the leſs poiſonous kinds. It grows to about two feet long, and is green on the back, and yellow on the belly. It feeds on eggs and ſmall birds; the natives cut off its head and tail, and eat the body as a delicate diſh. Ray.

CANINE, in a general ſenſe, ſomething that relates to dogs.

Dr. Douglas gives frequent compariſons between the *canine* muſcles and the human.

The voice of perſons ſeized with the *hydrophobia* is frequently uttered with a *canine* hoarſeneſs, and bears ſome reſemblance to the barking of a dog. Dr. Liſter accounts for the cynical appearances in the *hydrophobia* from a ſuppoſition, that the patient has undergone ſomewhat of a transformation into the *canine* nature, or that certain of the organical parts of his body, eſpecially the *gula*, tongue, &c. are diſpoſed after the manner of a dog. Phil. Tranſ. N° 207, and N° 147.

CANINE *appetite*, *appetentia*, or *fames canina*, amounts to much the ſame with *bulimia*, though the more exact writers make a diſtinction between the two. See BULIMY.

We have a late ſurpriſing inſtance of the *canine* appetite, mentioned in the Philoſophical Tranſactions, N° 476. p. 366, & ſeq. and p. 381.

CANINE *laughter*, *riſus caninus*, that wherein the lips are drawn far back, and the mouth much extended.

CANINE *ligament*, is that whereby the prepuce of the human PENIS is faſtened to the *glans*, otherwiſe called the FRÆNUM.

Canine *madneſs*, *rabies canina*, is uſually ſuppoſed the ſame with HYDROPHOBIA, though ſome diſtinguiſh, applying the former denomination where the patient raves, or has loſt all uſe of reaſon; the latter, where he ſtill retains his reaſoning faculty, only his members are ſubject to certain involuntary convulſive motions, as thoſe of an epileptic or aguiſh perſon. See MANIA.

The *rabies canina* is never without the *hydrophobia*, but the latter frequently without the former.

Canine *ſulphur*, a ſort of native SULPHUR diſcovered near Reggio, intermixed with earthy or ſtony matters; thus called by reaſon that dogs are ſo fond of it, as to dig it out of the earth.

Canine *teeth*, Canini *dentes*. See TEETH.

CANINUS *muſculus*, the ſame as ELEVATOR *labii ſuperioris*.

Caninus *ſerpens*, in *Zoology*, a name given by ſome writers to the *mauballa* of the Ceyloneſe, a ſnake that flies at every thing that comes in its way, in the manner of our dogs.

CANIS, *dog*, in the Linnæan ſyſtem of *Zoology*, makes a diſtinct, but very large *genus* of animals, of the order of *feræ*, and claſs of *mammalia*, taking in all the dog-kind, which this author only accounts ſo many varieties, and other diſtinct *ſpecies*. The characters of this *genus* are, that the ſeveral ſpecies of it have ſix upper fore-teeth; that the lateral ones are longer than the others; the intermediate ones of a lobated figure. There are alſo ſix fore-teeth in the lower-jaw, of which the lateral ones are lobated; the canine teeth are ſingle and incurvated; the grinders are ſix or ſeven in number.

The ſpecies are the common DOG, the WOLF, the HYÆNA, the FOX, the ALOPEX, the LAGOPUS, the JACKALL, or *lupus aureus*, the *Mexican* DOG, or *American mountain cat*, with a tail bent downwards, and an aſh-coloured body, variegated with brown and yellow ſpots; and the THOUS.

Canis *Major*, *the Great Dog*, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere, below Orion's feet, though ſomewhat to the weſtward of him; whoſe ſtars Ptolemy makes 29; Tycho obſerved only 13; Hevelius 21; in the Britannic Catalogue they are 31. Their order, names, places, longitude, magnitude, &c. are as follow.

Canis *carcharias*, in *Natural Hiſtory*, a name given by Rondeletius, and other authors, to that ſpecies of ſhark called the *lamia*, or white ſhark by others, or *carcarias*, *lamia*, &c. See *Tab. of Fiſhes*, N° 3.

Canis *galeus*, in *Zoology*, the name of a large fiſh of the ſhark kind. It has three rows of extremely ſharp teeth; the eyes are ſmall for the ſize of the fiſh, the pupils are proportionably ſmall, and the iris of a fine bright ſilver colour, with a caſt of blue or green. It is brought to market in Rome, and is ſometimes caught alſo on our own coaſts, as about Penzance in Cornwall. It is extremely fond of human fleſh, and will venture to leap up even upon the ſhore for it.

Canis *volans*, in *Zoology*, the name of an animal properly of the bat or veſpertilio kind, and diſtinguiſhed by Linnæus by the name of *veſpertilio cauda nulla*, the bat without a tail.

CANKER, ſometimes denotes a ſpeck made by a ſharp humour, which gnaws the fleſh almoſt like a cauſtic; very common to children, in their mouth eſpecially.

Canker ſeems alſo popularly uſed for a GANGRENE, or beginning mortification.

Canker is alſo a diſeaſe in dogs, which ſeizes their ears.

Canker, in hawks, breeds in the throat and tongue, occaſioned by foul feeding. It is cured by waſhing the mouth with honey and white wine boiled together, then ſtrewing it with chervil-powder.

Canker, in horſes, is a loathſome ſorrance, which, if it continue long uncured, ſo feſters and putrifies the part, that it will eat to the very bone; and if it happens to come upon the tongue, will cut it aſunder; lighting upon the noſe it devours the griſtle through.

Canker, in trees, a term uſed by our farmers to expreſs a wound or blemiſh in the trunk of a tree, which does not heal up by nature, but will encreaſe and damage, if not endanger, the whole tree. Theſe wounds are ſometimes occaſioned by accidents, as blows, or by the branches of one tree galling another by the motion they are put into by the winds; if this latter be the caſe, the offending branch muſt be cut off, or drawn another way, or elſe all remedies are vain.

The wound muſt be cut and enlarged every way to the quick, and all the decayed wood muſt be taken clean out; then the whole internal ſurface of the wound muſt be filled up with tar mingled with oil, and after this it muſt be filled up with clay and horſe-dung mixed together, or with horſe-dung alone, which many eſteem beſt of all. In this caſe the dung muſt be bound over with a rag; hogs dung is by many preferred to horſe-dung for this purpoſe; and it is proper to add to this application the keeping of the roots cool and moiſt, by laying fern and nettles about them. If the *canker* be only in one of the boughs of the tree, the ſhort way is to cut off the bough at once. If that be a large one, it ſhould be cut off at ſome diſtance from the body of the tree; but if a ſmall one it ſhould be cut off cloſe. The adding a coat of dung, and pond or river mud, about the roots of trees, if they are ſubject to this from their ſtanding in a dry barren land, as is often the caſe, is a very good cure. See BARK, and DISEASES *of Plants*.

Canker *worm*. See SCARABÆUS.

CANNA, in *Botany*, *indian* Cane, a *flowering-reed*, a genus of the *monandria monogynia* claſs. Its characters are theſe: the flower hath one petal, which is divided into ſix parts; the three upper ſegments are erect, and broader than the lower, two of which are erect, and the other turns back, and is twiſted. It hath one ſpear-ſhaped ſtamen, riſing as high as the petal, having the appearance of a ſegment. Below the empalement is ſituated a roundiſh, rough germen; which becomes an oblong, roundiſh, membranaceous capſule, having three longitudinal furrows, crowned by the empalement, which hath three cells filled with round, ſmooth ſeeds. There are three ſpecies.

All the ſorts are propagated by ſeeds, which ſhould be ſown on a hot-bed in the ſpring; and when the plants are fit to remove, they ſhould be tranſplanted into ſeparate ſmall pots,. and plunged in a moderate hot-bed of tanner's bark.

CANNA, in the *Ancient Pharmacy* and *Botany*, denoted the *calamus aromaticus*, or, according to others, *caſſia fiſtula*.

CANNA alſo denotes a ſort of long meaſure, otherwiſe called by modern authors a CANE, by the Latins *calamus*, and in Scripture a reed.

CANNABINA, in *Botany*. See *Baſtard* HEMP.

CANNABIS. See HEMP.

CANNACORUS, in *Botany*. See CANNA.

CANNEL-*coal*, a black bituminous foſſil, frequent in Staffordſhire and Lancaſhire, of a fine hard texture, ſo as to receive a poliſh, and become of ſervice for divers works inſtead of ivory, but chiefly uſed for fuel, as affording a brighter and purer flame than the common *ſea*-COAL.

Dr. Woodward takes our *cannel-coal* to be the ſame with the *lapis* AMPELITES of the ancients, and the *lapis* OBSIDIANUS of ſome later writers.

Cannel-coal, or, as ſome call it, *canal-coal*, is alſo found in Cumberland, and ſome other counties of the North.—It is of ſo cloſe a texture, that it will take a tolerable poliſh. The choir of the cathedral of Litchfield is ſaid to be in a great meaſure paved with *canal-coal* for the black, and alabaſter for the white, which when clean reſembles marble. It alſo turns like ivory into many pretty works, as ink-ſtandiſhes, ſalts, candleſticks, &c.

In diſpoſing it for fire regard is had to the grain. If they would have it burn ſlow, they lay it flatwiſe on the fire; if clear, they ſet it edgewiſe, in which caſe it burns as light as a candle.

CANNEQUINS, in *Commerce*, white cotton cloths brought from the Eaſt Indies. They are a proper commodity for trading on the coaſt of Guinea, particularly about the rivers Senega and Gambia. Theſe linens are folded ſquare wiſe, and are about eight ells long.

CANNEVAROLA, in *Zoology*, a name by which Aldrovandus, and ſome other authors, have called the leſſer reed-SPARROW, called by others *ficedula cannabina*, and, by Mr. Ray, *paſſer arundinaceus minor*.

CANNIBAL, or CANIBAL, is uſed by modern writers for an ANTHROPOPHAGUS, or man-eater, more eſpecially of the Weſt Indies.

CANNOCK, or CANNOT-*ſtone*, a baſe ſort of iron-oar, in Staffordſhire mines, of which the worſt metal is made.

CANNON, in *War*, a military engine for throwing iron, lead, or ſtone bullets, by force of gunpowder, to a place directly oppoſite to the axis of the cylinder whereof it conſiſts. See *Tab. Gunnery*, *fig.* 1.

The word ſeems derived from the Italian *cannone*, an augmentation of *canna*, *cane*; becauſe a *cannon* is long, ſtrait, and hollow, like a cane.

The firſt *cannons* were called *bombardæ*, from *bombus*, by reaſon of their noiſe. They were conſtructed of ſeveral pieces of iron adapted to each other lengthways, and hooped with iron rings, and employed in throwing ſtone bullets of a prodigious weight; accordingly their bore was enormouſly large, and they were very inconvenient for uſe.

The parts and proportions of a *cannon* about eleven feet long, are its barrel, or cavity, nine feet; its fulcrum, or ſupport, fourteen, and its axis ſeven; the bore, or diameter of the mouth, ſix inches, and two lines the play of the ball; the diameter of the ball therefore ſix inches, and its weight thirty-three pounds ⅓. In preſent practice, the diameter of a ſhot is divided into twenty equal parts, and that of the bore is twenty-one of theſe parts: the French uſe the proportion of twenty-ſix to twenty-ſeven; and Mr. Muller recommends a kind of medium between both; or that of twenty-four to twenty-five. The metal thick about the mouth, two inches, and at the breech ſix. It weighs about five thouſand ſix hundred pounds: its charge is from eighteen to twenty pounds. It carries, point-blank, ſix hundred paces; and loads ten times in an hour, ſometimes fifteen; in a day one hundred and twenty times. Its bed fifteen feet broad, and twenty long, for the rebound. It requires twenty horſes to draw it. See CALIBRE, GUN, and WINDAGE.

Larrey makes braſs *cannon* the invention of J. Owen; and ſays, the firſt known in England, were in 1535; and iron *cannon* was firſt caſt in England in 1547. *Cannons*, however, he owns, were known before; and obſerves, that at the battle of Creſſi, in 1346, there were five pieces of *cannon* in the Engliſh army, which were the firſt that had been ſeen in France. Mezeray alſo ſays, that king Edward ſtruck terror into the French army, by five or ſix pieces of *cannon*; it being the firſt time they had ſeen ſuch thundering machines.

In the liſt of aids raiſed for the redemption of king John of France, in 1368, mention is made of an officer in the French army called *maſter of the king's cannons*, and of his providing four great *cannons* for the garriſon of Harfleur. Father Daniel (dans la Vie de Philip V. dit de Valois, tom. ii.) produces a proof from the records of the chamber of accompts at Paris, that *cannon* and gunpowder were uſed in the year 1338.

Du-Cange even finds mention of the ſame engines in Froiſſart, and other French hiſtorians ſome time earlier. The Germans carry the invention of *cannon* farther back, and attribute it to Albertus Magnus, a Dominican monk, about the year 1250. Iſaac Voſſius rejects all theſe conjectures, and finds *cannons* in China almoſt ſeventeen hundred years ago. According to him, they were mounted by the emperor Kitey, in the year of Chriſt 85. The ancients had their fiery tubes, or *cannæ*, which being loaden with pitch, ſtones, and iron-balls, were exploded with a vehement noiſe, ſmoke, and great effect, though much inferior to our bombs.

Cannons are made cylindrical, that the motion of the ball may not be retarded in its paſſage; and that the powder, when on fire, may not ſlip between the ball and the ſurface of the *cannon*, which would hinder its effect. Wolfius would have the *cannon* always decreaſe towards the mouth or orifice; becauſe the force of the powder always decreaſes, in proportion to the ſpace through which it is expanded. The *cannons* made after the Spaniſh manner, had a cavity, or chamber, at the bottom of the barrel, which helped their effects. But the *cannon* are now made with a plain cylindrical bore without any CHAMBER. A *cannon* is found to recoil two or three paces after exploſion; which ſome account for from the air's ruſhing violently into the cavity, as ſoon as it is diſcharged of the ball: but the real cauſe is, the powder's acting equally on the breech of the *cannon*, and the ball. For a battering-piece, whoſe ball is thirty-ſix pounds, there muſt be two cannoneers, three chargers, and thirty pioneers.

Cannons are diſtinguiſhed from the diameters of the balls they carry; but this diſtinction is different in different nations. The proportion of their length to their diameter, depends rather on experience, than any reaſoning *à priori*; and has been accordingly various, in various times and places: the rule is, that the gun be of ſuch a length, as that the whole charge of powder be on fire before the ball quit the piece. If it be made too long, the quantity of air to be driven out before the ball, will give too much reſiſtance to the impulſe; and that impulſe ceaſing, the friction of the ball againſt the ſurface of the piece will take off ſome of its motion. Formerly, *cannons* were made much longer than at preſent; till ſome made by chance 2½ feet ſhorter than ordinary, taught them that the ball moves with a greater impetus through a leſs ſpace than a larger. This Guſtavus king of Sweden proved by experience in 1624, when an iron-ball, forty-eight pounds weight, was found to go farther from a new ſhort *cannon*, than another ball of ninety-ſix pounds out of an old, longer piece: whereas, in other reſpects, it is certain the larger the bore and ball, the greater the range.

Profeſſor Euler apprehends, that the alteration in the length of *cannon* has not been ſupported by proper experiments; ſo that we may be allowed to infer, that thoſe of the preſent conſtruction will throw a ſhot with a greater velocity than the longer *cannon* did. And he is of opinion, that the principal reaſon for laying aſide the uſe of very long and heavy *cannon* was the great difficulty of tranſporting them from place to place with an army. Principles of Gunnery inveſtigated, &c. p. 246. See alſo on this ſubject, Robins's Tracts, vol. i. p. 248, &c.

The names of the ſeveral *cannons*, their length, their weight, and that of their balls, as they obtain among us, are as in the following table; though their names are generally derived, eſpecially in naval uſe, from the weight of the ball which they diſcharge: thus a piece that diſcharges a ball of twenty-four pounds, is called a twenty-four pounder, &c.

Names of Cannon.	Weight of an iron ball.	Weight of the Cannon.	Length of the Cannon.
Cannon Royal	48 *lb.*	8000*lb.*	12 *Feet.*
Demi-cannon large	36	6000	12
Demi-cannon ordinary	32	5600	12
Demi-cannon leaſt	30	5400	11
Culverin largeſt	20	4800	12
Culverin ordinary	17 *lb.* 5 *oz.*	4500	12
Culverin leaſt	15	4000	11
Demi-culverin ordinary	10 11	2700	11
Demi-culverin leaſt	9	2000	10
Saker ordinary	6	1500	10
Saker leaſt	4 12	1400	8
Minion largeſt	3 12	1000	8
Minion ordinary	3 4	800	7
Falcon	2 8	750	7
Falconet	1 5	400	6
Rabinet	8	300	5.6 *Dig.*
Baſe	5	200	4.6

Cannon Royal is otherwiſe called *Cannon of Eight.*

The velocity of a ball or bullet, diſcharged from a *cannon*, was formerly ſuppoſed to be only about 500 or 600 feet in a ſecond of time. See BULLET. But Mr. Robins, Muller, and others, have ſince found, that it is much greater; or from 1000, even to 2000 feet, according to the length of the piece, the charge and the weight of the bullet. See VELOCITY.

The greateſt range of a *cannon* is ordinarily fixed at an elevation of 45°. Dr. Halley ſhews it to be at 44½.

It ſhould be remarked, that this range ſuppoſes the initial velocity to be very ſmall, becauſe every different velocity and ball require a different elevation to produce the greateſt range; from 45° downwards gradually to 30°, or even leſs in very great velocities. See VELOCITY *initial.*

M. S. Julian adjuſts the ranges of the ſeveral pieces of *cannon*, from the weight of the ball they bear, the charge of gunpowder being always ſuppoſed in a ſubduple ratio of the weight of the ball: thus,

Weight of a leaden ball.	Horizontal range.	Greateſt range.	Weight of a leaden ball.	Horizontal range.	Greateſt range.
33 *lib.*	600 *paces*	6000	12	450	5000
24	700	6000	8	400	1500
16	800	8000	2	150	1500

For the proportions of the lengths of guns, weight of ball, and ranges, deduced from later experiments and concluſions, ſee GUN.

For the ſeveral parts of a *cannon*, ſee ASTRAGAL, BASE-*ring*, BREECH, CALIBER, CASCABEL, CHASE, MUZZLE, OGEE, REINFORCED *ring*, TRUNNIONS, &c. See alſo GUN and GUNNERY.

CANNON, *boring of*, has lately been uſed inſtead of the method of caſting them hollow by means of a mould. The machine for this purpoſe, as well as for ſmoothing the inner ſurface, which is ſometimes done after they have been caſt hollow, is compoſed of a rectangular frame of timber, ABCD (ſee *Tab. Gunnery*, *fig.* 3.), fixed upon a ſolid plank EE, which is raiſed eight or ten feet above the floor of the workſhop. This frame contains two upright beams F*f*, F*f*, placed level and exactly parallel to each other, and ſtrongly fixed to the pieces of wood G, G, with their ends reſting on the croſs-bars that connect the ſides of the frame. Their length ſhould be about three times that of the *cannon* to be bored. In the inner ſide of theſe beams are two grooves, to which are applied two bars of wood 22, 22, which are connected together by the traverſe pieces 33, 33, 33, between which the *cannon* H is faſtened, ſo that the whole incloſed frame 22, 22, with the piece of ordnance fixed to it, may ſlide in the grooves of the beams F*f*, F*f*; being raiſed or lowered by means of the ropes and pullies K*k*, K*k*, fixed above to the upper part of the frame, and below to the breech of the *cannon*. The rope belonging to each block of pullies coils round an axis YY, bearing at each end the cogged wheels M, M. Each of theſe wheels lays hold of a trundle N, N, containing the ſame number of rounds: the trundles are fixed on a common axis ZZ, the ends of which paſs beyond the ſides of the frame, and bear ſpoked wheels *o*P, *o*P, by means of which the workmen turn the whole machine; and thus elevate or depreſs the *cannon* with the frame to which it is annexed at pleaſure. On the floor of the workſhop, directly under the frame F*f*F*f*, a block of ſtone is faſtened in the ground; and this ſupports a plate of iron or copper, placed exactly level and under a line, ſuppoſed to be parallel to the beams F*f*, F*f*, dividing the ſpace between them on either ſide into equal parts, and coinciding with the true axis of the *cannon.*

The inſtrument for boring is repreſented in *fig.* 6. The upper part of it *a* is formed with a double ſlope, and it is open at *d* for admitting the ſquare part *b* of the trunk, which is a ſtrong bar of iron, round at the part which is to enter the *cannon*, and terminating at its lower part in a pivot, which reſts on the plate R. About three or four feet above the plate, the trunk of the borer is ſquare, and bears upon it a ſtrong box of wood or iron S, through which levers, as TS, paſs, that are turned by men or horſes. The box or trough *v* ſerves to receive the pieces of metal that are taken off in the operation. By this motion, and the preſſure of the *cannon* on the point of the borer, it is gradually bored, till the *cannon* ſinks, by the contrivance already deſcribed, to a certain mark on the borer, which anſwers to the required depth of its bore. It is then elevated, till the borer may be taken out. When the borer is removed, an inſtrument formed for ſmoothing the inner ſurface of the *cannon* is ſubſtituted in its room. This is repreſented by D (*fig.* 7.) It is made of copper, and of a cylindric figure: in the middle there is a ſquare hole capable of admitting the ſquare, and a ſmall portion of the pyramidal part B of the trunk of the borer. This cylindric piece has four grooves, parallel to its axis, into which are fixed cutting inſtruments of tempered ſteel, repreſented by CC. This inſtrument ſerves to enlarge the inſide of the *cannon*, and to ſmooth it, by turning the trunk which ſupports it in the ſame manner as when the piece was bored. When this four-edged ſquarer has paſſed into the piece, another of five, and then another of ſix ſharp edges is made to enter it: the laſt of theſe pares off all the inequalities which the others had left, and gives to the inſide of the *cannon* that perfectly cylindrical and poliſhed figure which it ought to have. The *cannon*, after being thus bored and ſmoothed, is ſent to the chaſers, by whom it is finiſhed: with them the touch-hole is bored, and there it is prepared for being mounted on its carriage: and nothing remains, previous to its being uſed, but proving it. The method of caſting ſolid *cannon*, and boring them with this machine, was adopted, becauſe ſeveral inconveniences attending the other method of caſting them hollow on a mould were avoided by it: the firſt of theſe inſtruments was conſtructed at Straſburgh, and remained long a ſecret, though it is now pretty generally uſed. One of theſe machines will ſerve for three furnaces. Encyclopedie, art. ALESOIR.

A machine of this kind, with ſome little variation in the poſition of it, has very lately been introduced into this country, and is now generally uſed, for iron and braſs guns. The gun to be bored lies with its axis parallel to the horizon, and in that poſition, is turned round its axis by means of wheel-work, moved by one or more horſes. The borer is laid, as above deſcribed, in the direction of the axis of the gun, and is incapable of motion in any direction except that of its length; and in this direction it is conſtantly moved by means of a ſmall rack-wheel, kept in proper motion by a man, who thus makes the point of the borer ſo to bear againſt the part of the gun that is boring, as to pierce and cut it. The outſide of the gun is ſmoothed at the ſame time by men with inſtruments fit for the purpoſe, whilſt it turns round, ſo that the bore may be exactly in the centre of the metal.

For the *Methods of caſting Cannons*, ſee FOUNDERY.

As for the metal of *cannons* it is either iron, or a mixture of copper, tin, and braſs: the tin is added to the copper, to make the metal more denſe and compact: ſo that the better or heavier the copper is, the leſs tin is required. Some to a hundred pounds of copper, add ten of tin, and eight of braſs: others, ten of tin, five of braſs, and ten of lead.

What are commonly called *braſs-cannon*, are not made of pure braſs; they cannot be made either of this, or of pure copper; but it is always found neceſſary to mix with theſe metals ſome coarſer ones, in order to make the whole run the cloſer and ſounder: ſuch are lead, and what the founders call pot-metal. As bell-metal is a mixture of copper and tin, ſo pot-metal is copper and lead. About twenty pounds of lead is uſually put to a hundred weight of pot-metal, but about ſix pounds is ſufficient for a hundred weight of gun-metal, and is of vaſt ſervice.

Guns are now uſually made of iron, becauſe they are found to be much ſtronger and more durable, as well as cheaper than the compoſition with braſs. Mr. Muller, however, contends for the uſe of the latter, eſpecially for ſhips, as being, upon the whole, cheaper, and more ſerviceable than the former. Treat. of Artill. p. 18.

Braudius deſcribes a method of making *cannon* of leather, on occaſion: and it is certain the Swedes made uſe of ſuch in the long war of the laſt century; but theſe burſt too eaſily to have much effect.

It is found by experience, that of two *cannons* of equal bore, but of different lengths, the longer requires a greater charge of powder than the ſhorter, in order to reach the ſame range. The ordinary charge of a *cannon*, is for the weight of its gunpowder to be half that of its ball. See CHARGE.

Cannon are ſometimes cooled by ſmeering them with ſheep-ſkin dipped in water mixed with vinegar. Without this precaution they are apt to burſt after many diſcharges. It is alſo requiſite to clean them with the ſpunge, that no fire may be left behind to endanger the next charge of powder.

After each thirty diſcharges, the *cannon* is to be cooled, with two pints of vinegar, mixed with four of water, poured into the barrel; the touch-hole being firſt ſtopped.

CANNONS, *ordinary*, are thoſe of the common or middling length, each according to the proportions of its kind; e. g. 32 calibers for a culverin.

CANNONS, *extraordinary*, are thoſe which are longer than the uſual proportion allowed to their ſpecies; e. gr. from 32 to 48 or 50 calibers for a culverin.

Cannon, *baſtard*, thoſe which are ſhorter than ordinary, whether they be of the whole cannon, cannon, or demi-cannon, or quarter-cannon kind. Such, e. gr. are culverins from 32 to 26 calibers.

Some call thoſe *baſtard-cannons* which are longer than ordinary *cannons*, yet do not reach the length of culverins. But theſe ought rather to be called *extraordinary cannons*, or baſtard-culverins.

Cannons longer than ordinary are alſo called *ſlings*, *drakes*, &c. as thoſe ſhorter are called *cuts*.

Cannons, *reinforced*, or *fortified*, thoſe ſtronger and thicker in metal than ordinary, which have their metal at the touch-hole one diameter thicker, in the middle five or ſix eighths, and at the neck three eighths.

All chambered *cannons* are reinforced.

Cannon, *ſhip*, are ſtronger in metal than thoſe uſed by land, on account of the neceſſity they are often under of being charged with chain-ſhot. They lie on ſhip-carriages, having four ſmall wheels, without ſpokes, with two ropes to ſtop their running back, and bring them again to their place upon the battery.

Cannon *of courſe*, or *Chaſe*-**Cannon**, in a galley, is the largeſt, middlemoſt, and moſt effective of the guns placed in the prow, or chaſe of the veſſel, and which delivers its ſhot over the very ſtem, generally carrying a ſhot of 33 or 34 pounds weight. It is a long piece, and recoils all along the middle of the galley to the maſt.

Cannon-*mouth of a bit*, in the *Manege*, denotes a round, long piece of iron, ſometimes compoſed of two pieces coupled together, and bent in the middle. See **Bit**.

Cannon-*mouths*, in the *Manege*, are contrived to keep a horſe in ſubjection, being ſo ordered that they riſe gradually toward the middle, and aſcend toward the palate, that the void ſpace left underneath may afford a liberty to the tongue.

CANNONADE, in *Military Language*, is the application of artillery to the purpoſes of ſeiſing or deſtroying a ſhip, battery, or fortreſs.

CANNONEER, or **Cannonier**, an officer in the artillery, who has the care of charging, pointing, and firing a cannon.

The *cannoneer* is the ſame with what is otherwiſe called *gunner*; in the ſtreights, *captain*; and in other places, *conneſtable*.

CANNULA, or **Canula**, in *Chirurgery*, a little tube, or pipe, which the ſurgeons leave in wounds and ulcers, that they chooſe not to heal up; becauſe ſtill ſuppurating. The *cannula* is to be made of gold, ſilver, or lead; and is perforated, that the pus, entering within it, may fall upon a ſponge, dipped in ſpirit of wine, and placed at the orifice, to keep the ulcer warm, and to prevent the external air from entering: ſome of theſe *cannulæ* have rings, whereby to keep them faſt in the wound; and others have holes with ribbands through them, to bind them down. Some are round, others oval, others crooked.

There is a particular kind of *cannula*, formed taper-wiſe, with a ſcrew faſtened to one end, in manner of a cock: its uſe is for the diſcharge of the water out of the abdomen, after tapping, in an aſcites, or dropſy. To this end it is inſerted into the body, through a hole made near the navel, with a pointed inſtrument, and ſometimes a punch; and is faſtened into its place by a bandage, and guarded from any injury of the cloaths, &c. by a caſe or cover. It has this advantage over the common tapping; that by means thereof, the water is drawn out when, and in what meaſure, the patient pleaſes. See **Paracenteſis**.

There is likewiſe a kind of copper, or iron *cannulæ*, made for the more convenient application of actual cauteries: they are made very ſhallow, and are, in effect, little more than hoops; through the aperture whereof, the actual cautery is conveyed; which, by this means, is kept from damaging the adjacent parts.

Cannula, or **Canola**, in *Eccleſiaſtical Writers*, was a tube of ſilver, or other metal, wherein were put the relics, which the pope ſent as preſents to princes, &c.

Cannula, or **Canola**, was alſo a ſort of ſiphon, through which they anciently ſucked the wine in the euchariſt.

CANOE, a name given to the little boat uſed by the ſavages in both Indies, as well as by the negroes in Guinea; made chiefly of the trunks of trees dug hollow; ſometimes of pieces of bark faſtened together.

The common *canoes*, among the Indians, are thoſe made of trees hollowed; being either greater or leſs, according to the ſize of the tree they are made of. They are rowed with paddles, and rarely carry ſails; the loading is laid at the bottom: but having no ballaſt, they are frequently turned upſide down. They have no rudder, the want of which is ſupplied by the hind oars. The negroes of Guinea uſe the ſame ſort of *canoes*, though made in a different manner. They are long-ſhaped, having only room for one perſon in width, and ſeven or eight in length; they ſhew little wood above the water: thoſe who row are extremely dextrous, not only in giving the ſtrokes with cadence and uniformity, by which their *canoes* ſeem to fly along the ſurface of the water; but alſo in balancing the veſſel with their bodies, and preventing their overturning, which otherwiſe, on account of their lightneſs, would continually happen. Add, that when they are overturned, they have the addreſs to turn them up again in the water itſelf, and mount them anew. They venture as far as four leagues to ſea, but dare not venture further.

They are uſually ſixteen feet long, and a foot or two wide, though there are ſome larger, as far as thirty-five feet long, five wide, and three high, uſed for the carriage of cattle, and expeditions in war. They are fitted with ſails made of ruſhes.

On return from a voyage, the *canoes* are not left in the water, but preſently drawn aſhore, where they are hung by the two ends, and left to dry; in which ſtate they are ſo light, that two men will eaſily carry them on their ſhoulders.

The *canoes* of the Canadeſe are made of the bark of the birch-tree, ſometimes large enough to hold four or five perſons. Thoſe of the ſavages of Terra del Fuego, and the other iſlands of the ſtraits of Magellan, are alſo of bark, and faſhioned with great ſkill, from ten to ſixteen feet long, and two wide, capable of holding eight men, who row ſtanding, with a ſurpriſing ſwiftneſs.

In the repoſitory of the Royal Society is the model of a Greenland *canoe*, covered with ſeal-ſkins, and reſembling a great bladder; ſo as that, however the waves daſh over it, the perſon in it ſits ſafe. It is rowed with a ſingle paddle.

CANON, a perſon who poſſeſſes a prebend, or revenue allotted for the performance of divine ſervice, in a cathedral, or collegiate church.

Canons are of no great antiquity: Paſchier obſerves, that the name *canon* was not known before Charlemagne; at leaſt, the firſt we hear of, are in Gregory de Tours, who mentions a college of *canons*, inſtituted by Baldwin XVI. archbiſhop of that city, in the time of Clotharius I. The common opinion attributes the inſtitution of this order to Chrodegangus, biſhop of Metz, about the middle of the eighth century.

Originally *canons* were only prieſts, or inferior eccleſiaſtics, who lived in community; reſiding by the cathedral church, to aſſiſt the biſhop; depending entirely on his will; ſupported by the revenues of the biſhoprick; and living in the ſame houſe, as his domeſtics, or counſellors, &c. They even inherited his moveables, till the year 817, when this was prohibited by the council of Aix-la-Chapelle, and a new rule ſubſtituted in the place of that which had been appointed by Chrodegangus, and which was obſerved for the moſt part in the Weſt till the twelfth century. By degrees, theſe communities of prieſts, ſhaking off their dependence, formed ſeparate bodies; whereof the biſhops, however, were ſtill heads. In the tenth century, there were communities or congregations of the ſame kind, eſtabliſhed even in cities where there were no biſhops: theſe were called *collegiates*, as they uſed the terms *congregation* and *college* indifferently: the name *chapter*, now given to theſe bodies, being much more modern. Under the ſecond race of the French kings, the *canonical*, or collegiate life, had ſpread itſelf all over the country; and each cathedral had its chapter, diſtinct from the reſt of the clergy.

They had the name *canon* from the Greek *κανων*, which ſignifies three different things; *a rule*, *a penſion* or *fixed revenue to live on*, and *a catalogue* or *matricula*; all which are applicable to them.

In time, the *canons* freed themſelves from their rules, the obſervance relaxed, and, at length, they ceaſed to live in community: yet they ſtill formed bodies; pretending to other functions beſides the celebration of the common office in the church; yet aſſuming the rights of the reſt of the clergy; making themſelves as a neceſſary council of the biſhop; taking upon them the adminiſtration of a ſee during a vacancy, and the election of a biſhop to ſupply it. There are even ſome chapters exempt from the juriſdiction of the biſhop, and owning no head but their dean. After the example of cathedral chapters, collegiate ones alſo continued to form bodies, after they had abandoned living in community.

Canons are of various kinds; as,

Canons, *cardinal*, which are thoſe attached, and, as the Latins call it, *incardinati* to a church, as a prieſt is to a pariſh.

Canons, *domicellary*, were young *canons*, who, not being in orders, had no right in any particular chapters.

Canons, *expectative*, were ſuch as, without having any revenue or prebend, had the title and dignities of *canons*, a voice in the chapter, and a place in the choir; till ſuch time as a prebend ſhould fall.

Canons, *foreign*, were ſuch as did not officiate in the canonries to which they belonged.—To theſe were oppoſed *manſionary canons*, or *canons reſidentiary.*

Canons, *lay* or *honorary*, are ſuch among the laity, as have been admitted, out of honour and reſpect, into ſome chapter of *canons.*

Canons *regular*, are *canons* that ſtill live in community; and who, like religious, have, in proceſs of time, to the practice of their rules, added the ſolemn profeſſion of vows.

They are called *regulars*, to diſtinguiſh them from thoſe *ſecular canons* who abandon living in community, and at the ſame time, the obſervance of the *canons* made as the rule of the clergy, for the maintenance of the ancient diſcipline.

The *canons* ſubſiſted in their ſimplicity till the eleventh, ſome ſay the twelfth century, when ſome of them, ſeparating from the community, took with them the name of *canons*, or *acephalous prieſts*, becauſe they declined to live in community with the biſhop; and thoſe who were left, thenceforth acquired the denomination of *canons regular*, and adopted moſt of the profeſſions of the rule of St. Auguſtine. This order of *regular canons of St. Auguſtine*, was brought into England by Adelwald, confeſſor to Henry I. who erected a priory at Noſtel in Yorkſhire, and obtained for them the church of Carliſle as an epiſcopal ſee, with the privilege of chuſing their own biſhop. They were ſingularly protected and encouraged by Henry I. who gave them the priory of Dunſtable in 1107, and by queen Maud, who, in the following year, gave them the priory of the Holy Trinity in London. It appears, that under the reign of Edward I. they had fifty-three priories.

Canons, *tertiary*, thoſe who had only the third part of the revenues of the canonicate.

Canon, in an *Eccleſiaſtical Senſe*, is a LAW or rule, either of doctrine or diſcipline, enacted eſpecially by a council, and confirmed by the authority of the ſovereign.

Canons are properly deciſions of matters of religion; or regulations of the polity and diſcipline of a church, made by COUNCILS, either general, national, or provincial.

Such are the *canons* of the council of Nice, or Trent, &c. See CONSTITUTIONS.

There have been various collections of the *canons* of the Eaſtern councils; but four principal ones, each ampler than the preceding. The firſt, according to Uſher, A. D. 380, containing only thoſe of the firſt œcumenical council, and the firſt provincial ones: they were but 164 in number. To theſe, Dionyſius Exiguus, in the year 520, added the fifty *canons* of the apoſtles, and thoſe of the other general councils. The Greek *canons* in this ſecond collection, end with thoſe of the council of Chalcedon; to which are ſubjoined thoſe of the council of Sardica, and the African councils. The fourth and laſt collection comes down as low as the ſecond council of Nice; and it is on this that Balſamon and Zonaras have commented. See Hardouin's Acta Conſiliorum et Epiſtolæ decretales ac Conſtitutiones Summorum Pontificum, in 11 tomes; commencing with the year 34, and terminating in 1714. Prol. Paris, 1715.

Canons, *Apoſtolical*, are thoſe which have been uſually aſcribed to St. Clement. Bellarmin, Baronius, &c. will have them to be genuine *canons* of the apoſtles: Cotelerius obſerves, that they cannot be aſcribed to the apoſtles or Clement, becauſe they are not received with other books of Scripture, are not quoted by the writers of the firſt ages, and contain many things not agreeable to the apoſtolical times: Hincmar, De Marca, Beveridge, &c. take them to be framed by the biſhops who were the apoſtles diſciples in the ſecond or third century; S. Baſnage is of opinion, that they were collected by an anonymous writer in the fifth century; but Daille, &c. maintain them to have been forged by ſome heretic in the ſixth century; and S. Baſnage conjectures, that ſome of them are ancient, and others not older than the ſeventh century. The Greek church allow only eighty-five of them, and the Latins only fifty; though there are eighty-four in the edition given of them in the Corpus Juris Canonici.

Canon is alſo uſed for the authoriſed catalogue of the Sacred Writings. See BIBLE.

The ancient *canon*, or catalogue of the books of the Old Teſtament, was made by the Jews, and is ordinarily attributed to Ezra; who is ſaid to have diſtributed them into the LAW, the PROPHETS, and the HAGIOGRAPHA, to which our Saviour refers, Luke, chap. xxiv. ver. 44. The ſame diviſion is alſo mentioned by Joſephus, cont. Appion.

This is the *canon* allowed to have been followed by the primitive church, till the council of Carthage; and, according to St. Jerom, this conſiſted of no more than twenty-two books; anſwering to the number of the Hebrew alphabet; though at preſent they are claſſed into twenty-four diviſions, containing Geneſis, Exodus, Leviticus, Numbers, Deuteronomy, Joſhua, Judges, Samuel, Kings, Iſaiah, Jeremiah, Ezekiel, the twelve minor Prophets, the Pſalms, the Proverbs, Job, Canticles, Ruth, Lamentations, Eccleſiaſtes, Eſther, Daniel, Ezra comprehending the book of Nehemiah and the Chronicles. However, this order is not univerſally obſerved either among Jews or Chriſtians: nor were all the books above enumerated admitted into the *canon* in Ezra's time. It is moſt likely, ſays Dr. Prideaux, that the two books of Chronicles, Ezra, Nehemiah, Eſther, and Malachi, were added in the time of Simon the Juſt, when the *canon* was completed. Connection, &c. vol. ii. p. 476, &c.

But that council enlarged the *canon* very conſiderably, taking into it the books which we call apocryphal; which the council of Trent has further enforced, enjoining all theſe to be received as books of Holy Scripture, upon pain of anathema, and being attainted of hereſy. The Romaniſts, in defence of this *canon*, ſay, that it is the ſame with that of the council of Hippo, held in 393; and with that of the third council of Carthage, in 397, at which were preſent forty-ſix biſhops, and, among the reſt, St. Auguſtine; who declared that they received it from their fathers.

Their *canon* of the New Teſtament perfectly agrees with ours. See Hardouin's Collect. tom. i. p. 968. art. 47.

This *canon* conſiſts of books that are well known; ſome of which have been univerſally acknowledged; ſuch are the four Goſpels, the Acts of the Apoſtles, thirteen Epiſtles of St. Paul, one Epiſtle of St. Peter, and one Epiſtle of St. John: and others, concerning which doubts were entertained, but which were afterwards received as genuine; ſuch are the Epiſtle to the Hebrews, that of James, the ſecond of Peter, the ſecond and third of John, that of Jude, and the Revelation. Theſe books were written at different times, and they are authenticated, not by the decrees of councils, or infallible authority, but by ſuch kind of evidence as is thought ſufficient in the caſe of any other ancient writings. They were very extenſively diffuſed; they were read in every Chriſtian ſociety; they were valued and preſerved with care by the firſt Chriſtians; they were cited by Chriſtian writers of the ſecond, third, and fourth century, as by Irenæus, Clement the Alexandrian, Tertullian, Origen, Euſebius, &c. and their genuineneſs is proved by the teſtimony of thoſe who were contemporary with the apoſtles themſelves, and by tradition. The four Goſpels, and moſt of the other books of the New Teſtament, were collected either by one of the apoſtles, or ſome of their diſciples and ſucceſſors, before the end of the firſt century. The catalogue of *canonical* books furniſhed by the more ancient Chriſtian writers, as Origen about the year 210, Euſebius and Athanaſius in 315, Epiphanius in 370, Jerome in 382, Auſtin in 394, and many others, agrees with that which is now received among Chriſtians. For the time of writing the ſeveral books of the New Teſtament, ſee the titles of the books themſelves; as the Goſpel of St. MATTHEW, MARK, &c.

Some of the fathers diſtinguiſh the inſpired writings into three claſſes; PROTO-*canonical*, DEUTERO-*canonical*, and APOCRYPHAL.

Canon, *paſchal*, a table of the moveable feaſts, ſhewing the day of EASTER, and the other feaſts depending on it, for a cycle of nineteen years.

The *paſchal canon* is ſuppoſed to be the calculation of Euſebius of Cæſarea, and to have been done by order of the council of Nice.

Canon, in *Monaſtic Orders*, a book wherein the religious of every convent have a fair tranſcript of the rules of their order, frequently read among them as their local ſtatutes.

This is alſo called *Regula*, as containing the rule and inſtitution of their order.

The *canon* differs from the MISSALE, MARTYROLOGIUM, and NECROLOGIUM.

Canon, again, is uſed for the catalogue of ſaints acknowledged and canonized in the Roman church.

Canon is alſo uſed, by way of excellence, in the Romiſh church, for the ſecret words of the maſs, from the preface to the *Pater*; in the middle of which the prieſt conſecrates the hoſt. The common opinion is, that the *canon* of the maſs commences with *Te igitur*, &c. The people are to be on their knees, hearing the *canon*; and are to rehearſe it to themſelves, ſo as not to be heard.

Canon, in the *Ancient Muſic*, is a rule or method of determining the intervals of notes.

Ptolemy, rejecting the Ariſtoxenian way of meaſuring the intervals in muſic, by the magnitude of a tone (which was ſuppoſed to be formed by the difference between a diapente and a diateſſaron), thought that muſical intervals ſhould be diſtinguiſhed, according to the ratios or proportions which the ſounds terminating thoſe intervals

vals bear to one another, when conſidered according to their degree of acuteneſs or gravity; which, before Ariſtoxenus, was the old Pythagorean way. He therefore made the diapaſon conſiſt in a double ratio; the diapente, in a ſeſquialterate; the diateſſaron, in a ſeſquitertian; and the tone itſelf, in a ſeſquioctave; and all the other intervals, according to the proportion of the ſounds that terminate them: wherefore taking the *canon* (as it is called) for a determinate line of any length, he ſhews how this *canon* is to be cut accordingly, ſo that it may repreſent the reſpective intervals: and this method anſwers exactly to experiment, in the different lengths of muſical chords. From this *canon*, Ptolemy and his followers have been called *Canonici*; as thoſe of Ariſtoxenus were called *Muſici*.

Canon likewiſe denotes a muſical compoſition, in which the parts follow each other in the ſame melody and intervals.

Canon, in *Geometry* and *Algebra*, a general rule for the ſolution of all caſes of a like nature with the preſent inquiry. Thus every laſt ſtep of an equation is a *canon*; and, if turned into words, becomes a rule to ſolve all queſtions of the ſame nature with that propoſed.

Canon, *natural, of triangles*, is a table of ſines, tangents, and ſecants together: ſo called, becauſe ſerving principally for the ſolution of triangles.

Canon, *artificial, of triangles*, is a table wherein the logarithms of ſines and tangents are laid down. See Sine, under which article the method of conſtructing the *natural* and *artificial canon* will be explained.

Canon *Law*, a collection of eccleſiaſtical conſtitutions, deciſions, and maxims, taken partly from Scripture, partly from the ancient councils, and partly from the decrees of popes, and the reports and ſayings of the primitive fathers, whereby all matters of polity in the Roman church are regulated.

The *canon law* that obtained throughout the Weſt, till the twelfth century, was the collection of *canons* made by Dionyſius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes, from Siricius to Anaſtaſius.—No regard was had to any thing not compriſed in theſe; and the French ſtill maintain the rights of the Gallican church to conſiſt in their not being obliged to admit any thing elſe, but to be at liberty to reject all innovations made in the canonical juriſprudence ſince that compilation, as well as papal decrees before Siricius.

Indeed, between the eighth and eleventh centuries, the *canon law* was mixed and confounded with the papal decrees, from St. Clement to Siricius; which till then had been unknown: this gave occaſion to a new reform, or body of the *canon law*; which is the collection ſtill extant, under the title of Concordia Diſcordantium Canonum, firſt made by Ivo in 1114, and perfected in 1151, by Gratian, a Benedictine monk, from texts of Scripture, councils, and ſentiments of the fathers, in the ſeveral points of eccleſiaſtical polity; and containing thoſe conſtitutions which have been denominated, by way of eminence, the Decrees, and forming the firſt part of the *canon law*. It is now generally known by the name of the Decretum of Gratian, which was formed in imitation of the Pandects of Juſtinian; and is a confuſed immethodical compilation, full of errors and forgeries.

The ſecond part of the *canon law* conſiſts of the decrees of the popes, from the time of pope Alexander III. to pope Gregory IX. and publiſhed, under the auſpices of that pope, about the year 1230, in five books, entitled Decretalia Gregorii Noni.

In 1298, pope Boniface VIII. continued the papal decrees as far as his time, under the title of Sextus Decretalium. To theſe, pope John XXII. added the Clementines, or the five books of the conſtitutions of his predeceſſor Clement V. firſt publiſhed about the year 1317. And to all theſe were afterwards added twenty conſtitutions of the ſaid pope John, called the Extravagantes; and ſome other conſtitutions of his ſucceſſors, called Extravagantes Communes. Theſe are uſually called the Decretals.

All theſe compoſe the body of the *canon law*; which, including the Comments, make three volumes in folio; the rule and meaſure of church government. Indeed, with us, ſince the Reformation, the *canon law* has been much abridged and reſtrained; only ſo much of it obtaining, as is conſiſtent with the common and ſtatute laws of the realm, and the doctrine of the eſtabliſhed church. Beſides the foreign *canon law*, we have our *legatine* and *provincial* constitutions. In the reign of Henry VIII. it was enacted, that the *canon law* ſhould be reviewed; and till that review took place, ſuch canons, conſtitutions, ordinances, and ſynodals provincial as had been made, and were not repugnant to the law of the land or king's prerogative, ſhould ſtill be uſed and executed. The review was propoſed again in the reign of Edward VI. and of queen Elizabeth; but as it was never accompliſhed, the authority of the *canon law* in England depends upon the ſtatute of the 25 Henry VIII. c. 19. which was repealed indeed by queen Mary, and again revived by 1 Eliz. c. 1.

As to the conſtitutions and *canons* made in the convocation of the province of Canterbury in 1603, ratified by the king, and ſoon after adopted in the province of York; theſe never obtained a parliamentary confirmation; and it has been therefore adjudged, upon the principles of law and the conſtitution, that they do not bind the laity, however the clergy may regard them. Strange's Rep. 1057.

CANONARCHA, or **Canonarchus**, a dignity in the Greek church, anſwering to the precentor in the Latin, or chanter in the Engliſh church.

The word is formed from *κανων* and *αρχη*, *beginning*, or *governing*; becauſe it belongs to this officer to ſet the canons, or church hymns, and to direct the choir in ſinging them.

A like officer we alſo find in the ancient monaſteries, under the denomination *canonarcha*, whoſe buſineſs was to beat the ſemantrum, or wooden inſtrument, whereby the monks were called to the choir to ſing canons. There appear to have been ſeveral *canonarchæ* in the ſame monaſtery.

CANONE *al ſoſpiro*, in the Italian *Muſic*, a canon, the parts of which ſucceed each other by a *ſoſpiro*, that is, the time of a crotchet.

CANONESS, in the *Romiſh Church*, a woman who enjoys a prebend, aſſixed, by the foundation, to maids; without their being obliged to renounce the world, or make any vows.

There are few of theſe, except in Flanders and Germany: they are rather looked upon as a ſeminary and retreat of girls for marriage, than an engagement for the ſervice of God.

Canonesses *of St. Auguſtine*, or *Regular* **Canonesses**, are a kind of religious, who follow the rules of St. Auguſtine; of which there are various congregations.

The order of *canoneſſes* was firſt inſtituted by Lewis the Meek, in the beginning of the ninth century.

CANONICA, in *Philoſophical Hiſtory*, an appellation given by Epicurus to his doctrine of logic.

It was called *Canonica*, as conſiſting of a few canons, or rules, for directing the underſtanding in the purſuit and knowledge of truth.

Epicurus's *Canonica* is repreſented as a very ſlight and inſufficient logic, by ſeveral ancients who put a great value on his ethics and phyſics.

The ſtreſs of Epicurus's *Canonica* conſiſts in his doctrine of the *criteria* of truth.

All queſtions in philoſophy are either concerning words or things: concerning things we ſeek their truth, concerning words their ſignification: things are either natural or moral; and the former are either perceived by ſenſe, or by the underſtanding. Hence, according to Epicurus, ariſe three *criterions* of truth, viz. ſenſe, anticipation, or prænotion, and paſſion. The great canon, or principle, of Epicurus's logic is, that the ſenſes are never deceived; and therefore that every ſenſation, or perception of an appearance, is true. Stanley's Hiſt. Phil. p. xiii. p. 35.

Canonica is alſo uſed by ſome ancients to denote the art of muſic.

Canonica is more particularly uſed to denote that ſpecies of muſic, which does not determine the intervals of ſounds by the ear, but by a canon, or ſtretched chord. See Canon.

CANONICAL, ſomething that belongs to, or partakes of the nature of a rule or canon.

Canonical amounts to much the ſame with what we otherwiſe call regular.

Canonical is an appellation more peculiarly given to thoſe writings which have been received as the rule of our faith and practice, and comprehended in the canon, or catalogue of the Scriptures.

In which ſenſe, *canonical* ſtands contradiſtinguiſhed from *apocryphal*.

The conditions then requiſite to conſtitute a book *canonical* are, that it be admitted to be written by divine inſpiration, and that it be ſolemnly accepted, and conſigned by the church for a perpetual guide or rule of faith and practice.

Divines generally hold, that thoſe books only of the New Teſtament are to be accounted *canonical*, which were either written, or at leaſt approved and authorized, by the apoſtles.

Formerly they were not ſo well diſtinguiſhed as among us. In the firſt ages of the church, Dodwell obſerves, the genuine writings of the apoſtles uſed to be bound up together with thoſe now called ſpurious, and apocryphal; ſo that it was not manifeſt, by any public judgment, which of them was to be preferred to the other; but later times thought fit to make a ſeparation.

The Jews allow of no book for *canonical*, but thoſe written before or ſoon after the return from the Babyloniſh captivity, when the gift of prophecy ceaſed among them.

Euſebius lays down three marks, by which the ſpurious writings forged by heretics, under the names of the apoſtles, were diſtinguiſhed from the genuine and *canonical*. Hiſt. Ecleſ. lib. iii. cap. 25.

Canonical, *poſt*, or *deutero*-Canonical. See Canon, and Deutero-*Canonical*.

Canonical is alſo an appellation given to thoſe epiſtles in the New Teſtament, more frequently called catholic, or general epiſtles.

Canonical, *canonicus*, was alſo an appellation given to all the officers and miniſters of a church or monaſtery, from the biſhop or abbot to the meaneſt ſervant, including prieſts, monks, virgins, and all who were entered in canon, that is, in the matricula or regiſter of the church.

Canonical *horſes*, *canonici equi*, was an ancient tax, or tribute, impoſed on certain provinces, whereby they were obliged to furniſh the emperor with ſo many horſes to mount his cavalry.

Canonical *hours*, are certain ſtated times of the day, conſigned, more eſpecially by the Romiſh church, to the offices of prayer and devotion. Such are *mattins*, *lauds*, *ſixth*, *ninth*, *veſpers*. In our country the canonical hours are from eight to twelve in the forenoon, before or after which marriage cannot be legally performed in any pariſh-church.

Canonical *inſtitution*, a regular and legitimate collation to a benefice, agreeable to the rules of the canon-law.

Canonical *letters*, in the *Ancient Church*, were a ſort of teſtimonials of the orthodox faith, which the biſhops and clergy ſent each other, to keep up catholic communion, and diſtinguiſh orthodox Chriſtians from Arian, and other heretics.

When they had occaſion to travel into other dioceſes, or countries, dimiſſory and recommendatory letters, alſo letters of peace, &c. were ſo many ſpecies of *canonical letters*. See Dimissory.

Canonical *liberty*, a freedom to which certain churches are left, being governed by the ancient canons and uſages eſtabliſhed before the papal hierarchy was carried to its height: ſuch is that which, of later days, the French call the *Gallican liberty*.

Canonical *life*, the method or rule of living preſcribed by the ancient clergy who lived in community.

The *canonical life* was a kind of medium between the monaſtic and clerical lives.

Canonical *obedience*, is that ſubmiſſion which by the eccleſiaſtical laws the inferior clergy are to pay to their biſhops, and religious, to their ſuperiors.

Canonical *portion*, ſo much of the effects of a perſon deceaſed, as the canons allow to the pariſh church to which he belonged.

Canonical *puniſhments* are thoſe which the church may inflict: ſuch are excommunication, degradation, and penance, in Roman catholic countries; alſo faſting, alms, whipping, &c.

Canonical *purgations*, were ancient methods of proving innocency, by ordeal, purgation, &c.

Canonical *ſins*, in the *Ancient Church*, thoſe which were capital or mortal: ſuch eſpecially were idolatry, adultery, murder, hereſy, and ſchiſm.

CANONICUM, in a general ſenſe, denotes a tax, or tribute.

Canonicum is more particularly uſed in the Greek church for a fee paid by the clergy to biſhops, archbiſhops, and metropolitans, for degrees and promotions.

Canonicum alſo denotes a due of firſt-fruits, paid by the Greek laity to their biſhops, or, according to Du-Cange, to their prieſts. The *canonicum* is aſſeſſed according to the number of houſes, or chimnies, in a place.

The emperor Iſaac Comnenus made a conſtitution for regulating the *canonicum* of biſhops, which was confirmed by another made in 1086, by his nephew Alexis Comnenus. A village containing thirty fires, was to pay for its *canonicum*, one piece of gold, two of ſilver, one ſheep, ſix buſhels of barley, ſix of wheat-flour, ſix meaſures of wine, and thirty hens. Du-Cange, Gloſs. Gr. tom. i. p. 578.

CANONIST, a perſon ſkilled in, or who makes profeſſion of the ſtudy and practice of the canon-*law*.

Canoniſts and *Civilians* are uſually combined in the ſame perſons. And hence the title of *doctor juris utriuſque*, or *legum doctor*, uſually expreſſed in abbreviature, LL. D. or J. U. D.

CANONIZATION, a declaration of the pope, whereby, after a great deal of ſolemnity, he enters into the liſt of ſaints ſome perſon who has lived an exemplary life, and wrought miracles; or, as is often the caſe, performed ſome ſingular ſervice for the church, in which a principal part of this kind of merit conſiſts.

The word *canonization* ſeems to be of later origin than the thing; there being no inſtance of the uſe of the word before the twelfth century, whereas St. Uldaricus was *canonized* in the tenth. The term is formed from *canon*; becauſe the primitive *canonizations* were only orders of the popes, or biſhops, whereby perſons eminent for piety, &c. were inſerted in the *canon* of the maſs, that they might be commemorated in the ſervice: becauſe, in thoſe days, the uſe of martyrologies was unknown in the church.

Mabillon diſtinguiſhes two kinds of *canonization*; a *general*, and *particular*, the firſt made by a general council, or a pope; the ſecond, by a biſhop, a particular church, or a provincial council.

There are inſtances likewiſe of *canonizations*, or at leaſt of ſomething very like them, by abbots.

At firſt, only martyrs were *canonized*; but by degrees they came to confeſſors, &c.

Canonization anciently conſiſted in inſerting the ſaint's name in the ſacred diptychs, or *canon* of ſaints; in appointing a proper office for invoking him, and erecting churches under his invocation, with altars for maſs to be celebrated on; taking up the body from the place of its firſt burial, and the like ceremonies: by degrees, other formalities were added; and proceſſions were made with the ſaint's image in triumph; the day of his death was declared a feaſt; and to render the thing ſtill more ſolemn, Honorius III. in 1225, added ſeveral days indulgence to a *canonization*.

It is a great diſpute among the learned, when the right of *canonization*, which it is owned was anciently common to ordinaries, eſpecially metropolitans and princes, with the pope, became firſt peculiar to the pope. Some ſay, Alexander III. made this reſerve to the holy ſee. The Jeſuits of Antwerp, in their Propylæum, aſſert, it was not eſtabliſhed till two or three ages ago; and then by a mere cuſtom, which paſſed tacitly into a law; which appears not to have been generally received in the tenth and eleventh centuries. This, however, is pretty certain, that it was generally allowed before pope Alexander III.; but ſince his time we read of no ſaints *canonized* by any but the popes: and the archbiſhop of Vienne in France, and his ſuffragans, acknowlege it in an authentic manner in the year 1231, by a letter written to Gregory IX. deſiring him to *canonize* Stephen, biſhop of Die, who died in 1208. *Quia nemo*, ſay they, *quantalibet meritorum prærogativa polleat, ab eccleſia Dei pro ſancto habendus, aut venerandus eſt, niſi prius per ſedem apoſtolicam ejus ſanctitas fuerit approbata.*

CANONRY, or Canonicate, the benefice filled by a *canon*.

Canonicate is diſtinguiſhed from prebend, in that the prebend may ſubſiſt without the *canonicate*, whereas the *canonicate* is inſeparable from the prebend. It is to the *canonicate*, not to the prebend, that the right of ſuffrages, and other privileges, are annexed. See Prebend.

CANOPUS, in *Aſtronomy*, a bright ſtar of the firſt magnitude in the rudder of Argo, a conſtellation of the ſouthern hemiſphere. See Argo.

The longitude of *Canopus*, as given by Halley, for the year 1700, is 10° 52′ of Cancer, and its ſouthern latitude, 72° 49′. F. Noel, in 1697, found its right aſcenſion 93° 54′, its declination ſouthwards, 52° 29′. F. Feuille, in the beginning of March 1709, obſerved the declination of *canopus* 52° 30′ 4″. F. Thomas, in January 1682, found the declination 52° 31′ 33″, its right aſcenſion 93° 32′ 20″, longitude, 8° 52′, of Cancer, latitude ſouthern, 75° 55′. Wolf. Lex. Math. p. 303, ſeq. Mem. Acad. Scienc. ann. 1693. p. 390, ſeq.

CANOPY, in *Architecture* and *Sculpture*, a magnificent kind of decoration, ſerving to cover, and crown an altar, throne, tribunal, pulpit, chair, or the like. See Baldachin.

The word is formed from the barbarous Latin *canopeum*, of κωνωπειον, *a net ſpread over a bed to keep off the gnats*, from κωνωψ, *a gnat*.

Canopies are alſo borne over the head in proceſſions of ſtate, after the manner of umbrellas.

The *canopy* of an altar is more peculiarly called Ciborium.

The Roman grandees had their *canopies*, or ſpread veils, called *thenſæ*, over their chairs: the like were alſo in temples over the ſtatues of the gods. The modern cardinals ſtill retain the uſe of *canopies*.

CANOSA, in *Zoology*, the name by which Salvian, and ſome other authors have called the canis *galeus*, and *muſtelus levis*, a kind of ſhark.

CANQUES, in *Commerce*, a ſort of cotton cloth made in China; with this cloth they make that firſt garment next their ſkin, which is properly their ſhirt.

CANSCHY, in *Botany*, is the name of a tree in Japan, from which the inhabitants of that country make their paper. See a particular account of the proceſs, from the

Ephem. N. C. in the Coll. Acad. P. Etr. tom. iv. p. 144.

CANSTRISIUS, an officer in the church of Conſtantinople, whoſe buſineſs is to take care of the patriarchs pontifical veſtments, aſſiſt in robing him, and during maſs to hold the incenſe pot, and ſprinkle holy water among the people, while the hymn of the Trinity is ſinging. The word is alſo written *Canſtrinſius*, it is uſually derived from *caniſtrum*, a name which ſome ſuppoſe given to the incenſe pot, others to the kind of baſket in which the patriarchs veſtments were kept. Du-Cange.

CANT, a quaint, affected manner of ſpeaking, or writing, adapted chiefly to the lower ſort.

Cant is originally derived from *Andrew Cant*, a Cameronian preacher in Scotland, who, by exerciſe, had obtained the faculty of talking in the pulpit in ſuch a tone and dialect as was underſtood by none but his own congregation.

Cant, or *Canting language*, is alſo applied to words and phraſes affected by particular perſons, or profeſſions for low ends, and not authorized by the eſtabliſhed language. *Cant* is not reſtrained to the ſtyle of gypſies, thieves, and beggars, but poſſeſſes a large department in the politer provinces of the Engliſh language.

An anonymous author has given a *canting* dictionary, comprehending all the terms uſed in the ſeveral tribes of gypſies, beggars, ſhoplifters, highwaymen, footpads, and other clans of cheats and villains, with a collection of ſongs in the *canting* dialect. Lond. 1725, 8vo.

A writer in the Tatler, aſſigns divers ſources of *cant*-words; as *phizz*, *hippo*, *mobb*, *pozz*, *bamm*, &c. Tatl. N° 230.

The Sea-Language will moſt of it come under the denomination of *cant*; and the like holds of the terms in alchemy, heraldry, not to ſay in aſtrology, or even chemiſtry, pharmacy, &c. In reality, the difference between a *cant*-term, and a technical term is not eaſy to aſſign, unleſs we chooſe to reſtrain the former to words introduced out of folly, affectation, or impoſture; and the latter to ſuch as are introduced for the ſake of clearneſs, preciſion, and ſignificancy.

Cant is alſo uſed to denote a ſale by auction.

The origin of the word, in this ſenſe, is dubious; it may come, according to ſome, from *quantum*, how much; according to others, from *cantare*, to ſing, or cry aloud; agreeably to which, we ſometimes alſo call it an *out-cry*.

Cant is alſo a term uſed by ſome carpenters, principally in ſhip-building; when a piece of timber comes the wrong way in their work, they ſay *cant* it; i. e. turn it over.

Accordingly, *cant-timbers* are thoſe which are ſituated at the two ends of a ſhip: and they are ſo called, becauſe they are *canted*, or raiſed obliquely from the keel, and are hereby diſtinguiſhed from thoſe whoſe planks are perpendicular to it.

Cant is alſo popularly uſed for an angle, or corner.

CANTABRIAN, the ancient language of the north-eaſtern part of Spain, in uſe before the country was ſubdued by the Romans.

Dr. Wallis ſeems to make the *Cantabrian* the ancient language of all Spain: which, according to him, like the Gauliſh, gave way to a kind of broken Latin called *romance*, or *romanſhe*; which by degrees was refined into the Caſtilian or preſent Spaniſh. But we can hardly ſuppoſe, that ſo large a country, inhabited by ſuch a variety of people, ſpoke all the ſame language.

The ancient *Cantabrian*, in effect, is ſtill found to ſubſiſt in the more barren and mountainous parts of the province of Biſcay, Aſturias, and Navarre, as far as Bayonne, much as the Britiſh does in Wales; but the people only talk it: for writing, they uſe either the Spaniſh or French, as they happen to live under the one or the other nation. Some attribute this to a jealouſy of foreigners learning the myſteries of their language; others to a poverty of words and expreſſions. The *Cantabrian* does not appear to have any affinity with any other known language, abating that ſome Spaniſh words have been adopted in it for things whoſe uſe the Biſcayens were antiently unacquainted with. Its pronunciation is not diſagreeable.

The Lord's prayer, in the *Cantabrian* tongue, runs thus: *Gure aita ceruetan aicena, ſanctifica bedi hire icena, ethor bedi hire reſuma, eguin bedi hire vorondatea cervan becala lurrean ere*, &c.

CANTABRICA, in *Botany*, a name by which different authors call two different ſpecies of plants. The *cantabrica* of Pliny is the ranunculus. The *cantabrica* of Turner, the clove gilliflower.

Cantabrica is alſo a name uſed by Cluſius and ſome others for the little narrow-leaved bind-weed. See Convolvulus.

CANTABRUM, in *Antiquity*, a large kind of flag uſed by the Roman emperors, diſtinguiſhed by its peculiar colour, and bearing on it ſome words, or motto of good omen, to encourage the ſoldiers.

CANTALIVERS, in *Architecture*, pieces of wood framed into the front, or ſides of a houſe, to ſuſtain the mouldings and eaves over it.

Cantalivers are the ſame with modillions, except that the former are plain, and the latter carved. They are both a kind of cartouſes ſet at equal diſtances under the corona of the cornice of a building.

Cantaliver-Cornice, is a cornice with *cantalivers* or modillions under it.

Thoſe which project much are now out of faſhion, and with good reaſon, eſpecially in London, as they darken, by their hanging over, the upper chambers at leaſt; and are apt to ſpread, and communicate fire, in caſe of a misfortune of that kind; beſides, that in the preſent mode of building, uſe, conveniency, and ſimplicity are more ſtudied than ornament.

CANTAR, or **Cantaro**, an eaſtern weight, of different value in different places, equivalent at Acra in Turky to 603 pounds, at Tunis and Tripoli to 114 pounds.

Cantar is alſo an Egyptian weight, which is denominated a *quintal*, and conſiſts of a hundred, or of an hundred and fifty *rotolos*, according to the goods they are to weigh.

Cantaro is alſo an Egyptian weight, which at Naples is equivalent to 25 pounds, at Genoa to 150 pounds. At Leghorn there are three kinds of *cantaros*, one weighing 150 pounds, another 151, and a third 160 pounds.

Cantaro is alſo a Spaniſh liquid meaſure, in uſe eſpecially at Alicant, containing three gallons.

Cantaro is alſo a meaſure of capacity, uſed at Cochin, containing four rubies, the rubi 32 rotolos.

CANTATA, in *Muſic*, a ſort of ſong, or compoſition, intermixed with recitatives, airs, and variety of motions: ordinarily intended for a ſingle voice, with a thorough baſs; ſometimes for two, three, or more voices, with one or more violins, or other inſtruments.

The *cantata* paſſed from Italy into France, and thence to us: it has ſomething in it extremely fantaſtical and capricious, and ſeems only to pleaſe by its variety. The word is Italian, where it ſignifies the ſame thing.

CANTATRICES, in *Middle Age Writers*, hired weepers, and waiters at funerals.

CANTEENS, in *Military Language*, are tin veſſels in the form of ſquare bottles, uſed for carrying water to ſupply the ſoldiers in camp.

CANTEL, *cantellum*, in *Ancient Engliſh Writers*, denotes a cuſtom of ſelling by the lump, without tale or meaſure. Spelman derives the word from *quantillum*, and defines it by over meaſure, or what is added over and above ſtrict meaſure. Kennet derives it from the old word *cant*, a hundred, q. d. the ſale of about a hundred weight; anſwering to what we now call the taking of a hundred pound on content; as when we take it in a bag, ſealed up, without telling the pieces.

CANTERBURY-BELL, in *Botany*. See Convolvulus.

CANTERII, or **Cantherii**, in *Ancient Architecture*, rafters or joiſts of a houſe, which reach down from the ridge to the eaves.

CANTHARÆ, among the *Ancients*, a kind of candleſtick. See Branch.

CANTHARIAS *lapis*, in *Natural Hiſtory*, a name given by ſome writers to a foſſile ſubſtance ſuppoſed to reſemble a beetle. We ſometimes meet with parts of the ichthyperia or bony parts of fiſhes, which are ridged longitudinally, much in the manner of the outer wing of ſome of the beetle tribe; and from their ſize and ſhape, which is an oblong, or oval one of the bigneſs of a common beetle, and ſometimes of the largeſt, and at others of the very ſmalleſt kinds, theſe have been called by ſome petrified beetles and *cantharicæ lapides*; others have extended the name to ſuch ſpecies of amber as have in them the body or any fragment of the beetle of any ſpecies.

CANTHARIDES, in *Medicine*, a kind of poiſonous inſects, with wings and feet like beetles; much uſed as an epiſpaſtic for the raiſing of bliſters.

The ſtimulating power of *cantharides* is cauſed by a very acrid reſinous ſubſtance contained in theſe inſects, two ſcruples of which Neumann extracted from four ounces of *cantharides* by ſpirit of wine.

The word is formed from *cantharus*, the name of a ſort of beetle, and called alſo *ſcarabæus venenoſus*. The *cantharides* are properly a ſpecies of the beetle or ſcarab kind.

Cantharides, called alſo *Spaniſh flies*, though they ought rather to be denominated *Spaniſh beetles*, are produced from a kind of little worms, hatched on wheat, the leaves of the poplar, &c. There are various kinds of *cantharides*, but all of a greeniſh and golden hue; the beſt are thoſe which appear with different colours, having yellow lines running acroſs their wings, thick, and freſh. They are killed by expoſing them over a very ſtrong vinegar, which is made to boil for that purpoſe; after which they are dried, and may be preſerved a year or two.

Cantharides are very ſharp and corroſive, abounding with a ſub-a ſubtile, cauſtic, volatile ſalt; whereby they become exceedingly injurious to the bladder, ſo as to ulcerate it, even when applied externally, if ſuffered to lie on too long. They are much commended in fevers, as they raiſe and ſtrengthen a low trembling pulſe, give relief in delirious ravings, ſoporiferous ſtupors, loſs of reaſon, &c. (the common ſymptoms of high and dangerous fevers): they often alſo reduce continual fevers to regular and diſtinct remiſſions; and ſo make way for the bark; cleanſe and open the obſtructed glands and lymphatics; bring on critical ſweats, &c.

Dr. Morgan accounts for theſe effects of *cantharides* thus: « The ſubtile and volatile pungent parts, of which the « *cantharides* conſiſt, being carried into the blood, and « paſſing with the lymph or ſerum into the glandular « pipes, act there by diſſolving, attenuating, and rare- « fying the viſcid coheſions of the lymph; and by ſti- « mulating the nervous coats of the veſſels, they throw « off their ſtagnant viſcidities, and thus reſtore the cir- « culation and free drain of lymph from the arteries to « the veins; cleanſe the expurgatory glands, and bring « on critical ſweats and urines. Thus, the extremely « ſubtle, active, and pungent volatile ſalts, derived from « the *cantharides*, purge the glands and lymphatics uni- « verſally; much after the ſame manner as common ca- « thartics do the guts.” Philoſoph. Princip. of Medicine, p. 304.

The ancients held them a poiſon when taken internally, undoubtedly on account of their tendency to ulcerate the bladder. Yet ſome moderns, as Langius, Bartholin, and others, have ventured to give them internally, ſupported by the authority of Hippocrates, who appears to have given them in dropſies and jaundices: and in the Philoſophical Tranſactions, we have inſtances of their internal uſe, and that with ſucceſs, by Mr. Young, in dropſical and other caſes; ſometimes mixed with camphor, and ſometimes without; only well waſhed down with large draughts of poſſet, ptiſan, emulſions, or the like. The form wherein he tells us he uſes to adminiſter this fiery inſect, is that of a ſoft pill, or bolus, compoſed of three *cantharides præpar. Troch. e Myrrha* ʒ ß. *Sem. Amei.* gr. vi. *Rob. Cynoſb. q. ſ.* This, in ſtubborn ſuppreſſions of the menſes and lochia, in difficult childbirth, and retention of the ſecundines, he finds does wonders: he adds, that the heat or pain it occaſions in the neck of the bladder, is much ſhort of what he has an hundred times ſeen, and ſometimes felt, from the application of an epiſpaſtic to the back.

Groenvelt has a treatiſe expreſs on the ſafe internal uſe of *cantharides*, wherein he recommends them, eſpecially againſt ulcers in the bladder; for which he ſuffered a perſecution from the college of phyſicians, though further experience has ſhewn he had juſtice on his ſide.

Dr. Morgan propoſes a tincture of *cantharides*, made with the *elixir vitrioli*, as good in the DIABETES.

Their principal uſe, however, is in veſicatories, to raiſe bliſters on the ſkin; and by that means to turn off and diſcharge ſome flux of ill humours.

Cantharides are ſometimes applied to the temples for the tooth-ach: the farriers uſe them in ſeveral diſeaſes of horſes. They muſt be choſen new, dry, and whole: they will not keep above two years, without ſpoiling or mouldering into a duſt, which is of no uſe.

CANTHARIS. See GLOW-*worm.*

CANTHARUS *of a* FOUNTAIN, among Roman *Writers*, denotes the part, or apparatus, out of which the water iſſued.

It was made in divers forms, ſometimes in that of a ſhell, at other times in that of an animal, which yielded water at its mouth, eyes, and the like.

CANTHARUS, in *Eccleſiaſtical Writers*, denotes a fountain, or ciſtern, in the middle of the *atrium*, before the ancient churches, wherein perſons waſhed their hands and faces before they entered.

CANTHARUS, in *Zoology*, the name of a ſea-fiſh much reſembling the ſparus and ſargus in ſhape, but of a duſkier and blacker colour, covered with ſmall ſcales, and not marked with the annular black ſpots which both thoſe fiſhes have near the tail. It is common in the Mediterranean, and is frequently brought to market in Rome, &c. being eſteemed a very well taſted fiſh.

The *cantharus* of the ancients is called by Artedi the *ſilver-eyed* SPARUS, with longitudinal and parallel yellow lines on each ſide. Gaza calls this fiſh *ſcarabæus.*

CANTHARUS *unctuoſus.* See *Oil* BEETLE.

CANTHUS, in *Anatomy*, the corner, or angle of the EYE; formed by the commiſſure or joining of the upper and lower eyelids.

That corner next the noſe, is called the *great*, *inner*, and *domeſtic canthus*; and by ſome phyſicians the *fountain.*—The other, towards the temples, is called the *little*, or *external canthus.*

CANTHUS, in *Chemiſtry*, the lip of a veſſel; or that part of the mouth of a veſſel, which is a little hollowed, or depreſſed, for the eaſy pouring off a liquor.

Hence, to pour by decantation, is to pour through that place.

CANTICLES, a canonical book of the Old Teſtament, otherwiſe called the Song of Solomon; by the Jews, the Song of Songs, *Canticum Canticorum.*

The Book of *Canticles* is uſually ſuppoſed to be an epithalamium compoſed by Solomon, on occaſion of his marriage with the king of Egypt's daughter. But thoſe who penetrate further into the myſtery, pretend to find it the marriage of Jeſus Chriſt with human nature, the church, and good men.

On this principle the *Canticles* is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and ſpiritual marriage is expreſſed.

The Jews themſelves, apprehending the book liable to be underſtood in a groſs and carnal manner, prudently prohibited the reading of it before the age of thirty, and the ſame uſage anciently obtained in the Chriſtian church. Orig. Præf. in Cant. Teod. Op. tom. i. p. 985. Hierom. in Ezek. Wolf. Bib. Heb. tom. i. p. 126.

Among the ancients, Theodore Mopſuetanus rejected the book of *Canticles*, as not divine. Divers rabbins have alſo queſtioned its being written by inſpiration. It is alledged, that the name of God is not once found in it. Mr. Whiſton has a diſcourſe expreſs to prove, that the *Canticles* is not a ſacred book of the Old Teſtament. He alledges it indeed to have been written by king Solomon, the ſon of David, but aſſerts, that it was compoſed at the time when that prince, blinded by his concubines, was ſunk in filthy love, and even idolatry. This he chiefly infers from the general character of vanity and diſſoluteneſs which reigns through the *Canticles*, in which there is not, according to Whiſton, one thought that leads the mind toward religion, but all is worldly and carnal, to ſay no worſe. For the myſtic ſenſe, he aſſerts it to be without any foundation, and that the book is not cited as canonical by any writer before the deſtruction of Jeruſalem. Mr. Whiſton will have it to have been taken into the canon between the years 77 and 128, when allegories came in vogue, and the rabbins began to corrupt the text of Scripture.

CANTIMARONS, or CATIMARONS, a kind of floats or rafts, uſed by the inhabitants of the coaſt of Coromandel to go a fiſhing in, and to trade along the coaſt. They are made of three or four ſmall canoes, or trunks of trees dug hollow, and tied together with cacao ropes, with a triangular ſail in the middle, made of matts. The perſons who manage them are almoſt half in the water, there being only a place in the middle a little raiſed to hold their merchandiſe; which laſt particular is only to be underſtood of the trading *cantimarons*, and not of thoſe who go fiſhing.

CANTING-*arms*, among *Heralds*, are thoſe ARMS which expreſs their owner's ſurname.

Theſe anſwer to what the French call *armes parlantes*; they are a ſort of rebuſes, and are never preſumed to be noble.

CANTING-*quoins*, in *Ship Building*, the ſame as *cantic-quoins.* See QUOIN.

In Harris's Lex. Techn. they are called *canoigne coins*, but this ſeems an error of the preſs. Manwayring calls them *cantick-quoynes.*

CANTO denotes a part or diviſion of a poem, anſwering to what is otherwiſe called a book.

The word is Italian, where it properly ſignifies ſong.

Taſſo, Arioſto, and ſeveral other Italians, have divided their longer or heroic poems into *cantos.* In imitation of them Scarron has alſo divided his Gigantomachia, and Boileau his Lutrin, into *chants*, or ſongs. The like uſage has been adopted by ſome Engliſh writers, as Butler, who divides his Hudibras, and Dr. Garth his Diſpenſary, into *cantos.* A late tranſlator of part of Virgil's Æneid has even ſubdivided a book of Virgil into ſeveral *cantos.*

CANTO, in the *Italian Muſic*, ſignifies a ſong: hence *canto ſimplice* is where all the notes or figures are equal, called alſo *canto fermo*: *canto figurato*, that where the figures are unequal, and expreſs different motions.

CANTO alſo ſignifies the treble part of a ſong; hence *canto concertante*, the treble of the little chorus; *canto ripieno*, the treble of the grand chorus, or that which ſings only now and then, in particular places.

Canto ſignifies the firſt treble, unleſs ſome other word be added to it, as *ſecondo*; in which caſe it denotes the ſecond treble.

CANTON, a quarter of a city, conſidered as ſeparated and detached from the reſt.

The word ſeems formed from the Italian *cantone*, a *ſquare ſtone*, or *corner ſtone.*

CANTON is alſo more frequently uſed for a ſmall country, or diſtrict, under its ſeparate government.

Such are the thirteen Swiſs *cantons*; each of which forms a republic apart; but all are leagued together, and conſtitute what is called the Helvetic body.

CANTON, in *Heraldry*, is one of the nine honourable ordinaries; being a ſquare portion of the eſcutcheon parted from the reſt.

It has not any fixed proportion; though regularly it ſhould be leſs than a quarter: it is often only a ninth part, and uſed as an addition, or difference, frequently to expreſs baſtardy. The *canton* is ſometimes placed at the right corner, and ſometimes at the left; in which latter caſe, it is called a *canton ſiniſter*. Its form is expreſſed in *Tab. Herald. fig.* 12.—He bears ermin, a *canton* argent, charged with a chevron gules.

CANTON is alſo uſed for the ſpaces left between the branches of a croſs or ſaltier.

CANTONED, a word uſed in *Architecture*, when the corner of a building is adorned with a pilaſter, an angular column, ruſtic quoins, or any thing that projects beyond the naked of the wall.

CANTONED, **CANTONNE´**, or **CANTONIZED**, in *Heraldry*, is when the four *cantons*, or ſpaces round a croſs, or ſaltier, are filled up with any pieces.—He bears gules, a croſs argent, *cantoned* with four ſcallop ſhells.

The word is alſo uſed when there are little pieces in the *cantons*, or ſpaces, of any principal figure of an eſcutcheon. Thus the ſaltier of Lenox is *cantoned* with four roſes.

CANTONING, in *Middle Age Writers*, denotes the dividing a thing into hundreds, or ſelling it by hundred weights, or hundreds in tale.

CANTONING, in the *Military Art*, is a method of quartering troops in a town, where the garriſon is ſo numerous, that ſeveral regiments muſt be quartered on the inhabitants for want of caſerns, or barracks, to contain them.

In this caſe they divide the town into as many parts as there are regiments to be ſo quartered, that the officers and ſoldiers of each may have a diſtinct part to themſelves. This, in the military phraſe, is called *cantoning of a town*.

CANTRED, or **CANTREY**, denotes a diſtrict or diviſion of an HUNDRED towns or villages.

The word is Britiſh, compounded of *cant*, *hundred*, and *trev*, or *tref*, *town* or *village*.

In Wales the counties are divided into *cantreds*, as thoſe in England are into hundreds. Angleſey, in particular, is divided into three *cantrevs* or *cantreds*, which are each ſubdivided into ſix *comots* or *commotes*, each *commote* containing about ſixty *trevs* or townſhips. The general partition of Wales into *cantrevs* and *comots* is very ancient. Rowl. Monaſt. Ant. Eſſ. § 10. p. 110, &c.

CANVAS, or **CANVASS**, a coarſe ſort of linen or hempen cloth, uſually woven open, and regularly, in little ſquares; ſerving for divers domeſtic purpoſes, and eſpecially for the ground of tapeſtry-work, and painting.

We have divers ſorts and denominations of *canvas*, moſt of them imported from abroad; as Dutch, Barras, and Heſſian *canvas*; packing *canvas*; guttings and ſpruce *canvas*; poledavies, ebbing, or Queenſborough *canvas*; working *canvas*, for botts or cuſhions, narrow, broad, and broadeſt.

CANVAS alſo is the cloth on which painters uſually draw their pictures; the *canvas* being ſmoothed over with a ſlick-ſtone, then ſized, and afterwards whited over, makes what the painters call their *primed cloth*, on which they draw their firſt ſketches with a coal or chalk, and afterwards finiſh with colours.

CANVAS is alſo a name ſometimes given to ſail-cloth.

CANVAS-*bags*, in the *Military Art*, contain about a cubic foot of earth or ſand, with which they are filled. Their uſe is to raiſe a parapet in haſte, or to repair one, when beaten down. See SACKS *of earth*.

CANVAS is alſo uſed, among the French, for the model, or firſt words, whereon an air, or piece of muſic, is compoſed, and given to a poet to regulate and finiſh. The *canvas* of a ſong, contains certain notes of the compoſer, which ſhew the poet the meaſure of the verſes he is to make. Thus Du Lot ſays, he has *canvas* for ten ſonnets againſt the Muſes.

CANULA. See CANNULA.

CANUTI *avis*. See TRINGA.

CANZONE, in the *Italian Muſic*, in the general, ſignifies a ſong; particularly a ſort of Italian ode, or lyric poem, conſiſting of ſeveral ſtanzas, through all which the ſame order and diſpoſition of verſes, meaſures, and rhimes, are obſerved as in the firſt.

The *canzone* is uſually very long, and may be ſet to muſic in much the ſame ſtyle with the CANTATA.

The *canzone* is a compoſition ſomewhat reſembling, but leſs elaborate, than the MADRIGAL. It admits of little figures and points, and ſeldom exceeds three parts; though the name is ſometimes given to a ſong for one voice.

There are alſo pieces of ſymphony without words, called *canzone*, much the ſame with ſonatas.

The word *canzone* in ſonatas ſerves to indicate that the airs it is put under are airs of briſk movement; ſuch as are the uſual figures otherwiſe marked with ALLEGRO.

CANZONETTA denotes a little *canzone*. See CANZONE. The word is a diminutive of the Italian *canzona*, or *canzone*.

CANZURI, a name given by ſome authors to a peculiar kind of camphor more eſteemed than any other ſort. Some have ſuppoſed it thus called from *Kanzur* or *Chanzur*, the name of a place where they ſuppoſe it to be produced, which ſeems the more probable opinion, though Scaliger rejects it, and will have it that this fine camphor had its name from a certain gum called *canzur*, which, according to Garcias, and ſome others, is frequently mixed with the camphor by the people who collect it for ſale.

This gum, he ſays, is called alſo *canderros*; and that it is ſomewhat like the crude amber, only that it is whiter. There is this great objection to this being the true ſenſe of the word, that it expreſſes an adulterated kind, which it is ſcarce probable ſhould be true of that which all the authors who have mentioned this kind of camphor, have agreed in calling the beſt and moſt excellent of all the ſorts.

CAOUANNE, in *Zoology*, the name of a ſpecies of tortoiſe very much reſembling the JURUCUA of the Braſilians, but having a thicker ſhell, and a harſh, tough, and ſtringy fleſh, of a very bad taſte.

CAOUKE, in the *Turkiſh Dreſs*, a high ſtiff turban, worn by the odabaſhees, or heads of the chambers of janizaries, when they go in proceſſion.

CAOUTCHOUC, in *Natural Hiſtory*, is one name, among many more, given to a very elaſtic reſin; the produce of a tree which grows along the banks of the river of the Amazons. This tree grows to a very great height, perfectly ſtraight, having no branches, except at top, which is but ſmall, covering no more than a circumference of ten feet. Its leaves bear ſome reſemblance to thoſe of the *manioc* (*juca foliis cannabinis*): they are green on the upper part, and white beneath. The ſeeds are three in number, and contained in a pod, conſiſting of three cells, not unlike thoſe of the *ricinus*, or *palma Chriſti*; and in each of them there is a kernel, which being ſtripped and boiled in water produces a thick oil or fat, anſwering the purpoſes of butter in the cookery of that country. The juice, which is applied to a great variety of uſes, is gathered chiefly in time of rain, becauſe, though it may be collected at all times, it flows then moſt abundantly. It is extracted from the tree by ſimple inciſion, and flows in the form of a milky liquor. The means employed to inſpiſſate and indurate it, M. de la Borde ſays, are kept a profound ſecret. M. Bomare, and others, affirm, that it thickens and hardens gradually by being expoſed to the air; and as ſoon as it acquires a ſolid conſiſtence, it manifeſts a very extraordinary degree of flexibility and elaſticity. Accordingly the Indians make boots of it, which water cannot penetrate, and which when ſmoaked have the appearance of real leather. Bottles are alſo made of this ſubſtance, to the necks of which are faſtened hollow reeds, ſo that the liquor contained in them may be ſquirted through the reeds or pipes by preſſure. One of theſe filled with water is always preſented to each of the gueſts at their entertainments, who never fail to make uſe of it before eating. This whimſical cuſtom led the Portugueſe in that country to call the tree that produces this reſin *pao de xirringa*, and hence the name of *ſeringat* is given both to the tree, and to its reſinous production.

Flambeaux, an inch and a half in diameter, and two feet long, are likewiſe made of this reſin, which give a beautiful light, have no bad ſmell, and burn twelve hours. A kind of cloth is alſo prepared from it, which the inhabitants of Quito apply to the ſame purpoſes as our oil-cloth and ſail-cloth. It is formed, by means of earthen moulds, into a variety of figures for uſe and ornament. Ever ſince this reſin has been known in Europe, its chemical qualities, and other intereſting properties, have been very diligently inveſtigated. It was ſoon found that it may be ſoftened by warm water; but it could neither be diſſolved in water, nor in ſpirit of wine; and though it may be diſſolved in certain oils, yet the ſolution remains ſoft, of a viſcous conſiſtence, and totally incapable of being reſtored to a ſolid and elaſtic ſtate. Many attempts were made for diſſolving this ſubſtance, without deſtroying its peculiar properties. M. Macquer, in particular, employed various oils, camphire, and different kinds of ſalts, for this purpoſe, without effect. He made uſe of Papin's digeſtor, and of the milky juices of ſome of our European plants, and particularly of the *milk-thiſtle*, without ſucceſs. In ſome of theſe operations, the reſin was not at all affected; and, in others, it was altered or deſtroyed. At laſt he had recourſe to the *vitriolic æther*, which quickly and eaſily diſſolved this anomalous ſubſtance; forming with it a tranſparent tincture, and after evaporation leaving the reſin behind, poſſeſſed of its former conſiſtence, elaſticity, and other properties, and of ſuch a form as he choſe to give it, while in its liquid ſtate. He obſerves, however, that two pints of the beſt æther, obtained by rectifying eight or ten pints of the common æther by a gentle heat, muſt be uſed, in order to the ſucceſs of the operation. The diſtinguiſhing properties of this ſubſtance, viz. its ſolidity, flexibility, and elaſticity, and its quality of reſiſting the action of aqueous, ſpirituous, ſaline, oily, and other common ſolvents, render it extremely fit for the conſtruction of tubes, catheters, and other inſtruments, in which theſe properties are wanted. In order to form this reſin into ſmall tubes, M. Macquer prepared a ſolid, cylindrical mould of wax, of the deſired ſize and ſhape; and then dipping a pencil into the ætherial ſolution of the reſin, daubed the mould over with it, till he had covered it with a coat of reſin of a ſufficient thickneſs. The whole piece is then thrown into boiling water; by the heat of which the wax is ſoon melted, and riſes to the ſurface, leaving the reſinous tube completely formed behind. This ſubſtance is very uſeful in drawing, &c. for eraſing the ſtrokes of black lead pencils, and is popularly called *rubber*, and *lead-eater*. A reſin ſimilar to this was not long ſince diſcovered by M. Poivre, in the Iſle of France; and there are various milky juices extracted from trees in America and elſewhere, which by previous mixtures and preparations are formed into an elaſtic reſin, but of an inferior quality to that of Cayenne. Hiſt. del' Acad. Roy. des Scienc. 1763. Ib. 1768. Ib. 1769.

CAP, a garment ſerving to cover the head, and made nearly of the figure thereof.

The æra of *caps* and hats is referred to the year 1449, the firſt ſeen in theſe parts of the world being at the entry of Charles VII. into Rouen: from that time they began, by little and little, to take place of the hoods, or chaperoons, that had been uſed till then. M. le Gendre, indeed, goes further back; they began, ſays he, under Charles V. to let fall the angles of the hood upon the ſhoulders, and to cover the head with a cap, or bonnet: when this cap was of velvet, they called it *mortier*; when of wool, ſimply *bonnet*: the firſt was laced, the latter had no ornament, beſides two horns, raiſed a moderate height, one of which ſerved in covering and uncovering. None but kings, princes, and knights, were allowed the uſe of the *mortier*.

The *cap* was the head-dreſs of the clergy and graduates. Paſquier ſays, that it was anciently a part of the hood worn by the people of the robe; the ſkirts whereof being cut off, as an incumbrance, left the round *cap* an eaſy commodious cover for the head; which round *cap* being afterwards aſſumed by the people, thoſe of the gown changed it for a ſquare one, firſt invented by a Frenchman, called Patrouillet: he adds, that the giving of the *cap* to the ſtudents in the univerſities, was to denote, that they had acquired full liberty, and were no longer ſubject to the rod of their ſuperiors; in imitation of the ancient Romans, who gave a *pileus*, or *cap*, to their ſlaves, in the ceremony of making them free: whence the proverb, *Vocare ſervos ad pileum.* Hence, alſo, on medals, the *cap* is the ſymbol of liberty, whom they repreſent holding a *cap* in her right hand, by the point.

The Romans were many ages without any regular covering for the head: when either the rain or ſun was troubleſome, the lappet of the gown was thrown over the head; and hence it is that all the ancient ſtatues appear bareheaded, excepting ſometimes a wreath, or the like. And the ſame uſage obtained among the Greeks, where, at leaſt during the heroic age, no *caps* were known.

The ſorts of *caps* or covers of the head in uſe among the Romans on divers occaſions, were the *pitra*, *pileus*, *cucullus*, *galerus*, and *palliolum*; the differences between which are often confounded by ancient as well as modern writers.

The French clergy wear a ſhallow kind of *cap*, called *calotte*, which only covers the top of the head, made of leather, ſattin, worſted, or other ſtuff.

The *red cap* is a mark of dignity allowed only to thoſe who are raiſed to the cardinalate.

The ſecular clergy are diſtinguiſhed by black leathern *caps*, the regulars by knit and worſted ones.

The Chineſe have not the uſe of the hat, like us; but wear a *cap* of a peculiar ſtructure, which the laws of civility will not allow them to put off: it is different for the different ſeaſons of the year: that uſed in ſummer, is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with ſatin: to this is added, at top, a large lock of red ſilk, which falls all round as low as the bottom; ſo that, in walking, the ſilk fluctuating regularly on all ſides, makes a graceful appearance: ſometimes, inſtead of ſilk, they uſe a kind of bright red hair, the luſtre whereof no weather effaces. In winter they wear a pluſh *cap*, bordered with martlet's, or fox's ſkin; as to the reſt, like thoſe for the ſummer. Nothing can be neater than theſe *caps*; they are frequently ſold for eight or ten crowns; but they are ſo ſhort, that the ears are expoſed.

Cap, *ſquare*.—The *cap* or bonnet, is a mark, or ornament of certain characters: thus churchmen, and the members of univerſities, ſtudents in law, phyſic, &c. as well as graduates, wear *ſquare caps*. In moſt univerſities, doctors are diſtinguiſhed by peculiar *caps*, given them in aſſuming the doctorate. Wickliff calls the canons of his time *bifurcati*, from their *caps*. Paſquier obſerves, that, in his time, the *caps* worn by the churchmen, &c. were called *ſquare caps*; though, in effect, they were round, yellow *caps*.

The *cap* is ſometimes alſo uſed as a mark of infamy: in Italy the Jews are diſtinguiſhed by a *yellow cap*; at Lucca by an *orange* one. In France, thoſe who had been bankrupts were obliged ever after to wear a *green cap*, to prevent people from being impoſed on in any future commerce. By ſeveral arrets in 1584, 1622, 1628, 1688, it was decreed, that if they were at any time found without their *green cap*, their protection ſhould be null, and their creditors impowered to caſt them into priſon: but the ſentence is not now executed.

Cap *of maintenance*, one of the regalia or ornaments of ſtate belonging to the kings of England, before whom it was carried at the coronation and other great ſolemnities; and alſo of the mayors of ſeveral cities in England.

Cap *of a gun*, is a piece of lead which is put over the touch-hole of a gun, to keep the priming from being waſted or ſpilt.

To cap, is ſaid of a ſhip in the trials of the running of ſetting of currents.

Cap, in a ſhip, is a ſquare piece of timber, put over the head, or upper end of a maſt, having a round hole to receive the maſt. By theſe *caps*, the top-maſts, and top-gallant-maſts, are kept ſteady and firm in the treſſel-trees, where their feet ſtand; as thoſe of the lower-maſts do in the ſteps. See *Tab. Ship. fig.* 1. *n.* 31. 58. 76. 101. 113. 143. and *fig.* 1. *n.* 15.

Cap, in *Chemiſtry*, ſignifies the piece which terminates the top of a *melting* FURNACE.

Cap, or *great* **Cap**, in *Chirurgery*, a denomination of a kind of compendious bandage, ſerving for almoſt all occaſions of the head, being in figure not unlike a helmet.

Among chirurgical inſtruments we meet with a ſilver *cap*, *pileolus argenteus* (though of late alſo made of wood, or even white wax), perforated at both ends, applied to the paps of nurſing women, when ulcerated, for the more commodious giving of ſuck.

Cap, in *Phytology*, a name given to the huſk or green ſucculent coat which covers the upper part of a nut, and connects it to the parent tree.

The *cap* conſiſts of a pilling and parenchyma derived from the bark, and ramulets from the ligneous body of the branch.

Cap *of a* MUSHROOM, is the head or ſuperior part expanded over the footſtalk, ſomewhat in manner of a canopy, or umbrella.

Cap, *black*, in *Zoology*. See Pewit.

Cap, *Neptune's*. See Neptune.

Cap, *prieſt's*, in *Fortification*. See Bonnet *à prêtre*.

Cap-*merchant*, in a trading ſhip, is the ſame officer who is called purſer on board a man of war. The French call him writer (*ecrivain*). He is appointed by the merchant to whom the ſhip belongs, to take care that nothing be embezzled or ſquandered away.

CAPACITY, in a general ſenſe, an aptitude, or diſpoſition to retain or hold any thing.

Our law allows the king two *capacities*, a *natural*, and a *political*: in the firſt he may purchaſe land to him, and his heirs; in the latter, to him, and his ſucceſſors.—The clergy have the like.

CAPARASON, or **Caparison**, the covering or cloathing laid over an horſe; eſpecially a ſumpter, or horſe of ſtate.

The word is Spaniſh, being an augmentative of *cape*, *caput*, *head*.

Anciently the *caparaſons* were a kind of iron armour, wherewith horſes were covered in battle.

CAPASH, a kind of head-dreſs worn by the women of Candia. It is of a ſtiffened fine muſlin, and is made ſo as to ſtand up very high, and extends out a great way on the right ſide. Pococke's Egypt. vol. ii. part ii. p. 10.

CAPE, in *Geography*, a head-land; or a piece of land running out beyond the reſt, into the ſea.

Sicily was called by the ancients *Trinacria*, by reaſon of its three *capes*, or promontories, repreſented on medals, by three mens legs joined together at the top of the thigh, and bent in the knee; which pretty nearly reſembles the triangular figure of that iſland.

Cape, in *Law*, a writ touching plea of lands and tenements; ſo termed, from the word which carries the chief intention or end of it.

Cape is of two kinds, the *magnum* and *parvum*; which in their effect are alike, as to the taking hold of things immoveable; though in certain circumſtances they differ: 1. In that the *cape magnum*, or *grand cape*, lies before; and the *cape parvum*, or *petit cape*, after appearance. 2. *Cape magnum* ſummons the defendant to anſwer the default; and beſides to the demandant: *cape parvum* only to the default. It is called *petit cape*, not becauſe of its ſmall force; but becauſe contained in few words.

Cape *magnum* is thus defined in the old Nat. Brev. "Where a man hath brought a *præcipe quod reddat* of a "thing that touches plea of land, and the tenant makes "default of the day to him given in the original writ; "then this writ ſhall be for the king to take the land "into his hands: and if the tenant come not at the day "given him by the writ, he loſes his land."

Cape *parvum*, or *petit cape*, is thus defined, ibid. "Where "the tenant is ſummoned in plea of land, and comes "at the ſummons, and his appearance is recorded; and "at the day given him, prays the view; and having it "granted, makes default; then ſhall this writ iſſue for "the king, &c."

Cape *ad valentiam*, a ſpecies of *cape magnum*, ſo called from the end to which it tends: it is thus deſcribed, "Where "I am impleaded of lands, and I vouch to warrant an-"other, againſt whom the ſummons *ad warrantandum* "hath been awarded, and the ſheriff comes not at the "day given; then, if the defendant recover againſt me, "I ſhall have a writ againſt the vouchee; and ſhall re-"cover ſo much in value of the lands of the vouchee, if "he has ſo much: otherwiſe, I ſhall have execution of "ſuch lands and tenements as deſcend to him in fee; "or, if he purchaſe afterwards, I ſhall have a re-ſum-"mons againſt him: and if he can ſay nothing, I ſhall "recover the value."

CAPEDUNCULA, in *Roman Antiquity*, the veſſels wherein the ſacred fire of Veſta was preſerved. See Vestals.

CAPELAN, in *Zoology*, a name given by ſome authors to the ſmall ſpecies of whiting called by the Venetians *matlo*, and by others the *aſellus omnium minimus*, and *merlangus*.

CAPELINE, a kind of bandage uſed by the French ſurgeons in caſes of amputations; conſiſting of a roller with two equal heads.

CAPELLA, in *Aſtronomy*, a bright ſtar of the firſt magnitude, in the left or preceding ſhoulder of the conſtellation Auriga.

Capella, in *Ornithology*. See Lapwing.

CAPER-*buſh*, *Capparis*, in *Botany*, a genus of the *polyandria monogynia* claſs. Its characters are theſe: the flower hath four large roundiſh petals, and a great number of ſlender ſtamina. In the midſt of theſe ariſe a ſingle ſtyle, longer than the ſtamina, with an oval germen, which afterward becomes a fleſhy turbinated capſule with one cell, filled with kidney-ſhaped ſeeds. There are ten ſpecies. The firſt is the common *caper*, whoſe full-grown flower-bud is pickled, and brought to England annually from Italy and the Mediterranean. This is a low ſhrub, which generally grows out of the joints of old walls, the fiſſures of rocks, and among rubbiſh, in moſt of the warm parts of Europe.

Some ſay the plant grows in Oxfordſhire, and might doubtleſs be propagated in other places. In England, broom-buds pickled are frequently ſubſtituted for *capers*.

When the *capers* are budded for flowering, the ſhoots are cut away, and the leaves and flower-buds ſtript off; and being paſſed through a ſieve, the *capers* are thereby ſeparated from the leaves.

This is a ſpeedy way, without which they would come too dear for common uſe.

They are dried in a ſhady place; then infuſed in vinegar; to which, at laſt, ſalt is added: after which they are put up in barrels to be uſed as a pickle, chiefly in ſauces; and ſometimes alſo in medicine, as being very aperitive, and entering certain compoſitions for diſeaſes of the ſpleen.

All the *capers* ſold throughout Europe, are brought from about Toulon, in France; except ſome ſmall ſalt *capers* from Majorca, and a few flat ones from about Lyons.

The bark of the *caper*-tree, when dried, is much preſcribed by the French phyſicians in oppilations of the ſpleen.

Caper, *bean*. See Bean-*caper*.

Capers, *long*, are the ſtyle or piſtil of the flower which grows into a fruit, long and round like an olive or acorn when ripe, containing divers hard brown ſeeds, like the acini of grapes.

Capers, *capuchin*, are produced by a plant formerly brought from India; thus called, becauſe the bottom of the calix of the flower reſembles the *capouche* of the religious of St. Francis.

Caper is alſo a veſſel uſed by the Dutch, for cruiſing and taking prizes from the enemy.

In which ſenſe, *caper* amounts to the ſame with privateer.

Capers are commonly double officered, and crowded with hands even beyond the rates of ſhips of war, becauſe the thing chiefly in view is boarding the enemies.

CAPH, a Jewiſh meaſure of capacity for things eſtimated by Kimchi at the 30th part of the log, by Arbuthnot at the 16th part of the hin, or 32d of the ſeah, amounting to five eighths of an Engliſh pint.

The *caph* does not occur in Scripture as the name of any meaſure.

CAPHAR, a toll, or duty, impoſed by the Turks on the Chriſtian merchants, who carry or ſend merchandiſes from Aleppo to Jeruſalem.

The *caphar* was firſt ſettled by the Chriſtians themſelves, when maſters of the Holy Land, for the ſupport of troops and forces poſted in the more difficult paſſes, to watch the Arabs, and prevent their pillages. But the Turks, who have continued, and even raiſed the toll, abuſe it; exacting arbitrary ſums of the Chriſtian merchants and travellers, on pretence of guarding them from the Arabs; with whom they yet frequently keep an underſtanding, and even favour their robberies.

CAPHURA, the ſame with *camphor*. The Arabians call it caphur and cofor. The authors who have written firſt of the navigation and trade of the Eaſt Indies, have diſtinguiſhed three kinds of camphor, which they ſay are put to different uſes, and bear a different price in the Indies. See Camphor.

CAPI-AGA, or Capi-Agassi, a Turkiſh officer, who is governor of the gates of the Seraglio; or grand maſter of the Seraglio.

The *capi-aga* is the firſt dignity among the white eunuchs: he is always near the perſon of the grand ſignior: he introduces embaſſadors to their audience: nobody enters, or goes out of the grand ſignior's apartment, but by his means. His office gives him the privilege of wearing the turban in the Seraglio, and of going every where on horſeback. He accompanies the grand ſignior to the apartment of the ſultanas, but ſtops at the door without entering. His appointment is very moderate; the grand ſignior bears the expence of his table, and allows him at the rate of about ſixty French livres per day; but his office brings him in abundance of preſents; no affair of conſequence coming to the emperor's knowledge, without paſſing through his hand. The *capi-aga* cannot be baſhaw when he quits his poſt.

CAPIAS, a writ, or proceſs, which is of two ſorts; one before judgment, called *Capias ad reſpondendum*; granted in an action perſonal, when the ſheriff, upon the firſt writ of diſtreſs, returns, *Nihil habet in balliva noſtra.*

The other is a writ of execution after judgment, which is alſo of various kinds; as, *Capias ad ſatisfaciendum*, *Capias pro fine*, *Capias utlagatum*, &c.

Capias *ad ſatisfaciendum*, is a writ of execution after judgment; lying where a man recovers in an action perſonal, as for debt, damage, &c. in which caſes, this writ iſſues to the ſheriff, commanding him to take the body of him againſt whom the debt is recovered; who is to be kept in priſon till he make ſatisfaction.

It is uſual to take out this writ, where the defendant hath no lands nor goods, whereof the debt recovered may be levied: and when the body is taken upon a *Ca. Sa.* and the writ is returned and filed, it is an abſolute and perfect execution againſt the defendant, and no other execution can be againſt his lands and goods. But this is unleſs the defendant eſcape, or die in execution, &c. for where a perſon dies in execution, his lands and goods are liable to ſatisfy judgment, by ſtat. 21 Jac. I. c. 24.

Capias *pro fine*, is where one being by judgment fined to the king, upon ſome offence againſt a ſtatute, does not diſcharge it according to the judgment: by this writ, therefore, his body is to be taken, and committed to priſon till he pay the fine.

It is uſed in other caſes, for not making out ſome pleas in civil actions. 3 Rep. 12.

CAPIAS *utlegatum*, a writ which lies againſt one outlawed upon any action, perſonal or criminal; by which the ſheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in ſafe cuſtody till the day of return; when he is to preſent him to the court, to be there further ordered for his contempt.

CAPIAS *in Withernam*. See WITHERNAM.

CAPIAS *conductos ad proficiſcendum*, an original writ, which lies, by the common law, againſt any ſoldier who has covenanted to ſerve the king in war, and appears not at the time and place appointed. It is directed to two of the king's ſerjeants at arms, to arreſt and take him wherever he may be found; and to bring him *coram concilio noſtro*, with a clauſe of aſſiſtance.

CAPIATUR, *judgment quod*. When the plaintiff had obtained judgment, it was formerly conſidered that the defendant ſhould be either amerced, for his wilful delay of juſtice in not immediately obeying the king's writ, by rendering the plaintiff his due; or be taken up, *capiatur*, to pay a fine to the king, in caſe of any forcible injury. But now, by ſtat. 5 and 6 W. and M. c. 12. no writ of *capias* ſhall iſſue for this fine, but the plaintiff ſhall pay 6*s*. 8*d*. and be allowed it againſt the defendant in his other coſts. In the court of common pleas, they enter that the fine is remitted; but in the court of king's bench, they take no notice of any fine or *capias* at all.

CAPICATINGA, in the *Materia Medica*, a name by which ſome authors have called the *acorus Aſiaticus*, or Aſiatic ſweet-flag.

CAPIDODIUS, in *Ichthyology*, a name given by Paulus Jovius, and ſome others, to the fiſh we call the GRAMPUS, and the generality of authors the ORCA. According to the Artedian ſyſtem, it is a ſpecies of the *delphinus* or dolphin; and it is diſtinguiſhed by that author by the name of the dolphin with the ſnout bending upwards, and with broad ſerrated teeth.

CAPIGI, a porter, or door-keeper of the Turkiſh Seraglio. There are about five hundred *capigis*, or porters in the Seraglio, divided into two companies; one conſiſting of three hundred, under a chief called *Capigi-Baſſa*, who has a ſtipend of three ducats per day; the other conſiſts of two hundred, diſtinguiſhed by the name of *Cuccicapigi*, and their chief *Cuccicapigi-Baſſa*, who has two ducats. The *capigis* have from ſeven to fifteen aſpers per day; ſome more, others leſs. Their buſineſs is to aſſiſt the janizaries in the guard of the firſt and ſecond gates of the Seraglio; ſometimes all together; as when the Turk holds a general council, receives an embaſſador, or goes to the moſque; and ſometimes only in part; being ranged on either ſide, to prevent people entering with arms, any tumults being made, &c. The word, in its original, ſignifies *gate*.

CAPILLAMENT, literally ſignifies *hair*, being formed of the Latin *capillus*, of *caput*, q. d. *hair of the head*. Hence the word is figuratively applied to ſeveral things, which, on account of their length, or their fineneſs, reſemble hairs: as,

CAPILLAMENTS *of the nerves*, the fine fibres, or filaments, whereof the nerves are compoſed.

CAPILLAMENTS, in *Botany*, more uſually called STAMINA, are thoſe ſmall threads, or hairs, which grow up in the middle of flowers; and are headed with little knobs, called APICES.

Bradley ſeems to reſtrain *capillaments* to the ſmaller flowers; and *ſtamina* (which he corruptly calls *apices)* to the larger.

CAPILLAMENT is alſo applied to the ſtrings or threads about the roots of plants.

CAPILLARY, of the Latin *capillus*, *a hair*, is applied to ſeveral things, to intimate their exceeding ſmallneſs, or fineneſs, reſembling that of a hair.

CAPILLARY *veſſels*, in *Anatomy*, are the leaſt, minuteſt, inſenſible ramifications of the veins and arteries; which, when cut, or broken, yield but very little blood.

The *capillary* veſſels ſhould be conceived as vaſtly finer than hairs: they are beſt compared to the threads of cobwebs, and are ſometimes called *evaneſcent* veſſels.

CAPILLARY, or CAPILLACEOUS *plants*, a ſpecies of plants, thus denominated from their form, and manner of growth, as having no principal ſtalk, or ſtem, with branches, &c. ſhooting out of the ſame; but growing from the ground, like hairs from the head: and bearing their ſeed in little tufts, or prominences, on the backſide of their leaves.

The principal of theſe is, the *capilla veneris*, or ADIANTUM; from which the reſt take their name.

This genus is placed in Linnæus's twenty-fourth claſs, entitled *Cryptogamia*; where he has ranged the ferns, maidenhairs, polypodium, &c. with the moſs, muſhroom, and all thoſe plants which do not produce flowers conſpicuous to the naked eye; being either concealed in their fructification, or ſo ſmall as not to be perceived without the help of glaſſes. The firſt order of this claſs is ferns, &c. moſt of which have their flowers and ſeeds on the backs of their leaves.

Capillary plants amount to much the ſame with what are otherwiſe denominated ACAULOSE plants. See Phil. Tranſ. Nº 186. p. 284.

All the *capillaries* are reputed of uſe in medicine, eſpecially in the making of pectoral ſyrups; to which, wonderful virtues are attributed. But, in effect, only the *capillary* of Montpelier, *adiantum album Monſpelienſe*, and that of Canada, *adiantum album Canadenſe*, are regularly uſed for that purpoſe: the reſt only ſerve to counterfeit them.

CAPILLARIS or CAPILLATA, *Arbor*, an ancient tree at Rome, on which the feſtal virgins when ſhaven for their office, hung up their hair, and conſecrated it to the gods.

CAPILLARY is alſo uſed by *Mineraliſts* in ſpeaking of ores which ramify or ſhoot out fine branches like threads.

In which ſenſe it amounts to the ſame with what is otherwiſe called *arboreſcent* and *ſtriated*. Woodward ſpeaks of *capillary* or arboreſcent ſilver, and iron; Grew deſcribes a piece of pure *capillary* copper from the mine at Heragrunt, the ſeveral ſtriæ, or capilli of which are ſhort, of a reddiſh golden colour, growing together almoſt like thoſe of the little ſtone-moſs.

CAPILLARY *roots*. See FIBROSE *roots*.

CAPILLARY *tubes*, in *Phyſics*, are little pipes, whoſe canals are the narroweſt poſſible; not ſuch, whoſe diameters do not exceed that of a common hair; for none ſuch can be made. The uſual diameter of *capillary* tubes, is a half, third, or fourth of a line: though Dr. Hook aſſures us he drew tubes in the flame of a lamp much ſmaller, as fine almoſt as a thread of a cobweb.

CAPILLARY *tubes*, *the aſcent of water*, *&c. in*, is a famous phænomenon which has long embarraſſed the philoſophers. Let one end of a ſmall tube, open at both ends, be immerged in water, and the liquor within the tube will riſe to ſome ſenſible height above the external ſurface: or immerge two or more tubes in the ſame fluid, one of them a *capillary* one, and the other conſiderably larger; the water will aſcend conſiderably higher in the *capillary* tube than the other, in the reciprocal ratio of the diameters of the tubes, both in open air and in vacuo. See ASCENT.

Mr. Hauksbee, and others, have recourſe to the attraction of the annuli of the concave ſurface of the tube; to which opinion Dr. Morgan ſubſcribes.

But ſince in every *capillary* tube, the height to which the water will ſpontaneouſly aſcend, is reciprocally as the diameter of the tube; it follows, that the ſurface, containing the ſuſpended water, is always a given quantity. But the column of water ſuſpended in every tube, is as the diameter of the tube: therefore, if the attraction of the containing ſurface be the cauſe of the water's ſuſpenſion; it will follow, that equal cauſes produce unequal effects; which is abſurd. And, again, not only his ſolution, but his phænomenon alſo, is extended too far: for it is not in all fluids that the phænomenon obtains; but in mercury the very contrary is found; that fluid in a tube not riſing ſo high as the level of that in the veſſel; and the defect being found the greater, as the tube is ſmaller.

We muſt, therefore, recur to Dr. Jurin's ſolution of this phænomenon, which is well ſupported by experiments. "The ſuſpenſion of the water (on that gentleman's "ſyſtem) is owing to the attraction of the periphery of "the concave ſurface of the tube, to which the upper "ſurface of the water is contiguous, and adheres;" this being the only part of the tube, from which the water muſt recede upon its ſubſiding; and conſequently the only one which, by the force of its coheſion and attraction, oppoſes the deſcent of the water. This he ſhews to be a cauſe proportional to the effect; becauſe the periphery, and the ſuſpended column, are both in the ſame proportion as the diameter of the tube. The ſuſpenſion thus accounted for, the ſeemingly ſpontaneous aſcent will eaſily be ſolved: for ſince the water that enters a *capillary* tube, as ſoon as its orifice is dipped therein, has its gravity taken off by the attraction of the periphery, with which its upper ſurface is in contact, it muſt neceſſarily riſe higher; partly by the preſſure of the ſtagnant water, and partly by the attraction of the periphery, immediately above that which is already contiguous to it. Phil. Tranſ. abr. vol. iv. p. 423, &c. Nº 355. or Cotes's Hyd. and Pneum. Lect. p. 265.

Some doubt whether the law holds throughout, of the aſcent of the fluid being always higher as the TUBE is ſmaller; Dr. Hook's experiments, with tubes almoſt as fine as cobwebs, ſeem to ſhew the contrary. The water in theſe, he obſerves, did not riſe ſo high as one would have expected. The higheſt he ever found was at 21 inches above the level of the water in the baſon, which is much ſhort of what it ought to have been by the law above mentioned.

Capillary tubes which naturally diſcharge water only in ſeparate drops, yield, when electrified, a continued and accelerated ſtream; and the acceleration is proportional to the ſmallneſs of the tube: and the effect of electricity is ſo conſiderable, that it produces a continued ſtream from a very ſmall tube, out of which the water had not before been able to drop. Prieſtley's Hiſt. Electr. 8vo. vol. i. p. 171. ed. 3d.

Capillary *veſſels*. Many ſmall veſſels of animal bodies have been diſcovered by the modern invention of injecting the veſſels of animals with a coloured fluid, which upon cooling grows hard. But though moſt anatomiſts know the manner of filling the large trunks, few are acquainted with the art of filling the *capillaries*. Mr. Monro has given us what he, after many trials, has found moſt ſucceſsful, in the Medic. Eſſ. Edinb. vol. i. art. 9. where he enters into a very nice detail of the operation, to which we muſt refer the curious. Some particulars we ſhall give under the head INJECTION.

Capillary *worms*, in children, are the ſame with what are otherwiſe called CRINONES, *comodones*, and *dracunculi*.

Capillary *fracture*. See CAPILLATION.

CAPILLATION, or Capillary *fracture*, according to ſome writers, is a fracture in the ſkull, ſo ſmall that it can ſcarce be perceived; but yet it often proves mortal. See FRACTURE.

CAPILLITIUM *Veneris*, in *Phyſiology*, denotes a meteor appearing in the air, in form of fine threads reſembling a ſpider's web.

Some think that the *capillitium Veneris* derives its origin from a cloud, the watery parts of which having been exhaled by the ſun's heat, only the earthy and ſulphureous parts are left behind, which ſhoot into this figure.

It is ſometimes alſo found hanging about woods and coppices, or even extended on the ground like a fine net, frequently enough miſtaken for ſpiders webs.

CAPILLUS. See HAIR.

Capillus *Veneris*. See ADIANTUM.

CAPIPLENIUM, from *caput*, *head*, and *plenus*, *full*, is uſed by ſome authors for a catarrh; but more properly, by the Italian phyſicians, for a continual heavineſs of the head, frequent at Rome, and almoſt endemic.

CAPISCOLUS, or Capischolus, in *Eccleſiaſtical Writers*, denotes a dignitary in certain cathedrals, who had the ſuperintendency of the choir, or band of muſic, anſwering to what in other churches is called CHANTER or *precentor*.

The word is alſo written *cabiſcolus*, and *caputſcholæ*, q. d. *the head of the ſchool*, or *band of muſic*.

The *capiſcolus* is alſo called *ſcolaſticus*, as having the inſtruction of the young clerks and choriſters, how to perform their duty.

CAPISTRUM, among the *Ancient Muſicians*, was a kind of headſtall, or bridle made of leather, faſtened round the head, which paſſing over the mouth, compreſſed the lips and cheeks ſo cloſe, that the perſon, whatever effort he made, could not give his pipe, or flute, above the due quantity of wind requiſite to make it ſpeak.

The figure of a muſician equipt with a *capiſtrum*, is given by Salmaſius, who maintains it to be that of Marſyas the ſatyr, who, according to Plutarch, was the inventor of this inſtrument; in virtue of which he had even dared to contend with Apollo. It was copied from an ancient ſeal, formerly belonging to Velſerus. Plut. Sympoſ. lib. vii. cap. 8. Salmaſ. Exerc. ad Solin. p. 585.

Some pretend that the uſe of the *capiſtrum* was to hide the deformity of bloated cheeks, and a gaping mouth, eſpecially where the teeth were bad; others, that it was intended to ſave the lips and cheeks from being extended ſo as to endanger burſting; others, to fortify the part, that it might yield the ſtronger noiſe. But the chief uſe appears to have been, to temper and moderate the breath, and prevent its animating the pipe beyond the due pitch. See PHORBÆA.

The chemiſts give the denomination *capiſtrum auri* to BORAX.

Capistrum, in *Surgery*, a headſtall, or bandage uſed in caſe of injuries of the head, eſpecially fractures of the jaw.

CAPITA, or Capitum, in *Antiquity*, denotes a tax among the Romans for the maintenance of the horſes in the army, levied according to the number of heads thereof.

Capita, *diſtribution by*, is ſuch a diſtribution, that every man has an equal ſhare of *perſonal* eſtate, when all the claimants claim in their own rights, as in equal degree of kindred, and not *jure repreſentationis*. Blackſt. Com. vol. ii. p. 517.

Capita, *ſucceſſion by*, is that where the claimants are next in degree to the anceſtor, in their own right, and not by right of repreſentation. Blackſt. Com. vol. ii. p. 218.

CAPITAL, of the Latin *caput*, is uſed on various occaſions, to expreſs the relation of a head, chief, or principal: thus,

Capital *city*, intimates the principal CITY of a kingdom, province, or ſtate; as, London is the *capital*, or *capital city* of England; Moſcow, of Ruſſia; Conſtantinople, of the Ottoman empire; Rouen, of Normandy, &c. See METROPOLIS.

M. Bayle has a diſcourſe on the advantages of being born and living in the *capital* of the country.

Capital *court*, *capitalis curia*, the chief manor-houſe, or place-houſe where the lord of the manor holds his COURT; called alſo in Kent the court-lodge.

Capital court is ſometimes uſed for the ſame with *capital* MESSUAGE.

Capital *honour*, *capitalis honor*, denotes the chief honour, or prime barony of the whole county, as that in ancient times uſually enjoyed by the count or earl of ſuch county.

Capital *lord*, *capitalis dominus*, the lord of the fee, from whom the eſtate is held by inferior tenants.

Capital *picture*, in *Painting*, denotes one of the moſt excellent pieces of any celebrated maſter.

F. Chamillard gives a liſt of the pieces of each famous painter, and the places where they are found.

Capital, or Capital *ſtock*, in *Commerce*, is the fund, or ſtock, of a trading company, or corporation; or the ſum of money which they jointly furniſh, or contribute, to be employed in trade.

It is alſo uſed to denote the ſtock which a merchant or tradeſman employs in buſineſs on his own account.

The power given by parliament to the South-ſea company, to increaſe their *capital*, was the ſource of all the miſchief which enſued in the year 1720.

Capital, in *Money Matters*, denotes the ſum of money put out to intereſt.

In which ſenſe it amounts to the ſame with *principal*, and ſtands oppoſed to *intereſt*.

Capital *crime*, is that which ſubjects the criminal to a *capital* puniſhment; i. e. to the loſs of life, either natural, or civil.

Capital *lees*, are the ſtrong lees made by the ſoap-boilers from pot-aſhes.

They are alſo uſed, in *Surgery*, as a cauſtic; and to make the *lapis infernalis*.

Capital *letters*. See CAPITALS.

Capital *medicines*, in *Pharmacy*, are the great, or principal preparations of the ſhops: theſe are remarkable for the number of their ingredients, and their extraordinary virtues; ſuch as Venice treacle, mithridate, &c.

Capital, in *Architecture*, the uppermoſt part of a column, or pilaſter, ſerving as the head, or crowning thereof; placed immediately over the ſhaft, and under the entablature.

Capital *of a column*, properly, is that whoſe plan is round. Whereas the CAPITAL *of a pilaſter* is that whoſe plan is ſquare, or at leaſt rectilinear.

The *capital* is a principal and eſſential part of an order of column, or pilaſter: it is made differently in the different orders; and is that which chiefly diſtinguiſhes and characteriſes the orders themſelves.

Capital, *Tuſcan*, is the moſt ſimple and unadorned: its members, or parts, are but three; viz. an abacus; under this, an ovolo, or quarter-round; and under that, a gorge, or colarino. The gorge, or neck, terminates in an aſtragal, or fillet belonging to the fuſt, or ſhaft.—See *Tab. Archit. fig.* 24.

The character of this *capital*, whereby it is diſtinguiſhed from the Doric, &c. is, that the abacus is ſquare, and quite plain, and has no ogee, or other moulding; and that there are no annulets under the ovolo.

Indeed, authors vary a little as to the character of the Tuſcan *capital*. Vignola gives the abacus a fillet, in lieu of an ovolo; Vitruvius and Scamozzi add an aſtragal and fillet, between the ovolo and neck; Serlio only a fillet; Philander rounds the corner of the abacus. In the Trajan column there is no neck; but the aſtragal of the ſhaft is confounded with that of the *capital*.

The height of this *capital* is the ſame with that of the baſe, viz. one module, or ſemidiameter. Its projecture is equal to that of the cincture at the bottom of the column; viz. eight fifths of the module. See COLUMN.

Capital, *Doric*, beſide an abacus, an ovolo, and a gorge, in common with the Tuſcan, has three annulets, or little ſquare members, underneath the ovolo, in lieu of the aſtragal in the Tuſcan; and a talon, cima, or ogee, with a fillet over the abacus. See *fig.* 25.

Authors vary too, as to the characters of this *capital*: Palladio, Vignola, &c. put roſes under the corners of the abacus, and in the neck of the *capital*.

The height of this *capital*, Vitruvius, &c. make one module;

dule; and its projecture thirty-ſeven minutes and an half.—See *Tab. Archit. fig.* 25.

CAPITAL, *Ionic*, is compoſed of three parts: an abacus, conſiſting of an ogee, and a fillet; under this a rind, which produces the volutes, or ſcrolls, the moſt eſſential part of this *capital*; and, at the bottom, an ovolo, or quarter-round: the aſtragal, under the ovolo, belongs to the ſhaft. The middle part is called a *rind*, or bark, from its ſuppoſed reſemblance to the bark of a tree laid on a vaſe, whoſe brim is repreſented by the ovolo, and ſeeming to have been ſhrunk up in drying, and to have twiſted into the volutes.

The ovolo is adorned with eggs, as they are ſometimes called, from their oval form: the Greeks call it the *echinos*.

The height of this *capital*, M. Perrault makes eighteen minutes; its projecture, one module, ſeven tenths.—See *Tab. Archit. fig.* 26.

The differences in the character of this *capital* flow moſtly from the different management of the volutes; and conſiſt in this: that in the antique, and ſome of the modern, the eye of the volute anſwers not the aſtragal of the top of the ſhaft, as Vitruvius, and moſt of the moderns, make it: that the face of the volutes, which uſually make a flat, is ſometimes curved and convexed, ſo that the circumvolutions go advancing outwards; as is frequent in the antique: that the border, or rim of the ſcroll in the volute, is ſometimes not only a plain ſweep, as ordinarily; but the ſweep is accompanied with a fillet: that the leaves which inveſt the balluſter, are ſometimes long and narrow; ſometimes larger and broader: that the two faces of the volutes are ſometimes joined at the outer corner; the balluſters meeting in the inner, to make a regularity between the faces on front and back of the building, with thoſe of the ſides: that among the moderns, ſince Scamozzi, the Ionic *capital* has been altered, and the four faces made alike, by taking away the balluſter, and hollowing all the faces of the volutes inwards, as in the compoſite: that Scamozzi, and ſome others, make the volutes to ſpring out from the ovolo, as from a vaſe, after the manner of the modern compoſite; whereas in the antique the bark paſſes between the ovolo and abacus quite ſtrait, only twiſting at its extremities, to form the volute. And, laſtly, that of late years the ſculptors have added a kind of little feſtoons, ſpringing from the flower whoſe ſtalk lies on the firſt circumvolution of the volute; and ſuppoſed to repreſent the locks of hair hanging down on both ſides of the face. See IONIC.

CAPITAL, *Corinthian*, is much the richeſt: it has no ovolo; and its abacus is very different from thoſe of the Tuſcan, Doric, or Ionic; as having its faces circular, and hollowed inward, with a roſe in the middle of each ſweep: inſtead of an ovolo, and annulets, here is only a brim of a vaſe; and the neck is much lengthened and enriched with a double row of eight leaves in each, bending their heads downwards; and between them, ſmall ſtalks ariſing: whence ſpring the volutes; which do not reſemble thoſe of the Ionic *capital*; and which, inſtead of the four in the Ionic, are here ſixteen: four on each ſide, under the four horns of the abacus, where the volutes meet in a ſmall leaf, which turns back towards the corner of the abacus. The leaves are divided, each making three ranges of leſſer leaves, whereof they are compoſed: each leſſer leaf is, again, generally parted into five, called *olive-leaves*; ſometimes into three, and called *laurel-leaves*: the middle leaf, which bends down, is parted into eleven. In the middle, over the leaves, is a flower, ſhooting out between the ſtems and volutes, like the roſe in the abacus. The height of this *capital* is two modules and one third; and its projecture, one and ſeven thirds.

The differences in the character of this *capital* are, that in Vitruvius, &c. the leaves are in form of the acanthus; whereas, in the antique, they are more ordinarily olive-leaves: that their leaves are uſually unequal, the undermoſt being made commonly talleſt, ſometimes the ſhorteſt; though ſometimes they are all equal. Sometimes the leaves are ruffled; ſometimes quite plain: the firſt row generally belly out towards the bottom, but are ſometimes ſtrait; ſometimes the horns of the abacus are ſharp at the corners, which ſeems agreeable to the rules of Vitruvius; but they are more commonly cut off. There is ſome difference too, in the form and ſize of the roſe: again, the volutes are ſometimes joined to each other; ſometimes wholly ſeparate: ſometimes the ſpires of the volutes continue twiſting even to the end of the ſame courſe; and ſometimes they turn back again near the centre, in the form of an S.—See *Tab. Archit. fig.* 21. and 27.

CAPITAL, *Compoſite*, is ſo called, becauſe compoſed of members borrowed from the *capitals* of the other columns. It takes a quarter-round, or ovolo, from the Doric; an aſtragal under this, together with volutes, or ſcrolls, from the Ionic; and a double row of leaves from the Corinthian, which it reſembles in moſt other things; conſiſting, generally, of the ſame members, and the ſame proportions. In the middle of the abacus is a flower; and under the thorns, leaves which return upward, as in the Corinthian: indeed, inſtead of ſtalks in the Corinthian, the Compoſite has ſmall flowers, lying cloſe to the vaſe, or bell; twiſting round towards the middle of the face of the *capital*, and terminating in the roſe.

The height of the Compoſite *capital* is two modules and one third; and its projecture, one module and two thirds, as in the Corinthian.—See *Tab. Archit. fig.* 28.

The differences of the character of this *capital* conſiſt in this; that the volutes, which ordinarily deſcend, and touch the leaves, are, in ſome works of the antique, ſeparate from them: that the leaves, which are generally unequal in height, the lower rank being talleſt, are ſometimes equal: that the volutes of the moderns generally ſpring out of the vaſe; whereas, in the antique, they ordinarily run ſtrait the length of the abacus, over the ovolo, without ſtriking into the vaſe: that the volutes, whoſe thickneſs is contracted in the middle, and enlarged above and below in the antique, have their ſides parallel in the works of the moderns: and, laſtly, that the volutes, which have been hitherto, both by the ancients and moderns, made as if ſolid, are now much lighter, and more airy; the folds ſtanding hollow, and at a diſtance from each other.

For the proportions of the ſeveral members of the *capitals* of columns, ſee COLUMN. See alſo each member under its proper head; as ABACUS, ACANTHUS, VOLUTE, &c.

Some architects diſtinguiſh the Tuſcan and Doric *capitals*, which have no ornaments, by the title of *capitals of mouldings*; and the three others, which have leaves and ornaments, they call *capitals of ſculpture*.

CAPITAL, *Angular*, is that which bears the return of an entablature, at the corner of the projecture of a frontiſpiece.

CAPITAL, *Folded*, in *Architecture*, that of a pilaſter in a re-entering angle, whether right or obtuſe.

CAPITAL, *Mutilated*, that whoſe projecture is leſs on one ſide than on another, as being too near ſome adjacent body or angle.

CAPITAL, *Attic*, that which has water-leaves in the gorgerin.

CAPITALS, *Symbolical*, thoſe adorned with the attributes of heathen deities. Such are moſt of the antique *capitals*, in which we find thunderbolts and eagles for Jupiter, trophies for Mars, lyres for Apollo, &c. Such alſo among the moderns are thoſe which bear the arms and devices of a nation, the marks of a victory, a dignity, or the like.

CAPITAL *of a Balluſter*, is that part which crowns the balluſter; which ſometimes bears a reſemblance to the *capitals* of ſome columns, particularly the Ionic.

CAPITAL *of a Niche*, is a kind of little canopy over a ſhallow niche, covering or crowning a ſtatue.

CAPITAL *of a Triglyph*, is the plat-band over the triglyph; called, by Vitruvius, *tænia*. It is ſometimes alſo a triglyph which does the office of a *capital* to a Doric pilaſter.

The *capitals* of triglyphs, according to Vitruvius, are to be a ſixth part of the module. Over them is to be placed a corona.

CAPITAL, in *Chemiſtry*, ſignifies the head of an ALEMBIC.

CAPITAL *of a Baſtion*, in *Fortification*, is a line drawn from the angle of the polygon to the point of the BASTION.

The *capitals* of baſtions are from thirty-five to forty fathoms long, from the point of the baſtion to the point where the two demigorges meet.

CAPITAL *of a Lanthorn*, the covering which terminates the lanthorn of a dome, either in the figure of a bell, as that of the Sorbonne; or of a cupola, or a ſpiral, as that of the church of Sapienza at Rome.

CAPITAL *of a Mill*, the covering thereof in form of a cone, which turns vertically on the round tower, in order to expoſe the ſails to the wind.

CAPITALS, in *Printing*, large or initial letters, wherein titles, &c. are compoſed; and with which all periods, verſes, &c. commence.

All proper names of men, countries, kingdoms, terms of arts, ſciences, and dignities, uſually begin with *capitals*.

The ancient MSS. both Greek and Latin, are written wholly in *capitals*.

In the early days of printing, there were alſo ſeveral editions of books in *capitals*, as of Homer, the Greek Anthology, Apollonius, &c. Johannis Laſcaris ſeems to have brought the ancient printers to give editions in *capitals*.

Capitalis *reflexa*, in *Surgery*. See Capeline.

CAPITANA, or Captain *galley*, the chief or principal galley of a ſtate, not dignified with the title of a kingdom.

The *capitane* was anciently the denomination of the chief galley of France, which the commander went on board of. But ſince the ſuppreſſion of the office of captain general of the gallies in 1669, they have no *capitana*, but the firſt galley is called *reale*, and the ſecond *patrone*.

CAPITANEATE, in a general ſenſe, the ſame with capitania.

Capitaneates, in Pruſſia, are a kind of noble feuds, or eſtates, which, beſides their revenue, raiſe their owners to the rank of nobility. They are otherwiſe called *ſtaroſties*. Bibl. Germ. tom. vi. p. 11.

CAPITANEI, or Catanei, in Italy, was a denomination given to all dukes, marquiſſes, and counts, who were called *capitanei regis*. The ſame appellation was alſo given to perſons of inferior rank who were inveſted with fees, formerly diſtinguiſhed by the appellation *valvaſores majores*. Du-Cange.

CAPITANEUS, in *Ancient Law Writers*, denotes a tenant in capite, or chief.

Capitaneus *eccleſiæ*, the ſame with *advocate*. Du-Cange, Gloſſ. Lat. tom. i. p. 802.

CAPITANIA, the office or dignity of a captain, and more eſpecially a perpetual feud. See Capitaneate.

Capitania is alſo a denomination given to the twelve governments eſtabliſhed by the Portugueſe in Braſil.

CAPITATÆ *Plantæ*, in *Botany*, are thoſe plants whoſe flowers are fiſtular, compoſed of many edged and hollow little flowers. They were thus called by Mr. Ray, becauſe their ſcaly calyx (or cup of the flower) moſt uſually ſwells out into a large and round head, containing within it the pappous ſeed: as in the carduus, centaury, knapweed, cinara, cirſium, lappa major, cyanus, &c.

CAPITATION, a tax, or impoſition, raiſed on each perſon, in conſideration of his labour, induſtry, office, rank, &c. This kind of tribute is very ancient, and anſwers to what the Greeks called επικεφαλαιον; the Latins, *capita*, *capitatio*, and *tributum*, or *tributum capitis*, or *capitulare*. By this term, taxes on the perſon are diſtinguiſhed from taxes on merchandiſe, which were called *vectigalia*, *quia vehebantur*.

Capitation alſo denotes a certain ſum of money impoſed per head, in exigencies of ſtate.

CAPITATUS, in *Ichthyology*, a name given by Johannes Cuba, and ſome others, to that fiſh which we commonly call the bull-head, and miller's thumb, the *cottus* and *gobio capitatus* of authors. It is of the genus of the *cotti*, according to the Artedian ſyſtem, and is diſtinguiſhed by that author by the name of the ſmooth ſcaleleſs *cottus*.

CAPITE, in *Law*, an ancient tenure, whereby a perſon held of the king immediately, as of his crown, either by knight's ſervice, or ſoccage.

By a ſtatute, 12 Car. II. c. 24. all ſuch tenures by knight's ſervice of the king, or of any other perſon, knight's ſervices *in capite*, or soccage, with all rights, &c. are annulled.

Capite *cenſi*, in *Antiquity*, the loweſt rank of Roman citizens, who in public taxes were rated the leaſt of all, being ſuch as were never worth above 365 aſſes.

They were ſuppoſed to have been thus called, becauſe they were rather counted and marſhalled by their heads than their eſtates. Aul. Gell. lib. vii. cap. 13.

The *capite cenſi* made part of the ſixth claſs of citizens, being below the *proletarii*, who formed the other moiety of that claſs.

The *capite cenſi* were not enrolled in the army, as being judged not able to ſupport the expences of war; for in thoſe days the ſoldiers maintained themſelves. It does not appear that before Caius Marius any of the Roman generals liſted the *capite cenſi* in their armies. Salluſt. Jug. p. 135.

CAPITIS *nonus*, in *Anatomy*, the name given by Fallopius to one of the muſcles of the head, deſcribed by Albinus under the name of the *rectus capitis internus major*, and by Winſlow and others under that of the *rectus capitis anterior longus*. See Head.

Capitis *par tertium*, in *Anatomy*, a name given by Fallopius and others of his time, to a muſcle ſince called, by Winſlow, complexus *minor*, and *maſtoidæus lateralis*; and, by Cowper and Albinus, *trachelomaſtoidæus*.

CAPITO, in *Ichthyology*, the *chub*; it is alſo called by ſome authors the *cephalus* and *ſqualus*, and *cyprinus*, and in ſome parts of England the *chevin*. It is a longer-bodied fiſh than the carp; and its head is black, large, and ſomewhat flat.

It has no teeth either in the jaws, palate, tongue, or throat; its tail is forked, and all its fins are of a bluiſh black colour. Its belly is ſomewhat prominent; it is a river-fiſh, and loves the covert of old ſtumps of trees and hollow banks, and gives the angler much diverſion; it will not live in ponds; it ſpawns in May, and is in beſt ſeaſon in April, when full of ſpawn, but is never a very delicate fiſh. Ray. See Chub.

Capito is alſo a name given by ſeveral authors to the *mugil* or *mullet*. Gaza ſeems to have given riſe to this error: he found the word cephalus in Ariſtotle as the name of the mullet, and tranſlated it by the word *capito*; not conſidering that he by that name confounded this fiſh with another, namely, the chub.

Capito *anodromus*, in *Ichthyology*. See Zerta.

Capito *cæruleus*, the blue *chub*, a fiſh common in the Danube, and other of the large rivers in Germany, and frequently called the jentling.

Capito *rapax*, in *Zoology*, a name given by ſome authors to the corvus *piſcis*, a fiſh of the ſhape of our river-chub.

CAPITOL, Capitolium, in *Antiquity*, a famous fort, or caſtle, on the Mons Capitolinus at Rome, wherein was a temple dedicated to Jupiter, thence alſo denominated *Capitolinus*, in which the ſenate anciently aſſembled; and which ſtill ſerves as the city-hall, or town-houſe, for the meeting of the conſervators of the Roman people.

It had its name, *capitol*, from *caput*, *a man's head*; ſaid to have been found freſh, and yet bleeding, upon digging the foundation of the temple, built in honour of Jupiter. Arnobius adds, that the man's name was Tolus; whence *caputtolium*.

The firſt foundations of the *capitol* were laid by Tarquin the Elder, in the year of Rome 139. His ſucceſſor, Servius, raiſed the walls; and Tarquin the Proud finiſhed it, in the year 221: but it was not conſecrated till the third year after the expulſion of the kings, and eſtabliſhment of the conſulate. The ceremony of the dedication of the temple was performed by the conſul Horatius, in 246.

The *capitol* conſiſted of three parts: a nave, ſacred to Jupiter; and two wings, or iſles, to Juno and Minerva. It was aſcended by ſtairs; Lipſius reckons one hundred in number, becauſe there were ſo many in the aſcent of the Tarpeian rock. The frontiſpiece and ſides were encompaſſed with galleries, wherein thoſe, who had the honour of a triumph, entertained the ſenate at a magnificent banquet, after the performance of ſacrifice to the gods. Both inſide and outſide were enriched with numerous ornaments; the ſtatue of Jupiter, with his golden thunderbolt, his ſceptre, and crown, were the moſt diſtinguiſhed.

In the ſame *capitol* there were, likewiſe, a temple to Jupiter the Guardian, and another to Juno; with the mint: and on the deſcent of the hill was the temple of Concord.

The *capitol* was burnt under Vitellius, and rebuilt under Veſpaſian: it was burnt a ſecond time by lightning, under Titus; and was again reſtored by Domitian.

Anciently, the name *capitol* was likewiſe applied to all the principal temples, in moſt of the colonies throughout the Roman empire: as, at Conſtantinople, Jeruſalem, Carthage, Ravenna, Capua, &c.

CAPITOLINE *Games*, *Ludi* Capitolini, were annual games, or combats, inſtituted by Camillus, in honour of Jupiter Capitolinus; and in commemoration of the capitol's not being ſurpriſed by the Gauls.

Plutarch tells us, that a part of the ceremony conſiſted in the public cryer's putting up the Hetrurians to ſale by auction: they alſo took an old man, tying a golden bulla to his neck, ſuch as were worn by their children, and expoſed him to the public deriſion Feſtus ſays, they dreſſed him in a prætexta, hung a bulla at his neck; not as accounting him a child, but becauſe this was an ornament of the kings of Hetruria.

There was alſo another kind of *capitoline* games, called *agones capitolini*, inſtituted by Domitian, and celebrated each five years; wherein there were rewards and crowns beſtowed on the victorious poets, and put on their heads by the emperor himſelf. Theſe games became ſo celebrated, that the manner of accounting time by luſtres, which had obtained till then, was changed; and they began to count by *capitoline* games, as the Greeks by olympiads. The feaſt was not for poets alone, but alſo for athletæ, orators, hiſtorians, comedians, muſicians, &c.

CAPITOLINI, in *Roman Antiquity*, a college of men reſiding in the capital and arx, to whom was committed the care of celebrating the Capitoline games.

CAPITOUL, or Capitol, an appellation given to the chief magiſtrates of Tholouſe, who have the adminiſtration of juſtice and policy both civil and mercantile in the city.

The *capitouls* at Tholouſe are much the ſame with the echevins at Paris, and the conſuls, bailiffs, burgermaſters, mayors, and aldermen, &c. in other cities. In ancient acts they are called *conſules capitularii*, or *capitolini*, and their body *capitulum*. From this laſt come the words *capitularii* and *capitouls*. The appellative *capitolini* aroſe hence, that they have the charge and cuſtody of the town-houſe, which was anciently called *capitol*.

The office only laſts one year, and ennobles the bearers. In ſome ancient acts they are called *capitulum nobilium Toloſæ*. Thoſe who have borne it, ſtyle themſelves afterwards burgeſſes. They are called to all general councils, and have the *jus imaginum*; that is, when the year of their adminiſtration is expired, their pictures are drawn in the town-houſe; a cuſtom which they have retained from the ancient Romans, as may be ſeen in Sigonius.

CAPITOULATE, an appellation given to the ſeveral quarters or diſtricts of the city of Tholouſe, each under the direction of a CAPITOUL; much like the wards of London, under their aldermen.

Tholouſe is now divided into eight *capitoulates* or quarters, which are ſubdivided into *moulans*, each of which has its tithing-man, whoſe buſineſs is to inform the *capitoul* of what paſſes in his tithing, and to inform the inhabitants of the tithing, of the orders of the *capitoul*.

CAPITULA *ruralia*, denote chapters held by the rural dean and clergy within the precincts of each deanry, anciently held every three weeks, then once a month, and more ſolemnly once a quarter.

CAPITULAR, or CAPITULARY, denotes an act paſſed in a chapter, either of knights, canons, or religious.

The *capitularia*, or *capitulars* of Charlemagne, Charles the Bald, &c. are the laws, both eccleſiaſtical and civil, made by thoſe emperors in the general councils, or aſſemblies of the people: which was the way in which the conſtitutions of moſt of the ancient princes were made; each perſon preſent, though a plebeian, ſetting his hand to them.

Some diſtinguiſh theſe from laws; and ſay, they were only ſupplements to laws.—They had their name, *capitulars*, becauſe divided into *capitula*, chapters, or ſections. In theſe *capitulars* did the whole French juriſprudence anciently conſiſt.—In proceſs of time, the name was changed for that of *ordonnances*.

Some diſtinguiſh three kinds of *capitulars*, according to the difference of their ſubject-matter: thoſe on eccleſiaſtical affairs, are really canons, extracted from councils; thoſe on ſecular affairs, real laws; thoſe relating to particular perſons, or occaſions, private regulations.

CAPITULATION, a treaty made with the garriſon, or inhabitants of a place beſieged; whereby they ſurrender themſelves up, on certain articles and conditions ſtipulated with the beſiegers.

Before a ſurrender, the governor of the garriſon gives orders for beating the CHAMADE, and for fixing one or more white colours on the rampart; one of which remains either on the breach or rampart, during the time of negociation. When the chamade is beat, the fire ceaſes on both ſides, and the governor ſends ſome officers of diſtinction to the commander in chief of the beſiegers, who deliver to him the conditions on which the governor propoſes to ſurrender the town: and as a ſecurity for theſe officers, the beſiegers ſend a like number into the town. If the governor's conditions are not ſatisfactory to the general of the beſiegers, he preſcribes the conditions of ſurrender; threatening to allow no conditions, if thoſe propoſed are not complied with within a certain time. If the conditions are too hard, the officers return, and the drums are beat upon the rampart, for the recommencement of hoſtilities. During the ſuſpenſion of arms, no work ſhould be done for the ſecurity either of the beſieged or beſiegers; however, ſtratagems are counted lawful, and ſhould be guarded againſt.

If the terms of *capitulation* are agreed upon, the governor ſends two or three of his principal officers into the camp, and the general ſends the ſame number and of the ſame rank into the town, as a ſecurity for accompliſhing the *capitulation*. When every thing is finiſhed, the hoſtages on both ſides return. The conditions of the beſieged are of various kinds, according to their circumſtances. A garriſon ſhould have proviſion and ammunition at leaſt for three days, to be entitled to a compoſition, without which they are to be made priſoners of war; but this ſhould be known, before the *capitulation* is ſigned. When the *capitulation* is ſettled, an officer of artillery from the beſiegers comes into the place with an officer of artillery from the garriſon, who takes an inventory of all the artillery and ammunition remaining; and a commiſſary of proviſions takes an account of the proviſions. When the beſieged have delivered a gate of the place to the beſiegers, the firſt regiment of the army enters and mounts guard. When the garriſon leaves the place, the army of the beſiegers is put under arms, and ranged in two files, at the head of which are the general and principal officers, between which the garriſon paſſes. See farther on this ſubject, Muller's Math. &c. vol. vi. p. 197, &c.

CAPITULATION denotes alſo a kind of treaty, *pacta conventa*, or original contract, drawn up by the electors, before the election of an emperor; which the emperor is to ratify before his coronation, and to obſerve inviolably in the courſe of his reign.

Theſe imperial *capitulations* have only been obtained ſince the time of Charles V. They were occaſioned by the jealouſy the German princes had entertained of the too great power of the emperor. Frederick, duke of Saxony, ſurnamed the Wiſe, paſſes for the author of the imperial *capitulations*; who, declining the empire, which was offered him after the death of Maximilian, adviſed the electors to chooſe Charles V. under ſuch conditions as might ſecure the liberty of the empire.

The deſign of the *capitulation* is, on the one hand, to prevent the emperor from abuſing his power to the oppreſſion of the people; and on the other, to prevent the people from breaking in on the juſt rights of the emperor. The imperial *capitulations* are conſidered as fundamental laws of the empire; and though the drawing up, preſenting, procuring the ſignature, and taking care of the execution of it, be committed to the electors, it is reputed the act of the ſtates of the empire.

The king of the Romans alſo, when elected, ſigns the emperor's *capitulation*, as being in right of ſuch election to ſucceed to the empire after the death of the emperor.

CAPITULUM, in *Anatomy*, a little head, eſpecially of a bone, anſwering to the Greek *condylus*.

CAPITULUM, in *Botany*, the head, or compound flower, of any plant; being compoſed of many leaves and threads, or ſtamina, cloſely connected in a globous, circular, or diſcous figure; as the flowers of bluebottles, ſcabious, carduus, &c.

CAPITULUM, in the *Ancient Military Art*, was a tranſverſe beam, wherein were holes through which paſſed the ſtrings whereby the arms of huge engines, as balliſtæ, catapultæ, and ſcorpions, were played or worked. Vitruv. de Arch. lib. i. cap. 1.

CAPITULUM, in *Eccleſiaſtical Writers*, denoted part of a chapter of the Bible read and explained.

In which ſenſe they ſaid, *ire ad capitulum, to go to ſuch a lecture*. Afterwards the place or apartment where ſuch theological exerciſes were performed, was denominated *domus capituli*.

CAPWARD, in *Zoology*; in Portugueſe, a *water-dog*, which is deſcribed to be an amphibious animal, with a body like a hog, a head like a hare, and without a tail. It keeps itſelf almoſt continually on its poſteriors, like an ape. It is found in Braſil; it lives all day in the ſea, and at night comes aſhore to ravage the gardens, and to root up the trees: the fleſh is wholeſome food.

CAPIVI. See BALSAM.

CAPNELÆON, from καπνος, *ſmoke*, and ελαιον, *oil*, among *Ancient Naturaliſts*, denotes a ſpecies of reſin, which flows ſpontaneouſly, being warmer, thinner, and more fluid than all other ſorts of reſins, ſo as nearly to approach the nature of oil, and evaporating plentifully on being expoſed to the fire; whence the denomination, which imports as much as ſmoking oil. It is ſometimes alſo called *piſſanthos*, or flower of pitch.

CAPNICON, in *Antiquity*, chimney-money, or a tax which the Roman emperors levied for ſmoke, and which of conſequence was due from all, even the pooreſt, who kept a fire. This was firſt invented by Nicephorus.

CAPNISTON, among *Ancient Phyſicians*, denotes oil whoſe fumes rendered aromatic by burning ſpices, are conveyed to a part affected.

CAPNITIS, or CAPNITAS *jaſpis*, in the *Natural Hiſtory of the Ancients*, the name of a ſpecies of chalcedony, of a browniſh ground, clouded with a large miſt of blackiſh, looking like a column of ſmoke. The ancients alſo called our common chalcedony a jaſper, not allotting any peculiar generical name to theſe miſty ſtones; and the name they gave this ſpecies very happily expreſſed its character, becauſe it looks exactly as if obſcured by a cloud of thick ſmoke.

It is very common in the Eaſt Indies, and is ſometimes found in Germany and France, but is ſeldom worked into any thing better than knife-hafts.

CAPNOIDES, in *Botany*. See FUMITORY.

CAPNOMANCY, a kind of divination by means of ſmoke, uſed by the ancients in their ſacrifices.

The word comes καπνος, *ſmoke*, and μαντεια, *divination*. The general rule was, when the ſmoke was thin, and light, and roſe ſtrait up, it was a good omen: if the contrary, it was an ill one.

There was alſo another ſpecies of *capnomancy*, conſiſting in the obſervation of the ſmoke riſing from poppy and jeſſamin-ſeed, caſt upon lighted coals.

CAPO, in *Ichthyology*, a name given by Paulus Jovius and ſome others to the fiſh called *coccyx* by the ancient Greeks, *cuculus* by the Latin writers, and by ſome *lyra*. It is a ſpecies of the *triglæ*, diſtinguiſhed by Artedi by the name of the *red trigla*, with a bifid ſnout, and with the coverings of the gills ſtriated.

Capo *negro*. See Duck.

Capo *roſſo*. See Duck.

CAPOC, in *Commerce*, a ſort of cotton, ſo fine and ſo ſhort, that it cannot be ſpun. It is uſed in the Eaſt Indies to line palanquins, to make beds, matraſſes, cuſhions, pillows, &c.

CAPOLLIN, in *Botany*; *Mexicanorum Hernandez, ſeu Ceraſus dulcis Indica*. It is a tree of moderate bigneſs, with leaves like thoſe of an almond, or our country cherry-tree. The flowers hang down in bunches, which are ſucceeded by fruit reſembling our cherries. It bloſſoms in the ſpring, and bears fruit all the ſummer; it requires a temperate climate, and grows in gardens and fields in Mexico, as well ſpontaneouſly as by cultivation.

The juice of the young buds mollifies the tongue when parched by heat. A decoction of the bark being expoſed to the ſun for fifteen days, and the weight of a dram of it taken, cures the dyſentery. The powder helps inflammations. In times of dearth, they make bread and drink of the fruit; but it affords an aliment inclining to melancholy, giving a rankneſs to the breath, and making the teeth black. There are three ſpecies of this tree, which differ only in fruit; but all of them hang in cluſters.

CAPON, a cock chicken caſtrated young, generally as ſoon as left by the dam.

The word is formed from the Latin *capo*, of the Greek *καπων*, which ſignify the ſame.

Capons, beſides their uſe for the table, ſerve to lead chickens, ducklings, turkey-pouts, pea-hens, pheaſants, or partridges, in lieu of their natural dams, over which they have ſeveral advantages, by the largeneſs of their body, which will brood, or cover, thirty or forty young.

Capon's*-tail graſs*. See Festuca.

CAPONE, in *Ichthyology*, a name given by the Italians to the fiſh called the *hirundo* and *corvus* by authors, and by Artedi made a ſpecies of the *trigla*. It is diſtinguiſhed from the reſt of this genus by that author, under the name of the *trigla* with an aculeated head, and with three appendages on each ſide to the pectoral fins.

CAPONIERE, or Caponniere, in *Fortification*, is a paſſage from one work to another, ten or twelve feet wide, covered on each ſide by a parapet, terminating in a ſlope or glacis.

In dry moats, the paſſage from the curtain to the ravelin, or that from the covert-way to the arrows or detached redoubts, are called *caponieres*.

Single parapets raiſed at the entrance of the ditch, before the ravelin, behind which are placed ſmall cannons and men, to diſpute the paſſage over the ditch, are likewiſe called *caponieres*.

The *caponiere* differs from the coffer, in that the latter poſſeſſes the whole breadth of the ditch, whereas the former only takes up a part of it. See Coffer.

Caponieres are partly under ground, and partly above it. They are ſo well ſcreened at the top, that no bomb or carcaſs can penetrate them.

CAPOT, at *Picquet*, is when one of the gameſters wins all the cards, in which caſe he gains forty points.

CAPPADINE, in *Commerce*, a ſort of ſilk flock, taken from the upper part of the ſilk-worm cod, after the true ſilk has been wound off. It is alſo called *laſſis* and *carbaſs*, becauſe ſlight ſtuffs under thoſe names are made of it.

CAPPANUS, in *Natural Hiſtory*, the name given by ſome authors to the ſea-worm, which bores into the bottoms of ſhips.

In order to prevent the pernicious effects of this worm, ſeveral ſhips have lately been ſheathed with copper.

CAPPARIS, in *Botany*. See Caper-*buſh*.

CAPPEROL *Coronde*, a name given by the Ceyloneſe to a peculiar kind of cinnamon, eſteemed the third in value: this has a very ſtrong taſte and ſmell of camphor, and its name with the natives ſignifies camphorated cinnamon. The tree which produces it, grows very plentifully in many parts of the iſland of Borneo, but is not met with in the eaſtern parts of it. This is often ſold to the Danes and Engliſh who come to trade on the coaſts of Coromandel; it is prohibited exportation from the iſland, but ſo long as only one port is open, there are people enough who will carry out great quantities of it.

There is a ſpecies of canella very much reſembling this kind of cinnamon-tree, which grows very frequently on the continent of India toward Goa; and another canella or wild cinnamon on the coaſt of Malabar, in many reſpects reſembles this. The barks of all theſe trees are greatly inferior to the true cinnamon in ſmell, taſte, and virtue; yet they are too often ſold to the leſs judicous traders in theſe things, either alone or mixed with the ſeveral better kinds of cinnamon, to the great damage of all that afterwards buy them. Phil. Tranſ. N°. 409.

CAPRA, in *Aſtronomy*, a denomination given to the ſtar Capella; and ſometimes alſo to the conſtellation Capricorn.

Some repreſent *Capra*, or the *ſhe-goat*, as a conſtellation in the northern hemiſphere, conſiſting of three ſtars, compriſed between the 45th and 55th degree of latitude. The poets ſay, it is Amalthea's goat, which ſuckled Jupiter in his infancy. Horace, making mention of it, calls it, *Inſana ſidera Capræ*.

Capra *Saltans*, or Capræ *Saltantes*, in *Meteorology*, a fiery meteor, or exhalation, which ſometimes appears in the atmoſphere, and is not fired in a ſtrait line, but with inflexions, and windings in and out, reſembling the caperings of a goat.

The *capræ ſaltantes* are not ſo called from their figure, which is various, ſometimes round, ſometimes long, but from their moving by jerks ſomewhat like the leaps of that animal; and from the little languets of fire which hang at, and ſometimes fall from them, which antiquity has been pleaſed to fancy like the beard or locks of a goat's hair.

Ariſtotle diſtinguiſhes the *capra* from the trabs, in that the latter proceeds with an uniform motion, the former with an irregular one, and as it were by jumps. Ariſt. Met. lib. i. cap. 5. Mem. Ac. Inſcr. tom. vi. p. 95.

The *capræ* ſeem to be very low, yet ſometimes fly ſo high, that meteorologiſts have placed them in the upper region, though not ſo conſtantly, but they are ſometimes alſo found in the middle region.

Of globular *capræ* we have divers inſtances, in ancient as well as modern naturaliſts. Such was the flame ſaid by Seneca to have been ſeen in form of a huge ball, about the bigneſs of the moon, when Paulus Æmilius waged war againſt Perſeus. Such another, he tells us, was ſeen at the death of Auguſtus; another on the tragedy of Seijanus, another at the death of Germanicus. Such was that ſeen about Michaelmas 1676, by no leſs than twelve counties at once; it is deſcribed by Mr. Naſh, as it appeared near Seighford in Staffordſhire, as of a globular figure moving by jerks, and making ſhort reſts at every one of them, letting fall drops of fire, which were parts of its body; for it decreaſed in magnitude the farther it went, and the oftener it dropped, till at length it wholly diſappeared. Senec. Nat. Queſt. lib. i. cap. 1. Phil. Tranſ. N° 135. p. 863, ſeq. Plott. Nat. Hiſt. Stafford. cap. 1. § 40.

Capra *trituratoria*, in *Ancient Huſbandry*, was a kind of iron log, made in the figure of a goat, which was laid on the *tribula*, to make it more effectual in ſeparating the corn from the ears, the ancient way of threſhing.

Capra, in *Zoology*. See Goat.

CAPRARIA, *Sweet-weed*, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower is bell-ſhaped, of one leaf, divided at the top into five equal parts; it hath four ſtamina, which are inſerted in the baſe of the petal, and but little more than half ſo long; two of the lower being ſhorter than the other. It hath a conical germen, which afterward becomes an oblong conical capſule, compreſſed at the point, having two cells divided by a partition, filled with roundiſh ſeeds. We have but one ſpecies, which grows naturally in the warm parts of America, where it is often a troubleſome weed.

CAPREA, in *Zoology*. See *Roe* Deer.

CAPREOLATÆ *plantæ*, are ſuch plants as turn, wind, and climb along the ſurface of the earth, and ſticks or trees, by means of their *capreoli*, or tendrils: as gourds, melons, cucumbers, &c.

CAPREOLI, in the *Ancient Architecture*, a ſort of raſters or timbers ſerving to ſuſtain the *canterii*, either in buildings, or machines.

They were thus called, not, as Philander imagines, from their reſemblance to the *capreoli*, or tendrils of vines, but from the affinity of their form and office to wild goats; as theſe butt and repel things with their horns, ſo do the former oppoſe their heads or horns to the weight of the *canterii*.

CAPREOLUS, in *Anatomy*, denotes the *helix*, or outer ambit of the ear.

Capreolus, in *Botany*, the claſper, or tendril, by which vines, peas, and ſuch like creeping plants, faſten themſelves to thoſe things which ſtand near, or are deſigned to ſupport them. This is alſo ſometimes called *clavicula*.

Capreolus, in the *Ancient Huſbandry*, a kind of iron hoe or inſtrument with two forks or fangs, wherewith to ſtir and move the ground.

Capreolus, in *Zoology*. See *Roe* Deer.

CAPRICE, in *Muſic*, is ſometimes uſed for an irregular compoſition, which ſucceeds rather by the force of genius, than obſervation of the rules of art.

The word is French, where it ſignifies humourouſneſs, fantaſticalneſs. Some deduce it from the Italian *capriccio*, and that from the Latin *capra, goat*, to whoſe wantonneſs it is ſuppoſed to bear alluſion. Morhof. Polyhiſt. tom. i. lib. ii. cap. 1.

Caprice is applied in *Architecture* to an edifice of a ſingular taſte, and deviating much from the common rules of building.

CAPRICORN, in *Aſtronomy*, according to ſome, the tenth ſign of the zodiac; from which alſo the tenth part of the ecliptic takes the ſame denomination.

The character whereby *Capricorn* is repreſented in aſtronomical writing, is ♑.

The ancients accounted *Capricorn* the tenth ſign, and when the ſun arrived thereat, it made the winter ſolſtice, with regard to our hemiſphere; but the ſtars having advanced a whole ſign towards the eaſt, *Capricorn* is now rather the eleventh ſign; and it is at the ſun's entry into Sagittary, that the ſolſtice happens: though the ancient manner of ſpeaking is ſtill retained.

This ſign is repreſented on ancient monuments, medals, &c. as having the fore-part of a goat, and the hind-part of a fiſh; which is the form of an ægipan; and ſometimes, ſimply, under the form of a goat.

The ſtars in the conſtellation of *Capricorn*, in Ptolemy's and Tycho's Catalogue, are 28; in that of Hevelius 29; though it is to be obſerved, one of thoſe in the tail, of the ſixth magnitude, marked in Tycho's book the twenty-ſeventh, was loſt in Hevelius's time. Mr. Flamſtead, in the Britannic Catalogue, gives 51 ſtars in *Capricorn*. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude.			Magnitude

Capricorn, *tropic of*, a leſſer circle of the ſphere, parallel to the equator; paſſing through the beginning of *Capricorn*. See **Tropic**.

Capricorn-*beetle*, the Engliſh name of a ſpecies of *cerambyx*. See **Beetle**.

CAPRICORNUS, in *Zoology*. See **Mordella**.

CAPRIFICATION, a name given in the iſlands of the Archipelago to a peculiar method of propagating and ripening the fruits of the domeſtic fig-trees, by means of inſects. Plin. Hiſt. Nat. lib. xv. cap. 19.

M. Tournefort aſſures us, that this method is ſtill practiſed every year in moſt of the Grecian iſlands; and he admired the patience of thoſe who ſpent above three months in carrying the flies from one fig-tree to another. *Caprification* is formed from *caprificus*, the wild fig-tree, from whoſe fruits the inſects are produced, which are the chief inſtruments of *caprification*. This tree bears three different ſpecies of fruit, called *fornites*, *cratirites*, and *orni*, which anſwer no other purpoſe but that of facilitating the above operation. The *fornites* appear in Auguſt, and contain little worms, hatched from eggs depoſited by flies; in October and November, theſe worms become flies, which pierce the ſecond figs called *cratirites*, which do not appear till the end of September: theſe figs continue till the month of May following, and furniſh a lodgment for the eggs of the ſecond claſs of flies. In May, the third ſpecies of figs, called *orni* appear; and when they are grown to a certain ſize, and begin to open at the eye, they are pierced by the flies produced by the *cratirites*, or winter figs. When the worms bred in theſe ſpring figs are transformed into flies, which happens in the months of May or July, the peaſants gather them, and tranſport them to the garden fig-trees. The ſucceſs of the *caprification* depends on this circumſtance; and therefore they viſit their wild fig-trees, and their garden fig-trees, every morning, to examine the eye of the fig; by which they judge when the flies are about to iſſue from the wild figs, and when they may be applied ſo as to pierce the garden figs. They are then depoſited on ſuch trees as are fit to receive them, and enter the fruit by the eye, where they lay eggs, the worms of which cauſe the garden figs to attain their proper degree of bigneſs and maturity. The conſequence of this operation is, that garden fig-trees, which would ſcarcely yield twenty-five pounds of ripe figs, and fit for drying, yield two hundred and eighty pounds.

As to the manner whereby the puncture of the flies contribute to the maturation of the fruit, poſſibly it may be by lacerating the veſſels, and extravaſating the nutritious juice when they depoſit their eggs; or when with the egg they alſo convey ſome liquor which gently ferments with the juice of the fig, and ſoftens its pulp. Even the Provence and Paris figs ripen much ſooner by wounding their buds with a ſtraw or feather dipped in oil-olive; plums and pears alſo wounded by inſects, are found to ripen the ſooneſt, and in theſe the pulp about the wound is more exquiſite than the reſt. Mem. Acad. Scienc. ann. 1705. p. 447, ſeq.

Caprification is alſo applied in a leſs proper ſenſe to the art of propagating the palm-tree. Act. Erudit. Lipſ. 1721. p. 84.

CAPRIFICUS, in *Botany*, a term by which ſome authors, particularly Pliny, call the leſſer SPURGE or *eſula*. Ger. Emac. Ind. 2.

CAPRIFOLIUM, the *honey-ſuckle*. See **Honey**-*ſuckle*.

CAPRIMULGUS, in *Zoology*. See *Churn*-**Owl**.

CAPRIOLES, in *Horſemanſhip*, are leaps which a horſe makes in one and the ſame place, without advancing forwards; and that in ſuch manner that when he is in the air, at the height of his leap, he yerks or ſtrikes out with his hind-legs as near and even togther, and as far out as he can ſtretch them; in which action, he clacks, or makes a noiſe with them.

The word comes from *capreolus*, a diminutive of *capra*, *goat*.

The *capriole* is the moſt difficult of all the high-raiſed airs: there are ſeveral kinds of *caprioles*; as a *right capriole*, *back capriole*, *ſide capriole*, *broken capriole*, the *open capriole*, &c.

CAPRISCUS, the *goat-fiſh*. See **Goat-fish**.

CAPSARIUS, from *capſa*, *ſatchel*, in *Antiquity*, a ſervant who attended the Roman youth to ſchool, carrying a ſatchel with their books in it, ſometimes alſo called *librarius*.

Capsarius was alſo an attendant at the baths, to whom perſons committed the keeping of their cloaths.

Capsarius, from *capſa*, *cheſt*, among the Roman *Bankers*, was he who had the care of the money-cheſt, or coffer.

CAPSICUM, in *Botany*, a genus of the *pentandria monogynia* claſs; *Guinea*, or *Bonnet pepper*. Its characters are theſe: the flower hath but one petal, which is wheel-ſhaped, and hath five ſmall ſtamina. It hath an oval germen, which afterward becomes a ſoft fruit or capſule, of an indeterminate figure, having two or more cells divided by intermediate partitions, to which adhere many compreſſed kidney-ſhaped ſeeds.

Guinea pepper is more uſed as a ſauce, and in pickle, than in phyſic, being frequently put into fiſh-ſauce, or into any thing that is flatulent and windy; for which purpoſe it is ordered divers ways, either green or ripe, pickled, or rubbed to powder with ſalt. A decoction of it with pennyroyal is commended by ſome to expel a dead child. The ſkins boiled, and uſed as a gargle, are good againſt the tooth-ach; a cataplaſm of the ſeeds, powdered and mixed with honey, applied to the throat, is good for the quinſy.

CAPSQUARES, in *Gunnery*, ſtrong plates of iron, which come over the trunnions of a gun, and keep it in the carriage.

Theſe are faſtened by hinges to the prize-plate, that they may lift up and down. They form a part of an arch in the middle, to receive a third part of the thickneſs of the trunnions; for two-thirds of them are let into the carriage, and the other end is faſtened by two iron wedges, which are called the *fore-locks* and *keys*.

CAPSTAN, a large maſſy column ſhaped like a truncated cone, and placed perpendicularly on the deck of a ſhip, and turned by levers, or bars, which paſs through holes pierced in its upper extremity; ſerving, by means of a cable which winds round the barrel, to draw up burdens faſtened to the end of the cable. See *Tab.* III. *Mechanics*, *fig.* 70.

The word is alſo written *capſtand*, *capſtern*, and even *capſtow*. It is formed from the French *cabeſtan*, which ſignifies the ſame.

The power of the *capſtan* is reducible to that of the AXIS *in peritrochio*

De Camus conſiders the *capſtan* as a perpetual LEVER.

By the *capſtan* veſſels are drawn aſhore, and hoiſted up to be refitted; anchors weighed, and ſails hoiſted, &c.

There are commonly two *capſtans* in a ſhip of war; the *main-capſtan* placed behind the main-maſt, ſtanding on the firſt deck, and reaching four or five feet above the ſecond: this is alſo called *double-capſtan*, becauſe it has two drum-heads, and ſerves two decks for drawing of anchors; and becauſe its force may be doubled by applying hands on each deck. It has bars, whelps, &c. for turning and ſtopping it. See *Tab. Ship. fig.* 2. *n.* 32. or *Tab.* III. *Mechanics*, *fig.* 71.

And the *jeer-capſtan*, or *little-capſtan:* this ſtands on the ſecond deck, between the main-maſt and the mizzen: its uſe is, chiefly, to heave upon the jeer-rope, or to heave upon the viol, to hold off by when the anchor is weighed; and on other occaſions where a leſs force is required, than to weigh the anchors, &c. See *n.* 33, or *fig.* 70. *Tab.* III. *Mech.*

The French call that an *Engliſh capſtan* where there are only half-bars uſed; and which, for that reaſon, is only half perforated: this is thicker than the others.

There is alſo a *flying capſtan*, which may be moved from place to place.

The parts of a *capſtan* are, the foot *d*, which is the loweſt part; the ſpindle *f*, the ſmalleſt part of which turns round in an iron ſocket, called the ſaucer; the whelps, *b*, a ſort of brackets ſet into the body of the *capſtan* cloſe under the bars, and reaching downwards from the lower part of the drum-head to the deck; the barrel A, the main body of the whole; the *drum*-head *c*, which is a broad cylindric piece of wood fixed above the barrel and whelps, in which are the holes for the bars to be put into; the bars, which are ſmall pieces of timber by which the men heave; the pins, as *e*, which are little bolts of iron, thruſt perpendicularly through the holes of the drum-head, and through a correſpondent hole in the end of the bar, made to receive them when the bars are fixed; the pawls, which are pieces of iron bolted to one end of the beams of the deck, cloſe to the body of the *capſtan*, but ſo as that it have liberty to turn about every way; and againſt them do the whelps of the *capſtan* bear; ſo as that by them the *capſtan* may be ſtopped from turning back. There are alſo hanging pawls, as *g*, *g*, *fig.* 71. which reach from the deck above to the drum-head immediately beneath it; and laſtly, the ſwifter, which is a rope paſſed horizontally through holes in the outer ends of the bars and drawn tight, deſigned to keep the men ſteady whilſt they work, and to afford room for a greater number to work at once.

The terms belonging to the uſe of the *capſtans* are, *rig the capſtan*, i. e. fix the bars in their reſpective holes; *heave the capſtan*, i. e. go round with it heaving on the bars; *ſurge the capſtan*; and *come up capſtan*, that is, ſlacken the cable which you heave by; in a like ſenſe they alſo ſay, *launch out the capſtan*; *pawl out the capſtan*, ſignifies, ſtop it from going back.

CAPSULA, or **CAPSELLA**, denotes a bag, pouch, or receptacle of divers kinds of things.

The word is a diminutive of the Latin *capſa*, literally ſignifying, a little box, or caſe; particularly a bag, or ſatchel, wherein boys carry their books, &c. to ſchool.

CAPSULA, or **CAPSULE**, among *Botaniſts*, a ſpecies of *pericarpium* compoſed of dry elaſtic valves, which uſually burſt open at the points: this kind of PERICARPIUM ſometimes contains only one cell or cavity, ſometimes more; in the firſt caſe it it called *unilocular*; in the ſecond, *bilocular*, *trilocular*, &c. according to the number of cells in it for the reception of ſeeds.

Thoſe plants whoſe ſeeds are incloſed in *capſulæ*, are denominated *angioſpermous*; and thoſe whoſe ſeeds have no *capſules*, *gymnoſpermous*.

CAPSULA *communis*, or *of the Porta*, in *Anatomy*, is a membrane ariſing from the *peritonæum*, and incloſing the trunk of the *vena porta* after its entrance into the liver, as a caſe, or cover; dividing itſelf into the ſame number of branches, and accompanying all, even in its ſmalleſt ramifications.

The ſame *capſula*, or membrane, likewiſe incloſes the *porus bilarius*, and other veſſels of the liver; whence it takes the name of *capſula communis*.

CAPSULA *cordis*, a membrane inveſting the heart: more uſually called the *pericardium*.

CAPSULÆ *atrabilariæ*, in *Anatomy*, called alſo *renes ſuccenturiati*, and *glandulæ renales*, are two glands ſituate near the kidneys: called *atrabilares*, from a black liquor found in their cavity; and *ſuccenturiati* and *renales*, from their poſition. They are about the bigneſs of a *nux vomica*; their figures are ſomewhat various; in ſome bodies round, in others triangular, ſquare, &c. The membrane wherewith they are covered is very fine: their cavity is pretty large for their bulk. Their uſe is very obſcure; probably it is to ſecrete the black humour found in their cavity, which, being afterwards diſcharged by their duct into the emulgent, mixes with the blood; and ſerves, according to ſome, as a ferment; according to others, only to dilute its thickneſs: in a *fœtus* they are almoſt as big as the kidneys.

CAPSULA *of the cryſtalline.* See CRYSTALLINE.

CAPSULÆ *ſeminales*, are the ſame with VESICULÆ *ſeminales*.

CAPSULA, in *Chemiſtry*, is an earthen veſſel, in form of a pan; wherein things are frequently placed, that are to undergo very violent operations of the fire.

CAPSULATE *plants*, **CAPSULATÆ** *plantæ*, are ſuch as have a tetrapetalous regular flower, conſiſting of four diſtinct petala in each flower, and which bear their ſeeds in ſhort *capſulæ:* by which they are diſtinguiſhed from the *ſiliquoſæ*, which have their ſeed in long caſes, or pods.

CAPTAIN, a military officer, whereof there are various kinds and degrees, diſtinguiſhed by their commands: as,

CAPTAIN *of a company*, or *troop*, is an inferior officer, who commands a company of foot, or troop of horſe, under the colonel.

In the like ſenſe, we ſay, a *captain* of dragoons, of grenadiers, of marines, of invalids, &c.

In the horſe and foot guards, the *captains* are ſtiled *colonels*; being uſually perſons of rank, and general officers of the army. In the colonel's company of a regiment, i. e. the firſt company, or that whereof he himſelf is *captain*, the commanding officer is called *captain-lieutenant*.

The duty of this officer is to be careful to keep his company full of able-bodied ſoldiers, to viſit their tents and lodgings, to ſee what is wanting, pay them well, cauſe them to keep themſelves neat and clean in their cloaths, and to keep their arms bright. He has power in his own company of making ſerjeants and corporals.

CAPTAIN, *ſecond*, one whoſe command having been taken away, that is joined to another *captain*, to ſerve under him, and receive pay as a *captain* reformed.

Among the French, there are alſo *ſecond captains*, who never had companies of their own.

CAPTAIN *en pied*, a *captain* kept in pay, that is not yet reformed.

The expreſſion, though altogether French, occurs ſometimes.

CAPTAIN-*lieutenant*, is he who commands a troop, or company, in the name and place of ſome other perſon, who has the commiſſion, with the title, honour, and pay thereof; but is diſpenſed withal, on account of his quality, from performing the functions of his poſt.

Thus, the colonel, being uſually likewiſe *captain* of the firſt company of his regiment, that company is commanded by his deputy, under the title of *captain-lieutenant*. So in England, France, &c. the king, prince, dauphin, &c. have uſually the titles, dignities, &c. *of captains of the guards*, *gens d'armes*, &c. the real duty of which offices is performed by *captains-lieutenant*.

CAPTAIN, *reformed*, is one, who, upon a reduction of the forces, has his commiſſion and company ſuppreſſed; yet is continued *captain*, either as ſecond to another, or without any poſt or command at all.

CAPTAIN *of the guides*, an officer appointed for providing guides for the army. Of theſe he ought always to have a ſufficient number with him, who know the country very well; that they may guide the army on a march, or go with convoys, parties, baggage, artillery, and detachments. To provide ſuch the *captain* ought to have a party of horſe to go to the adjacent villages, caſtles, or forts, to bring boors to his quarters, and keep them under a guard, till the army comes to another ground, where he may be provided with others. He ought to underſtand ſeveral languages, eſpecially that of the country in which the army is.

Captain-*general* of an army, is the general or commander in chief.

Captain-*general of Great Britain* is the higheſt military poſt in our army.

In Holland the office of *captain-general* is uſually joined with that of STADTHOLDER, and though, by the perpetual edict paſſed in 1667, the two offices were for ever disjoined; ſo that whoever was poſſeſſed of one, was rendered incapable of the other: this regulation laſted but five years.

Captain *of militia*, is he who commands a company of militia or trained-bands.

Captain-*baſhaw*, ſignifies the Turkiſh high-admiral. See BASHAW.

He poſſeſſes the third office in the empire, and is inveſted with the ſame power at ſea, that the vizir has on ſhore. Solyman II. inſtituted this office in favour of the famous Barbaroſſa; with abſolute authority over the officers of the marine and arſenal, whom he may puniſh, caſhier, or put to death, as ſoon as he is without the Dardanelles. He commands in chief in all the maritime countries, cities, caſtles, &c. and at Conſtantinople is the firſt magiſtrate of police in the villages on the ſide of the Porte, and the canal of the Black ſea. The mark of his authority is a large Indian cane, which he carries in his hand, both in the arſenal and in the army.

The *captain-baſhaw* enjoys two ſorts of revenues; the one fixed, and the other caſual. The firſt ariſes from a capitation of the iſlands of the Archipelago, and certain governments in Natolia and Gallipoli. The latter conſiſts in the pay of the men who die during the campaign; in a fifth of all prizes made by the begs; in the profits accruing from the labour of the ſlaves, whom he hires as rowers to the grand ſignior; and in the contributions he exacts in all places where he paſſes.

Captain *reis*, or **Capidan** *reis*, an appellation given by the Turks to the grand pilot, anſwering to pilot royal among the French.

Captain *of a ſhip* is a ſea-officer, whereof we make two kinds; the one of a ſhip of war, the other of a trading veſſel; though, in propriety, the title *captain* belongs only to the commander of ſhips of war.

Captain *of a ſhip of war*, is the commanding officer of a ſhip, gally, fire-ſhip, or the like.

The *captain of a man of war* is held equivalent to that of a colonel at land. The *captain* is accountable for the ſhip, if loſt or taken by his miſconduct; and his province extends to the military government, navigation, and equipment of the ſhip which he commands, and to the conduct of the inferior officers and men, which he is required to ſuperintend and regulate.

In admiral ſhips, and all ſhips of the firſt rate, the French have two *captains*, two lieutenants, and two enſigns.

The pay of ſea *captains*, in the Engliſh ſervice, was formerly ſmall, which defect was made up to them, by indulging them in many privileges not now allowed, as plundering of prizes, taking convoy monies, and even carrying merchants goods, plate, &c. King James II. taking this laſt privilege away, in lieu thereof granted them an annual allowance of table monies, almoſt equal to their whole former pay. But this not taking place by reaſon of the abdication, king William III. in 1693, ordered the pay of the *captains* to be doubled, but the fund for this failing at the peace of Ryſwick, a new eſtabliſhment was made in 1700, whereby nearly one third was retrenched from the ſea-pay, and that of a firſt-rate fixed at 1*l.* of a ſecond rate at 16*s.* of a third rate at 13*s.* 6*d.* of a fourth rate at 10*s.* of a fifth rate at 8*s.* of a ſixth rate at 6*s.* *per* day.

Captain *of a merchant-ſhip*, is the maſter thereof; or he who has the command or direction of the ſhip, her crew, lading, &c. This officer is more uſually called the *maſter*; eſpecially in ordinary voyages.

On the Mediterranean he is called the *patron*, or *patroon*; and in long voyages, as to the Eaſt Indies, South-ſea, &c. the *captain*.

The proprietot of the veſſel appoints the *captain*, or maſter; and the *captain* is to form the crew, and chooſe and hire the pilots, mates, ſeamen, &c. though when the proprietor and maſter reſide on the ſame ſpot, this is uſually done in concert with the proprietor.

Captains *of port*, in the French *Marine Affairs*, officers eſtabliſhed in ſome conſiderable ſea-ports where there are arſenals. To them belong the command of the guard of the place, the watching of the ſea, and the care and cuſtody of the veſſels brought into port.

There are ſuch *captains* at Toulon, Rochfort, Breſt, Havre, Dunkirk, and Port Lewis. They are to take care of mooring the king's ſhips, and oblige all to give the due ſalutes.

CAPTAINRY, *capitainerie*, in the French *Law*, denotes the government or command of a royal palace, and the lands dependent thereon.

The name is alſo applied to the office of *captains* of chaces or woods. Such are the *captainries* of Fontainbleau, the wood of Boulogne, &c.

CAPTION, in *Law*, is when a commiſſion is executed, and the commiſſioners names ſubſcribed to a certificate, declaring when and where ſuch commiſſion was executed.

The *caption* uſually commences with theſe words, *Virtute iſtius commiſſionis nos*, &c. or, *Executio iſtius commiſſionis patet in quadom ſchedula annexata*, &c. or, *Capt. & cogn. die.* &c. or, *Capt. fuit hæc reſponſ.*

Theſe *captions*, and the executions of the commiſſions, muſt now be in Engliſh, by 4 Geo. II. cap. 26.

CAPTIVE, a SLAVE, or perſon taken by the enemy in war, or by a PIRATE or corſair.

Captives, *captivi*, among the Romans, differed from *dedititii*, as the former were taken by force, whereas the latter ſurrendered themſelves.

By the *Lex Cornelia*, a Roman citizen taken *captive*, in caſe he returned, was reputed as having never been taken; if he died in captivity he was reputed for dead the moment he was taken: in the former caſe he recovered all his rights, and even the dominion over his children; in the latter his ſon became free from the time of his father's detention. Juſtin. Inſt. lib. i. tit. xii. § 5.

Formerly, *captives* in war became the ſlaves of thoſe who took them; and though ſlavery, ſuch as obtained among the ancients, be now aboliſhed, ſome ſhadow of it ſtill ſubſiſts in reſpect of priſoners of war, who are reputed the property of their captors, and have no right to liberty, but by conceſſion from them, or till their ranſom is paid. Negro-ſervants, likewiſe, who are purchaſed when *captives*, continue in ſome degree the property of the maſters who buy them; though the property conſiſts rather in the perpetual ſervice, than in the body or perſon of the captive. Blackſt. Com. vol. ii. p. 402.

The Romans uſed their *captives* with great ſeverity; their necks were expoſed to the ſoldiers to be trampled on, and their perſons afterwards ſold by public auction.

Captives were frequently burnt in the funeral piles of the ancient warriors, as a ſacrifice to the infernal gods. See BURIAL.

Thoſe of royal or noble blood had their heads ſhaven, and their hair ſent to Rome, to ſerve as decorations in female toys, &c. They were led in triumph loaden with chains through Rome, in the emperors train, at leaſt as far as the foot of the Capitoline mount, for they were not permitted to aſcend the ſacred hill, but carried thence to priſon. Thoſe of the prime quality were honoured with golden chains on their hands as well as feet, and golden collars on their necks. If they made their eſcape, or killed themſelves, to avoid the ignominy of being led in triumph, their images or effigies were frequently carried in their place.

Captivity is uſed, in *Scripture*, to denote the puniſhment inflicted by Providence on the Jews for their idolatry and wickedneſs. The principal *captivities*, if we omit the Egyptian bondage, from which they were reſcued by Moſes, are the Aſſyrian and Babyloniſh. The Aſſyrian *captivity* was that of the ten tribes, begun in the reign of Pekah king of Iſrael, and completed by Shalmaneſer. 2 Kings, xv. 29. 2 Kings, xvii. 5, 6.

The greater part of the ten tribes were loſt in this *captivity*, which put a period to the kingdom of Iſrael; though ſome of them returned with thoſe of Judah and Benjamin, upon the decree of Cyrus, to their own land.

The Babyloniſh *captivity* was that of the kingdom of Judah, or of the two tribes who adhered to the houſe of David. This was begun by Nebuchadnezzar, and completed by Nebuzaradan. 2 Chron. xxxvi. 6, 7. 2 Kings, xxv. 8. Jerem. lii. 30. This laſted ſeventy years, and terminated in the famous decree of Cyrus, in the year before Chriſt 536, for reſtoring the Jews to their own land, and for rebuilding Jeruſalem and the Temple. Ezra, i. 1. 3.

Some have computed theſe years from the fourth of Jehoiakim to the firſt iſſuing of Cyrus's decree. 2 Kings xxiv. 10, &c. others from the deſtruction of Jeruſalem to the publication of Darius's decree for building the Temple, in the fourth year of his reign, Zechar. vii. 1. either of which computations will give ſeventy years: or again, they may be computed from the twenty-third year of Nebuchadnezzar to the firſt Paſſover celebrated in the new

Temple, in the ſeventh year of Darius's reign. Prid. Conn. vol. i.

CAPTIVITY, *princes of the*, are heads or chiefs of the Jewiſh nation, appointed for the adminiſtration of juſtice among them, during their captivity both in the Eaſt and Weſt, ſince the deſtruction of their Temple by the Romans.

The prince of the *captivity* in the Eaſt, is ſaid to have had the government of the Jews who dwelt at Babylon, in Chaldæa, Aſſyria, and Perſia. The prince of the *captivity* in the Weſt, had the direction of thoſe who lived in Judæa, Egypt, Italy, and other parts of the Roman empire.

The former were called *rabbana*, and were ſuppoſed to have deſcended from David, in a direct line by the males; the latter called *rabban*, only deſcended from David by the females.

The Jews, we are told by Prideaux, after the loſs of their authority, ſtill kept up the title, and for many ages had a perſon of the houſe of David reſident about Babylon, who, under the name of the head of the *captivity*, was acknowleged and honoured as a prince among that people, and had ſome ſort of juriſdiction, as far as was conſiſtent with the ſubordination they were under, always inveſted in him, and ſometimes even a ratification of it was obtained from the ſovereigns of the country. Something of this pageantry is ſaid to be ſtill kept up; perhaps that they may be furniſhed with an anſwer to the Chriſtians, when they urge the prophecy of Jacob againſt them; the ſcepter they pretend being ſtill preſerved among them in the head of the *captivity*. See ÆCHMALOTARCHA.

CAPTURE, a prize, or prey; particularly that of a ſhip taken at ſea.

Captures made at ſea were formerly held to be the property of the captors after a poſſeſſion of twenty-four hours; but the modern authorities require, that before the property can be changed, the goods muſt have been brought into port, and have continued a night *intra præſidia*, in a place of ſafe cuſtody, ſo that all hope of recovering them was loſt. Blackſt. Com. vol. ii. p. 401. See PRIZE and PRIVATEER.

CAPTURE alſo denotes an arreſt, or ſeizure of a criminal, debtor, &c. at land.

CAPUCHE. See COWL, and next article.

CAPUCHINS, religious of the order of St. Francis, in its ſtricteſt obſervance.

The *capuchins* are thus called, from *capuce*, or *capuchon*, a *ſtuff cap*, or *cowl*, wherewith they cover their heads; and which they added to the ordinary Franciſcan habit.

They are cloathed with brown or grey; are always barefooted; and never to go in a coach, nor ever ſhave the head.

The *Capuchins* are a reform made from the order of Minors, commonly called *Cordeliers*, ſet on foot in the ſixteenth century by Matthew de Baſſi, a religious obſervant of the monaſtery of Monteſiaſcone, who, being at Rome, ſaid he was advertiſed ſeveral times from Heaven, to practiſe the rule of St. Francis to the letter. Upon this he made application to pope Clement in 1525, who gave him permiſſion to retire into a ſolitude; and not only him, but as many others as would embrace the ſtrict obſervance; which ſome did accordingly. In 1528, they obtained the pope's bull. In 1529, the order was brought into complete form; Matthew was elected general, and the chapter made conſtitutions. In 1543, the right of preaching was taken from the *Capuchins* by the pope; but in 1545, it was reſtored to them again with honour. In 1578, there were ſeventeen general chapters in the order of *Capuchins*.

The *Capuchins* were at firſt reſtrained from ſpreading out of Italy; but Charles IX. of France, writing to pope Gregory XIII. to demand ſome *Capuchins*, that pope, by a bull, dated in 1575, took off the prohibition, and granted them leave to ſettle any where. The cardinal of Lorraine built them a convent at Meudon, and Henry III. another at Paris, in the rue St. Honoré. F. Zach. de Boverio has written the annals of the *Capuchins* in Latin, in three volumes folio, from the year 1524 to 1634.

CAPUCHIN is alſo the name of a particular ſpecies of pigeon, in ſhape and make much like the jacobine or jack, but ſomething larger than that; its beak alſo is longer; and it has a tolerable hood of feathers on the back part of its head, but has no cravat or chain down the ſhoulders as that ſpecies has. Its marks are the ſame with the jacobine, and it ſeems to be no other than a baſtard breed between that and a common pigeon.

CAPUCIATI, an appellation given to the followers of Wickliff in the fourteenth century, by reaſon they did not uncover themſelves before the hoſt, but kept on their *capuce*, or cap uſed in thoſe times. Spondanus ſpeaks of the *capuciati*, under the year 1387.

CAPUCIATI is alſo the denomination of a faction which appeared in Auvergne in 1183, having at their head a carpenter named Durand; thus called becauſe they wore the image of the Virgin in their white linen capuces, as the badge of their engagement.

CAPUCINE, in *Botany*, the name by which the French call the CARDAMINDUM, or *naſturtium Indicum*, a plant commonly kept in our gardens for the beauty of its flower, and its uſe in ſallads and pickles.

CAPUENA, in *Zoology*, the name of a fiſh caught in the American ſeas among the rocks, and about the ſhore, and eſteemed a very delicate one for the table. It is of a long and rounded ſhape: its uſual length is about five inches.

CAPUT. See HEAD.

CAPUT *baroniæ*, the head of the BARONY, in *Ancient Cuſtoms*, denotes the ancient or chief ſeat, or caſtle of a nobleman, where he made his uſual reſidence, and held his court: ſometimes alſo called *caput honoris*, or the head of the honour.

The *caput baroniæ* could not be ſettled in dowry; nor could it be divided among the daughters, in caſe there were no ſon to inherit; but was to deſcend entire to the eldeſt daughter, *cæteris filiabus aliunde ſatisfactis*.

CAPUT *concutiens*, in *Anatomy*, the name given by Douglas, and ſome others, to a muſcle, deſcribed by Albinus under the name of the *intertranſverſarius colli*, among ſome others of the ſame nature, which he diſtinguiſhes according to their ſituation into *priores* and *poſteriores*. This being of the former number. Winſlow calls it the TRANSVERSALIS *ſecundus anterior*.

CAPUT *cordis*, a name ſometimes given to the upper and larger ſide of the HEART, otherwiſe called its BASIS.

CAPUT *draconis*, a denomination given by ſome to a fixed ſtar of the firſt magnitude, in the head of the conſtellation DRACO, called alſo by the Arabs *raſaben* and *eltanin*. See NODE.

CAPUT *gallinaginis*, or *galli gallinacei*, *cock's head*, is a kind of ſeptum, or ſpongious border, at the extremities or apertures of each of the *veſiculæ ſeminales*; ſerving to prevent the ſeed coming from one ſide, from ruſhing upon, and ſo ſtopping, the diſcharge of the other.

Some will have its uſe to be, to prevent the impulſe of the ſeed from dilating the orifices of the *veſiculæ*, and ſo ouſing out, except when aſſiſted by the compreſſion of the ſurrounding parts; as in copulation: but this, according to Dr. Drake, is rather the office of a diſtinct caruncle placed at each orifice, and acting as a valve.—See *Tab. Anat. (Splanch.) fig.* 8. *lit. q.*

CAPUT *jejunii*, a name given to Aſh-Wedneſday, as being the firſt day of the LENT-*faſt*.

CAPUT *lupinum*. An outlawed felon was anciently ſaid to have *caput lupinum*, and might be knocked on the head like a *wolf*, becauſe having renounced all law, he was to be dealt with as in a ſtate of nature: but now the wilful killing of ſuch a one is murder, unleſs in the endeavour to apprehend him.

CAPUT MEDUSÆ, a northern conſtellation included in that of PERSEUS.

CAPUT *mortuum*, in *Chemiſtry*, the *fæces* remaining of any body, after all the volatile and humid parts, as the phlegm, ſpirit, ſalt, &c. have been extracted therefrom, by force of fire. As theſe *fæces*, or *reſidua*, are very different, modern chemiſts ſpecify them more particularly, by adding a term expreſſive of their qualities; as *earthy* reſiduum, *charry* or *ſaline* reſiduum, &c.

What remains after diſtillation is properly called *fæces*. This, before it be *caput mortuum*, muſt likewiſe have paſſed the retort, or open fire.

The *caput mortuum*, called alſo *terra damnata*, is found in form of a friable, porous matter, without taſte or ſmell: it is ranked among the chemical elements; and ſuppoſed to conſtitute the dry, fixed, earthy, and ſolid part of all mixed bodies. As an element, it is more commonly expreſſed by the name *earth*.

It is what the chemiſts call a *paſſive element*, or *principle*; ſerving as the baſis or ſupport of the active ones.

The term is ſometimes more immediately reſtrained to the remains of vitriol, after diſtillation; otherwiſe called *colcothar vitrioli*.

The *caput mortuum* is never pure, but there is ſtill ſome active principle remaining in it, and particularly a fixed SALT.

Thus the *colcothar vitrioli*, expoſed to the air, is reconverted into vitriol.

CAPUT *moventium ſecundus*, in *Anatomy*, a name given by Fallopius, and others, to a muſcle called by Albinus *biventer cervicis*, and by ſome the *complexus*.

CAPUT *porcinum*, *ſwine's head*, a denomination given by the Romans to an order of BATTLE more frequently called *cuneus*.

CAPUT *purgia*, a barbarous term uſed by ſome phyſicians to denote medicines which cleanſe the head, either in the way of ſneezing, more frequently called *errhines*; or by chewing in the way of ſalivation, called APOPHLEGMATIZANTS. See ERRHINA and STERNUTATIVE.

CAPUTIATI. See CAPUCIATI.

CAPYBARA, in *Zoology*, the name of an animal found in many parts of America, and ſomewhat approaching to the nature of the river-horſe, but with ſo much of the general figure of the hog-kind, that Margrave, and ſome others, have called it the *porcus marinus*, or ſea-hog. It is of the ſize of a half-grown hog, meaſuring in length, from the head to the rump, about two feet: its belly is as prominent as that of a fat hog. It has no tail, its feet are wholly like thoſe of the hog, but that the fore ones have four claws each, and the hinder ones only three. Its head is very thick, and proportionably too large for the body; its eyes are large and black, its ears ſmall and round; the lower jaw is ſhorter than the upper, and each has two long crooked teeth that ſtand out a finger and a half from the jaw, and are buried two fingers in it; but theſe do not ſhew themſelves outwardly when the mouth is ſhut. It feeds on vegetables, and its fleſh is eaten by the Indians, but is not well taſted. Ray.

CAR. See CARR.

CARA, in *Botany*, a name given by the old Roman authors to a plant with large and eſculent roots. We are told that the ſoldiers of Cæſar, in ſome of their marches, when diſtreſſed for proviſions, made a ſort of bread of the root of the *cara*. And we learn from Paulus Ægineta, and Dioſcorides, that this plant was of the *paſtinacha*, or parſnip kind. It was probably the *elaphoboſcum*, or wild parſnip, which has roots long and thick, and of as good a taſte as the garden parſnips, only that they are not ſo tender. It is ſuppoſed by ſome that our word carrot is derived from this *cara*.

CARABE, or KARABE, denotes yellow AMBER.

CARABINE, a ſmall ſort of fire-arm, ſhorter than a fuſil, ond carrying a BULLET of twenty in the pound; borne by the light horſe, hanging at a belt over the left ſhoulder. The *carabine* is a kind of medium between the piſtol and the muſquet; and bears a near affinity to the harquebuſs, only that its bore is ſmaller.

It was formerly made with a match-lock, but of late only with a flint-lock.

The barrel is two feet and a half long, and is ſometimes furrowed ſpirally within, which is ſaid to add to the range of the piece.

CARABINEERS, a ſort of light horſe, carrying longer *carabines* than the reſt; and uſed ſometimes as foot, like the dragoons. The French have formed entire corps of theſe *carabineers*, choſen out of the whole cavalry, and better paid than the reſt. There are but few of them in the Engliſh army.

CARABUS, in *Zoology*, the name of a genus of four-winged flies, belonging to the Linnæan order of *coleoptera*, whoſe *antennæ* are oblong, ſlender, and ſetaceous; the thorax is ſomewhat convex, marginated, of a cordated figure, and truncated in the hinder part.

CARACALLA, in *Antiquity*, a long garment, having a ſort of capuchin, or hood a-top, and reaching to the heels; worn equally among the Romans by the men and the women, in the city and the camp.

Spartian and Xiphilin repreſent the emperor Caracalla as the inventor of this garment, and hence ſuppoſe the appellation *Caracalla* was firſt given him. Others, with more probability, make the *Caracalla* originally a Gallic habit, and only brought to Rome by the emperor abovementioned, who firſt enjoined the ſoldiery to wear it. The people called it *Antoninian*, from the ſame prince, who had borrowed the name of Antoninus.

The *Caracalla* was a ſort of caſſock, or ſurtout. Salmaſius, Scaliger, and after them Du-Cange, even take the name *Caſaque* to have been formed from that of *Caraque*, for *Caracalla*. This is certain from St. Jerom, that the *Caracalla*, with a retrenchment of the capuchin, became an eccleſiaſtical garment. It is deſcribed as made of ſeveral pieces cut and ſewed together, and hanging down to the feet; but it is more than probable there were ſome made ſhorter, eſpecially out of Rome, otherwiſe we do not ſee how it could have fitted the ſoldiers purpoſes.

CARACALLA, in *Botany*. See *Kidney*-BEAN.

CARACARA, in *Zoology*, the name of a Braſilian bird of the genus of the hawk, called by the Portugueſe *gavicaou*. It is properly of the ſparrow-hawk kind, but of the ſize of a kite. They are great deſtroyers of the poultry. See *Tab. of Birds*, N° 4.

CARACOL, in the *Manege*, a motion which a cavalier makes half round; or a half-turn from left to right; changing hands; that his enemy may be uncertain on which ſide he intends to attack; whether in front or flank. The word comes from the Arabic *garagol*, and that from the Hebrew *carac*, *involvere*: but we have it immediately from the Spaniſh, where *caracol* ſignifies properly a *ſnail*, and figuratively the evolution deſcribed above.

CARACOL is alſo the half-turn each horſeman in an army makes after his diſcharge, to paſs from the front of the ſquadron to the rear.

CARACOL is ſometimes alſo uſed in *Architecture*, for a ſtair-caſe in a heliacal, or ſpiral form.

CARACOLI, in *Commerce*, a factitious metal whereof the natives of the Caribbee iſlands make a kind of ornament, in form of a half-moon, which is called by the ſame name. The metal is brought from the *Terra Firma*; and the common opinion is, that it is compoſed of gold, ſilver, and copper; but the mixture is ſo perfect, that a metal reſults from the whole which never ruſts nor tarniſhes, how long ſoever kept either in the ſea, or the ground. The Engliſh and French goldſmiths have made frequent attempts to imitate it. Thoſe who have ſucceeded beſt, uſe ſix parts of ſilver, three of purified copper, and one of gold. But the curious find all the imitations much inferior in beauty to the original metal of the ſavages.

M. Hauterire, procurator-general of Martinico, makes the *caracoli* to be a compound of gold only with a ſort of copper found in the *Terra Firma* of America. F. Labat takes it for a native, or ſimple metal. The Americans alſo make rings, buckles, cane-heads, and the like, of *caracoli*. A. D. S. an. 1724. p. 26. It is there recommended as a remedy for the head-ach. Hiſt. 28.

CARACT, or CARAT, a denomination given to the weight, which expreſſes the degree of goodneſs, fineneſs, and perfection, or imperfection of GOLD.

The word is alſo written *carract*, *carrat*, *karract*, and *karrat*. Its original is conteſted: but we chooſe to follow Kennet, who derives it from *carecta*, a term which this author obſerves anciently denoted any weight, and came not till of later days to be appropriated to that which expreſſes the fineneſs of gold, and the gravity of diamonds.

The mint-men fix the higheſt purity and perfection of gold at twenty-four *carats*; and the ſeveral degrees are eſtimated from the diviſions hereof, which are called *grains*: but it is to be obſerved, that what care ſoever is taken in purifying gold, to clear it from droſs, it can never be brought to twenty-four *carats*; but ſtill comes ſhort, at leaſt $\frac{1}{4}$ of a *carat*, or a grain: this grain they call a *ſixteenth*; and this ſixteenth they ſubdivide into two eighths; and each of thoſe eighths into two ſixteenths: on which calculation, they ſay, gold may be purified as far as the firſt ſixteenth of the ſecond eighth, but no further.

Gold of twenty-two *carats*, is that which has twenty-two parts of fine gold, and two of ſilver, or other metal; or that which, in refining, loſes two parts in twenty-four of its weight. The goldſmiths generally work in gold of twenty-two *carats*; that being the ſtandard gold of this kingdom. By the laws of France they are prohibited from working in gold below twenty-three *carats*. In England, the *carat* is divided into four grains; in Germany, into twelve parts; and in France, into thirty-two. The Chineſe reckon by TOUCHES, a hundred of which correſpond to our twenty-four *carats*.

Carat fine, as above, is the twenty-fourth part of the goodneſs of a piece of pure gold.

Carat price is the twenty-fourth part of the value of an ounce or mark of gold.—They alſo ſometimes ſay, the *carat weight*, which is the twenty-fourth part of the weight of the ounce or mark. Two troy grains make a *carat* grain.

CARAT is alſo the weight uſed in weighing diamonds, pearls, and precious ſtones; where it conſiſts of four grains. In this ſenſe, the word is by ſome ſuppoſed to be derived from κερατιον, a fruit which the Latins call *ſiliqua*, and we *carob bean*; each of which may weigh about four grains of wheat: whence the Latin *ſiliqua* has alſo been uſed for a weight of four grains.

The *carat* by which jewellers eſtimate the weight of diamonds and pearls, is about $\frac{1}{150}$ of a troy ounce. Jeffreys on Diamonds.

Hence the *carat* is about $3\frac{1}{5}$ grains troy.

Carats are divided into halves, quarters, or grains; and farther, into eighths, ſixteenths, and thirty-two parts. Id. ibid.

CARAGACH, in *Commerce*, a cotton that comes from Smyrna, by the way of Marſeilles.

CARAGANA, in *Botany*. See *Bitter*-VETCH.

CARAGROUCH, a ſilver coin of the empire, weighing nine drams, which does not quite amount to a French crown, of three livres Tournois.

CARAGUATA, a Braſilian name, by which ſome authors have called the common great aloe.

From an inciſion made in the ſhoots of this plant, there flows a great quantity of liquor, whereof the Braſilians make wine, vinegar, honey, and ſugar.

CARAGUATA is alſo a ſort of thiſtle which grows in Braſil, and in ſome other parts of America. The leaves of this plant being ſteeped in water, and afterward well waſhed and rubbed, afford a kind of flax very fine and ſtrong, proper for ſeveral manufactures. The Americans make fiſhing-nets of it.

CARAITES, a ſect among the ancient Jews: whereof there are ſtill ſome ſubſiſting in Poland, Ruſſia, Conſtantinople, Cairo, and other places of the Levant; whoſe diſtinguiſhing tenet and practice it is, to adhere cloſely to the words and letter of the Scripture, excluſive of allegories, traditions, and the like.

Leo of Modena, a rabbin of Venice, obſerves, that of all the hereſies among that people, before the deſtruction of the temple, there is none now left but that of the *Carraim*, a name derived from *Micra*, which ſignifies the pure text of the Bible; becauſe of their keeping to the Pentateuch, obſerving it to the letter, and rejecting all interpretations, paraphraſes, and conſtitutions of the rabbins. Aben Ezra, and ſome other rabbins, treat the *Caraites* as Sadducees; but Leo de Juda calls them, more accurately, Sadducees reformed; becauſe they believe the immortality of the ſoul, paradiſe, hell, reſurrection, &c. which the ancient Sadducees denied. He adds, however, that they were doubtleſs originally real Sadducees, and ſprung from among them.

M. Simon, with more probability, ſuppoſes them to have riſen hence; that the more knowing among the Jews oppoſing the dreams and reveries of the rabbins, and uſing the pure texts of Scripture to refute their groundleſs traditions, had the name of *Carraim* given them; which ſignifies as much as the barbarous Latin, *Scripturarii*; i. e. people attached to the text of Scripture. The other Jews give them the odious name *Sadducees*, from their agreement with thoſe ſectaries on the head of traditions. Scaliger, Voſſius, and Spanheim, rank the *Caraites* among the Sabeans, Magi, Manichees, and Muſſulmen, but by miſtake: Wolfgang, Fabricius, &c. ſay, the Sadducees and Eſſeni were called *Caraites*, in oppoſition to the Phariſees: others take them for the Doctors of the law ſo often mentioned in the Goſpel: but theſe are all conjectures. Joſephus and Philo make no mention of them; which ſhews them to be more modern than either of thoſe authors. In all probability, this ſect was not formed till after the collection of the ſecond part of the Talmud, or the Gemara; perhaps not till after the compiling of the Miſchna in the third century.—The *Caraites* themſelves pretend to be the remains of the ten tribes led captive by Shalmaneſer. Wolfius, from the Memoirs of Mardacheus, a *Caraite*, refers their origin to a maſſacre among the Jewiſh doctors, under Alexander Jannæus, their king, about one hundred years before Chriſt: becauſe Simeon, ſon of Schetach, and the queen's brother, making his eſcape into Egypt, there forged his pretended traditions; and, at his return to Jeruſalem, publiſhed his viſions; interpolating the law after his own fancy, and ſupporting his novelties on the notices which God, he ſaid, had communicated by the mouth of Moſes, whoſe depoſitary he was: he gained many followers; and was oppoſed by others, who maintained, that all which God had revealed to Moſes was written. Hence the Jews became divided into two ſects, the *Caraites* and *Traditionaries:* among the firſt, Juda, ſon of Tabbai, diſtinguiſhed himſelf; among the latter, Hillel. Wolfius reckons not only the Sadducees, but alſo the Scribes, in the number of *Caraites*. But the addreſs of the Phariſees prevailed againſt them all; and the number of *Caraites* decreaſed: Anan, indeed, in the eighth century, retrieved their credit a little; and rabbi Schalomon in the ninth. They ſucceeded pretty well till the fourteenth; but ſince that time they have been declining.

The *Caraites* are but little known; their works coming only into very few hands, even among the greateſt Hebraiſts. Buxtorf never ſaw more than one; Selden two; but Mr. Trigland ſays, he has recovered enough to ſpeak of them with aſſurance. He aſſerts, that ſoon after the prophets had ceaſed, the Jews became divided on the ſubject of works, and ſupererogation: ſome maintaining their neceſſity from tradition; whilſt others, keeping cloſe to the written law, ſet them aſide; and it was from theſe laſt that *Caraitiſm* commenced. He adds, that after the return from the Babyloniſh captivity, the obſervation of the law being to be re-eſtabliſhed, there were ſeveral practices found proper for that end; and theſe, once introduced, were looked upon as eſſential, and appointed by Moſes; which was the origin of Phariſaiſm; as a contrary party, continuing to keep cloſe to the letter, founded *Caraitiſm*.

The modern *Caraites*, Leo of Modena obſerves, have their ſynagogues, and ceremonies; they pretend to be the ſole proper Jews, or obſervers of the laws of Moſes; calling the reſt by the term *Rabbanim*, or *followers of the Rabbins:* theſe hate the *Caraites* mortally; refuſing to ally, or even to converſe with them, and treating them as *mamzerim*, or baſtards; becauſe of their rejecting the conſtitutions of the rabbins relating to marriages, repudiations, purifications of women, &c. This averſion is ſo great, that if a *Caraite* would become a rabbiniſt, he would never be received by the other Jews.

The *Caraites*, however, do not abſolutely reject all kind of traditions; but only ſuch as do not appear well grounded. Selden, who is very expreſs on this point, in his Uxor Hebraica, obſerves, that beſides the mere text, they have certain interpretations, which they call *hereditary*, and which are proper traditions. Their theology only ſeems to differ from that of the other Jews, in that it is purer, and clearer of ſuperſtition: they give no credit to the explications of the Cabbaliſts, chimerical allegories, nor to any conſtitutions of the Talmud, but what are conformable to the Scripture, and may be drawn from it by juſt and neceſſary conſequences.

Peringer obſerves of the *Caraites* in Lithuania, that they are very different, both in aſpect, language, and manners, from the rabbiniſts, wherewith that country abounds. Their mother tongue is the Turkiſh; and this they uſe in their ſchools and ſynagogues. In viſage they reſemble the Mahometan Tartars. Their ſynagogues are placed north and ſouth; and the reaſon they give for it, is, that Shalmaneſer brought them northward: ſo that, in praying, to look to Jeruſalem, they muſt turn to the ſouth. He adds, that they admit all the books of the Old Teſtament; contrary to the opinion of many of the learned, who hold that they reject all but the Pentateuch.

Caleb, a *Caraite*, reduces the difference between them and the rabbiniſts to three points: 1. In that they deny the oral law to come from Moſes, and reject the Cabbala. 2. In that they abhor the Talmud. 3. In that they obſerve the feaſts, as the ſabbaths, &c. much more rigorouſly than the rabbins do. To this may be added, that they extend the degrees of affinity, wherein marriage is prohibited, almoſt to infinity.—See on this ſubject, Relandi Antiq. Hebræor. part ii. cap. 9. § 12. Trigland. de Sectâ Karæoram. Baſnage's Hiſt. of the Jews, book ii. chap. 8, 9.

CARAMANGCE, a drug which comes from China. The Tonquineſe value it very much.

CARANDA, in the *Materia Medica*, a name uſed by ſome authors for the tamarind-tree.

CARANNA, a hard, brittle, reſinous gum, brought from ſome parts of the Weſt Indies, as Carthagena and New Spain; of an aromatic flavour; and ſometimes uſed in medicine as a cephalic.

The trees from which it runs, are like the palm-tree. When it is freſh, it is white; but as it grows ſtale, it becomes greyiſh inclining to green, in which condition it is ſent to Europe, where the white is ſeldom to be met with. It is brought in lumps wrapped up in leaves. To be of the beſt quality, it muſt be ſoft, of a pleaſant aromatic ſmell, and as white as ſnow. As this gum is very dear, it is ſeldom ſold unadulterated; and other ſorts are often ſubſtituted in its ſtead, which have not the ſame properties. When applied to the head, it has an extraordinary virtue to relieve it from pain; which renders it highly valuable. It produces the ſame effects in the joints; and is ſo much eſteemed in medicine, that it is become a proverb in pharmacy to ſay, Whatever the *tacamahaca* has not cured, the *caranna* will.

The Americans make a balm of it, which they pretend to be a ſovereign remedy for the cure of wounds, and the hæmorrhoids or piles.

CARANTIA, in the *Materia Medica*, a name given by ſome authors to the CAROB, or *ſiliqua dulcis*, the ſweet-pipe.

CARAPACE, the thick, ſolid, firm ſhell, which covers the turtle or tortoiſe; and to which adhere thoſe fine tranſparent ſhells, which are known under the name of tortoiſe-ſhell, of which ſnuff-boxes and ſeveral ſorts of inlaid work are made.

CARAPO, in *Zoology*, the name of a fiſh, of which there are two kinds caught in many parts of the lakes of America. The firſt has a long and thin body, of the ſhape of a knife-blade, the back being thick, the belly very thin and narrow; the tail is pointed; and the uſual ſize of the fiſh is a foot in length, and two fingers broad in the broadeſt part. The head is flat and pointed, and the lower jaw runs out a little farther than the upper; the mouth is very narrow, and the bottom jaw is furniſhed with very ſmall and ſharp teeth; the upper is toothleſs; its eyes are very ſmall; and it is covered with little ſcales. It is of a brown colour, with a faint admixture of red, and the back and head are ſomewhat blackiſh; there runs a duſky line all along the ſides in their middle, and under this the fiſh is ſpeckled with black ſpots of the ſize of a ſeed of muſtard.

The ſecond kind no way differs from the firſt, but that it is much narrower in proportion to its length, and has no ſpots. They are both eatable. Margrave.

CARAPOPEBA, in *Zoology*, the name of a ſmall ſpecies of lizard, common in the Braſils, and eſteemed a poiſonous animal. Its body is of a liver colour, and has ſeveral white ſpots. There are marks of white on the tail, variegated with ſome ſmall quantity of yellow; the eyes are remarkably bright and vivid. Ray.

CARARA, a weight at Leghorn, and in other parts of Italy, uſed in the ſale of wool and cod-fiſh, equivalent to ſixty pounds of that country.

CARASSIUS, in *Zoology*, the name of a genus of leather-mouthed fiſhes of the carp or bream kind, of which there are three ſpecies. It is a ſmall freſh-water fiſh, of about three, four, or five inches long, with a flatted body, and a riſing back; it reſembles the bream indeed in ſhape very nearly, but is ſomewhat thicker; its colour is a pale yellow, and its belly of a deeper yellow, without any redneſs. The mouth is ſmall and round; and the eyes ſmall, and ſunk in their orbit. See CRUCIAN, and CYPRINUS.

CARATH, in the *Materia Medica*, a name given by the Arabian writers to the ACACIA.

CARAT, CARRAT, or CARACT. See CARACT.

CARAVAN, or CARAVANNE, in the Eaſt, a troop or company of travellers, merchants, and pilgrims, who for their greater ſecurity march in a body through the deſerts, and other dangerous places, infeſted with Arabs and robbers.

The word comes from the Arabic *cairawan*, or *cairoan*; and that from the Perſian *kervan*, or *cârvân*, *negotiator*, *a trader* or *dealer*. Vid. Peritiſ. Itin. Mund. ed. Hyde. p. 61.

There is a chief, or aga, who commands each *caravan*, and has under him a number of janizaries, or other forces, ſufficient for their defence. The *caravans* encamp every night near wells, or rivulets known to the guides; and obſerve a diſcipline as regular as in war. They chiefly uſe camels for their vehicles, becauſe of their enduring much fatigue, eating little, and paſſing three or four days without drinking.

The grand ſignior gives one fourth part of the revenue to Egypt, to defray the expence of the *caravan* that goes yearly to Mecca to viſit Mahomet's tomb: the devotees, in this *caravan*, are from forty thouſand to ſeventy thouſand; accompanied with ſoldiers to protect them from the pillage of the Arabs, and followed with eight or nine thouſand camels, laden with all neceſſary proviſions for ſo long a paſſage acroſs deſerts.

Days journeys are diſtinguiſhed in the Eaſt, into journeys of *horſe-caravan*, and *caravans of camels*: thoſe of horſes are equal to two of camels.

There are four regular *caravans* which go yearly to Mecca; the firſt from Damaſcus, compoſed of the pilgrims from Europe and Aſia; the ſecond from Cairo, for the Mahometans of Barbary; the third from Zibith, a place near the mouth of the Red Sea, where thoſe of Arabia and India meet; the fourth from Babylon, where the Perſians aſſemble. Moſt of the inland commerce in the Eaſt is carried on by *caravans*. The late czar, Peter the Great, eſtabliſhed a trade between Ruſſia and China by means of a *caravan*. M. Bougnon, geographer of the duke of Lorraine, has given a treatiſe of the *caravans* of merchants in Aſia, wherein he ſhews of what they are compoſed; how many ſorts there are; the ſeveral uſes of the different ſorts of animals in them; the price given for them; the officers and men appointed to conduct them, and the pay of each; with their manner of marching, halting, fighting, treating, &c.

In the heavy *caravans*, to five hundred elephants there are a thouſand dromedaries, and at leaſt two thouſand horſes, eſcorted by four thouſand cavaliers. Two men are required to lead each elephant; five to three dromedaries; and ſeven to twelve camels. Such a number of ſervants joined with the officers and paſſengers, the number whereof is not limited, renders the body very formidable; the paſſengers indeed are not obliged to fight, but in caſe they refuſe, proviſion will ſcarce be allowed them afterwards, even for their money.

As few of the Arab princes have any other ſubſtance than what they can get by pillage, they keep continually ſpies on foot, to give them intelligence of the departure and motions of *caravans*, which they frequently attack with ſuperior forces: in caſe of repulſe, they come to an accommodation; but if the *caravan* be beaten, it is abſolutely plundered, and the whole guard made ſlaves; though more indulgence is ſhewed to ſtrangers. The taking of a ſingle *caravan* ſometimes enriches a prince for ever.

The profits to be made in a *caravan*, during its march, are often incredible; Mr. Bougnon gives inſtances where, by repeated bargains and exchanges, a perſon has made twenty thouſand crowns out of a ſingle gold watch, and thirty *louis d' ors*.

Any dealer is at liberty to form a company, in order to make a *caravan*. He in whoſe name it is raiſed, is conſidered as the *caravan-bachi*, or chief of the *caravan*, unleſs he appoint ſome other in his place. If there be ſeveral merchants equally concerned, they elect a *caravan-bachi*; after which they appoint officers to conduct the *caravan*, and decide all controverſies which may ariſe during the journey.

There are five ſorts of *caravans*, viz.

CARAVAN, *heavy*, compoſed of elephants, dromedaries, camels, and horſes.

CARAVAN, *light*, in which there are but few elephants.

CARAVAN, *ordinary*, that in which there are no elephants.

CARAVAN *of horſes*, that in which there are neither camels nor dromedaries, but only horſes.

CARAVANS, *ſea*, are companies of merchant veſſels, loaden with goods, and convoyed by ſhips of war.

CARAVAN is alſo an appellation given to the voyages, or campaigns, which the knights of Malta are obliged to make at ſea, againſt the Turks and Corſairs; in order to arrive at the commanderies and dignities of the order. They are thus called, becauſe the knights have frequently ſeized the *caravan* going from Alexandria to Conſtantinople.

CARAVANIER, a perſon who leads the camels and other beaſts of burden uſed in the *caravans* of the Eaſt.

CARAVANSERA, a large public building, or inn, deſtined to receive and lodge the *caravans*.

The word comes from the Arabic *cairawan*, or Perſian *karwan* or *cârvân*, *a caravan*, and *ſerai*, *a large houſe*.

Of theſe *caravanſeras*, or, as Chardin calls them, *caravanſerai*, there are a great number throughout the Eaſt; erected out of the charity and magnificence of the princes, &c. of the ſeveral countries.

Thoſe of Schiras and Caſbin, in Perſia, are ſaid to have coſt ſixty thouſand crowns each. They are open to people of all religions and countries, without any queſtions aſked, or any money required.

The *caravanſerai* are uſually huge ſquare buildings, with a ſpacious court in the middle thereof. They are encompaſſed with galleries and arches, under which runs a kind of banquette, or elevation, ſome feet high, where travellers reſt themſelves, and make their lodgings as well as they can; their baggage, and the beaſts that carry them, being faſtened to the foot of the banquette. Over the gate, there is frequently a ſort of little chambers; which the *caravanſeraſkier* lets out, at a very dear rate, to ſuch as have a mind to be retired.

Though the *caravanſeras* ſerve in lieu of inns, yet there is this eſſential difference between them and our inns, that the traveller finds nothing at all in the *caravanſera*, neither for himſelf, nor his cattle; but muſt carry all his proviſions and neceſſaries with him. They are chiefly built in dry, barren, deſert places; and are generally furniſhed with water from a great diſtance, and at a vaſt expence; there being no *caravanſera* without its well of water. There are ſeveral of them in cities: where they ſerve not only as inns, but as ſhops, warehouſes, and even exchanges.

There are ſome *caravanſeras* where moſt things may be had for money; and as the profits of theſe are conſiderable, the magiſtrates of the cities to whoſe juriſdiction they belong, take care to ſtore them well: they have an inſpector, who fixes the price of lodging, without appeal. There are few cities in the Eaſt without their *caravanſerai*; eſpecially within the dominions of Turky, Perſia, and the Great Mogul. Thoſe of Conſtantinople, Iſpahan, and Agra, the capitals of three empires, are diſtinguiſhed for their magnificence and commodiouſneſs.

In Turky, none but the grand ſignior's mother and ſiſter, with the viſiers and baſhaws, who have been in three battles againſt Chriſtians, are allowed to build a *caravanſera*.

CARAVANSERASKIER, the director, ſteward, or intendant of a *caravanſera*.

At Iſpahan there are *caravanſeras* in manner of halls or exchanges, where goods are laid up, and expoſed to view; for which the *caravanſeraſkier* is accountable, in conſideration of a certain fee.

CARAVEL; thus they call a ſmall veſſel on the coaſt of France, which goes to fiſh for herring on the banks. They are commonly from twenty-five to thirty tons burden. Thoſe which are deſigned for the ſame fiſhery in the Britiſh channel, are called by the French *trinquarts*: theſe are from twelve to fifteen tons burden.

CARAUNA, in *Zoology*, the name of a ſmall Braſilian fiſh, in many reſpects approaching to the turdus kind. Its colour is a fine bright red, all over ſpotted with very ſmall black ſpots.

CARAWAY, *Carum*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it hath an umbellated flower, compoſed of ſeveral ſmall umbels, which are formed as rays to the general umbel; neither of which have any involucrum: the flower hath five heart-ſhaped petals, and five hairy ſtamina. The germen is ſituated under the flower, which becomes an oblong channelled fruit, dividing into two parts, each having an oblong furrowed ſeed. There are two ſpecies.

The common *caroway*, whoſe ſeed is uſed both medicinally and in the kitchen, grows naturally in ſome of the rich meadows in Lincolnſhire and Yorkſhire, and is ſometimes found in paſtures near London. It is alſo cultivated in ſome places.

The ſeed of the *carui*, or *caraway*, is narrow, longiſh, furrowed on the back, and of a briſk aromatic taſte.

It is one of the greater hot ſeeds, and is eſteemed ſtomachic, and diuretic; it diſpels wind, and ſtrengthens digeſtion, &c. The Engliſh and Germans make great uſe of it; particularly in biſcuits, comfits, ſeed-cakes, and other foods, and confections.

CARBASA *Caryſtia*, a term uſed by many of the ancient writers to expreſs pieces of cloth made of the *linum incombuſtibile*, or aſbeſtos ſtone, which being found plentifully about Caryſtium, was thence called by the name of the place. Pauſanias calls it *linum Carpaſum*, for the ſame ſort of reaſon; Carpaſus, a town in the iſland of Cyprus, being a place famous for affording large quantities of the ſtone in its neighbourhood.

CARBENSIS *aqua*, in the *Materia Medica*, the name of a mineral water of Germany, of which Hoffman from Petzlerus has given the following account. All about the place of its origin, and along the canals through which it paſſes, it depoſits an earthy and ferruginous matter, which concretes into a ſtony hardneſs. When any alcaline liquor, whether fixed or volatile, is added to theſe waters, they become turbid, and precipitate a whitiſh earthy matter to the bottom of the veſſel; after the evaporation of the water they leave a *ſal enixum*, and an alcaline earth; two quarts of them yield two ſcruples and ten grains of the earth, and twelve grains of the ſalt. If it be kept for any time in a glaſs, or earthen veſſel, it depoſits a ſediment of a yellow ochreous earthy matter, and when immediately taken from the ſpring, it changes to a bluiſh brown colour, on being mixed with galls. It contains a very large portion of a ſubtile mineral ſpirit; for if a long-necked veſſel be filled half full with it, and the orifice ſtopped with the thumb, the whole, on a little ſhaking, ſends up a froth to the top; and when the thumb is taken off, the water ſquirts out to ſeveral feet diſtance. It makes an efferveſcence on mixing oil of vitriol with it; but this laſts but a very little time. From the whole, it ſeems to contain a large quantity of calcareous earth, and ſome ſmall portion of ferruginous matter; whence it purges both by ſtool and urine, though moſtly the latter way: the former operation, which is pretty conſtant, is owing to this alcaline earth meeting with an acid in the *prima via*, and being by it changed into a bitter purging ſalt, of the nature of Glauber's.

CARBEQUI, or *Aſper of copper*, a coin which is current in the province of Georgia in Aſia; particularly at Teſſlis, the capital.

CARBO *aquaticus*. See CORMORANT.

CARBONADE, or CARBONADO, in *Cookery*, fleſh, fowl, or the like, ſeaſoned, and broiled on the coals.

CARBUNCLE, among *Ancient Naturaliſts*, is a ſort of ſtone, whereof Pliny and Theophraſtus relate many fabulous wonders.

The name is formed of the Latin *carbunculus*, q. d. *a burning coal*. Pliny, treating of the *carbuncle*, diſtinguiſhes twelve ſorts of it.

Many of the ancients, and ſome of the moderns after them, have ſuppoſed the *carbuncle* to be taken from the dragon's head; and we read of many cavaliers, who went to combat with dragons, on purpoſe to gain this invaluable jewel.—Vartoman aſſures us, that the king of Pegu uſed no other light in the night-time, but that of his *carbuncle*, which caſt a blaze like that of the ſun.

CARBUNCLE, among *Modern Lapidaries*, is a ſtone of the ruby kind, very rare, and of a rich, glowing blood-red colour.

The diſtinguiſhing character of the *carbuncle* is, that it is a gem of great hardneſs, and of a deep red with an admixture of ſcarlet. It was known among the ancients by the name ανθραξ, which was uſed metaphorically to ſignify that this gem was in ſome lights of a fire colour; the proper ſignification of the word being a piece of lighted charcoal.

The *carbuncle* is uſually found pure and faultleſs, and is of the ſame degree of hardneſs with the ſapphire, being ſecond only to the diamond. It is ever found naturally of an angular figure, ſmaller at one end than at the other, and at that ſmall end tapering to a pointed pyramid, compoſed of the ſame number of planes with the column, which is ſix, and thoſe uſually very unequal. It is found adhering by its baſe to a heavy and hard ferruginous ſtone of the emery kind, and is always more finely coloured toward the point than in the baſe of the column.

Its uſual ſize is near a quarter of an inch in length, and two thirds of that in diameter in its thickeſt part. It bears the force of fire unaltered, not parting with its colour by it, as do moſt of the gems; nay, it even will not be at all affected by fire, nor become in the leaſt degree paler. It is found only in the Eaſt Indies, ſo far as is yet known, and that but very rarely.

The diſtinctions between the ſeveral red gems are very nice, and their names in ſome degree arbitrary. Many authors have confounded the *carbuncle* with the ruby, and determined with Garcias, that every ruby which exceeded twenty-four caracts in weight, was properly a *carbuncle*. This gem, however, is by all trials proved to be evidently the *carbuncle* of the ancients, and eſſentially different from the ruby in wanting the purpliſh tinge into which the colour of that gem goes off, as is extremely evident in all the deep ones; this going off into a true ſcarlet, and for that reaſon giving the colour of a lighted charcoal in the ſun, which neither the ruby, garnet, nor any other gem can do which has the blue or purple caſt.

The fineſt *carbuncles* are ſaid to be produced in the iſland of Ceylon, the king of which country is poſſeſſed of a *carbuncle* a palm broad, and three inches thick, of the brightneſs of fire.

Some include GRANATES and HYACINTHS under the claſs of *carbuncles*.

CARBUNCLE, in *Medicine*, is a malignant tumour, ariſing ſometimes on one part, and ſometimes on another; accompanied with a painful heat, mortification, lividneſs, and at laſt a blackneſs of the part.

The Greeks call it ANTHRAX; the Latins *carbunculus*, ſometimes alſo *carbo*; and the French *charbon*; all importing *coal*; from the reſemblance of its ſcab to a coal of fire. It is ſometimes peſtilential, and ſometimes not. When it ariſes without puſtules, it is properly called *pruna*; when with, *ignis Perſicus*.

It uſually begins with one or more puſtules, under which is formed a putrid ulcer; ſometimes with a ſcab, without any puſtule; the ulcer being formed under the ſcab. Within the tumour is a kernel, very painful; ſometimes red, and ſometimes livid, or blackiſh.

The *carbuncle* is owing to a ſharp, cauſtic, malignant, ſaline humour, which gnaws and corrupts the part whereon it is diſcharged.

CARBUNCLE is alſo, in *Medicine*, ſometimes uſed for the *furunculus*, or BOIL.

This is more particularly called the *benign carbunculus*, by way of contradiſtinction from that which is of the *malignant* kind.

CARBUNCLE is alſo frequently uſed to denote a ſmall eruption, which, coming on any part of the body, ſoon diſcharges its contents, and afterwards appears in form of a cruſty tubercle, of the ſize of a millet-ſeed, ſurrounded with a red fiery circle.

CARBUNCLE, *peſtilential*. This is an inflammation that ariſes in time of peſtilential contagion, with a veſicle or bliſter, almoſt like thoſe which are cauſed by burning; but this inflammation generally terminates in a mortification, and putrifies the adjacent parts down to the bone, all about becoming as black as a coal.

This kind of inflammation always breaks out very ſpeedily, ſometimes even in an hour or two, attended with the moſt intolerable heat and pain. On opening it, there is always diſcharged a darkiſh limpid or watery ſanies, and the fleſh underneath is of a black colour, the mortification having then already ſeized it, and ſpreading more and more by degrees; but in thoſe who recover, the mortification at length ſtops, and the putrified fleſh ſuppurates, and parts from the ſound.

The ſize and number of theſe inflammations in the ſame patient, are both very various and uncertain; there is no part of the body but what they may infeſt; and they are generally, if not always, accompanied by buboes.

The immediate cauſe of theſe is a violent inflammation, excited in the blood by the peſtilential venom; and the inflammation, from the nature of the caſe, is ever ſpeedy, and always followed by ſphacelation and a corruption of the parts. What is remarkable, is, that the parts and juices do not ſuppurate into matter, as is uſual in other tumours, but whatever is internally corrupted, ſeparates and entirely falls off: for the inflamed parts ſuppurate at the margin of the inflammation, ſo that if the patient does not die ſuddenly, the ſphacelated parts are ſeparated, and naturally thrown off.

Carbuncles are always a worſe ſymptom than buboes in theſe caſes, eſpecially if the eruptions turn directly either livid or black; but if they are red firſt, and then gradually turn to a citron colour, the danger is leſs.

Thoſe *carbuncles* alſo which ariſe in the face, neck, breaſt, or arm-pits, are always accounted the worſt, and uſually kill the patient.

The chief buſineſs of internal medicines, in this caſe, is to keep the patient in a conſtant breathing ſweat; and the buſineſs to be aimed chiefly at in external applications, is to procure, as ſoon as poſſible, the ſeparation of the ſphacelated parts from the ſound. Some, therefore, uſe ſcarification alone in this caſe, and that with very good ſucceſs; for, by making a great number of inciſions in the corrupted parts, they let out the peſtilential venom which corrupted the blood. Others on the ſame occaſion uſe alſo, as a cataplaſm, a mixture of two ounces of flour and half an ounce of vinegar, made with water or ſkimmed milk into a proper form, and with an ounce of honey, and an ounce of powder of ſaffron; thoſe ingredients are to be thoroughly mixed in, and the cataplaſm to be applied warm, and renewed frequently, till the whole *carbuncle* ſeparates and falls off from the ſound parts; and this is a much better and ſafer method of extirpating the *carbuncle*, than by cutting it out at once, by which operation ſome have been known to have been killed upon the ſpot. When the greateſt part of the *carbuncle* is, however, of its own accord ſeparated from the ſound parts, the part where it adheres may always be ſafely divided with the ſcalpel; and this, indeed, is abſolutely neceſſary.

If an ill-conditioned and luxuriant fleſh grows internally in this caſe, either of itſelf, or from the extirpation of the *carbuncle* being made too ſoon, this muſt ever be neceſſarily entirely conſumed by the application either of the Ægyptian ointment, or of the following: take two ſpoonfuls of honey, the yolks of two eggs, and of burnt alum, gentian, and birthwort-root in powder, each an ounce; make the whole into an ointment.

If the inflammation diſpoſes the adjacent parts to a gangrene, it will be moſt proper to uſe the following application: take ſalt of wormwood, half an ounce; of the herb ſcordium, and of elder and chamomile flowers each a handful; and of river-water two pints and a half: when theſe have been well boiled and ſtrained, mix with the liquor ſix ounces of camphorated ſpirit of wine, and two ounces of Venice treacle; and let this be applied hot to the parts, by means of double linen rags being well wetted in it, and repeated frequently till the violence of the inflammation abates.

When the mortified fleſh of the *carbuncle* has ſeparated itſelf from the ſound part, it is neceſſary to cleanſe the ulcer perfectly with digeſtive ointments, leſt any of the matter remain there, and mix itſelf again by degrees with the blood; and this deterging of the ulcer is always to be continued till there remain no more ſymptoms of the peſtilential infection in the patient; and after this the wound may be healed like other ulcers. Heiſter.

Carbuncle, *Carbunculus*, alſo denotes a ſort of ſandy matter found in Hetruria, formed of a hard earth of the ſame name, concocted in the viſcera of the mountains, by the heat of the ſubterranean vapours.

Pliny and Varro ſpeak of the *carbunculus*, as a peculiar kind of hot, dry, lean ſoil.

Carbuncle, in *Heraldry*, a charge, or bearing, conſiſting of eight radii, or ſpokes; four whereof make a common croſs, and the other four a ſaltier. See *Tab. Herald. fig.* 13.

Some call theſe radii *battons*, or *ſtaves*; becauſe round, and enriched with buttons, or pearled, like pilgrims ſtaves; and frequently tipped, or terminated with fleurs-de-lis. Others blazon them, royal ſceptres, placed in ſaltier, pale and feſſe.

CARBUNCULATION, the blaſting, or ſcorching of the new-ſprouted buds of trees, or plants, either by exceſſive heat, or exceſſive cold.

It happens chiefly in the ſpring and autumnal ſeaſons, when vegetables being covered with dewy vapours, a ſudden cold comes on them, which, congealing thoſe vapours, the nutritious juice of the plant is coagulated, and the texture of its fibres deſtroyed.

CARCAJOU, in *Zoology*, a ſpecies of quadrupeds in North America; ſmall, but very ſtrong and furious: ſee the deſcription of it by M. Saraſſin, in Hiſt. Acad. Sc. 1713.

CARCAPULI, in *Botany*, the Indian yellow orange of Malabar. This is a tall ſpreading tree; the trunk as much in compaſs, as two men can encircle with their arms. The leaves ſtand by pairs on the ſprays, at the extremities of which appear yellowiſh and tetrapetalous flowers, which are void of ſmell, but of a ſouriſh taſte. The calyx conſiſts of four pale concave leaves; and the fruit, which hangs by a pedicle an inch long, is big, round, and diſtinguiſhed by eight or ten exuberances like ribs; with a ſmall head at the top, ſtriated in like manner with ſmall ribs. It is firſt green, then yellow, and when ripe, whitiſh; and has an acid ſweetneſs of taſte. The ſeeds are contained in the middle of the pulp; and are oblong, flattiſh, and of a dark azure colour.

This fruit, according to Acoſta, as to ſize and ſhape, is like a quince with the rind taken off, and conſiſts in like manner of grumous parts, but not ſeparable, as in the quince; it is covered with a thin, light, and ſhining rind. It is dried, and exported from Malabar to other countries.

It is commonly eaten, and the inhabitants commend it much for medicinal uſes: but it is moſt eminent for ſtopping a flux of the belly, of what kind ſoever, eſpecially that contracted by exceſſive venery.

Carcapuli *Linſchotani*. C. Bauhine confounds this with the preceding; but they differ in flower and fruit, though agreeing in other reſpects. The firſt bears an acid, ſulcated, gold-coloured fruit, as big as an apple; the latter produces a round ſweet fruit, of the bigneſs of a cherry: the firſt is called by the natives ſimply *ghoraka*, the other *kanna ghoraka*. They both afford gum gutta, but the latter the beſt. But this gum gutta, ſays Dr. Syen, muſt not be confounded with the common gum gutta, which, as Bontius aſſures us, is collected from a plant which is near akin to the *Eſula Indica*, and is called by the Indians *Lonam Cambodia*, becauſe it grows plentifully in the country of Cambodia.

CARCARIAS *canis*. See **Shark**.

CARCASE, the corpſe, or body of a dead animal. Thus, we ſay, the *carcaſes* of the ſoldiers, horſes, &c. were ſeen long afterwards on the field of battle.

The *carcaſe* of a fowl, capon, partridge, leveret, rabbet, &c. is what remains thereof, after the four members, or limbs, viz. the legs and wings, have been cut off.

Carcase, in *Architecture*, is the ſhell, or ribs of a houſe; containing the partitions, floors, rafters, &c. made by the carpenter, &c. The *carcaſe* is otherwiſe called the **framing**.

CARCASSE, or **Carcuss**, in *War*, a kind of bomb, either oblong, and oval, or circular; conſiſting of a ſhell, or caſe, ſometimes of iron, with holes; but more commonly of a coarſe ſtrong canvas, pitched over, and girt with iron hoops; filled with combuſtible matters, as hand-granadoes, ends of muſquets, loaded piſtols, and preparations of gunpowder, &c. Its uſe is to be thrown out of a mortar, to ſet houſes on fire, and do other execution.

It has the name *carcaſſe*, becauſe the circles which paſs from one ring, or plate, to the other, ſeem to repreſent the ribs of a human *carcaſe*.

The oblong *carcaſſes* are now diſuſed, on account of the uncertainty of their flight: the round ones are compoſed of pitch, ſaltpetre, ſulphur, and corned powder.

In lieu of the ancient *carcaſſes*, a new ſort has been introduced made of iron bands, or ribs, which incloſe a canvas bag, filled with combuſtible matter, hardly to be extinguiſhed.

We have alſo a third ſort of *carcaſſes*, of a late invention, for the ſea-ſervice, differing in nothing from a bomb, except in their being filled with a compoſition like that above mentioned, and having five holes all primed with powder and quick-match, which take fire from the flaſh of the mortar, and communicating it to the compoſition, cauſe it to burn vehemently from thoſe holes.

CARCERES, in *Antiquity*, were the liſts, or barriers of the circus, within which the horſes were confined, till the ſignal was given by the magiſtrate for ſtarting.

The word is Latin, ſuppoſed to be formed *a coërcendo*, as they ſerved as a reſtraint to the horſes ready to run.

The number of *carceres* was twelve. In the early days of Rome they were made of wood, which Claudius afterwards changed for marble. They were kept faſt with bolts, ſuſtained by ropes, which, the moment the ſignal was given, flew open all at once. Some think that only four were uſed at a time. Suet. in Claud. cap. xxi. n. 6.

CARCINIUM *Opalinum*, a new genus of marine animal, diſcovered by Mr. Banks and Dr. Solander, in their paſſage to Madeira, which ſhone in the water with colours that exceeded in variety and brightneſs any thing they had ever ſeen. The beautiful colouring and ſplendour of theſe animals were equal to thoſe of an **opal**; and from their reſemblance to that gem, they gave this denomination to the genus. One of them lived ſeveral hours in a glaſs of ſalt water, ſwimming about with great agility, and diſplaying at every motion a change of colours almoſt infinitely various. See **Dagysa**.

CARCINOMA, in *Medicine*, a tumour more uſually called a **cancer**.

The word comes from καρκινος, *cancer*, and νεμω, *depaſco, to feed upon.*

Carcinoma is ſometimes uſed to denote a diſorder of the *tunica cornea* of the eye, wherein the little veins of the part appear turgid and livid.

CARCINOMATOUS, the ſame with **cancerous**.

Schirrhi and ſtrumæ, which are formed of the humours ſtopped by their viſcidity, or coagulated by an acid, as alſo polypuſes, wherein the veſſels retain their order and diſtribution, are originally different from *carcinomatous* tumours, which, according to Gendron, ariſe from an indiſpoſition of the glandular veſſels. Yet, when the ſtructure of the veſſels is once deſtroyed, the former degenerate into a hard indiſſolvable lump, capable of germination, ſo that they loſe their former nature, and become cancerous. Phil. Tranſ. N° 260. p. 479.

CARD, in the *Woollen Manufactory*. See CARDING.

The word ſeems formed from the Latin *carduus (fullonum)* which denotes the fuller's teazle; a kind of thiſtle whoſe head is uſed to ſmooth and range the nap of cloth, &c. Skin. Etym. Angl. in voc.

There are divers ſorts of theſe *cards*, as ſtock-*cards*, hand-*cards*, wool-*cards*, tow-*cards*, &c.

Cards for wool in England, may not be imported, nor the wire taken out of old *cards*, to be put into new leather and boards, in order for ſale; upon forfeiture thereof, or of the value, if not ſeized: but may be amended for the proprietor's own uſe, or for tranſportation only.

CARD-*playing*. See CARDS.

CARDAMINDUM, in *Botany*. See CRESSES.

CARDAMINE, in *Botany*, a genus of the *tetradynamia ſiliquoſa* claſs; lady's ſmock. The characters are theſe: the flower hath four oblong petals placed in form of a croſs; it hath ſix ſtamina, four of which are the length of the empalement, the other two, which are oppoſite, being much longer. It hath a cylindrical germen, which afterward turns to a long, compreſſed, cylindrical pod, with two cells, opening in two valves which twiſt ſpirally, and caſt out the ſeeds when ripe by their elaſticity. There are ten ſpecies. Miller's Gard. Dict.

This plant is alſo known by the names of *cuckow-flower*, and *meadow-creſſes*. It is a kind of NASTURTIUM, and is pungent and diſcuſſive; but is not uſed either in compoſition, or common preſcription. Dr. Baker recommends it to the trial of phyſicians as an antiſpaſmodic remedy, in the Medical Tranſact. vol. i. p. 442.

CARDAMOMUM, or CARDAMON, medicinal ſeeds of the aromatic kind, contained in capſulæ, or pods, brought from the Eaſt Indies; and uſed in the compoſition of Venice treacle, and many other medicines. Their pungency and aromatic ſmell are cauſed by an eſſential oil. Neumann.

This ſeed is diſtinguiſhed into three kinds, according to the ſeveral ſizes of the pods; viz. *majus*, *minus*, and *maximum*; or great, leſſer, and greateſt: but the taſte, ſmell, colour, and form of the grain, is the ſame in all; being of a purple colour, angular, of a ſharp biting taſte, and a ſtrong penetrating ſmell.—The laſt kind is alſo called *grains of paradiſe*; but the firſt excels the reſt, both in ſmell, taſte, and virtue: it is this that enters the compoſition of the theriaca.

The *cardamoms* warm, and deterge: they ſtrengthen the nobler parts, diſſipate wind, and help digeſtion; and are uſed in diſeaſes of the brain, ſtomach, and womb.

CARDANES, in *Natural Hiſtory*, the name of a ſmall inſect reſembling a beetle, of a very ſweet ſmell, and very ſoft to the touch. It is very ſwift in its motions, and is of a blackiſh colour, having two ſhort wings, which do not nearly reach to the tail; it is likewiſe remarkable for having the tail of the ſame ſhape with the head, ſo that, when it ſtands ſtill, it looks as if it had two heads, one at each end.

CARDASS, a ſort of card, proper for carding flocks of ſilk, to make cappadine of it. It is alſo the name which the French give to thoſe flocks of ſilk.

CARDASSES, is alſo the name which in the cloth manufactories of Languedoc, they give to a ſort of large card, which is uſed for carding the dyed wool, deſigned for making cloth of mixed colours.

CARDERS, in the *Woollen Manufactory*, are perſons who prepare wool, &c. for ſpinning, &c. See CARDING and CLOTH.

Carders, ſpinners, weavers, fullers, ſheermen, and dyers, not performing their duty in their occupations, ſhall yield to the party grieved, double damages; to be committed until payment. One juſtice to hear and determine complaints.

Carders, combers, ſorters, ſpinners, or weavers, conveying away, embezzling, or detaining any wool or yarn, delivered by the clothier, or any other perſon, ſhall give the party grieved ſuch ſatisfaction, as two juſtices, mayor, &c. ſhall think fit: if not able or willing to make ſatisfaction, for the firſt offence to be whipped, or ſet in the ſtocks in ſome market-town, or in any other town where the offence is committed: the ſecond offence to incur the like, or ſuch further puniſhment by whipping, &c. as juſtices ſhall think proper. Conviction by one witneſs on oath, or confeſſion.

CARDIA, in *Natural Hiſtory*, a genus of ſhell-fiſh, the ſhell of which is formed of two ovals, and reſembles the figure of a heart at cards: the valves are equal and gibboſe. Of this genus are ſeveral ſpecies; under it are comprehended the cockles, ark-ſhells, &c. together with the *pectines inauriti*, or ſcallops without ears. See HEART-*ſhell*.

CARDIACA. See MOTHER-*wort*.

CARDIACS, CARDIACA, in a general ſenſe, comprehend all medicines beneficial to the heart; whether internally, or externally applied.

The word comes from *καρδια*, *cor*; the heart being reputed the immediate ſeat of their operation.

CARDIACS, in a more particular ſenſe, denote medicines which raiſe the ſpirits, and give preſent ſtrength and chearfulneſs. Theſe amount to the ſame with what are popularly called *cordials*.

Cardiacs are ſuppoſed to produce their effect, by putting the blood into a gentle fermentation, whereby the ſprings, before decayed, are repaired and invigorated; and the tone and elaſticity of the fibres of the veſſels reſtored: the conſequence of which is a more eaſy and briſk circulation. See CORDIAL.

CARDIACUS *plexus*, in *Anatomy*, a plexus, or piece of net-work, formed of a ramification of the *par vagum*, or eighth pair of nerves.

CARDIALGIA, CARDIALGY, in *Medicine*, a violent ſenſation of heat, or acrimony, attended with a conſtrictory pain, felt towards the upper or left orifice of the ſtomach, though ſeemingly at the heart; ſometimes accompanied with palpitations of the heart, fainting, and a propenſion to vomit: better known by the name of *cardiac paſſion*, or HEART-*burn*.

The word is compounded of *καρδια*, which denotes either the *heart*, or the left orifice of the ſtomach, and *αλγος*, *pain*.

It is otherwiſe called *cardiogmus*; though ſome diſtinguiſh, reſtraining the latter to the ſeverer degrees of this diſorder, which riſe to palpitations and fevers, and *cardialgia* to the ſlighter acceſſes of it.

Phyſicians divide this diſtemper into the idiopathic and ſymptomatic; the firſt, which is alſo called by ſome the *cardialgia nauſeoſa*, takes its riſe from crudities in the *primæ viæ*, and is often owing to worms; the other uſually is owing to a ſuppreſſion of the menſtrual, or hæmorrhoidal diſcharges. Theſe differ greatly in degree, the ſymptomatic being much the moſt violent, as the *viſcera* and *vena porta* are brought into conſent with it; but the moſt violent degree of the *cardialgia* is that which is attended with fainting: in this the whole meſentery is drawn into conſent, and is affected with ſpaſmodic contractions. Sometimes alſo in the idiopathic *cardialgia* there is a great apprehenſion of ſuffocation; this ariſes from the conſent of the *diaphragm* and *pericardium*.

CARDIALGIA, *ſigns of a*. Theſe are a ſenſation of preſſure and tenſion about the pit of the ſtomach, a ſtraitneſs and anxiety of the *precordia*, and often there comes on a nauſea, and ſometimes actual vomiting. When there are worms in the caſe, water comes into the mouth in great quantities, and the mucous matter is felt in the bottom of the jaws, as if a piece of ſomething cold lay there. Heat and cold often return ſucceſſively and ſuddenly on the perſon, and the complaint is always worſe upon an empty ſtomach, and mitigates on taking a full meal; whenever the patient can belch alſo, it gives him conſiderable relief for the time; and finally, where the commotions of blood in the *vena porta* are in fault, there is uſually a ſlight touch of a fever attending it.

CARDIALGIA, *perſons ſubject to the*. Theſe are principally valetudinary people, who have foulneſſes of the *primæ viæ*; ſometimes hypochondriac perſons have it to a very great degree, theſe people being uſually troubled with flatulencies; women ſubject to hyſteric complaints alſo, and ſuch as have ſuppreſſions of the menſes, often fall into it; and not uncommonly infants, in caſes of worms.

The cauſe of the complaint is either flatulency or a foulneſs in the ſtomach and inteſtines, which occaſion a reciprocal laxation and ſtricture of the tone of the ſtomach and inteſtines, and other parts which are drawn into conſent.

The occaſional cauſes of its coming on, are coſtiveneſs and the retention of flatulencies; ſudden cooling of the abdomen when the body is hot; coarſe foods, and ſuch as are hard of digeſtion; and the ſwallowing the victuals in large quantities without chewing it: the change of a common coarſe diet into a finer, will ſometimes occaſion it; and ſometimes the ſuppreſſing a violent paſſion of anger, while eating. Tender conſtitutions are in general moſt ſubject to it.

CARDIALGIA, *prognoſtics in a*. This, in its ſimple ſtate and firſt ſtages, is no very terrible complaint; but its long continuance often brings on habitual faintings, and ſometimes there is danger of congeſtions of the blood, and inflammations. The ſymptomatic kind is more difficult of cure, as well as more violent than the idiopathic; for this often is but of ſhort duration, whereas the other frequently becomes habitual, and brings on convulſions, eſpecially in caſes where hot medicines have been given in it, with intent to ſtrengthen the tone of the ſtomach. There have alſo been inſtances where vomits given to hypochondriac perſons have brought on deliriums, and even abſolute madneſs.

CARDIALGIA, *method of curing the.* In the idiopathic *cardialgia*, the peccant matter is to be prepared and corrected by reſolvent, abſtergent, and inciding medicines, ſuch as the *tartarus tartariſatus*, and vitriolated tartar; after this the acrid aromatics are to be given, among which common pepper is one of the very beſt; with this may be given the acrid roots, as thoſe of pimpernel, arum, and the like; and with all theſe it will be very proper to drink at certain intervals wine made hot, and aromatiſed with the ſpices. Muſtard-ſeed is particularly recommended by ſome on this occaſion; and, in many caſes, the common abſorbents ſerve in the place of correctors, by rendering the matter ſoft and pulpy.

After a few days taking theſe things, if there be no contra-indication in the caſe, it will be very proper to give a vomit; to which purpoſe two or three grains of tartar emetic, with ſome of the tartariſed tartar, is a very proper medicine. Where there are worms in the caſe, after the bitter digeſtives have been given, ſuch things are to follow as will deſtroy thoſe animals, as *mercurius dulcis*, and the like; after theſe things, it will be very proper to give the *theriaca* every night in ſmall doſes, by way of anodyne; and after all this, the tone of the parts is to be ſtrengthened by chalybeates, with the common bitters.

In caſes of the ſymptomatic *cardialgia*, attended with fainting, the hot medicines preſcribed in the laſt caſe are wholly to be abſtained from; and in their place the temperating nitrous ones are to be taken, with a little cinnabar, and the digeſtive ſalts impregnated with a few drops of the eſſential oils of the ſpices. Medicines of this kind are always of ſingular ſervice in caſes of ſtraitneſs and conſtriction of the *præcordia*, and diſorders of a like kind, from whatever cauſe, and in either ſex. In the intermediate days during a courſe of theſe, the patient is to take ſome purgatives of the gentler kind, and afterwards the common chalybeates and bitters for reſtoring the tone of the parts; and, finally, the beſt of all preſervatives againſt a return of this complaint, are bleedings at the ſpring and autumnal ſeaſons. Junker Conſp. Med. p. 580, &c.

CARDINAL, a term ſerving to expreſs the relation, or quality, of prime, principal, or moſt conſiderable.

The word is formed of the Latin *cardo*, *a hinge*; it being on theſe fundamental points, that all the reſt of the ſame kind are ſuppoſed to turn.

Thus, juſtice, prudence, temperance, and fortitude, are called the four *cardinal virtues*, as being the baſis of all the reſt.

CARDINAL *flower*, in *Botany*, *Lobelia*, a genus of the *ſyngeneſia monogamia* claſs. Its characters are theſe: the empalement of the flower is cut into five linear ſegments, the two upper being larger than the other. The flower is of one petal, with a long cylindrical tube, a little curved; and is divided at the brim into five ſegments, two of which compoſe the upper lip, and are ſmaller than the three lower which compoſe the under. It hath five awl-ſhaped ſtamina, terminated by oblong ſummits, which coaleſce at the top in form of a cylinder, but open in five parts at their baſe; it has an acute germen, ſituated below the flower, ſupporting a cylindrical ſtyle, crowned by a hairy obtuſe ſtigma. The germen afterward becomes an oval capſule, opening at the top, filled with ſmall ſeeds.

This genus is the *rapuntium* of Tournefort.

CARDINAL *Points*, in *Coſmography*, are the four interſections of the horizon with the meridian, and the prime vertical circle. See POINT.

Of theſe, two, viz. the interſections of the horizon and meridian, are called *North* and *South*, with regard to the poles they are directed to.

To determine the places of theſe points, ſee MERIDIAN *line*.

The other two, viz. the interſections of the horizon, and firſt vertical, are called *Eaſt* and *Weſt*.

The *cardinal points*, therefore, coincide with the four *cardinal* regions of the heavens; and are 90° diſtant from each other. The intermediate points are called COLLATERAL POINTS.

CARDINAL *Points of the Heavens*, or, *of a Nativity*, are the riſing, and ſetting of the ſun, the zenith, and nadir.

CARDINAL *Signs*, in *Aſtronomy*, are Aries, Libra, Cancer, and Capricorn. See SIGN.

CARDINAL *Winds*, are thoſe that blow from the *cardinal* points.

CARDINAL *Numbers*, in *Grammar*, are the numbers one, two, three, &c. which are indeclinable; in oppoſition to the ordinal numbers, firſt, ſecond, third, fourth, &c. See NUMBER.

CARDINAL, in *Zoology*, a name given in Louiſiana to a bird, from the ſhining red of its plumage and capuchin, &c. It keeps its neſt all winter, in which it ſtores up proviſion during the ſummer, to the quantity ſometimes of a Paris buſhel, which is artfully depoſited, and covered firſt with leaves, and then with ſmall branches, &c. See Melanges D'Hiſt. Natur. tom. iv. p. 283.

CARDINAL is more particularly uſed for an eccleſiaſtic prince, one who has a voice, both active and paſſive, in the Roman conclave, at the election of a pope.

Some ſay, the *cardinals* were ſo called from the Latin *incardinatio*, which ſignifies the adoption in any church made of a prieſt of a foreign church, driven thence by misfortune; and add, that the uſe of the word commenced at Rome and Ravenna; the revenues of the churches of which cities being very great, they became the common refuge of the unhappy prieſts of all other churches.

The *cardinals* compoſe the pope's council, or ſenate: in the Vatican is a conſtitution of pope John, which regulates the rights and titles of the *cardinals*; and which declares, that as the pope repreſents Moſes, ſo the *cardinals* repreſent the ſeventy elders, who, under the pontifical authority, decide private and particular differences.

Cardinals, in their firſt inſtitution, were only the principal prieſts, or incumbents of the pariſhes of Rome. In the primitive church, the chief prieſt of a pariſh, who immediately followed the biſhop, was called *preſbyter cardinalis*; to diſtinguiſh him from the other petty prieſts, who had no church, nor preferment: the term was firſt applied to them in the year 150; others ſay, under pope Silveſter, in the year 300. Theſe *cardinal* prieſts were alone allowed to baptize, and adminiſter the euchariſt. When the *cardinal* prieſts became biſhops, their cardinalate became vacant; they being then ſuppoſed to be raiſed to a higher dignity.—Under pope Gregory, *cardinal* prieſts, and *cardinal* deacons, were only ſuch prieſts or deacons, as had a church or chapel under their particular care: and this was the original uſe of the word. Leo IV. in the council of Rome, held in 853, calls them *preſbyteros ſui cardinis*; and their churches, *patrochias cardinales*.

The *cardinals* continued on this footing till the eleventh century: but as the grandeur and ſtate of his holineſs became then exceedingly augmented, he would have his council of *cardinals* make a better figure than the ancient prieſts had done. It is true, they ſtill preſerved their ancient title; bnt the thing expreſſed by it was no more. It was a good while, however, before they had the precedence over biſhops, or got the election of the pope into their hands: but when they were once poſſeſſed of thoſe privileges, they ſoon had the red hat and purple; and growing ſtill in authority, they became at length ſuperior to the biſhops, by the ſole quality of being *cardinals*.

Du-Cange obſerves, that originally there were three kinds of churches: the firſt or genuine churches were properly called *pariſhes*; the ſecond, *deaconries*, which were chapels joined to hoſpitals, and ſerved by deacons; the third were ſimple *oratories*, where private maſſes were ſaid, and were diſcharged by local and reſident chaplains. He adds, that to diſtinguiſh the principal, or pariſh churches from the chapels, and oratories, the name *cardinales* was given them. Accordingly, pariſh churches gave titles to *cardinal* prieſts; and ſome chapels alſo, at length, gave the title of *cardinal deacons*.

Others obſerve, that the term *cardinal* was given not only to prieſts, but alſo to biſhops and deacons who were attached to certain churches; to diſtinguiſh them from thoſe who only ſerved them *en paſſant*, and by commiſſion. Titular churches, or benefices, were a kind of pariſhes, i. e. churches aſſigned each to a *cardinal* prieſt; with ſome ſtated diſtrict depending on it, and a font for adminiſtering of baptiſm, in caſes where the biſhop himſelf could not adminiſter it.—Theſe *cardinals* were ſubordinate to the biſhops; and accordingly, in councils, particularly that held at Rome in 868, ſubſcribed after them.

It was not, however, only at Rome, that prieſts bore this name; for we find there were *cardinal* prieſts in France: thus, the curate of the pariſh of St. John de Vignes is called in old charters, the *cardinal* prieſt of that pariſh.

The title of *cardinal* is alſo given to ſome biſhops, *quatenus* biſhops; e. g. to thoſe of Mentz and Milan: the archbiſhop of Bourges is alſo, in ancient writings, called *cardinal*; and the church of Bourges a *cardinal* church. The abbot of Vendome calls himſelf *cardinalis natus*.

The *cardinals* are divided into three claſſes, or orders; containing ſix biſhops, fifty prieſts, and fourteen deacons; making in all, ſeventy: which conſtitute what they call the *ſacred college*. The *cardinal* biſhops, who are, as it were, the pope's vicars, bear the titles of the biſhopricks aſſigned to them; the reſt take ſuch titles as are given them: the number of *cardinal* biſhops has been fixed; but that of *cardinal* prieſts and deacons, and conſequently the ſacred college itſelf, is always fluctuating. Till the year 1125, the college only conſiſted of fifty-two, or fifty-three: the council of Conſtance reduced them to twenty-four; but Sixtus IV. without any regard to that reſtriction, raiſed them again to fifty-three, and Leo to ſixty-five. Thus, as the number of *cardinal* prieſts was anciently fixed to twenty-eight, new titles were to be eſtabliſhed, in proportion as new *cardinals* were created.—As for the *cardinal* deacons, they were originally no more than ſeven, for the fourteen quarters of Rome; but they were afterwards increaſed to nineteen, and after that were again diminiſhed.

According to Onuphrius, it was pope Pius IV. who firſt enacted, in 1562, that the pope ſhould be choſen only by the ſenate of *cardinals:* whereas, till that time, the election was by all the clergy of Rome. Some ſay, the election of the pope reſted in the *cardinals*, excluſive of the clergy, in the time of Alexander III. in 1160. Others go higher ſtill, and ſay, that Nicholas II. having been elected at Sienna, in 1058, by the *cardinals* alone, occaſioned the right of election to be taken from the clergy, and people of Rome; only leaving them that of confirming him by their conſent; which was at length, however, taken from them. See his decree for this purpoſe, iſſued in the Roman council of 1059, in Hardouin's Acta Conciliorum, tom. vi. pt. i. p. 1165. Whence it appears, that the *cardinals* who had the right of ſuffrage in the election of his ſucceſſors, were divided by this pontiff into *cardinal biſhops* and *cardinal clerks:* meaning by the former the ſeven biſhops who belonged to the city and territory of Rome; and by the latter, the *cardinal preſbyters* or miniſters of the twenty-eight Roman pariſhes, or principal churches. To theſe were added, in proceſs of time, under Alexander III. and other pontiffs, new members, in order to appeaſe the tumults occaſioned by the edict of Nicholas II.

The *cardinals* began to wear the red hat at the council of Lyons, in 1243. See Conclave. The decree of pope Urban VIII. whereby it is appointed, that the *cardinals* be addreſſed under the title of *eminence*, is of the year 1630; till then, they were called *illuſtriſſimi*.

See further concerning the origin and rights of *cardinals* in Onuphrius, Duarenus, Ciaconus.

Aubery has given the General Hiſtory of *Cardinals*, in five volumes, 4to.

Cardinal has alſo been applied to ſecular officers.

Thus, the prime miniſters in the court of the emperor Theodoſius, are called *cardinales*. Caſſiodorus, lib. vii. Formul. 31. makes mention of the *cardinal* prince of the city of Rome; and in the liſt of officers of the duke of Bretagne, in 1447, we meet with one Raoul de Thorel, *cardinal* of Quillart, chancellor, and ſervant of the viſcount de Rohan: which ſhews it to have been an inferior quality.

CARDINALITIUS, in *Zoology*, a name given by ſome to the *coccothrauſtes Indica criſtata*, commonly called the Virginian NIGHTINGALE.

CARDING, in the *Manufactories*, a preparation of wool, cotton, hair, or flax, by paſſing it between the iron points, or teeth, of two inſtruments, called *cards*, to comb, diſentangle, and range the hairs or fibres thereof; and to diſpoſe it for ſpinning, &c.

Before the wool be *carded*, it is oiled, or greaſed with oil; whereof, one fourth of the weight of the wool is required, for wool deſtined for the woof of ſtuffs; and one eighth for that of the warp. See Cloth.

CARDIOGMUS, is ſometimes uſed for CARDIALGIA.

Cardiogmus, in a more reſtrained ſenſe, denotes a peculiar ſpecies of CARDIALGIA, attended with an anxiety of the *præcordia*, and a painful heavineſs, cauſed by a flatulent diſtention of the abdomen and ſtomach, which compreſſes the *diaphragm*.

CARDIOIDE, in *Geometry*, is thus formed; let the diameter AB (*Tab. Analyſis, fig.* 38.) of the circle AMBA, revolve about the point A, and on AB produced let B*a*, MN, AD, MN, &c. be always equal to AB; then will the point *a* deſcribe a curve, which from its figure reſembling a heart, is called *cardioide*.

From the conſtruction it appears, that $AN = BA + AM$, and that NMAN is always double of the diameter AB, and is biſected by the circle in M.

This curve is algebraical; if $AB = a$, $aE = x$, $EN = y$, its equation will be,

$$\begin{aligned} y^4 - 6ay^3 + 12x^2y^2 - 6ax^2y + x^4 \\ + 12a^2y^2 - 8a^3y + 3a^2x^2 = 0 \end{aligned}$$

For the method of drawing tangents, and other properties of this curve, ſee Phil. Tranſ. N° 461. ſect. 8. See alſo Mem. Acad. Scienc. 1705, where M. Carré firſt propoſed this curve.

CARDIOSPERMUM, in *Botany*, the name by which Linnæus calls that genus of plants named CORINDUM by Tournefort and other authors. See *Heart*-Pea.

CARDISCE, in *Natural Hiſtory*, the name of a ſtone mentioned by the old authors, and called alſo *encardia*. Pliny tells us, there were three kinds of it; the one black, in which there was the plain figure of a heart delineated in white; another green in that part where the heart was figured; and the third white all over, except that the heart is marked in black. We know of no ſuch ſtones as theſe at preſent, unleſs they are to be ſought for among the agates, the various and accidental courſe of the veins in which, repreſent ſometimes a thouſand ſingular figures, among which imagination may eaſily trace hearts, eyes, and the like. Our modern writers underſtand by this name a very different ſtone, more uſually called BUCARDITES, from its reſembling the heart of an ox.

Plott deſcribes a ſtone of this kind, found near Stoken Church, ſo exactly like the heart of a man, that the very trunks of the deſcending and aſcending parts of the *vena cava*, with a part of the *aorta*, were repreſented in it, in their due poſition. Nat. Hiſt. Oxf. chap. v. § 154.

CARDIUM, in *Zoology*, a genus of worms in the Linnæan ſyſtem, belonging to the order of *teſtacea*.

CARDO, in *Anatomy*, the ſecond *vertebra* of the neck; ſo called, becauſe the head turns upon it.

CARDONIUM, among *Ancient Phyſicians*, denotes wine medicated with herbs.

It is made by pouring muſt, or new wine on the herbs.

CARDOON, a ſpecies of wild ARTICHOKE.

CARDOPATIUM, in *Botany*, a name applied by ſome authors to the *carline-thiſtle*.

CARDS.—*Playing* Cards, are little pieces of fine thin paſte-board, whereon are printed divers points and figures; a certain number, or aſſemblage of which, ſerve for the performance of divers games: as baſſet, ombre, picquet, whiſt, &c. A full pack conſiſts of fifty-two *cards*.

A pack is always wrapped up in a piece of paper, on which are printed the name, ſign, dwelling-place, &c. of the maker; with the label of the ſtamp-office of England, ſignifying that the ſtamp-duty has been paid, and that there is a penalty of 10*l*. for every pack ſold unlabelled.

Among ſharpers, divers ſorts of falſe or fraudulent *cards* have been contrived; as marked *cards*, breef *cards*, corner-bend, middle-bend, &c.

Cards, *marked*, are thoſe where the aces, kings, queens, and knaves, are marked on the corners of the backs with ſpots of different number and order, either with clear water, or water tinged with pale Indian ink, that thoſe in the ſecret may diſtinguiſh them. Aces are marked with ſingle ſpots on two corners oppoſite diagonally; kings with two ſpots at the ſame corners; knaves with the ſame number tranſverſed, &c.

Cards, *breef*, are thoſe which are either longer or broader than the reſt; chiefly uſed at whiſt and picquet.

The broad *cards* are uſually for kings, queens, knaves, and aces; the long for the reſt. Their deſign is to direct the cutting, to enable him in the ſecret to cut the *cards* diſadvantageouſly to his adverſary, and draw the perſon unacquainted with the fraud, to cut them favourably for the ſharper. As the pack is placed either endways or ſideways to him that is to cut, the long or broad *cards* naturally lead him to cut to them. Breef *cards* are ſometimes made thus by the manufacturer; but in defect of theſe, ſharpers pare all but the breefs with a razor or pen-knife.

Corner-bend, denotes four *cards* turned down finely at one corner, to ſerve as a ſignal to cut by.

Middle-bend, or *Kingſton-bridge*, is where the tricks are bent two different ways, which cauſes an opening or arch in the middle, to direct likewiſe the cutting.

The inventor of *cards* is not known, nor even the age when they firſt appeared; but by the matter they were always made of, viz. leaves of paper, they ſhould ſeem to be much poſterior to the time of Charlemagne. They were probably invented about the year 1390, to divert Charles VI. then king of France, who was fallen into a melancholy diſpoſition. By the four ſuits or colours, the inventor might deſign to repreſent the four ſtates or claſſes of men in the kingdom. The *cœurs* or hearts denote the *gens de chœur*, choir-men or eccleſiaſtics. The nobility or prime military part of the kingdom, are repreſented by the ends or points of lances or pikes, which, through ignorance of the meaning of the figure, we have called ſpades. By diamonds are deſigned the order of citizens, merchants, and tradeſmen. The trefoil leaf, or clover glaſs, corruptly called clubs, alludes to the huſbandmen and peaſants. The four kings are David, Alexander, Cæſar, and Charles; repreſenting the four celebrated monarchies of the Jews, Greeks, Romans, and Franks under Charlemagne. The queens repreſent Argine (for Regina, queen by deſcent), Eſther, Judith, and Pallas; which are typical of birth, piety, fortitude, and wiſdom. The knaves denoted the ſervants to the knights: others apprehend that the knights themſelves were denoted by theſe *cards*, becauſe Hogier and Lahire, two names on the French *cards*, were famous knights at the time when they were ſuppoſed to be invented.

The method of making playing *cards* ſeems to have given the firſt hint to the invention of printing; as appears from the firſt ſpecimens of printing at Haerlem, and thoſe in the Bodleian library.

Cards, *making of.* The cutting of the moulds, or blocks, for theſe *cards*, is preciſely the ſame as that uſed for the firſt books; and a ſheet of wet or moiſt paper is laid on the form or block, which is firſt lightly bruſhed over with an ink, made of lamp-black mixed with ſtarch and water; and then rubbed off with a round liſt, in the hand. The court-*cards* they colour by help of ſeveral patterns, called *ſtaneſiles*; conſiſting of papers cut through with a pen-knife; within the apertures, or inciſions of which, the ſeveral colours, as red, &c. are ſeverally applied (for at the firſt printing, the *card* has only a mere outline). Theſe patterns are painted with oil colours, to keep them from wearing out by the bruſhes: being laid on the paſte-board, they ſlide a bruſh full of colour looſe over the pattern; which, leaving the colour within the apertures, forms the face or figure of the *card*.

This, very probably, was the way of the firſt printing at Haerlem; as might have been diſcovered long ago, if it had been conſidered, that the great letters in our old manuſcripts of nine hundred years ago, are apparently done by the illuminers, after this method of *card-making*.

Cards and dice may, upon ſufficient ſecurity, be exported without paying the ſtamp-duty. 10 Ann. c. 19. § 170. 5 Geo. I. c. 19. § ult.

Playing *cards* may not be imported. 10 Ann. c. 19. § 165. See Stamps.

Cards, in *Manufacture.* See Card.

CARDUELIS, in *Zoology*, the name of a very well known bird, called in Engliſh the GOLD-*finch*, and by the old naturaliſts the *chryſomitres* and *acanthis*; the firſt from its yellow head, and the laſt from its feeding among thiſtles.

CARDUS, in *Botany*, a name given by the Romans to the plants called *cactos* by the Greeks. Theſe words were ſometimes uſed by both as the general names of the thiſtle kind, and in that ſenſe the word *cardus* and *carduus* are the ſame; but ſome of the Roman authors have uſed this as the Greeks did *cactos*, in a more limited ſenſe, expreſſing by it only the artichoke. This they knew both in its wild ſtate, and in its garden ſtate; the wild plant was very prickly, and the garden one much larger in all its parts, and ſmooth.

Columella is almoſt the only author among the ancients who ſeems to make the *cactos* and *cinara* different plants; but his diſtinction turning only upon the one being prickly, the other not, it comes to no more than that *cactus* was the name of the plant in its wild ſtate, and *cinara* in its garden ſtate.

CARDUUS, in *Natural Hiſtory* and *Botany*, a name common to divers ſpecies of plants, in Engliſh called THISTLES.

Carduus *Benedictus.* See *Bleſſed* Thistle.

Carduus *Fullonum*, or *Fuller's weed.* See Teazel.

CAREENING, a term, in the *Sea-Language*, uſed for the laying a veſſel on one ſide, to caulk, ſtop up leaks, and refit or trim the other ſide.

The word comes from *cariner*, which ſignifies the ſame, formed of the Latin *carina*, *the keel of a ſhip*.

A ſhip is ſaid to be brought to a *careen*, when the greateſt part of her lading, &c. being taken out, and a pontoon, or another veſſel lower than herſelf, laid by her ſide, ſhe is haled down to it as low as occaſion requires, and there kept, by the weight of ballaſt, ordnance, &c. as well as by ropes, leſt it ſhould ſtrain her maſts too much. This is done with deſign to trim her ſides, or bottom, to caulk her ſeams, or to mend any fault ſhe has under water. Hence, when a ſhip lies on one ſide in ſailing, ſhe is ſaid to *ſail on the careen*.

Ships of war are generally *careened* every three years.

The *half careen* is when they can only *careen* half the ſhip; not being able to reach ſo low as the bottom of the keel.

CAREER, or Carier, in the *Manege*, a place incloſed with a barrier, wherein they run the ring.

The word is alſo uſed for the race, or courſe of the horſe itſelf, provided it does not exceed two hundred paces.

In the ancient circus, the *career* was the ſpace which the bigæ, or quadrigæ, were to run at full ſpeed, to gain the prize. See Circus.

Career, in *Falconry*, is a flight or tour of the bird, about one hundred and twenty yards. If it mounts more, it is called a *double career*; if leſs, a *ſemi career*.

CARELIA, in *Botany*, a name given by ſome to the *baſtard-hemp* AGRIMONY, OR AGERATUM.

CAREOPULI, in *Botany*, a name given by ſome authors to the tree which affords us the gamboge, the *gutta gamba*, and *gambogium* of the ſhops.

CARET, in *Grammar*, a character in this form (ʌ) denoting that there is ſomething inſerted, or interlined, which ſhould regularly have come in where the character is placed.

CARETTA, in *Zoology*. See Tortoise.

CARETTI, in *Botany*, a name by which many authors have called the *acacia glorioſa*, or the tree which produces the marſao, or bezoar-nuts.

CAREX, in *Botany*, a word uſed by Linnæus as the name of a genus of plants, of the *monoecia triandria* claſs; comprehending thoſe called *cyperoides* by Tournefort and others, and the *ſcirpoides* of other authors. The characters of the genus are theſe: it produces male and female flowers, in moſt ſpecies, on the ſame plant; the male flowers are digeſted into a long ſpike; the cup is an oblong and imbricated amentum, conſiſting of acute, hollow, and lanceolated ſcales, each containing one flower; there is no corolla; the ſtamina are three erect, ſetaceous filaments, of the length of the cup; the antheræ are oblong, and not pendulous, but erect.

In the female flowers the cup is the ſame as in the male; there are no petals, but there is an inflated oblong nectarium; the germen is three-ſquare, and is placed within the nectarium; the ſtyle is very ſhort; the ſtigmata are ſometimes three, ſometimes but two; they are long, crooked, pointed, and hoary. The nectarium grows larger when the flower is fallen, and contains the ſeed in it; the ſeed is ſingle, of an acute, and ſomewhat oval form, three-cornered, and has one of its angles uſually much ſmaller than the others. The *ſcirpoides* of authors uſually have the male and female flowers on the ſame plant.

CARGADORS, a name given by the Dutch to a kind of brokers who make it their ſole buſineſs to find freight for ſhips which want loading, and veſſels for merchants or paſſengers who want conveyance to ſuch or ſuch a place.

CARGO, the lading or FREIGHT of a ſhip.

Cargo, *ſortable*, is that which contains ſomething of every ſort neceſſary to furniſh the tradeſmen of the place it is ſent to, with parcels fit to fill their ſhops, and invite their cuſtomers.

Officers and ſailors on board a veſſel are allowed to carry a ſmall *cargo* or *pacotille*, not exceeding a certain bulk or weight, for their own account, without paying any freight.

Cargo is ſometimes alſo uſed for an INVOICE of the goods wherewith a ſhip is laden.

Cargo alſo denotes a weight uſed in Spain and Turky, amounting to about three hundred Engliſh pounds.

CARIA, in *Natural Hiſtory*, a name given by authors to a very miſchievous ſpecies of ant, common in ſome parts of the Eaſt Indies. This creature is larger than our ant, and is the common food of a great many other animals, as the ſquirrels, ſerpents, lizards, and a great many birds. In order to defend itſelf from ſo many enemies, it enters into large communities, which together erect great hills of earth, of five or ſix feet high. The fields in ſome places are full of theſe, and it is in vain to attempt beating them down, ſince they would be immediately made up again; the creature builds them with firm and tough clay, which it wets as it uſes it; and the walls or outer caſe is built ſo thick and firm, that ſcarce any rain can hurt them.

There is another ſpecies of the *caria* much ſmaller than this, which builds in the peoples houſes, not in the fields. In the center of the habitation of this creature there is uſually found a ſort of comb, or collection of cells, reſembling a honey-comb. Obſervations ſur l'Aſie, p. 380.

CARIAMA, in *Zoology*, the name of a Braſilian bird of the ſize of the heron, and, like that bird, frequenting watery places. It makes a loud noiſe like the turkey, and is a very valuable and well-taſted fowl. Marcgrave's Hiſt. of Braſil.

CARIATIDES, or Cariates, in *Architecture*. See Caryatides.

CARIBOU, in *Zoology*, an American animal of the ſtag kind.

CARICA, in *Botany*. See Papaw.

Carica, among *Ancient Naturaliſts*, denotes a kind of fig peculiar to Syria; ſometimes alſo the dried fig. It is alſo uſed in ancient writers to denote the fruit of the palm-tree, otherwiſe called *cariata*, which was ſent annually by clients, on New Year's day, as a preſent or acknowlegement to their patrons.

CARICATURA, in *Painting*, a loading, or exaggerating of the defects of an object repreſented, with a concealment of the beauties or advantages of it; yet ſo as ſtill to preſerve a reſemblance. Vid. Spectat. Nº 537.

The word is Italian, formed of *carica*, a *load*, *burden*, or the like.

CARICOUS, or CARYCOUS *tumour*, a ſwelling reſembling the figure of a fig; ſuch as are frequently found in the piles.

The word comes from *carica*, a kind of fig; which is from *Caria*, a country where they are frequent, and from whence they are ſometimes brought.

Quincy repreſents the *caricous* tumor as the ſame with what Hippocrates called *carycoides*, which ſeems to be a miſtake; καρυκοειδες, in Hippocrates, denoting an excrement of a bloody colour, reſembling a kind of condiment or confection, anciently called *caryca*, made of blood, and invented by the Lydians.

CARICUM, in *Pharmacy*, a catharectic medicine, which deterges ſordid ulcers, and eats away proud fleſh. Hippocr. de Ulceribus. It is prepared of black hellebore, ſandarach, *ſquama æris*, waſhed lead, ſulphur, orpiment, and cantharides: theſe being mixed, are made up with oil of cedar into a liquid medicine. Sometimes there is added arum, in decoction or juice, or the powder of it mixed with honey. The dry medicine, or powder, for the ſame purpoſe, is prepared of the ſame ingredients, omitting the oil of cedar, and the honey: it is alſo made of black hellebore and ſandarach only.

CARIES, in *Medicine*, a ſolution of continuity in a bone, attended with a waſte of its ſubſtance, occaſioned by ſome acrimonious matter corroding it.

The *caries* is a kind of rottenneſs, or putrefaction, peculiar to the hard, or bony parts of the body; anſwering to a gangrene or mortification in the ſoft, or fleſhy part; or, according to others, to an abſceſs, or ulcer.

Caries ariſe either from a conſtant afflux of vicious humours, or from their extreme acrimony; or from a bruiſe, compound fracture, luxation, ulcer, venereal diſorder, corroſive medicines, or from their being ſtripped or laid bare of their fleſh, and long expoſed to the air, &c. This diſorder, if not quickly remedied, ſpreads and communicates itſelf to the neighbouring parts of the bone, and makes the ſame progreſs that ulcers do in the ſofter parts.

There are ſeveral ſpecies of *caries* in the bones. The learned Mr. Monro mentions ſeven which he has ſeen. Theſe he diſtinguiſhes by the appellations of, 1. The dry or gangrenous *caries*. 2. The worm-eaten *caries*, or ulcer of the bones. 3. The carnous *caries*, or ulcer of the bones with hyperſarcoſis. 4. The phagedenic *caries*, with hyperſarcoſis. 5. The ſcrophulous *caries*. 6. The ſchirro-cancrous *caries*. 7. The ſpreading cancrous *caries*.

He enters into a curious detail of the ſeveral natures of theſe kinds of *caries*, and of the topical management. A ſpeedy and ſafe ſeparation of all the corrupted part is the principal indication to be purſued. See Medic. Eſſ. Edinb. vol. v. art. 24. Abridg. vol. ii. p. 150, ſeq. where he ſhews the analogy between theſe diſeaſes of the bones to thoſe of other parts of the body. This is not ſurpriſing, ſince bones have the ſame general texture, and are only diſtinguiſhed from other parts by a greater ſolidity or firmneſs.

A *caries* differs from a SPINA *ventoſa*, in that the latter begins within the ſubſtance of the bone, and proceeds outward; whereas the former begins on the ſurface, and proceeds inward.

Caries are divided into *idiopathic* and *ſymptomatic*.

CARIES, *idiopathic*, or *ſimple*, is an eroſion of a bone, happening without any other diſeaſe, commonly owing to ſome external cauſe, rarely to an internal one, as the afflux of humours.

CARIES, *ſymptomatic*, that which ofteneſt happens to perſons deeply affected with ſome other diſorder, eſpecially the ſcurvy, or venereal diſeaſe.

Caries may alſo be divided in reſpect of their degree.

Thoſe in the firſt degree diſcover a yellow fattineſs on the ſurface of the bone; in the ſecond a blackneſs; in the third a roughneſs, and inequality of the bone, cauſed by a multitude of foramina or little holes; in the fourth the corruption penetrates deeper through the whole ſubſtance, which it ſeems as it were to diſſolve.

A *caries* is properly a diſorder, in which the bone, from whatever cauſe, is deprived of its perioſteum, and having loſt its natural heat and colour, becomes fatty, yellow, brown, and at length black; this is the firſt and lighteſt degree of the diſorder, and is what, according to Celſus, the ancients called *os vitiatum*, and the *nigrities oſſium*. But the greater degree of this diſorder is where the bone is eroded and eaten, and becomes uneven by reaſon of the number of ſmall holes, of which it is full, when it diſcharges a filthy ſanies, whoſe acrimony ſoftens, relaxes, and deſtroys the fleſhy parts that grow round it. This is a true *caries*, or ulcer of the bone, and every bone in the body is ſubject to this diſorder; and though this ulcer may appear to be ever ſo ſafely or happily healed, yet it too often happens that after the cicatrix is formed, and has been ſo for ſome time, a new abſceſs will be made, the whole diſorder will return afreſh, and the acrimonious and corrupted matter, which continually ouſes out from the carious bone, being collected within, will produce many very grievous ſymptoms, and deſtroy the neighbouring fleſh again: but the worſt of all *caries*, and that in which the caſe may indeed be almoſt pronounced deſperate, is that which falls upon the joints, or thoſe parts of the bones that lie very deep, becauſe in this caſe there is no acceſs for the hands to clean the bone, and there is no remedy but amputation of the limb.

Many methods have been attempted for the cure of a *caries*; the firſt and mildeſt is applied to the ſlighteſt degree of the diſeaſe, and is performed by the application of ſpirituous remedies, ſuch as ſpirit of wine, Hungary-water; or, by ſlight balſamics, ſuch as the powder of birthwort, florentine, iris, myrrh, or aloes. Either of theſe powders is to be ſprinkled on the part, after the ſanies has been carefully wiped away with dry lint, and this continued till the cure is perfected. In a *caries* that penetrates ſomewhat deeper, ſtronger remedies take place, ſuch as powder of euphorbium, or its eſſence, made in well rectified ſpirit of wine; or oil of cloves, cinnamon, or guaiacum; either of theſe may be touched on with a pencil, or laid upon dry lint, and applied: ſome alſo uſe the corroſive medicines, the phagadenic water, and ſpirit of vitriol, or of ſulphur; and, in the place of theſe, a ſolution of quickſilver in *aqua fortis* may be uſed with great ſucceſs. When, by theſe means, an exfoliation of the bone has been produced, the buſineſs is then to treat it with balſamics.

A ſecond method of cure for a greater degree of *caries*, is perforating the bone with the trepan, and dreſſing the part afterwards either with balſamics, or with dry lint. By theſe means the exfoliation of the bone is forwarded, and new veſſels puſh themſelves through the *foraminula*, which, joining with the neighbouring fleſh, make a new covering for the bone.

The third method of cure is performed by the raſpatory, or chiſſel, taking off the corrupted or vitiated part of the bone, till all beneath appears white or ruddy, and ſound; and the fourth, which is the moſt ancient, and the moſt ſpeedy, and certain method, is by the actual cautery, burning down the vitiated part of the bone. This method, however, is not neceſſary, except in great degrees of this diſorder; and in performing it great care muſt be taken not to injure the neighbouring ſoft parts: for this reaſon, an aſſiſtant ſhould always draw back the lips of the wound both ways, while this is performed; and if the opening be not wide enough, it ſhould be opened and enlarged by ſpunge tents before, or widened by the knife, till the bone lies fair, and the part muſt be carefully wiped firſt with dry lint, from the ſanies; and if there be any fungous fleſh, that muſt alſo firſt be removed. One application of the cautery, when the diſorder is conſiderable, will ſeldom prove ſufficient; it uſually requires to be repeated ſeveral times, at proper intervals; and if the *caries* be of ſuch extent that one cautery will not cover it all over, the firſt muſt be applied to the middle, and the ſucceeding towards its edges. This operation is not attended with any great pain, if care be taken not to injure the adjacent ſoft parts; for the bones are, in themſelves, free from any ſenſe of pain. Where the cranium is the ſeat of this diſorder, the cautery is attended with great hazard, as it is alſo in a *caries* of the ribs, or ſternum, from the neighbourhood of parts of the utmoſt conſequence to life. The carpus and tarſus alſo will very badly admit of cauterizing, becauſe of the neighbourhood of the tendons and ligaments, which it is ſcarce poſſible to avoid injuring in the operation. After cauterizing, the part is to be dreſſed with dry lint only, or if the patient complains of great heat in the part, the lint may be dipped in ſpirit of wine before it is applied; afterwards balſamics are to be applied, till the part exfoliates; and then, if the cure be perfect, the vacuity will ſoon be filled with new ſound fleſh. But if the bone remains bare, or the fleſh it is covered with be ſoft and ſpungy, and does not adhere ſufficiently to the ſubjacent bone, or where the bone remains diſcoloured; in either of theſe caſes the cure will not be complete, but the diſorder will break out again, unleſs prevented. In theſe caſes, therefore, the work muſt be all done over again, the ſpungy fleſh removed, and the actual cautery again applied, before the cure is finiſhed. Heiſter.

Anatomiſts, in diſſecting of bodies, frequently find *carious* bones; particularly thoſe of the jaws, legs, &c. where nothing of that kind was ſuſpected during the perſon's life-time, nor any diſorder felt therefrom. Mr. Cheſelden conjectures, that the cure of a *carious* bone might be directly attempted, without waiting, as our ſurgeons uſually do, for an exfoliation.

CARIGOI, or **Carigueya**, in *Zoology*, the name by which ſome authors have deſcribed a very remarkable American animal, more uſually known by the name of the OPOSSUM.

CARILLONS, a ſpecies of CHIMES frequent in the Low Countries, particularly at Ghent and Antwerp, and played on a number of bells in a belfrey, forming a complete ſeries or ſcale of tones and ſemitones, like thoſe on the harpſichord and organ. There are petals communicating with the great bells, upon which the *carilloneur* with his feet plays the baſe to ſprightly airs, performed with the two hands upon the upper ſpecies of keys. Theſe keys are projecting ſticks, wide enough aſunder to be ſtruck with violence and velocity by either of the hands edgeways, without the danger of hitting the neighbouring key. The player is provided with a thick leather covering for the little finger of each hand, to guard againſt the violence of the ſtroke. Theſe *carillons* are heard through a large town. Burney.

CARIMPANA, in *Botany*, the name of an Indian palm-tree, deſcribed in the *Hortus Malabaricus*, the leaves of which, when full grown, are thirty feet long, and nine feet broad, or more, if carefully extended.

CARINA, a Latin term, properly ſignifying the KEEL of a ſhip; or that long piece of timber running along the bottom of the ſhip, from head to ſtern; upon which the whole ſtructure is built, or framed.

Carina is alſo frequently uſed for the whole capacity or bulk of a ſhip; containing the hull, or all the ſpace below the deck.

Hence the word is alſo ſometimes uſed, by a figure, for the whole ſhip.

Carina is alſo uſed in the ancient architecture.—The Romans gave the name *carina* to all buildings in form of a ſhip, as we ſtill give the name *nave* to the middle or principal vault of our Gothic churches; becauſe it has that figure.

Carina, among *Anatomiſts*, is uſed to denote the *ſpina dorſi*. As likewiſe for the fibrous rudiments, or embryo of a chick, appearing in an incubated egg.

The *carina* conſiſts of the entire *vertebræ*, as they appear after ten or twelve days incubation.

It is thus called, becauſe crooked, in form of the keel of a ſhip. Botaniſts alſo, for the like reaſon, uſe the word *carina*, to expreſs the lower petalum of a PAPILIONACEOUS flower.

Carina is alſo uſed, by ſome *Chemiſts*, for the twentieth part of a drop.

Carinæ were alſo weepers; or women hired, among the ancient Romans, to weep at FUNERALS: they were thus called from *Caria*, the country whence moſt of them came.

CARINATED *leaf*, in *Botany*, expreſſes a leaf whoſe back reſembles the keel of a ſhip.

CARIOUS, the ſtate of a bone putrified or rotten. See Caries.

Horchius gives the hiſtory of a *tophus*, taken out of a *carious* bone. Ephem. Acad. N. C. Dec. 2. ann. 10. Obſ. 167. p. 177.

CARIPI, a kind of cavalry in the Turkiſh army. The *caripi*, to the number of about 1000, are not ſlaves, nor bred up in ſeraglios or ſeminaries, like the reſt; but are generally Moors, or renegado Chriſtians, who having followed adventures, and being poor, and having their fortune to ſeek, by their dexterity and courage have arrived at the rank of horſe-guards to the grand ſignior. They march with the Ulufagi on the left hand, behind him: their pay is twelve aſpers *per* day.

The word *carapi* ſignifies *poor*, and *ſtranger*; an appellation ſaid by Chalcondylas to have been given them, becauſe chiefly brought out of Egypt, Africa, &c.

CARISSIMI, in *Antiquity*, a quality, or appellation, given by the emperors to preſidents, governors of provinces and others.

CARISTIA. See Charistia.

CARITAS.—The *poculum caritatis*, or grace-cup, was an extraordinary allowance of wine, or other liquors, wherein the religious, at feſtivals, drank in commemoration of their founder and benefactors.

CARK, or **Carke**, a certain quantity, or meaſure, of wool, equal to a thirtieth part of a SARPLAR.

CARL. See Churle.

CARLIN, **Carline**, or **Caroline**, a ſmall ſilver coin, current in Naples and Sicily, equivalent to about four pence Engliſh.

CARLINA, or **Carolina**, a plant of the THISTLE-kind, ſaid to have been diſcovered by an angel to Charlemagne, to cure his army of the plague; whence its denomination.

CARLINÆ *radix*, in the *Materia Medica*, the name of a root kept in the ſhops in ſome places, and diſtinguiſhed into two kinds, the white and the black; the white is the root of the common *carline-thiſtle*, which produces no ſtalk, the other of the *carlina cauleſcens*, called the black chamelion thiſtle.

The white *carline* root is of the thickneſs of one's thumb, and is often two feet long; it is brown on the outſide, and white within, and ſhould be choſen plump, firm, and well dried. It is accounted a very efficacious medicine in peſtilential diſeaſes.

The black is a ſmaller and ſhorter root than the white, and is much leſs eſteemed in medicine. The plant which produces the white grows very frequent with us on hilly places, and is a very ſingular plant, producing a number of fine long prickly and jagged leaves, and, in the center of them, a large purple flower, of the thiſtle kind, but growing cloſe to the ground; the other is very frequent in France, but is not met with in England.

Carline is eſteemed a very powerful ſudorific and alexipharmic. Schroder tells us alſo, that it is good againſt worms, and in dropſies; and that it is a powerful emmenagogue and diuretic.

CARLINES, or **Carlings**, in a ſhip, two pieces of timber lying fore and aft, along from one beam to another, directly over the keel; ſerving as a foundation for the whole body of the ſhip. On theſe the ledges reſt, whereon the planks of the deck, and other matters of carpentry, are made faſt. The *carlines* have their ends let into the beams called *culver-tail-wiſe.*—See *Tab. Ship. fig.* 2. *n.* 29. 37. 60. and 92.

Carline-*knees* are timbers going athwart the ſhip, from the ſides to the hatch-way, ſerving to ſuſtain the deck on both ſides.

CARLOCK, or **Charlock**, in *Botany*, a ſpecies of the Radish.

Carlock, a ſort of fiſh-glue, or iſinglaſs, imported from Archangel. It is made with the ſturgeon's bladder; and is uſed for clarifying wine, as alſo in dying. The beſt comes from Aſtracan, a city in Muſcovy, at the mouth of the river Wolga, where they catch great quantities of ſturgeon.

Carlostadians. See Carolostadians.

CARLSBAD *Water*, ſo called from a ſmall town of that name on the confines of Bohemia, remarkable for its warm mineral ſprings, of which there is an account in Phil. Tranſ. vol. l. part i. Nº 4. anno 1757. See WATER *mineral*.

CARMEL, *Knights of Mount*, are a military order of knights Hoſpitallers, inſtituted in 1607, by Henry IV. of France, under the title, habit, and rule of *our Lady of mount Carmel*, and in conſequence of a bull of pope Paul V. in 1608, united to the order of St. Lazarus of Jeruſalem, with all its commandaries, priories, and other goods for its endowment.

The founder propoſed it to conſiſt of one hundred French gentlemen, who ſhould be obliged, in times of war, to march cloſe to the kings of France, as their guard.

Authors are much divided, whether to call this a new inſtitution, or a reſtoration of that of St. Lazarus; though it is generally accounted a new inſtitution. See LAZARUS.

CARMELITES, or *White Fryars*, an order of religious, making one of the four tribes of mendicants, or begging fryars; and taking both the name and origin from *Carmel*, a mountain of Syria, formerly inhabited by the prophets Elias and Eliſha, and by the children of the prophets; from whom this order pretend to deſcend in an uninterrupted ſucceſſion.

The manner in which they make out their antiquity has ſomething in it too ridiculous to be rehearſed. Some among them pretend they are deſcendants of J. C. Others go further, and make Pythagoras a *Carmelite*, and the ancient Druids regular branches of their order.

Phocas, a Greek monk, ſpeaks the moſt reaſonably; he ſays, that in his time, viz. in 1185, Elias's cave was ſtill extant on the mountain; near which were the remains of a building, which intimated there had been anciently a monaſtery; that ſome years before, an old monk, a prieſt of Calabria, whoſe name was Berthold, by revelation, as he pretended, from the prophet Elias, fixed there, and aſſembled ten brothers. In 1209, Albert, patriarch of Jeruſalem, gave the ſolitaries a rigid rule; which Papebroch has ſince printed. In 1217, or, according to others, 1226, pope Honorius III. approved and confirmed it; though it was afterwards mitigated, by Innocent IV. S. Louis brought ſome of theſe *Carmelites* with him from the Holy Land into France. Many of the popes give them the title of *Brothers of the bleſſed Virgin.*

The *Carmelites* came into England in the year 1240, and erected a great number of monaſteries. Their firſt houſes were at Alnwick in Northumberland, and Ailesford in

Kent. In England and Wales they had about forty houſes. This order is eminent for the devotion of the ſcapulary, for its miſſions, and for the great number of ſaints with which it has ſtocked the Romiſh church. In the laſt century, there were four canonizations in this order, viz. of S. Thereſa, S. Andrew Corſin, S. Mag. de Pazzi, and S. J. de la Croix.

The order of the *Carmelites* is divided into two branches, viz. *Carmelites of the ancient obſervance*, called the *mitigated*, or *moderate*; and thoſe of the *ſtrict obſervance*, called *Bare-footed Carmelites.*

The *ancient obſervance* has only one general, under whom are forty provinces; and the congregation of Mantua, which has a vicar-general.

Bare-footed **CARMELITES** are a reform of the ancient *Carmelites*, ſet on foot in 1540, by St. Thereſa; ſo called from their going bare-footed.

She began with the convents of nuns, whom ſhe reſtored to the primitive auſterity of the order, which had been mitigated by Innocent IV. in 1245, and at length carried the ſame reform among the fryars. Pius V. approved the deſign, and Gregory XIII. confirmed the reform in 1580.

There are two congregations of bare-footed *Carmelites*, which have each their general, and their ſeveral conſtitutions: the one *the congregation of Spain*, divided into ſix provinces; the other called *the congregation of Italy*, comprehending all the reſt, not depending on Spain.

CARMEN, an ancient term among the Latins, uſed, in a general ſenſe, to ſignify a verſe; but in a more peculiar ſenſe to ſignify a ſpell, charm, form of expiation, execration, &c. couched in a few words, placed in a myſtic order, on which its efficacy depended.

Pezron derives *carmen* from the Celtic *carm*, the ſhout of joy, or the verſes which the ancient bards ſung, to encourage the ſoldiers before the combat; adding, that the Greek χαρμη, ſignifies combat and joy: which is true: but then it does not come from the Celtic *carm*, but from χαιρω, I rejoice.

Some fetch the origin of the poetical *carmina*, or verſes, hence; and ſay, they took that name from their reſemblance to theſe ſpells: others, on the contrary, ſay, that the ſpells had their origin from the poetical verſes, and took their name from their reſemblance to thoſe: it is at leaſt certain, that many of the ancient charms, wherewith diſeaſes were ſuppoſed to be cured, were metrical verſes, to which, in thoſe ages, greater efficacy was aſcribed than to mere words or proſe.

Vigenere, again, derives *carmen* from *Carmenta*, becauſe that propheteſs couched her predictions in verſes, or ſhort periods: but others ſay, the propheteſs took the name *Carmenta* from *carmen*, on the ſame account.

CARMEN, was anciently a denomination given to precepts, laws, prayers, imprecations, and all ſolemn formulæ, couched in a few words, placed in a certain order, though written in proſe.

In which ſenſe it was, that the elder Cato wrote a *Carmen de moribus*, which was not in verſe, but proſe.

CARMEN *ſaliare*, a ſet of ancient verſes compoſed by Numa, ſung by the SALII, accompanied by the claſhing of *Ancylia*, or ſacred bucklers. See ANCYLE.

CARMEN alſo denotes a form of prayer, or words whereby divers among the ancients devoted themſelves. Such was that of the Decii, ſpoken of by Pliny, Hiſt. Nat. lib. xxxviii. cap. 2.

CARMENIAN *wool*, a denomination given to a kind of goat's hair, brought from Carmenia, or Caramania, a country of Aſia Minor.

CARMENTALIA, a feaſt among the old Romans, celebrated annually on the 11th of January, in honour of *Carmenta*, or *Carmentis*, a propheteſs of Arcadia, mother of Evander, with whom ſhe came into Italy, ſixty years before the Trojan war.

The ſolemnity was alſo repeated on the 15th of January, which is marked in the old calendar by *Carmentalia relata.*

This feaſt was eſtabliſhed on occaſion of a great fecundity among the Roman dames, after a general reconciliation with their huſbands, with whom they had been at variance, in regard of the uſe of coaches being prohibited them by an edict of the ſenate.

It was the women who celebrated this feaſt: he who offered the ſacrifices, was called *Sacerdos Carmentalis.*

Authors are divided about the origin of the word *Carmenta*: Vigenere ſays, the propheteſs was ſo called *quaſi carens mente*, out of her ſenſes; by reaſon of the enthuſiaſm ſhe frequently fell into. Others ſay, ſhe took her name from *carmen*, verſe; becauſe her prophecies were couched in verſes: but Vigenere, as before noted, maintains *carmen* to be derived from *Carmenta.*

CARMES, *Eau de*, the Carmelite water, famous in France, and moſt parts of Europe, for its extraordinary cordial virtues. It is ſaid to be extremely reviving, to be good in all ſorts of fits, apoplexies not excepted; and to relieve the gout when it attacks the ſtomach. The Carmelites at Paris, who make conſiderable advantage by vending this water, keep the preparation of it a great ſecret.

CARMINATIVES, in *Medicine*, are remedies, whether ſimple or compound, uſed in colics, and other flatulent diſtempers, to diſpel the wind.

Numbers appear to be ſtrangers to this term, as it does not appear to carry in it any thing expreſſive of the medicinal efficacy of thoſe ſimples which paſs under the denomination. This term had certainly its riſe when medicine was too much in the hands of thoſe jugglers, who, for want of true knowledge in their profeſſion, brought religion into the party: and what through their ignorance they were not able to do by rational preſcription, they pretended to effect by invocation, and their intereſt with heaven. Which cant being generally, for ſurprize ſake, couched in ſome ſhort verſes, the word *carmen*, which ſignifies a verſe, was uſed alſo to mean an inchantment; which was frequently made uſe of to ſatisfy the people of the operation of a medicine they could not account for. And as thoſe medicines now under this name, are of quick efficacy, and the conſequences thereof in many inſtances ſurpriſing; the moſt violent pains, ſometimes ariſing from pent-up wind, immediately ceaſing upon its diſperſion; ſuch medicines as give relief in this caſe, are more properly termed *carminatives*, as if they cured by inchantment.

How they expel wind may be conceived, when we conſider that all the parts of the body are perſpirable. Sanctorius, in his *Medicina Statica*, determines all we call wind in the bowels to be ſuch perſpirable matter as makes its eſcape through the coats of the ſtomach and inteſtines. Between the ſeveral membranes likewiſe of the muſcular parts, ſuch matter may break out and lodge for ſome time. Now, whatever will rarify and render ſuch collections of vapours thinner, muſt conduce to their utter diſcharge out of the body, and conſequently relieve thoſe uneaſineſſes ariſing from their detenſion. And as all thoſe things that paſs under this denomination are warm, and conſiſt of very light ſubtil parts, it is eaſy to conceive how a mixture of ſuch particles may agitate and rarify thoſe flatulencies, ſo as to facilitate their expulſion, eſpecially conſidering thoſe grateful ſenſations which ſuch medicines gives to the fibres, and which cannot but invigorate their tonic undulations ſo much, that by degrees the obſtructed wind is diſlodged, and at laſt quite diſpelled. But if the obſtruction be not great, the rarefaction of the wind upon taking ſuch a medicine, is often ſo ſudden, and likewiſe its diſcharge, that it goes off like the exploſion of gunpowder.

All the things under this claſs, being warm and diſcuſſive, are much uſed in the compoſition of cathartics, of the rougher ſort eſpecially; for the irritation occaſioned by thoſe, would be ſcarcely tolerable, without the mitigation of ſuch grateful ingredients. Many likewiſe of this ſort, are in the compoſition of diſcuſſive topics.

The four *carminative* flowers, are thoſe of chamomile, melilot, motherwort, and dill: beſide angelica, fennel, lovage, aniſe, caraway, coriander, cummin, &c. which all agree in their *carminative* qualities; and are therefore uſed in compoſitions of that intention.

CARMINE, a bright red or crimſon colour, bordering ſomewhat on purple, uſed by painters in miniature; and ſometimes by painters in oil, though rarely, by reaſon of its exceſſive price, and becauſe it will not mix with oil, ſo as to have the due effect in this kind of painting. *Carmine* is the moſt valuable product of the *cochineal meſtique*: it is a *fecula* or ſediment, ſubſiding to the bottom of the water, wherein are ſteeped COCHINEAL, CHOUAN, and AUTOUR: ſome add ROUCOU, but this gives the *carmine* too much of the orange caſt. For this purpoſe thirty-ſix grains of *chouan* are boiled up three times in two pints and a half of rain or river water; then five drams of *cochineal* are put into the water, ſtrained through a linen cloth from the preceding liquor, and boiled up three times; to this eighteen grains of the huſk of *roucou*, and the ſame quantity of rock-alum, are added, and it is boiled up once: the liquor is filtrated through a linen cloth, and ſuffered to ſtand for ſeven or eight days; the *fæces* dried in the ſun, or a ſtove, will be the *carmine.* However, the *chouan* and *autour*, as well as the *roucou*, are now generally omitted. Runckel directs firſt to communicate a ſcarlet dye to fine wool, by boiling it in equal proportions of bran water and common water, with a mixture of alum and tartar, for two hours: half a pound of wool will require one pound of alum, and half a pound of pulverized tartar: the wool muſt then be drained, and having boiled four ounces of cochineal with two ounces of tartar, in a mixture of bran water and common water, the wool muſt be put in and boiled for an hour and a half, and it will take the colour. The *carmine*

mine may be extracted from the wool by boiling it in a ſtrong lye of pot-aſh, till it has loſt its colour: then paſs the lye through a filtrating bag, and pour a ſolution of two pounds of alum in water into the coloured lye; and the dye will thicken; and, when it is again filtrated, the *carmine* will remain in the filtre: and the operation may be repeated as often as it is found neceſſary. Encyclopedie.

To be good, it muſt be almoſt an impalpable powder.

As this colour is prepared by diſſolving cochineal in an alkaline lixivium, and precipitating the ſolution by alum, it conſiſts of the colouring matter of cochineal, adhering to the earth of alum: the beſt comes from France, where the method of preparing it is kept a profound ſecret.

Some make *carmine* with Braſil or Fernambouc wood, and gold leaf, beat in a mortar, and ſteeped in white-wine vinegar; the ſcum ariſing from this mixture, upon boiling, when dried, makes a ſort of *carmine*: but this kind is much inferior to the former. See DYING.

CARNABADIUM, in the *Materia Medica* of the ancients, a name given to a drug frequently mentioned by the Greek and Arabian writers. It is properly an Arabian word which the Greeks have adopted, and given a Greek termination to, writing it Καρναβάδιον. Guillandini ſuppoſes this to be the ſame with the *durunegi*, or *doronicum*, of the ſame authors; but nothing can be more abſurd than ſuch an opinion, an examination of theſe writers themſelves ſhewing that they commonly uſed it for caraway or carui ſeed, and ſometimes for the Æthiopian cummin ſeed.

CARNARIUM, a charnel-houſe, or repoſitory for the bones of the dead.

CARNATIONS, in *Gardening*. See DIANTHUS.—Theſe flowers are propagated two ways, the one by ſeed, the other by layers; the firſt of theſe methods is the way to raiſe new flowers, the other is the way to preſerve and multiply thoſe of former years.

For the raiſing them from ſeed, great care muſt be taken to produce good ſeed.

When they are in the flower the fineſt kinds ſhould be marked, and all the layers that can be, ſhould, during the time of their flowering, be laid down from them: toward the latter end of Auguſt theſe will have taken root, and they are then to be taken off, and planted out into pots, two in each pot. The method of laying them is this. Slip off the leaves from the lower part of the ſhoot intended to be laid, and cut a ſlit in one of the middle joints, and cut off the tops of the leaves, and cut out the ſwelling part of the joint, where the ſlit is made; then raiſe the earth about the place a little, and bend down the ſlit part of the joint into it, keeping the top upright, and faſten it in its place by a hooked ſtick, ſtuck into the ground over it, and cover it with earth; then give it a gentle watering, as often as is neceſſary, and in ſix weeks the layers will have taken ſo much root as to be ready to tranſplant.

They require ſhelter in the winter-ſeaſon, and as it is difficult to ſhelter a large number in their pots, which are uſually nine inches over, it may be a better way to plant them out in Auguſt in very ſmall pots, ſheltering a number of theſe during the winter in a frame; and in the middle of February they may be tranſplanted into the pots they are to flower in: theſe, in April, ſhould be ſet out upon a ſtage of boards, open to the ſouth-eaſt, but defended from the weſt winds, and not too near trees, walls, or buildings, where they are to flower.

CARNATION-*tree*. See *Alpine* COLTSFOOT.

Spaniſh CARNATION, in *Botany*. See BARBADOES *Flower-fence*.

CARNATION, among *Dyers*; to dye a *carnation*, or red roſe colour, take liquor of wheat bran a ſufficient quantity, alum three pounds, tartar two ounces; boil them and enter twenty yards of broad cloth; after it has boiled three hours, cool and waſh it: take freſh clear bran liquor a ſufficient quantity, madder five pounds; boil and ſadden according to art.

The Bow dyers know that the ſolution of jupiter, or delved tin, being put in a kettle to the alum and tartar, in another proceſs, makes the cloth, &c. attract the colour into it, ſo that none of the cochineal is left, but the whole is abſorbed by the cloth.

CARNATION, *Fleſh-colour*, in *Painting*, is underſtood of all the parts of a picture in general, which repreſent fleſh; or thoſe parts of human figures which are naked, and without drapery.

Titian and Corregio, in Italy, and Rubens and Van Dyke in Flanders, excelled in *carnations*.

It may be here obſerved, that the word *carnation* is not properly uſed for any particular part of the perſon painted, but for the whole nudity of the piece. See COLOURING.

CARNEDDE, in *Britiſh Antiquity*, denote heaps of ſtones ſuppoſed to be druidical remains, and thrown together on occaſion of confirming and commemorating a covenant. Gen. xxxi. 46. They are very common in the iſle of Angleſey: and were alſo uſed as ſepulchral monuments, in the manner of *tumuli*: for Mr. Rowland found a curious urn in one of theſe *carnedde*. Whence it may be inferred that the Britons had the cuſtom of throwing ſtones on the deceaſed. From this cuſtom is derived the Welch proverb, *Karn ardyben*, ill betide thee. Rowland's Mona Antiqua Reſtaurata.

CARNEIA, in *Antiquity*, a feſtival in honour of Apollo, ſurnamed Carneus, held in moſt cities of Greece, but eſpecially at Sparta, where it was firſt inſtituted.

The reaſon of the name, as well as the occaſion of the inſtitution, is controverted. It laſted nine days, beginning on the 13th of the month Carneus. The ceremonies were an imitation of the method of living, and diſcipline uſed in camps.

CARNEL.—The building of ſhips firſt with their timber and beams, and after bringing on their planks, is called *carnel-work*, to diſtinguiſh it from clinch-work.

Veſſels alſo which go with mizzen-ſails inſtead of main-ſails, are by ſome called *carnels*.

CARNELIAN. See CORNELIAN.

CARNEUM *operculum*, in *Anatomy*, a name given by ſome writers to a muſcle of the *abdomen*, called by Veſalius the *principium recti abdominis*; and by Fallopius, the *muſculus carnoſus*. It is now generally known by the name of PYRAMIDALIS.

CARNEY, a diſeaſe in horſes, wherein their mouths become ſo furred that they cannot eat.

CARNICULA is uſed by ſome for a caruncle, more particularly for that fleſhy ſubſtance which inveſts the teeth.

CARNID, in *Natural Hiſtory*, a name given by Averrhoes to what is called ZARNICH by more ancient writers.

CARNIFEX, among the *Romans*, the common executioner.

By reaſon of the odiouſneſs of his office, the *carnifex* was expreſly prohibited by the laws from having his dwelling-houſe within the city.

In middle age writers *carnifex* alſo denotes a butcher.

Under our Daniſh kings, the *carnifex* was an officer of great dignity; being ranked with the archbiſhop of York, earl Goodwin, and the lord ſteward. Flor. Wigorn. ann. 1040. *Rex Hardecanutus Alfricum Ebor. Archiep. Goodwinum comitem, Edricum diſpenſatorem, Thrond ſuum* carnificem, *& alios magnæ dignitatis viros Londinum miſit.* Spelm. Gloſſ. p. 125.

CARNIFICATION, the making of, or turning to fleſh.

Phyſicians gives inſtances of the *carnification* of BONES, that is, where the bones loſe their natural conſiſtence, and become ſoft and fleſhy. This is a tranſmutation which is the reverſe of OSSIFICATION.

CARNIFORMIS *abceſſus*, an abſceſs with a hardened orifice, which generally riſes where the muſcles apply themſelves to the joints.

CARNIVAL, or CARNAVAL, a ſeaſon of mirth and rejoicing, obſerved with great ſolemnity by the Italians, and particularly at Venice.

The word is formed of the Italian *carnavale*; which Du-Cange derives from *carn-a-val*, becauſe the *fleſh* is then put into the *pot*, in order to make amends for the ſeaſon of abſtinence enſuing. Accordingly, in the corrupt Latin, he obſerves, it was called *carnelevamen*, and *carniſprivium*; as the Spaniards ſtill denominate it, *carnes tollendas*.

The *carnival* time commences from Twelfth-day, and holds till Lent. Feaſts, balls, operas, concerts of muſic, intrigues, marriages, &c. are chiefly in *carnival* time.

CARNIVOROUS, CARNIVORUS, an epithet applied to thoſe animals which naturally ſeek, and feed on fleſh.

It is a diſpute among naturaliſts, whether or no man be naturally *carnivorous*? Some contend that the fruits of the earth were intended as his ſole food; and that it was neceſſity in ſome places, and luxury in others, that firſt prompted him to feed upon his fellow-animals. Pythagoras and his followers looked on it as a great impiety; and ſtrictly abſtained from all fleſh, from the notion of a metempſychoſis; and their ſucceſſors, the Bramins, continue the ſame to this day.

The conſideration Gaſſendus chiefly inſiſts on, why man ſhould not be *carnivorous*, is the ſtructure and conformation of our teeth; the moſt of them being either inciſores or molitores; not ſuch as *carnivorous* animals are furniſhed with, proper to tear fleſh; except the four *canini*: as if nature had rather prepared us for cutting herbs, roots, &c. than for eating meat.

To which may be added, that when we do feed on fleſh, it is not without a preparatory coction, by boiling, roaſting, &c.

And even then, as Dr. Drake obſerves, it is the hardeſt of digeſtion of all other foods, and is prohibited in fevers, and many other diſtempers: and laſtly, that children are rather averſe to all animal foods, till their palates become vitiated by cuſtom; and the breeding of worms in them is generally aſcribed to the too haſty eating of fleſh.

To theſe arguments, Dr. Wallis ſubjoins another; which is, that all quadrupeds which feed on herbs or plants, have a long colon, with a cœcum at the upper end of it, or ſomewhat equivalent, which conveys the food, by a long and large progreſs, from the ſtomach downwards, in order to its ſlower paſſage and longer ſtay in the inteſtines; but that in *carnivorous* animals ſuch cœcum is wanting, and inſtead thereof there is a more ſhort and ſlender gut, and quicker paſſage through the inteſtines. Now, in man, the cœcum is very viſible: a ſtrong preſumption, that nature, who is ſtill conſiſtent with herſelf, did not intend him for a *carnivorous* animal. It is true, the cœcum is but ſmall in adults, and ſeems of little or no uſe; but in a fœtus, it is much larger in proportion: and it is probable, our cuſtomary change of diet, as we grow up, may occaſion this ſhrinking.

To the arguments uſed by Dr. Wallis and others, to prove that man is not naturally *carnivorous*, Dr. Tyſon anſwers, that if man had been deſigned by nature not to be *carnivorous*, there would doubtleſs have been found ſomewhere in the globe, people who do not feed on fleſh; and as hiſtory ſeems not to furniſh any inſtance hereof, may not we ſay, that what is done univerſally by the whole ſpecies, is natural? For what the Pythagoreans did in abſtaining from fleſh, was on the principle of a tranſmigration, a miſtake in their philoſophy, not a law of nature: and though in ſome countries, men feed more ſparingly on fleſh than in others, this is owing to their own choice, from the advantage they perceive by it. He adds, that *carnivorous* animals are not always without a colon and *cœcum*; nor are all animals *carnivorous* which have thoſe parts; but that the carigueya, or opoſſum, for inſtance, has both a colon and a cæcum, yet feeds on poultry, and other fleſh; whereas the hedge-hog has neither colon nor cæcum, and therefore ought to be *carnivorous*, yet it feeds only on vegetables; add, that hogs, which have both, will feed on fleſh greedily enough when they can get it; and that rats and mice, which have large cœca, feed on bacon, as well as bread and cheeſe.

And, from the multitude of *carnivorous* animals which want thoſe parts, and of non-*carnivorous* which have one or both, no ſafe concluſion can be drawn; ſince we might as well argue, that becauſe the neat-kind, ſtag-kind, goat-kind, and ſheep-kind, which live on herbage, have four ſtomachs, therefore all thoſe which have not four ſtomachs were not deſigned by nature to be graminivorous; whereas the horſe-kind and hare-kind have but one ſtomach, yet feed on graſs like the former: add, that in many animals which live on the ſame ſort of food, the ſtructure of the ſtomach is found very different; and that in others which live on different foods, ex. gr. on fleſh, on fruits, on graſs, &c. the ſtomachs are found ſo like, that it is difficult to aſſign any difference between them; and if we cannot make a judgment what food is moſt natural to an animal from the ſtructure of its ſtomach, which is the part moſt concerned in digeſting it, much leſs can we judge from the colon or cæcum, which are parts remote from the ſtomach, and ſeem rather as a cloaca for the reception of the fæces, than of uſe for digeſting or diſtributing the food.

In fine, ſince man has all manner of teeth, fit for the preparation of all ſorts of food, ſhould it not rather ſeem that nature intended we ſhould live on all? And as the alimentary duct in the human-kind is fitted for digeſting all ſorts of food, may we not rather conclude that nature did not intend to deny us any? Phil. Tranſ. Nº 269, p. 775. Abridg. vol. v. p. 10.

CARNIUS, in *Chronology*, the Syracuſian name for the Athenian month METAGITNION; which was the ſecond of their year, and anſwered to the latter part of our July and beginning of Auguſt.

CARNOSUS, *muſculus*, in *Anatomy*, a name given by Fallopius and others to a muſcle, called by Veſalius the beginning of the ſtraight muſcle of the abdomen, and now generally known by the name of PYRAMIDALIS.

CARNOSA *Membrana*, } in *Anatomy*; ſee PANNICULUS
CARNOSUS *Panniculus*, } *Carnoſus*, and MEMBRANE.

CARNOSITY is uſed by ſome authors, for a little fleſhy excreſcence, tubercle, or wen, formed in the urethra, the neck of the bladder, or yard, which ſtops the paſſage of the urine.

Carnoſities are very difficult of cure: they are not eaſily known, but by introducing a probe into the paſſage, which there meets with reſiſtance. They uſually ariſe from ſome venereal malady ill managed.

CARNOSUM *folium*, in *Botany*. See LEAF.

CARNUBIA, in the *Materia Medica*, a name by which ſome authors have called the *carob*, or ſweet pipe.

CARO, in *Anatomy*, &c. See FLESH.

CARO *muſculoſa quadrata*, in *Anatomy*, a muſcle ſo called by Fallopius and Spigelius, but more popularly PALMARIS *brevis*.

CAROB, or ST. JOHN'S *Bread*, *ceratonia*, in *Botany*, a genus of the *polygamia polyoecia* claſs. Its characters are theſe: it is male and female on diſtinct trees; the male flowers have no petals, but a fleſhy germen ſituated within the receptacle, which becomes a long, fleſhy, compreſſed pod, divided by tranſverſe partions, each having one large, roundiſh, compreſſed ſeed. We have but one ſpecies, which is a native of the ſouthern parts of Europe, where it grows in the hedges, and produces a great quantity of long, flat, brown-coloured pods, which are thick, mealy, and of a ſweetiſh taſte.

Theſe pods are eaten by the poorer ſort of inhabitants in a ſcarcity of other food; but they are apt to looſen the belly, and cauſe gripings in the bowels. They are directed by the college of phyſicians as ingredients in ſome medicinal preparations.

CAROB is alſo a goldſmith's ſmall weight, amounting to the 24th part of a grain. It is alſo called *prime*.

CAROCHA, a name which the Spaniards and Portugueſe give to a kind of mitre made of paper or paſteboard, on which are painted flames of fire, and figures of demons, worn by thoſe who are condemned to death by the tribunal of the INQUISITION. See ACT *of faith*.

CAROENON, καροινον, ſometimes alſo called *carenum*, denotes wine boiled down, till a third be evaporated.

CAROLI, among ſome phyſicians, denote venereal puſtules on the penis; called alſo *caries pudendorum*.

CAROLINE, is a ſilver coin of Sweden, with the legend, *ſi deus pro nobis quis contra*. See COINS.

CAROLINE, is alſo a name given to the four books compoſed by order of Charlemagne, to refute the ſecond council of Nice, with regard to the worſhip of IMAGES. They contain one hundred and twenty heads of accuſation againſt that council, drawn up by the biſhops of France, and firſt publiſhed in 1549, by M. du Tillet, biſhop of Meaux, under the title of Elia Phylira.

CAROLOSTADIANS, or CARLOSTADIANS, an ancient ſect, or branch of Lutherans, who denied the real preſence of Chriſt in the euchariſt.

They were thus denominated from their leader Andrew Caroloſtadius, who having originally been archdeacon of Wittemberg, was converted by Luther, and was the firſt of all the reformed clergy who took a wife; but diſagreeing afterwards with Luther, chiefly in the point of the ſacrament, founded a ſect apart. The *Caroloſtadians* are the ſame with what are otherwiſe denominated SACRAMENTARIANS, and agree in moſt things with the ZUINGLIANS.

CAROLUS, an ancient Engliſh broad piece of gold, ſtruck under king Charles I. whoſe image and name it bears. Its value has been eſtimated at twenty-three ſhillings ſterling; though at the time when it was coined, it is ſaid to have been only rated at twenty ſhillings.

CAROLUS is uſed for a ſmall copper French coin, mixt with a little proportion of ſilver, firſt ſtruck by Charles VIII. of France, whence it took its name; being, at the time when it ceaſed to be current, valued at ſix *deniers*.

CAROPI, in *Botany*, a name given by the inhabitants of the Philippine iſlands to a plant more uſually known among authors by the name of TUGUS, a plant greatly eſteemed by the natives, and ſuppoſed by Camelli to be the true *amomum* of the Greeks, ſo much valued in thoſe ancient times.

CAROTEEL, in *Matters of Commerce*, denotes a certain weight or quantity of divers kinds of goods, ex. gr. of cloves, from four to five hundred weight; of currants, from five to nine hundred weight; of mace, about three hundred weight; and of nutmegs, from ſix to ſeven and an half hundred weight.

CAROTIC is uſed by ſome writers to denote thoſe who are ſeized with the CARUS.

CAROTIDS, in *Anatomy*, two arteries of the neck, on each ſide, ſerving to convey the blood from the aorta to the brain.—See *Tab. Anat. (angeiol.) fig.* 1. n. 5. 5. 13. 13. *(oſteol.) fig.* 5. 1. 1. 2. 3. 3. *lit.* xx. yy. *(ſplanch.) fig.* 12. *lit.* p.

The *right carotid* ariſes from the ſubclavian, juſt where that ſprings out of the porta; but the left immediately out of the aorta. They both lie pretty deep, and being defended by the aſpera arteria, paſs free from any compreſſure, and without ſending out almoſt any branches, ſtrait to the cranium. Juſt before their arrival there, they ſend forth the external *carotid*; and paſſing the os petroſum, proceed on with ſome circumvolutions, till laying aſide their muſcular membrane, and giving branches to the dura mater, they paſs along the cranium, defended by the ſides of the ſella-turcica, and dura mater: and ſending branches to the outer parts of the pia mater, and the nerves, they at laſt reach the cerebrum; where dividing into infinite ramifications, they are loſt in the cortical part; or perhaps proceed even into the medullary part thereof.

Hippocrates and the ancients placed the ſeat of drowſineſs in theſe arteries, whence they had the name *carotids*, i. e. *ſoporariæ*, from *καρος*, *drowſineſs*. For the ſame reaſon they were alſo called *lethargicæ*, and *apoplecticæ*.

CAROUGE, in *Botany*, a ſiliquous fruit, ſweet and good to eat, when arrived to a proper degree of maturity. The tree which bears it grows in Spain, and in ſeveral places of the Mediterranean. The fruit is of great uſe in fattening beaſts of burden, and is often given them inſtead of barley or oats: it is of ſome uſe in medicine, on account of its pectoral virtue, being taken in a decoction. The Spaniards call it *garroba*, or *algarrova*.

CARP, in *Ichthyology*. See CYPRINUS.

The *carp*, which was firſt brought into England by Leonard Maſchal, about the year 1514, is the moſt valuable of all kinds of fiſh for the ſtocking of ponds, becauſe of its quick growth and great increaſe. If the breeding and feeding of this fiſh were more underſtood and practiſed, the advantages would be very great, and fiſh-ponds become as valuable an article as gardens. The gentleman who has land in his own hands, may, beſide furniſhing his own table and ſupplying his friends, raiſe a great deal of money, and very conſiderably improve his land at the ſame time, ſo as to make it yield more this way than by any other employment whatever. The ſale of *carp* makes a part of the revenue of the nobility and gentry in Pruſſia, Pomerania, Brandenburg, Saxony, Bohemia, Mecklenburgh, and Holſtein.

For this purpoſe particular attention ſhould be paid to the ſoil, water, and ſituation of the *carp*-pond: the beſt kind of ponds are thoſe which are ſurrounded by the fineſt paſtures and corn-fields of a rich black mould, having ſoft ſprings on the ſpot, or running-water, that is neither too cold, nor impregnated with acid, calcareous, ſelenitic, or other mineral particles. The water indeed may be ſoftened by expoſing it to the air and ſun in a reſervoir, or by forming an open channel for it at ſome diſtance from the pond. They ſhould likewiſe be ſheltered againſt the eaſterly and northern winds, and be fully expoſed to the influence of the ſun.

It is found by experience moſt convenient to have three kinds of ponds for *carp*: viz. the ſpawning-pond, the nurſery, and the main pond. The firſt ſort of pond muſt be well cleared of all other kinds of fiſh, eſpecially thoſe of the rapacious kind, ſuch as the pike, perch, eel, and trout, and alſo of all the newts of lizards and the water-beetles. It ſhould be ſupplied with ſoft water, and be expoſed to the ſun and air. A pond of one acre requires three or four male *carp*, and ſix or eight female ones, and in the ſame proportion for each additional acre. The beſt *carp* for breeding are thoſe of five, ſix, or ſeven years old, in good health, with full ſcale, fine full eyes, and a long body, and without any blemiſh or wound. The pond ſhould be ſtocked on a fine calm day, towards the latter end of March or in April. *Carp* ſpawn in May, June, or July, according to the warmth of the ſeaſon; and for this purpoſe they ſwim to a ſhady, warm, ſheltered place, where they gently rub their bodies againſt the ſandy ground, graſs, or oſiers, and by this preſſure the ſpawn iſſues out. At the ſpawning ſeaſon all kinds of fowl ſhould be kept from the ponds. The young fry, hatched from the ſpawn by the genial influence of the ſun, are left in this pond through the whole ſummer, and even the next winter, if the pond is deep enough to prevent their ſuffocation under the ice in a ſevere winter; otherwiſe the breeders and the fry are put into ſeparate ponds, more convenient for their wintering.

The ſecond kind of ponds are the nurſeries: the young fiſh ſhould be removed into the nurſery in March or April, on a fine calm day: a pond of an acre will admit a thouſand or twelve hundred of this fry. When they are firſt put in, they ſhould be well watched and driven from the ſides of the pond, leſt they become the prey of rapacious birds. In two ſummers they will grow ſo much as to weigh four, five, ſometimes ſix pounds, and to be fleſhy and well-taſted.

The main-ponds are the laſt ſort: *carp* are put into theſe, that meaſure a foot, head and tail incluſive. Every ſquare of fifteen feet is ſufficient for one *carp*; their growth depends on the room and the quantity of food allowed them. The beſt ſeaſons for ſtocking the main ponds are ſpring and autumn: *carp* continue to grow for a long time, and to a very conſiderable ſize and weight. Mr. Forſter mentions one which he had ſeen in Pruſſia above a yard long, and of twenty-five pound weight; and two or three hundred between two and three feet long, and which, he was told, were of between fifty and ſixty years ſtanding: Geſner mentions an inſtance of one that was an hundred years old: theſe were tame, and came to the ſhore in order to be fed, and ſwallowed with eaſe a piece of white bread of the ſize of half a halfpenny roll. Ponds ſhould be well ſupplied with water during winter, and when they are covered with ice, holes ſhould be opened every day for the admiſſion of freſh air, through want of which *carp* frequently periſh. See *Carp*-FISHING.

Carp are ſometimes fed, during the colder ſeaſon, in a cellar: the fiſh is wrapped up in a quantity of wet moſs, ſpread on a piece of net, and then gathered into a purſe, in ſuch a manner, however, as to allow him room to breathe. The net is then plunged into water, and hung up to the cieling of a cellar: the dipping muſt at firſt be repeated every three or four hours, but afterwards it need only be plunged into the water once in about ſix or ſeven hours. Bread ſoaked in milk is firſt given him in ſmall quantities; in a ſhort time the fiſh will bear more and grow fat by this treatment. Many have been kept in this way, breathing nothing but air, for ſeveral days ſucceſſively. Phil. Tranſ. vol. lxi. pt i. Art. xxxvii. p. 310, &c.

CARP, *golden*. See GOLD-*fiſh*.

CARP-*ſtone*, *Lapis carpionis*, a kind of gem ſaid to be found in the fauces, by others in the back-bone, of the *carp* fiſh, about the ſize of a pea, of a triangular figure, and white colour without, but yellow within. It is ſuppoſed to be of uſe againſt the ſtone, and ebullitions of the bile, being taken in powder, or held in the mouth.

CARP-*meals*, a coarſe kind of cloth, made in the northern parts of England.

CARPACK, in the *Ægyptian Dreſs*, a ſort of red cap turned up with fur, which ſome make a cuſtom of wearing in common, though it is properly a part of the dreſs of the interpreters only, the ſame cap with muſlin tied round it being more properly the common dreſs.

CARPÆA, from Καρπαια, a kind of dance, or military exerciſe, in uſe among the Athenians and Magneſians, performed by two perſons; the one acting a labourer, the other a robber.

The labourer, laying by his arms, goes to ſowing and plowing; ſtill looking warily about him, as if afraid of being ſurpriſed: the robber at length appears, and the labourer, quitting his plough, betakes himſelf to his arms, and fights in defence of his oxen. The whole was performed to the ſound of flutes, and in cadence.

Sometimes the robber was overcome, and ſometimes the labourer; the victor's reward being the oxen and plough. The deſign of the exerciſe was, to teach and accuſtom the peaſants to defend themſelves againſt the attack of ruffians.

CARPASIUM *linum*. See LINUM *Carpaſium*.

CARPASUM, or CARPASIUM, in the *Materia Medica* of the ancients, the name of a poiſonous gum, exſudating from a tree, ſo like myrrh in appearance that many periſhed by the error of uſing it inſtead of myrrh, or mixed among it. We are, at this time, wholly ignorant of its nature; but that it was a gum exſudating from a tree is plain from the account of Dioſcorides, who calls it *opocarpaſum*, as we do the flowing balm of Gilead, *opobalſamum*. The wood of the tree which produced it, he calls *xylocarpaſum*, in the ſame manner as the other wood is called *xylobalſamum*. This wood was little leſs poiſonous than the *carpaſum*, or gum itſelf.

Galen tells us that the *carpaſum* was like myrrh of the very pureſt and fineſt kind; and that thoſe people who were moſt curious of all to have fine myrrh, often met with the *carpaſum* among it, and gave death, inſtead of relief, to the perſons they adminiſtered it to. We find, by the words of Galen, that this gum was not only like myrrh, but was alſo brought from the ſame places, and was often mixed with it. The fineſt myrrh uſually had moſt of this poiſon among it, and we may collect from the ſame account that it was a ſweet-ſcented gum, for otherwiſe no body could have miſtaken it for myrrh. Galen de Med. Simpl. lib. vii.

CARPENTER, an artificer whoſe buſineſs is to cut, faſhion, and join timber and other wood for the purpoſes of building.

The word is formed from the French *charpentier*, which ſignifies the ſame, formed of *charpente*, which denotes timber; or rather from the Latin *carpentarius*, a maker of *carpenta*, or carriages.

CARPENTERS *Work*, in *Architecture*, includes the framing, flooring, roofing; the foundation, carcaſe, doors, windows, &c.

Company of CARPENTERS. See COMPANY.

CARPENTER'S *Joint rule*. See RULE.

CARPENTER, *ſhip*, a perſon employed in the docks, in the conſtruction and repairing of veſſels.

CARPENTER *of a ſhip*, is an officer at ſea, whoſe buſineſs is to have things in readineſs for keeping the veſſels in repair; and to attend the ſtopping leaks, fiſhing maſts or yards, alſo calking, careening, breaming, and the like. He is to watch the timber of the veſſel that it does not rot;

conſult frequently with other officers on the ſtate of the maſts, yards, &c. and in time of battle he is to have plugs, tompions, and planks ready, for repairing breaches made by the enemy's cannon.

The *carpenter* has a mate under him, and a crew or gang to command on neceſſary occaſions.

CARPENTRY, the art of cutting, framing, and joining, large pieces of wood, for the uſes of BUILDING.

Carpentry is one of the arts ſubſervient to architecture, and is divided into two branches, *houſe-carpentry*, and *ſhip-carpentry*; the firſt employed in raiſing, framing, roofing, flooring, &c. of houſes, &c.

The ſecond in the conſtruction of veſſels for ſea; as ſhips, barks, barges, boats, &c.

The rules and practices in *carpentry*, as to planing, ſawing, morteſſing, tenanting, ſcribing, paring, moulding, &c. are much the ſame as thoſe in joinery: ſo likewiſe are the tools, or inſtruments, and the ſtuff is the ſame in both; all the difference between the two arts conſiſting in this, that joinery is uſed in the ſmaller and more curious works; and *carpentry* in the larger, ſtronger, and coarſer.

Fr. Pyrard aſſures us, that the art of *carpentry* is in its greateſt perfection in the Maldive iſlands: their works there, he obſerves, are ſo artfully managed, that they will hold tight and firm without either nails or pins. He adds, they are ſo curiouſly put together, that nobody can take them aſunder, but thoſe acquainted with the myſtery.

CARPENTUM, in *Antiquity*, a denomination common to divers ſorts of vehicles, anſwering to coaches as well as waggons, or even carts among us.

The *carpentum* was originally a kind of carr or vehicle wherein the Roman ladies were carried; though in aftertimes it was alſo uſed in war.

Some derive the word a *carro*; others from *Carmenta*, mother of Evander, by a converſion of the *m* into *p*, *carpentum* for *carmentum*. Thus Ovid, Faſt. lib. i.

Nam prius Auſonias matres Carpenta vehebant
Hæc quoque ab Evandri dicta parente reor.

CARPERA, in *Ichthyology*, a name given by Cuba, and ſome other writers on fiſhes, to the CARP. See CYPRINUS.

CARPERITARIA, in *Botany*, a name uſed by ſome authors for the barbarea or winter-creſs, a wild plant common in hedges in ſpring.

CARPESIA, in the *Materia Medica of the Ancients*, a name given to a kind of ſpice, or aromatic drug, often mentioned by Ægineta and others, and made an ingredient in cordial and ſtomachic medicines. This was a vegetable ſubſtance, being the top ſhoots of young twigs of an odoriferous ſhrub, growing in Pamphylia, and ſmelling very like the fineſt cinnamon.

As the ancients uſed both this drug and cubebs, it is certain that had they both been the produce of the ſame tree, they muſt have known it; and this it is plain they did not know, for they have no where named any ſuch thing; but, on the contrary, they have expreſly ſaid, that the *carpeſia* was the ſhoots of a tall tree, which produced no fruit. Avicenna gives alſo this account, and adds, that it grew, in his time, on mount Lebanon, and that the part gathered for this uſe was certain twigs, very long, cylindric, and but little thicker than a needle, which had a very fragrant ſmell.

CARPESIUM, in the *Materia Medica*, a name given by ſome authors to *cubebs*. See CARPESIA.

CARPET, a ſort of covering, worked either with the needle, or on a loom; to be ſpread on a table, trunk, an eſtrade, a paſſage, or a floor.

Perſian and Turky *carpets* are thoſe moſt prized; eſpecially the former: *carpets* that had a hair or ſhag on one ſide only, were called by the ancients *tapetes*; ſuch as had a ſhag on both ſides, were called *amphitapetes*. Engliſh *carpets*, eſpecially thoſe of Axminſter, are much valued.

Among *Jockeys*, to *ſhave the carpet*, is to GALLOP very cloſe, or near the ground; a fault foreigners charge on Engliſh horſes.

Figuratively, an affair, propoſal, &c. are ſaid to be brought on the *carpet*, or tapis, when they are under conſideration, &c.

CARPET-*knights*, a denomination given to gown-men, and others, of peaceable profeſſions, who, on account of their birth, office, or merits to the public, or the like, are, by the prince, raiſed to the dignity of knighthood.

They take the appellation *carpet*, becauſe they uſually receive their honours from the king's hands in the court, kneeling on a *carpet*. By which they are diſtinguiſhed from knights created in the camp, or field of battle, on account of their military proweſs.

Carpet-knights poſſeſs a medium between thoſe called *truck*, or *dunghill-knights*, who only purchaſe, or merit the honour by their wealth; and *knights-bachelors*, who are created for their ſervices in the war.

CARPINUS, in *Botany*. See HORNBEAM.

CARPIONE, in *Ichthyology*, a name given by Salvian to the fiſh called by other writers *carpio lacus Benaci*. It is the ſame with that fiſh called in ſome parts of England the *red* CHARRE. Artedi diſtinguiſhes it from the other ſpecies of SALMON, by calling it the ſmall *ſalmon* with five rows of teeth in the palate.

CARPOBALSAM, or CARPOBALSAMUM, the fruit of the tree which yields the true oriental balm, or balſam; very much reſembling, both in figure, ſize, and colour, that of turpentine.

The word comes from καρπος, *fruit*; and βαλσαμος, *balſam*.

The *carpobalſamum* is an oblong fruit with a ſhort footſtalk, a brown wrinkled rind, marked with four ribs; of a grateful taſte and ſmell.

It is ſeldom found in ſhops; ſome ſubſtituting Jamaica pepper, and others cubebs, in its place.

CARPOBOLUS, *Lycoperdon*, in *Botany*. See PUFF-*ball*.

CARPOCRATIANS, a branch of the ancient Gnoſtics, ſo called from *Carpocrates*, who in the ſecond century revived, and improved upon, the errors of Simon Magus, Menander, Saturnus, and other GNOSTICS.

He owned, with them, one ſole principle, and father of all things, whoſe name, as well as nature, was unknown. The world, he taught, was created by angels, vaſtly inferior to the firſt principle. He oppoſed the divinity of Jeſus Chriſt; making him a mere man, born of Joſeph and Mary, according to the ordinary courſe of nature, though poſſeſſed of uncommon gifts, which ſet him above other creatures. He inculcated a community of women; and taught, that the ſoul could not be purified, till it had committed all kinds of abominations, making that a neceſſary condition of perfection; that all actions were indifferent in their own nature, and were rendered good or evil by the opinions of men, or the laws of the ſtate.

CARPOS, Καρπος, *fruit*. The word in this ſenſe is too well known and underſtood to admit of any explanation; but it is neceſſary to obſerve that the old Greek writers did not keep ſtrictly to the ſenſe of the word, limiting it, as we do, to that part of a plant of a tree which ſucceeds the flower, and in which the ſeeds are contained; but they often uſed it in a larger ſenſe, and expreſſed by it the eſculent part of a plant, though it did not ſerve to this purpoſe.

CARPUM *flectentium interior*, in *Anatomy*, a name given by Spigelius to the muſcle called by Albinus *ulnaris internus*, and by Winſlow, *internus cubitalis*.

CARPUS, in *Anatomy*, the WRIST; or that part between the palm of the hand, and the arm.—See *Tab. Anat.* *(Oſteol.) fig.* 3. *n.* 9. and 7. *n.* 12. See WRIST.

The Arabians call it *raſceta*; the Latins ſometimes *carpiſmus*.

CARR, *carrum*, in the *Middle Age*, denoted any ſort of vehicle, or carriage, either by land or ſea.

CARR, CARRUS, a kind of rolling throne, uſed in TRIUMPHS, and at the ſplendid entries of princes.

The word is from the ancient Gauliſh, or Celtic, *carr*; mentioned by Cæſar, in his Commentaries, under the name *carrus*.

Plutarch relates, that Camillus having entered Rome in triumph, mounted on a *carr*, drawn by four white horſes, it was looked on as too haughty an innovation.

CARR is alſo uſed for a kind of light, or open chariot. Pontanus obſerves, that Erichthonius was the firſt that harneſſed horſes, and joined them in a *carr*, or chariot.

The *carr*, on medals, drawn either by horſes, lions, or elephants, uſually ſignifies, either a triumph, or an apotheoſis: ſometimes a proceſſion of the images of the gods, at a ſolemn ſupplication; and ſometimes of thoſe of ſome illuſtrious families at a funeral.—The *carr* covered, and drawn by mules, only ſignifies a *conſecration*, and the honour done any one of having his image carried at the games of the Circus.

The *carr* uſed by the ladies was called *pilentum*, *carpentum*, and *baſterna*.

CARRAC, or CARRACA, a name given by the Portugueſe to the veſſels they ſend to Braſil and the Eaſt Indies; being very large, round built, and fitted for fight, as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have ſometimes ſeven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little uſed. Formerly they were alſo in uſe among the knights of Rhodes, as well as among the Genoeſe, and other Italians.

It is a cuſtom among the Portugueſe, when the *carracs* return from India, not to bring any boat or ſloop for the ſervice of the ſhip, beyond the iſland of St. Helena; at which place they ſink them on purpoſe, in order to take from the crew all hopes or poſſibility of ſaving themſelves, in caſe of ſhipwreck.

CARRAGO, in *Antiquity*, a kind of fortification, or defence about a camp, compoſed of carts, waggons, and the like vehicles, chained or faſtened together; chiefly uſed by the barbarous nations.

CARRARA *marble*, among our *Artificers*, the name of a ſpecies of white marble, which is called *marmor* LUNENSE, and *liguſtrium* by the ancients: it is diſtinguiſhed from the Parian, now called the ſtatuary marble, by being harder and leſs bright.

CARRAT, Carat, or Caract. See Caract.

CARRIAGE, a vehicle for the conveyance of perſons, goods, &c. from place to place.

Carriage *of a cannon*, is the frame, or timber-work, whereon it is mounted; ſerving to point and direct it for ſhooting, and to convey it from place to place; of which there are three ſorts; viz. thoſe uſed in garriſons, at ſea aboard ſhips, and in the field. The two firſt differ only in ſome iron rings, and alſo that the trucks or wheels of garriſon carriages are made of caſt iron, whereas thoſe of ſhip carriages are of wood. Both have the ſame irons, except the breech-rings, which are peculiar to the latter.

Carriage, *the*, *of a field-piece*, conſiſts of two wheels, which carry long and ſtrong wooden beams, or cheeks, between which the cannon is as it were framed, moving on its trunnions as on a centre: when it is required to move them, they add a vant-train, compoſed of two ſmaller wheels.

The *carriage* conſiſts of the cheeks, the tranſums, the bolts, and plates, the train, the bands, the keys and locks, the bridge, the bed, the hooks, the trunnion-holes, and the cap-ſquare.

The ordinary proportion is, for the *carriage* to have $1\frac{1}{2}$ of the length of the gun; the wheels to be half the length of the piece in height: four times the diameter, or caliber, gives the depth of the planks at the fore-end; in the middle $3\frac{1}{2}$.

The *carriages* for mortars are low, with four wheels, each of one piece, exactly like the *ſea-carriages*.

Carriage, *block*, is a cart made on purpoſe for carrying of mortars, and their beds, from one place to another; and likewiſe for carrying guns in the field, which are too heavy to be tranſported on their own carriages.

Carriages, *truck*, are two ſhort planks of wood, ſupported on two axle-trees, having four trucks, or wheels, of ſolid wood, about a foot and a half, or two foot diameter, for carrying mortars or guns upon a battery, when their own carriages cannot go, and for removing timber, and other burthens; and are drawn by men.

Carriage, *the*, *of a ſhip gun*, conſiſts of four wheels, without ſpokes.

The parts of a *ſea-carriage* are the two cheeks, the axle-trees, bolts, cap-ſquares, commonly called clamps in the ſea-ſervice, hooks, forelocks, trucks, and linſpins. The breadth of the wheels is always equal to that of the cheeks; but the height of the cheeks, and diameter of the trucks, depend on the height of the gun-ports above the deck. See on the ſubject of *carriages* relating to the military art, both as to their conſtruction and the dimenſions of their parts, Muller's Treat. of Artillery, vol. iv. See Galloper, Limber, Tumbrel, &c. See alſo Bed, Breechings, &c. and Howitz, Mortar, &c.

Carriage, in *Agriculture*, denotes a ſort of furrow, cut for the conveyance of water, to overflow, or improve the ground.

Carriages are of two kinds, the main *carriage*, whoſe mouth is of breadth ſufficient to receive the whole ſtream intended; and leſſer *carriage* ariſing from ſpace to ſpace, out of the former.

Carriage alſo ſignifies the removal of goods, or other things, from one place to another, eſpecially with a carr or cart.

Carriage alſo denotes the money or hire paid to a carrier, or other bearer of goods.

Juſtices of peace have power to aſſeſs the price of *carriage* of goods yearly, at their Eaſter ſeſſions; and if any carrier ſhall take above the rates and prices ſo aſſeſſed, he ſhall forfeit 5*l*. 3 and 4 W. and M. cap. 12.

A common carrier having the charge and *carriage* of goods, is to anſwer for the ſame, or the value, to the owner. Co. Lyt. 78. And where goods are delivered to a carrier, and he is robbed of them, he ſhall be charged, and anſwer for them, becauſe of the hire. 1 Roll. abr. 338.

Where goods are ſtolen from a carrier, he may bring an indictment againſt the felon, as for his own goods, though he has only the poſſeſſory, and not the abſolute property; and the owner may likewiſe prefer an indictment againſt the felon. Kel. 39. If a carrier is robbed of goods, alſo either he or the owner may bring an action againſt the hundred to make it good.

The *carriage* of letters is called *poſtage*. See Post.

Carriage *by ſea*, is denominated FREIGHT.

Carriage, *bill of*, *lettre de voiture*, among the French, denotes a paper given to a carrier, expreſſing the quantity and quality of the goods and parcels committed to him, partly to entitle him to receive his hire from the perſon to whom they are directed, and partly that this letter may ſhew whether all be brought, and whether in due time, and in the condition required.

Carriage is alſo uſed to denote a ſpace of ground, over which the inhabitants of New France, and other colonies of North America, who trade with the ſavages uſually by means of canoes, are obliged to carry their boats and proviſions, &c. on their ſhoulders. This they are forced to when they come to places in lakes or rivers, covered with willows, or otherwiſe rendered impracticable to paſs by water, till they meet with ſome new place convenient for reimbarking.

CARRIER, he who undertakes to convey perſons, goods, papers, money, or the like, from place to place, on condition of a certain price either fixed by authority or cuſtom, or left to private agreement. See Carriage.

In Holland *carriers* are called *routiers*, becauſe they always keep the ſame road, or route; ſetting out, and arriving, at fixed hours.

Carrier *pigeon*, a ſort of pigeon uſed, when properly trained up, to be ſent with letters from one place to another.

It is larger in ſize than moſt of the other kinds. Its length from the tip of the beak to the end of the tail being often fifteen inches; but its greateſt weight not twenty ounces. Its fleſh is firm, and its feathers cloſe; it is long-necked, and of a better ſhape than moſt other pigeons. The upper chap of the bill is half covered from the head with a white or blackiſh tuberous furfuraceous fleſh, which projects or hangs over both its ſides, on the upper part neareſt the head, and ends in a point about the middle of the bill. This is called the *wattle*. The eyes are ſurrounded with the ſame ſort of corrugated fleſh for the breadth of a ſhilling, and their iris is red. Their beak is long, ſtraight, and thick; their wattle generally broad acroſs the beak, ſhort from the head toward the point, and tilting forward from the head; and the head narrow, long, and flat; the neck very long and thin, and the breaſt broad; the feather is chiefly black or dun, though there are blues, whites, and pyed.

It has its name from its remarkable ſagacity in returning to the place where it was bred, though carried to great diſtances; from which property it is made uſe of to carry letters to diſtant places, as a ſpeedy and ſafe method of conveyance.

They are trained to this ſervice in Turky and Perſia, and are carried firſt, while young, ſhort flights of half a mile, and afterwards more, till at length they will return from the fartheſt part of the kingdom. Every baſhaw has a baſket of theſe pigeons, bred at the ſeraglio, which, upon any emergent occaſions, as an inſurrection, or the like, he diſpatches with letters, braced under their wings, to the ſeraglio, only ſending out more than one, for fear of accidents. Lightow aſſures us, that one of theſe birds will carry a letter from Babylon to Aleppo, which is thirty days journey, in forty-eight hours. This is alſo a very ancient practice; Hirtius and Brutus, at the ſiege of Modena, held a correſpondence with one another by means of pigeons. And Ovid tells us, that Tauroſthenes, by a pigeon ſtained with purple, gave notice to his father of his victory at the Olympic games, ſending it to him at Ægina. Ælian. Var. Hiſt. lib. ix. cap. 2. Pliny, lib. x. cap. 24.

Anacreon tells us, that he conveyed a billet-doux to his beautiful Bathyllis, by a dove. Ode 9. See Dragoon, and Horse-*man*.

CARRIERE. See Career.

CARROBALISTA, in the *Ancient Military Art*, denotes a ſpecies of *baliſta* mounted on wheels, and drawn by horſes; by which it differed from the *manubaliſta*, which being leſſer and lighter was thrown by the hand.

CARROCIUM, or Carrocerum, in *Middle Age Writers*, denotes the BANNER, or chief flag of an army, which was mounted on a kind of chariot, and drawn by oxen.

CARROT, *Daucus*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it hath an umbelliferous hermaphrodite flower, which hath five heart-ſhaped petals turning inward, and five hairy ſtamina. The germen ſits under the flower, which afterward becomes a roundiſh ſtriated fruit, covered with ſtinging hairs.

Carrets were introduced into this kingdom by the Flemings, in the reign of queen Elizabeth, and firſt ſown about Sandwich, in Kent. There are two or three ſorts of this plant cultivated for the uſe of the kitchen; and theſe are ſown at ſeveral different ſeaſons of the year, to afford a ſupply of young roots, in all ſeaſons, for the table.

The ſeaſon for ſowing them, for the earlieſt crop, is ſoon after Chriſtmas. They ſhould be ſown in an open ſituation, but near a wall; though if they are ſown cloſe under it, they will be drawn up to ſeed too faſt, and give no good roots: about eight inches diſtant is the propereſt place.

They delight in a warm ſandy ſoil, which ſhould be light, and well dug to a good depth, that the roots may meet with no obſtruction in running down, which makes them grow forked, and ſhoot out lateral branches, eſpecially when the ground has been too much dunged the ſame year that the ſeeds were ſown, which will alſo occaſion their being worm-eaten. The hairyneſs of theſe ſeeds makes them apt to ſtick together in ſmall cluſters, and renders it difficult to ſow them equally: they ſhould therefore be always ſown on a calm day, when there is no wind ſtirring to blow them together, and be well rubbed between the hands to ſeparate them thoroughly: when they are ſown they ſhould be trod in with the feet, and the ground raked level over them.

When they firſt come up, they ſhould be hoed out to four inches diſtance; and a month after this, they muſt be cleared again; and if they are to be drawn while young, they are now to be left at ſix inches diſtance every way: if they are to ſtand to grow large, they muſt be ſeparated to ten inches.

The ſecond ſeaſon for ſowing *carrots* is in February. This muſt be done under a wall or hedge, and on warm banks; but thoſe which are to be in open large quarters, ſhould not be ſown till the beginning of March.

In July they may be ſown again for an autumnal crop, and finally in the end of Auguſt for thoſe which are to ſtand the winter. Theſe laſt will be fit for uſe in March, before any of the ſpring ones; but they are ſeldom ſo tender or well taſted.

In order to preſerve *carrots* for uſe all winter, they are to be dug up in the beginning of November, and laid in a dry place in ſand; and theſe roots being planted again in February, will ripen ſeeds in Auguſt for ſucceeding crops: the longeſt and ſtraiteſt roots are to be choſen for this purpoſe.

The cultivation of *carrots* has lately become a conſiderable branch of agriculture. For this purpoſe the ground ſhould be ploughed early, before the winter begins, that the froſt may mellow the ſoil, and well dunged. The ſeed ſhould be ſown in March or April, ſeparating it firſt by paſſing it through a fine chaff-ſieve. Four pounds of ſeed is ſufficient for an acre. In about ſeven or eight weeks they are fit for hoeing, and in a fortnight after they ſhould be harrowed, which is done without injury to the *carrot* plants. Mr. Billing, an ingenious farmer in Norfolk, obtained from twenty acres and a half of land, of different ſoil, and differently prepared, five hundred and ten loads of *carrots*, which, as experience led him to conclude, were equal in uſe and effect to a thouſand loads of turneps, or three hundred loads of hay. Some of them meaſured two feet long, and from twelve to fourteen inches round.

The ſeaſon for drawing *carrots* is a little after Michaelmas; and the beſt method of drawing them is by breaking the ground about ſix inches deep, with a four-pronged fork; though Mr. Billing has ploughed them up with a narrow-ſhared wheel-plough without injury, and the ſtock was turned into the ground to feed on them, without any farther preparation. Cows, ſheep, horſes, and hogs, become by uſe fond of *carrots*, and are greatly nouriſhed by them. See Billing's Account of the Culture of *Carrots*, 1765. 8vo.

Carrot, *wild*, or *Daucus Sylveſtris*. The ſeeds of this plant are eſteemed one of the moſt powerful diuretics we are acquainted with, of our own growth. They are alſo eſteemed provocatives to venery. They are alſo given in diſorders of the breaſt and lungs, in pleuriſies, in ſtranguries, and in the ſtone and gravel. An infuſion of them in white wine is excellent in hyſterical complaints. Many inſtances are related, in which tea made of the heads or ſeeds of the *wild carrot*, has given great relief in theſe complaints. Ale may be made of it, by adding to nine ounces of the ſeed eighteen ounces of raiſins of the ſun. Theſe muſt be put into a bag, and hung in a veſſel of ſix gallons of good ale, after fermentation. After eight days it will be fine, and it may be drank in the quantity of three pints a day.

See remarks on the uſe of the *carrot* peel-tree, in the Lond. Med. Obſerv. &c. vol. iv. p. 178. 191. and ibid. p. 358.

Carrot, *candy*. See SPIGNEL.

Carrot, *deaðly*, or *ſcorching*. See THAPSIA.

Carrot, *mountain*, a ſpecies of fennel. See FENNEL.

CARROUSAL, or **Carrowsal**, properly a courſe, or conteſt of chariots and horſes: or a magnificent entertainment, on occaſion of ſome public rejoicing; conſiſting in a cavalcade of ſeveral perſons, richly dreſſed, and equipped after the manner of the ancient cavaliers, divided into ſquadrons, meeting in ſome public place, and practiſing juſts, tournaments, and other noble exerciſes.

The word is ſince become of more general uſe, and is given to any merry meetings.

The word comes from the Italian *caroſello*, a diminutive of *carro*, *chariot*. Tertullian aſcribes the invention of *carrouſals* to Circe; and will have them inſtituted in honour of the Sun, her father; whence ſome derive the word from *carrus*, or *currus ſolis*.

The Moors introduced cyphers, liveries, and other ornaments of their arms, with trappings, &c. for their horſes. The Goths added creſts, plumes, &c.

CARR-TAKERS, are officers of the king's houſhold, who, when the court travels, have charge to provide waggons, carts, &c. to tranſport the king's furniture and baggage.

CARRUCA, in *Antiquity*, a ſplendid kind of carr, or chariot, mounted on four wheels, richly decorated with gold, ſilver, ivory, &c. in which the emperors, ſenators, and people of condition, were carried.

The word comes from the Latin *carrus*, or Britiſh *carr*, which is ſtill the Iriſh name for any wheel-carriage.

Carruca, or **Caruca**, is alſo uſed in *Middle Age Writers* for a PLOUGH.

Carruca was alſo ſometimes uſed for *carrucata*. See CARRUCATE.

CARRUCAGE, *carucagium*, a kind of tax anciently impoſed on every plough, for the public ſervice. See CARRUCATE and HIDAGE.

Carrucage, **Carucage**, or **Caruage**, in *Huſbandry*, denotes the ploughing of ground, either ordinary, as for grain, hemp, and flax; or extraordinary, as for woad, dyers weed, rape, and the like.

CARRUCATE, *carrucata*, in our *Ancient Laws* and *Hiſtory*, denotes a plough-land, or as much arable ground as can be tilled in one year, with one PLOUGH.

In Doomſday Inquiſition, the arable land is eſtimated in *carrucates*, the paſture in HIDES, and meadow in ACRES. Skene makes the *carrucata* the ſame with *hilda*, or *hida terræ*; Littleton the ſame with SOC.

The meaſure of a *carrucate* appears to have differed in reſpect of place, as well as time. In the reign of Rich. I. it was eſtimated at 60 acres, and in another charter of the ſame reign at 100 acres: in the time of Ed. I. at 180 acres: and in the 23d of Ed. III. a *carrucate* of land in Burceſter contained 112 acres, and in Middleton 150 acres. Dugd. Mon. tom. ii. p. 107. Kennet, Par. Ant. p. 471. Du-Cange.

By a ſtatute under William III. for charging perſons to the repair of the highways, a plough-land is rated at fifty pounds *per annum*, and may contain houſes, mills, wood, paſture, &c. Stat. 7 and 8 Will. III.

CARRYING, in *Falconry*, ſignifies a hawk's flying away with the quarry.

Carrying is one of the ill qualities of a hawk, which ſhe acquires either by a diſlike of the falconer, or not being ſufficiently broke to the LURE.

Carrying, among *Huntſmen*. When a hare runs on rotten ground (or even ſometimes in a froſt), and it ſticks to her feet, they ſay ſhe *carries*.

Carrying, among *Riding-Maſters*. A horſe is ſaid to *carry* low, when having naturally an ill-ſhaped neck, he lowers his head too much. All horſes that arm themſelves *carry* low, but a horſe may *carry* low without arming. A French branch, or gigot, is preſcribed as a remedy againſt *carrying* low.

A horſe is ſaid to *carry* well, when his neck is raiſed, or arched, and he holds his head high and firm, without conſtraint.

Carrying *wind*, a term uſed by our dealers in horſes to expreſs ſuch a one as frequently toſſes his noſe as high as his ears, and does not carry handſomely. This is called *carrying wind*; and the difference between *carrying* in the wind, and beating upon the hand, is this: that the horſe who beats upon the hand, ſhakes the bridle and reſiſts it, while he ſhakes his head; but the horſe that carries in the wind puts up his head without ſhaking, and ſometimes beats upon the hand. The oppoſite to *carrying* in the wind, is arming and *carrying* low; and even between theſe two there is a difference in wind.

CART, a vehicle mounted on two wheels, drawn by horſes, uſed for the carriage of heavy goods.

Mr. Sharp's *rolling cart* is fixed upon two rollers, running a-breaſt, or parallel with each other, and both placed under the body of the *cart*, working upon pivots like the wheel of a wheel-barrow. The rollers are both cylinders of caſt iron, two feet diameter, and fixteen inches broad. An iron ſpindle paſſes through the center of each roller, upon the ends of which reſt the four planks that ſupport the body of the *cart*.

The word ſeems formed from the French *charrette*, which ſignifies the ſame; or rather the Latin *carreta*, a diminutive of *carrus*. See CARR.

In London and Weſtminſter *carts* ſhall not carry more than twelve ſacks of meal, ſeven hundred and fifty bricks, one chaldron of coals, &c. on pain of forfeiting one of the horſes. 6 Geo. I. cap. 6.

By the laws of the city, carr-men are forbid to ride, either on their *carts*, or horſes. They are to lead, or drive them on foot, through the ſtreets, on the forfeiture of ten ſhillings. Stat. 1 Geo. I. cap. 57.

Criminals are drawn to execution in a *cart*. Bawds, and other malefactors, are whipped at the *cart's* tail.

Scripture makes mention of a ſort of *carts*, or drags, uſed by the Jews, to do the office of threſhing. They were ſupported on low thick wheels, bound with iron, which were rolled up and down on the ſheaves, to break them, and force out the corn. Something of the like kind alſo obtained among the Romans, under the denomination of *plauſtra*, of which Virgil makes mention. Georg. I.

> *Tardaque Eleuſinæ matris volventia plauſtra,*
> *Tribulaque, traheæque*——

On which Servius obſerves, that *trahea* denotes a *cart* without wheels, and *tribula* a ſort of *cart* armed on all ſides with teeth, uſed chiefly in Africa, for threſhing corn. The Septuagint and St. Jerome repreſent theſe *carts* as furniſhed with ſaws, inſomuch that their ſurface was beſet with teeth. David, having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be cruſhed to pieces under ſuch *carts*, moving on wheels ſet with iron teeth; and the king of Damaſcus is ſaid to have treated the Iſraelites of the land of Gilead, in the ſame manner. 2 Sam. xii. 31. Amos, i. 3. Calm. Dict. Bibl. tom. i. p. 366.

CART-*bote*, in our *Ancient Cuſtoms*, denotes wood to be employed in making or repairing inſtruments of huſbandry.

CARTE BLANCHE, a French term, ſeldom uſed but in this phraſe, To give, or ſend any one the *carte blanche*; i. e. to ſend him a blank paper, ſigned, for him to fill up with what conditions he pleaſes.

Much like this is the French *blanc ſigne*, a paper without writing, excepting a ſignature at the bottom, given by contending parties to arbitrators, or common friends, to fill up with the conditions they judge reaſonable, in order to end the quarrel.

CARTEL, originally ſignifies a placart, or manifeſto in writing, poſted in public places to notify its contents.

The word comes from the Italian *cartello*, or Latin *cartellus*, which ſignifies the ſame; formed by diminution of *charta*, *paper*.

CARTEL, a letter of defiance, or a challenge to ſingle combat; much in uſe when thoſe combats were practiſed, for the deciding of difficult, and not otherwiſe to be determined, controverſies at law. See DUEL.

The uſe of *cartels*, or challenges to fight, is very ancient, there being divers inſtances of them in Homer, Virgil, and other Greek and Latin poets. Rymer gives the *cartel* which Edward III. ſent to Philip de Valois, challenging him either to fight him, body to body, or an hundred men againſt an hundred, or army to army, within ten days, before the gates of Tournay. Fœd. tom. v.

CARTEL alſo denotes a treaty or agreement between two princes or generals, relating to the exchange of priſoners taken in war.

There are alſo *cartels* ſettled between princes in time of war, for what relates to commerce, that it may be carried on without interruption, notwithſtanding other hoſtilities.

CARTEL is alſo uſed for a ſhip commiſſioned in time of war, to exchange the priſoners of any two hoſtile powers; or to carry any requeſt or propoſal from one to another. The officer who commands her is ordered to carry only a ſingle gun, for the purpoſe of firing ſignals.

CARTEL alſo denotes a meaſure of capacity for corn, uſed in divers parts of France, being of different values from thirty to fifty pounds.

CARTESIAN *Philoſophy*, or CARTESIANISM, the ſyſtem of philoſophy advanced by Des Cartes, and maintained by his followers, the *Carteſians*.

The *Carteſian* philoſophy is founded on two great principles, the one metaphyſical, the other phyſical. The metaphyſical principle is this, *I think, therefore I am.* This principle has been attacked and defended, with great ſpirit, zeal, and partiality, on both ſides: for, though it be true, that we are as ſure by an inward perception or conſciouſneſs, that we exiſt, as that we think; yet it is true, too, that the concluſion of this reaſoning, *I am*, is drawn from the antecedent *I think:* ſince *to think*, ſuppoſes *to be*, or *exiſt*; and the mind ſees clearly the neceſſary connexion between thinking and being.

From our having the idea of a Being infinitely perfect and neceſſarily exiſting, Des Cartes concludes that he actually is, upon whoſe will he makes the certainty of ſelf-evident propoſitions, and of all neceſſary truths to depend. From the knowlege thus eſtabliſhed, he proceeds to deduce a complete knowlege of his effects by neceſſary ſteps; and he rejects all final cauſes from philoſophy. He infers the reality of material objects from the veracity of the Deity.

The phyſical principle of *Carteſianiſm* is this, that *nothing exiſts but ſubſtances:* which appears a dangerous principle to the divines; and is accordingly controverted every day in the ſchools of the catholics; who undertake to prove, that there are abſolute accidents.

Subſtance he makes of two kinds; the one a ſubſtance that thinks, the other a ſubſtance extended. Actual thought, therefore, and actual extenſion, are the eſſence of ſubſtance: ſo that the thinking ſubſtance cannot be without ſome actual thought; nor can any thing be retrenched from the extenſion of a thing, without taking away ſo much of its ſubſtance.

The firſt article is oppoſed by Mr. Locke, who endeavours to ſhew, that thinking is not eſſential to the ſoul, or that its eſſence does not conſiſt in thought; but that there are various occaſions wherein it does not think at all. See DREAM. The latter is ſtrongly oppoſed by the Jeſuits, &c. as inconſiſtent with the doctrine of TRANSUBSTANTIATION; but is much better confuted by the modern writers, from the principle of the Newtonian philoſophy.

The eſſence of matter being thus fixed in extenſion, Des Cartes naturally concludes there is no vacuum, nor any poſſibility thereof in nature; but that the world is abſolutely full: for mere ſpace is precluded by his principle: becauſe extenſion being implied in the idea of ſpace, matter is ſo too. If there were any ſuch a thing as a vacuum, ſays he, it might be meaſured: the vacuum, therefore, is extended, and of conſequence is matter; every thing extended being matter. See VACUUM.

He defines motion to be the tranſlation of a body from the neighbourhood of bodies that are in contact with it, and conſidered as quieſcent, to the neighbourhood of other bodies; and thus deſtroys the diſtinction between abſolute or real, and relative or apparent motion. He maintains that the ſame quantity of motion is always preſerved in the univerſe; becauſe God, he ſays, muſt be ſuppoſed to act in the moſt conſtant and immutable manner. And hence he likewiſe deduces his three laws of motion. See MOTION.

Theſe principles of phyſics once ſuppoſed, Des Cartes explains mechanically, and according to the laws of motion, how the world was formed; and whence the preſent appearances of nature do ariſe. He ſuppoſes, that God created matter of an indefinite extenſion; that he divided this matter into little ſquare portions, or maſſes, full of angles; that he impreſſed two motions on this matter; one, whereby each part revolved round its centre; another, whereby an aſſemblage, or ſyſtem of them, turned round a common centre: whence aroſe as many different vortices, or eddies, as there were different maſſes of matter, thus moving round common centres.

Theſe things thus put into motion, the conſequences, according to Des Cartes, in each vortex, will be as follow: the parts of matter could not move and revolve among each other, without having their angles gradually broken; and this continual friction of parts and angles muſt produce three elements: the firſt, an infinitely fine duſt, formed of the angles broken off; the ſecond, the ſpheres remaining, after all the angular irregularities are thus removed: theſe two make the matter of his firſt and ſecond element. And thoſe particles not yet rendered ſmooth and ſpherical, and which ſtill retain ſome of their angles, and hamous parts, make the third element.

Now the firſt, or ſubtileſt element, according to the laws of motion, muſt take up the centre of each ſyſtem, or vortex, by reaſon of the ſmallneſs of its parts: and this is the matter which conſtitutes the ſun, and the fixed ſtars above, and the fire below. The ſecond element, compoſed of ſpheres, makes the atmoſphere, and all the matter between the earth and the fixed ſtars; in ſuch manner, as that the largeſt ſpheres are always next the circumference of the vortex, and the ſmalleſt next its centre. The third element, or the hooked particles, is the matter that compoſes the earth, all terreſtrial bodies, comets, ſpots in the ſun, &c.

The parts of the ſolar vortex, according to his ſyſtem, increaſe in denſity, but decreaſe in celerity, to a certain diſtance; beyond which he ſuppoſes all the particles to be equal in magnitude, but to increaſe in celerity. He accounts for the gravity of terreſtrial bodies from the centrifugal force of the æther revolving round the earth; and upon the ſame general principles he pretends to explain the phænomena of the magnet, and to account for every other operation in nature.

His ſyſtem, though very artfully concerted, yet carries with it more of the air of a romance, than of a juſt philoſophy. Accordingly, both divines and philoſophers exclaim againſt it: the firſt, becauſe it leads to atheiſm, by furniſhing the maintainers of an eternal matter, with means how, from the laws of motion, to account for the production of the world: though, it is certain, Des Cartes ſuppoſed a Deity; and ſo muſt all who admit his philoſophy; elſe whence will they derive that motion of matter, which of itſelf is deſtitute of any ſuch principle?

But the philoſophers have much better pleas againſt it; and the elements, ſubtile matter, hooked atoms, vortices, and other machines, are now clearly on the ſame footing with the occult quality of the ancient peripatetics. Indeed, Des Cartes, by introducing geometry into phyſics, and accounting for natural phœnomena from the laws of mechanics, did infinite ſervice to philoſophy; and contributed, both by his practice and example, to free it from that venerable ruſt, which in a long ſucceſſion of ages it had contracted: accordingly, to him, in ſome meaſure, is owing the preſent ſyſtem of mechanical, and even the Newtonian philoſophy.

Carteſianiſm was nearly prohibited by an arret of the parliament of Paris; and had been ſo, in effect, but for a burleſque addreſs preſented to the firſt preſident.

René des Cartes, the noble founder of this ſect, was of Bretagne, born in the year 1596. His monument informs us, "That having maſtered all the learning of the ſchools, which proved ſhort of his expectation, he betook himſelf to the army, in Germany and Hungary; and there ſpent his vacant winter hours, in comparing the myſteries and phœnomena of nature, with the laws of mathematics; daring to hope, that theſe might unlock the other. Quitting, therefore, all other purſuits, he retired to a little village near Egmond, in Holland; where ſpending twenty-five years in continual reading and meditation, he effected his deſign."

He was a perſon of great genius and penetration, both as to the invention, and orderly ranging and diſpoſing of things. He began a new method of philoſophy, and finiſhed it, on his own foundation. His reputation in foreign nations appears on his monument; which conſiſts of four faces, inſcribed with ſo many encomiums. It was erected at Stockholm, where he died, in the year 1650, by Monſieur Chanut, the king of France's reſident in that court. But his bones were afterwards removed to Paris, at the charge of M. d'Alibret, who alſo erected a handſome monument over them, in the church of St. Genevieve.

See an accurate account and examination of the *Carteſian* ſyſtem, in Maclaurin's View of Sir Iſaac Newton's Philoſophical Diſcoveries, chap. iv.

CARTHAMUS. See *Baſtard* SAFFRON.

CARTHUSIANS, a branch of the BENEDICTINES, an order of religious, inſtituted by S. Bruno, about the year 1084 (ſome ſay in 1080, and others in 1086), remarkable for the auſterity of their rule, which obliges them to a perpetual ſolitude; a total abſtinence from fleſh, even at the peril of their lives; and to feed on bread, water, and ſalt, one day in every week; and abſolute ſilence, except at certain ſtated times.

Their houſes were uſually built in deſarts, their fare coarſe, and their diſcipline ſevere. It is obſerved, that the monaſtical piety is ſtill better preſerved in this, than in any of the other orders. M. l'Abbé de la Trappe, however, endeavours to ſhew, that the *Carthuſians* do not live up to the auſterity enjoined by the ancient ſtatutes of Guigues, their fifth general. M. Maſſon, general of the order, anſwers the abbé; and ſhews that what he calls the ſtatutes, or conſtitutions of Guigues, are, in reality, only cuſtoms compiled by father Guigues; and that they did not become laws till long after.

The word is formed from *Carthuſianus*, or *Carthuſienſis*, a denomination given them in Latin, from a village in Dauphiny called *Chartreuſe*, in Latin *Cartuſium*, *Caturſium*, as ſome ſay, where the firſt monaſtery of this kind was erected. Hence the French call the religious of this order *Chartreu*, and their convents *Chartreuſes*; an appellation which alſo appears to have anciently obtained in England; whence the name of that celebrated hoſpital, or rather college, in London, the Charter-houſe; by corruption from *Chartreuſe*.

The *Carthuſian* habit is all white within, their ſcapular being joined in the ſides by two pieces of the ſame ſtuff. They wore a hair ſhirt next their ſkin. Their prior and procurator, who may go abroad upon the neceſſary affairs of the houſe, appear in a black cloak down to the ground, and a black hood over the white one; the hood not round, but tapering to a point.

There are few nuns of this order. There have, however, been ſome female *Carthuſian* convents; but the increaſe of them was prohibited in 1368; and there remain only five at this day; four in France, and one at Bruges in Flanders. They were brought into England by Henry II. about the year 1180, and had only nine houſes; their firſt houſe being at Witham in Somerſetſhire.

CARTHUSIAN *powder*, *poudre des Chartreux*. See KERMES *mineral*.

CARTILAGE, in *Anatomy*, a ſmooth, ſolid, uniform, flexible, elaſtic part of an animal; ſofter than a bone, but harder than any other part.

Cartilages ſeem to be nearly of the ſame nature with bones, and only to differ as more or leſs hard. There are ſome very hard, and which even become bony with time; as thoſe, v. g. which form the ſternum. Others are ſofter, and ſerve to compoſe entire parts; as thoſe of the noſe, ears, &c. where an eaſy gentle motion is required; their natural elaſticity ſerving them inſtead of antagoniſt muſcles.

There are others ſofter ſtill, partaking of the nature of ligaments, and thence called *ligamentous cartilages*.

There are *cartilages* of various figures, acquiring various names from the things they reſemble: one is called *annularis*, becauſe it reſembles a ring; another *xiphoides*, from its reſembling the point of a dagger; a third *ſcutiformis*, becauſe made like a buckler; and ſo of the reſt. See each under its proper head.

Cartilages have no cavities for marrow; nor any membranes, or nerves, for ſenſation. Their uſes are to prevent the bones from being damaged or wounded by a continual friction; to join them together by a ſynchondroſis; and to contribute, in great meaſure, to the well forming of ſeveral parts; as the noſe, ears, trachea, eyelids, &c.

Cartilages cover the extremities of bones joined together by moveable articulations, increaſe the volume of ſome of them after the manner of epiphyſes, unite others very cloſely together, and have no immediate adheſion or connection with others. The *cartilages* which belong to the bones differ from each other in ſize, figure, ſituation, and uſe, and may all be ranked under two general heads: thoſe which are cloſely united to bones, and thoſe which are not immediately connected with them. The *cartilages* united to bones are of four kinds; ſome cover both ſides of the moveable articulations, and are very ſmooth and ſlippery; ſome unite the bones to each other, either ſo firmly as to allow no ſenſible motion, as in the ſymphyſis of the *oſſa pubis*, and ſtill more in that by which the epiphyſes are joined to the bones; or in ſuch manner as to allow of different motions, as in thoſe by which the bodies of the *vertebræ* are connected. The firſt eaſily grow hard, but the others appear in ſome degree viſcid, and retain their flexibility.

Some increaſe the ſize and extent of bones, as the cartilaginous portions of almoſt all the true ribs: theſe are articulated with bones; others with *cartilages*, as the *ſeptum narium*; others ſerve only for borders, as thoſe of the baſis of the *ſcapula*, and of the *criſta* of the *os ilium*, the *ſupercilia* of cavities, and thoſe of the ſpinal and tranſverſe proceſſes of the *vertebræ*. Some, in fine, have a ſingular form, as thoſe of the ears, and moſt of thoſe of the noſe; in which laſt, their elaſticity appears moſt ſenſibly. The *cartilages* belonging to the ſecond general claſs, or thoſe not immediately joined to bones, are for the moſt part placed in the moveable joints; and theſe may likewiſe be ſubdivided into ſeveral kinds. Some lie altogether looſe, being neither joined to the articulated bones, nor to the *cartilages* which cover them, but ſlide freely between them in different directions; as thoſe which are placed in the articulation of the *tibia* with the *os femoris*; in that of the lower jaw with the *oſſa temporum*; and in that of the clavicle with the ſternum. Thoſe between the clavicle and acromium, and between the firſt and ſecond *vertebræ* of the neck, are of the ſame kind. Some are partly joined to other *cartilages*, and partly ſlide between the cartilaginous extremities of the articulated bones, as the *cartilage* at the lower extremity of the *radius*. There may alſo be reckoned among the *cartilages*, though not ſo properly, ſeveral of the ſmall ſeſamoide bones, which remain long cartilaginous; and alſo the cartilaginous portions of tendons, which do the ſame office with the ſeſamoide bones. Winſlow.

It is commonly held, that all bones in their original were only *cartilages*, and arrived at the hardneſs of BONES by a gradual induration.

Hence it is, that in ſome caſes the *cartilages* themſelves have been found oſſified; of which a famous inſtance happened ſome years ago at Milan, where a malefactor was judged innocent, and ſaved, becauſe his *aſpera arteria* being turned bony, he was not ſuffocated by the hangman's rope.

CARTILAGES, *articulating*. See JOINT *Cartilages*.

CARTILAGINOUS *fiſhes*, thoſe, whoſe ſpine, or backbone,

bone, is of the conſiſtence of a cartilage, being hollow withal, and containing medulla. See FISH.

Cartilaginous fiſhes are of two kinds; flat, as the raia or ſkate; and long and round, as the *aſellus*, or cod.

CARTILAGINOUS *leaf*, among *Botaniſts*. See LEAF.

CARTON, or, as we pronounce it, CARTOON, in *Painting*, a DESIGN, made on ſtrong paper, to be afterwards calqued through, and transferred on the freſh plaſter of a wall, to be painted in freſco.

The word, in the original French, ſignifies *thick paper*, or *paſte-board*.

CARTON is alſo uſed for a deſign coloured, for working in moſaic, tapeſtry, &c. The *Cartoons* formerly preſerved at Hampton-court, but now in the queen's palace at Buckingham-houſe, are deſigns of Raphael Urbin, intended for a tapeſtry. See Richardſon, in his Eſſay on Painting; where he ſpends a great part of a chapter on the colouring of the *Cartoons*.

CARTOUCH, a wooden caſe about three inches thick, girt round with marlin, and loaden with two, three, or four hundred muſquet-balls, beſides ſix or eight balls of iron of a pound weight; to be fired out of a ſmall ſort of mortar, chiefly for the defence of a paſs, or the like.

The *cartouch* is alſo called by the French *gargouge*, *gargouche*, or *gargouſſe*.

In cannon of caſemates, or other poſts, which defend the paſſage of the ditch, or the like, *cartouches* have a terrible effect: ſince, burſting aſunder, they ſpread the ſhot they are loaden with far and wide. There are divers other forms and compoſitions of *cartouches*, and ſome made for guns.

CARTOUCH is alſo uſed for what is more frequently called a CARTRIDGE.

CARTOUCH alſo denotes an ornament in architecture, ſculpture, &c. repreſenting a ſcroll of paper; being uſually in form of a table, or flat member, with wavings; whereon is ſome inſcription, or device, ornament of armory, cypher, or the like.

It is nearly akin to a modillion; from which it only differs in this, that the latter is uſed under the cornice in the eaves of a houſe, and the former in wainſcotting within doors. Some workmen call the *cartoozes* DENTILS.

The word is French, formed from the Italian *cartoccio*, which ſignifies the ſame.

Cartouches are ſometimes drawn on paper, as in the titles of maps, &c. and are ſometimes made of ſtone, brick, plaſter, wood, &c. for buildings.

CARTOUCHES, in *Heraldry*, a name given to a ſort of oval ſhields, much uſed by the popes and ſecular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on. Many ſuppoſe this form derogatory to the honour of the perſon; but though the ſquare ſhield, with the rounded and pointed bottom, is more in uſe with us, as alſo with the French and Germans, yet this is ſuppoſed more truly the figure of the Roman ſhield worn by the ſoldiery, and therefore more ancient and honourable than either that or the indented ſhield of the Germans.

CARTRIDGE, in the *Military Art*, the charge or load of a fire-arm, wrapped up in a thick paper, paſte-board, or parchment; to be the more readily charged, or conveyed into the piece.

Cartridges are the ſame with what the French call *cartouches*; from which word Skinner ſcruples not to derive *cartridge*.

Thoſe of cannon and mortars are uſually in caſes of paſteboard, or tin, ſometimes of wood, half a foot long; taking up the place of the bullet in the piece, to whoſe caliber the diameter is proportioned. Thoſe of muſquets, piſtols, and ſmall arms, only contain the charge of powder, with a ball wrapped up in thick paper.

Flannel *cartridges* are now preferred, becauſe they do not retain the fire, and are therefore leſs liable to accidents in loading. A parchment cap is made to cover them, in order to prevent the duſt of powder from paſſing through them, which is taken off before they are put into the piece. Mr. Muller recommends for this purpoſe to boil the flannel in ſize. In quick firing, the ſhot is fixed to the *cartridge* by means of a wooden bottom, hollowed on one ſide, ſo as to receive nearly half the ſhot, which is faſtened to it by two ſmall ſlips of tin croſſing over the ſhot, and nailed to the bottom; and the *cartridge* is tied to the other end of this bottom. They are fixed likewiſe in the ſame manner to the bottoms of the grape-ſhot, which are uſed in field-pieces. Syſt. of Math. &c. vol. v. p. 291.

CARTRIDGE-*box*, a wooden or iron caſe covered with leather, holding a dozen or more muſket *cartridges*, borne by the ſoldier on his belt, hanging a little below the right pocket-hole.

CARVA, in *Botany*, a name given by the Indians to one of the kinds of cinnamon-tree. This is of all others the moſt eſteemed among them, and ſerves for the moſt purpoſes. They extract camphor and a liquid oil from the roots; they extract oil of cinnamon from the bark, and from the leaves they make another oil, which is called oil of cloves, and ſold as ſuch. The fruits yield them an oil reſembling that of juniper, and afterwards they extract from them a thick, fat ſubſtance, like wax, ſerving them for the making unguents and plaſters, and alſo for the making their candles.

CARVAGE, *carvagium*, the ſame with CARRUCAGE.

Henry III. is ſaid to have taken *carvage*, that is, two marks of ſilver of every knight's fee, towards the marriage of his ſiſter Iſabella to the emperor.

Carvage could only be impoſed on the tenants *in capite*.

CARVAGE alſo denotes a privilege whereby a man is exempted from the ſervice of *carrucage*.

CARUCATARIUS, in *Ancient Law Books*, he that held land in SOCCAGE, or by plough tenure.

CARUCATE. See CARRUCATE.

CARVER, a cutter of figures or other devices in wood. See CARVING.

Carvers anſwer to what the Romans called *ſculptores*, who were different from *cælatores*, or engravers, as theſe laſt wrought in metal.

CARVER is alſo an officer of the table, whoſe buſineſs is to cut up the meat, and diſtribute it to the gueſts.

The word is formed from the Latin *carptor*, which ſignifies the ſame. The Romans alſo called him *carpus*, ſometimes *ſciſſor*, *ſcindendi magiſter*, and *ſtructor*.

In the great families at Rome, the *carver* was an office of ſome figure. There were maſters to teach them the art regularly, by means of figures of animals cut in wood. The Greeks alſo had their *carvers*, called διατροι, q. d. *deribitores*, or *diſtributors*. In the primitive times, the maſter of the feaſt carved for all his gueſts. Thus in Homer, when Agamemnon's embaſſadors were entertained at Achilles's table, the hero himſelf carved the meat. Of later times, the ſame office on ſolemn occaſions was executed by ſome of the chief men of Sparta. Some derive the cuſtom of diſtributing to every gueſt his portion, from thoſe early ages when the Greeks firſt left off feeding on acorns, and learned the uſe of corn. The new diet was ſo great a delicacy, that to prevent the gueſts from quarrelling about it, it was found neceſſary to make a fair diſtribution. Athen. Deipn. lib. i. cap. 10. Potter. Arch. lib. iv. cap. 10.

CARVING, in a general ſenſe, the art or act of cutting or faſhioning a hard body by means of ſome ſharp inſtrument, eſpecially a chiſſel.

In which ſenſe, *carving* includes ſtatuary and engraving, as well as cutting in wood.

CARVING, in a more particular ſenſe, is the art of engraving or cutting figures in wood.

In this ſenſe, *carving*, according to Pliny, is prior both to ſtatuary and painting. See CUTTING *in wood*.

CARVIST, in *Falconry*. See FALCON.

CARUM, in *Botany*. See CARAWAY.

CARUNCULA, CARUNCLE, a term in *Anatomy*, properly ſignifying a little piece of fleſh, being a diminutive of the Latin *caro*, *fleſh*.

The name *caruncula* is applied to ſeveral parts of the body; as,

CARUNCULÆ *cuticulares alæ*, a name which ſome anatomiſts give the NYMPHÆ.

CARUNCULÆ *lachrymales*, are two little eminences, one in each great canthus, or corner of the EYE; ſeparating the two *puncta lachrymalia*.

Some reſtrain the appellation *lachrymalis* to the *caruncula* in the greater, or inner canthus; calling that in the leſſer canthus *innominata*.

Some have given the name *caruncula* to that pendant fleſhy part, called UVULA, or *columella*.

CARUNCULA is alſo applied to certain fleſhy morſels preternaturally contained in divers parts and humours of the body. We ſometimes meet with capillary *caruncles* excreted with the urine. See TRICHIASIS.

To the head of *carunculæ* alſo belong thoſe fleſhy excreſcences called *polypuſes*. See POLYPUS.

CARUNCULÆ *myrtiformes*, in *Anatomy*, are four little *caruncles*, or fleſhy knobs, about the ſize of myrtle-berries, whence their name; found adjoining to, or rather in the place of the HYMEN, in the parts of generation in women.

Some ſuppoſe them to be largeſt in maids, and to grow leſs and leſs by the uſe of venery; but others, with more probability, make them the conſequences of venery in the firſt copulation; deriving them from the broken membrane of the *hymen*, whoſe fragments ſhrunk up they appear to be.

CARUNCULÆ *papillares*, or *mamillares*, are little protuberances in the inſide of the *pelvis* of the KIDNEYS, made by the extremities of the tubes which bring the ſerum from the glands in the exterior parts, to the *pelvis*.

They were firſt diſcovered by Carpus; and thus called, from their reſembling a little teat or pap. They are in form of acorns heads, and are leſs red than the fleſh, as well as harder than the ſame. They are about the bigneſs of a pea, but larger at top than at bottom; ending, as it were, in a point, in the place where they are perforated to let the urine fall into the *pelvis*.

Carunculæ Urethræ. See Bougie and *Medicinal* Candles.

CARUS, Καρος, in *Medicine*, a ſpecies of lethargic diſeaſe, conſiſting in a profound ſleep, with a ſudden deprivation of ſenſation and motion, and an acute fever.

The *carus* differs from a coma in this, that the patient, in the latter, anſwers when interrogated; but not in the former; from a lethargy it is diſtinguiſhed by the fever which attends it, which the lethargy is free from; and by the return of ſenſation, which the lethargic perſon finds when agitated or pricked: from a proper apoplexy, by the freedom of reſpiration, which is always hurt in an apoplexy: from an epilepſy, in that there is no motion or froth at the mouth in the *carus*: from a ſyncope, by the pulſe, which is high, and the face ruddy; whereas the pulſe is low, and the face cadaverous, in the ſyncope: from an hyſteric ſuffocation, in that the patient hears and remembers things in the latter, not in the former.

CARYATES, in *Antiquity*, a feſtival in honour of Diana, ſurnamed Caryatis, held at Caryum, a city of Laconia. The chief ceremony was a certain dance, ſaid to have been invented by Caſtor and Pollux, and performed by the virgins of the place.

During Xerxes's invaſion, the Laconians not daring to appear and celebrate the cuſtomary ſolemnity, to prevent incurring the anger of the goddeſs by ſuch an intermiſſion, the neighbouring ſwains are ſaid to have aſſembled and ſung paſtorals, or *bucoliſmi*, which is ſaid to have been the origin of bucolic poetry.

CARYATIDES, or Cariates, in *Architecture*, a kind of order of columns, or pilaſters, under the figure of women, dreſſed in long robes, ſerving to ſupport entablatures. See *Tab. Archit. fig.* 38.

The origin of the *Caryatides* is related by Vitruvius: the Greeks, he obſerves, having taken the city *Carya*, led away their women captives; and to perpetuate their ſervitude, repreſented them in their buildings as charged with burdens, ſuch as thoſe ſupported by columns.

Though this *falſe* order, as many call it, differs from the general ſimplicity and plainneſs of the ancients, it is, nevertheleſs, introduced in many of their buildings: the temple of Erictheus, at Athens, affords a beautiful inſtance.

The *Caryatides*, M. le Clerc obſerves, are not now repreſented as among the ancients, viz. as ſymbols of ſlavery, with hands tied before and behind; thoſe characters being ſuppoſed to be injurious to the fair ſex. Among us, they are repreſented as images of juſtice, prudence, temperance, &c. Their legs are always to be cloſe to each other, and even acroſs; their arms are laid flat to the body, or to the head, or at leaſt as little ſpread as poſſible; that as they do the office of columns, they muſt have, as near as poſſible, the figure thereof. Sometimes their arms are cut off, for the greater delicacy; as in the hall of the Swiſs guards in the Louvre: but M. le Clerc does not approve ſuch mutilations.

When inſulated, they ſhould never have any great weight to ſupport; and their entablature and pedeſtal are ordinarily to be Ionic.—When they join to a wall, &c. it is adviſeable to put a conſole over them, which may appear to ſuſtain the weight of their entablature; otherwiſe, as they repreſent women, they do not ſeem ſo proper to ſuſtain great loads.—When they are made in form of angels, the ſame author would have them ſupport the entablature, which in that caſe is to be Corinthian, with their hands.

The ancients made the *Caryatides* frequently to ſupport baſkets, or corbels of flowers; and theſe they called canephoræ, or *ciſtiferæ*.

CARYOCATACTES, in *Zoology*, the name of a bird of the magpie kind, of a browniſh colour, all over beautifully variegated with white triangular ſpots, and very full of white feathers about the anus and origin of the tail. It is common in the mountainous parts of Germany.

CARYOCOSTYNUM, in *Pharmacy*, a kind of purging electary, the two principal ingredients of which, that give the denomination to the whole, are cloves, and coſtus. It works briſkly, and fetches the humours from the moſt remote parts; whence, and by reaſon of its warmth, it is preſcribed againſt rheumatic, arthritic, hydropic, paralytic, &c. diſorders.

CARYOPHYLLATA, *avens*, in *Botany*. See Herb *Bennet*.

CARYOPHYLLEOUS, in *Botany*, a term uſed by Mr. Tournefort to expreſs a ſort of flowers of the pink kind, or reſembling the pink-flowers in ſhape. Theſe are compoſed of ſeveral petals diſpoſed in an orbicular form, and ariſe from the bottom of the cup as from a ſort of tube. See *Tab.* VI. *of Botany*.

CARYOPHYLLON *Plinii*, the fruit of the *caſſia caryophyl'ata*, or cloveberry-tree, whoſe bark is uſed in medicine.

CARYOPHYLLUS, the pink.

Caryophyllus *aromaticus*, in *Botany*, the *clove-ſpice*. See Clove-*tree*.

Caryophyllus *marinus*, a name given by Dr. Woodward to a foſſile *mycetites*, or coralloide body found in ſeveral parts of Germany.

CARYOTA, in *Botany*, the name of a genus of plants deſcribed by the author of the Hortus Malabaricus, under the name of *ſchunda-pana*, and belonging to the *palmæ* of Linnæus. The characters are theſe: it produces male and female flowers in the ſame ear; the male flowers have for their cup the whole compound ſpatha; the flower is divided into three parts, and the petals are very ſmall and ſharp-pointed; the germen of the piſtil is roundiſh, the ſtyle is pointed, and the ſtigma ſimple; the fruit is a roundiſh berry, containing only one cell, in which are contained two large and oblong ſeeds, which are cylindric or rounded on one ſide, and flatted on the other.

CARYSTIUM *linum*. See Linum *caryſtium*.

Carystium *marmor*. See Marmor.

CARYUS, in the *Materia Medica*, a name given by Dioſcorides, and ſome other of the ancient Greeks, to the *eryngium*, or ſea-holly, called by us *eryngo*. It was thus named from its having a ſmall head or cluſter of flowers like a walnut. See Eryngium.

CASA, in *Ancient* and *Middle Age Writers*, is uſed to denote a cottage or houſe.

Casa *Santa*, denotes the chapel of the Holy Virgin at Loretto.

The *Santa Caſa* is properly the houſe, or rather chamber, in which the Bleſſed Virgin is ſaid to have been born, where ſhe was betrothed to her ſpouſe Joſeph, where the angel ſaluted her, the Holy Ghoſt overſhadowed her, and, by conſequence, where the Son of God was conceived, or incarnated.

Of this building the catholics tell many wonderful ſtories, too childiſh to tranſcribe.

The *Santa Caſa*, or holy chamber, conſiſts of one room, forty-four ſpans long, eighteen broad, and twenty-three high. Over the chimney, in a niche, ſtands the image called the great *Madona*, or Lady, four feet high, made of cedar, and, as they ſay, wrought by St. Luke, who was a carver as well as a phyſician. The mantle or robe ſhe has on, is covered with innumerable jewels of ineſtimable value. She has a crown, given her by Lewis XIII. of France, and a little crown for her ſon.

CASCABLE, the knob or button of metal behind the breech of a cannon, as a ſort of handle whereby to elevate and direct the piece: to which ſome add the fillet and ogees as far as the baſe-ring. See *Tab. Gunnery, fig.* 1.

The neck of the *caſcable* is the part which joins it to the breech-mouldings; its diameter is $\frac{1}{4}$ of a calibre; that of the button ſomething more than a calibre. The length of the *caſcable* is always two calibres and a quarter. They are made of various figures, ſometimes like a bunch of grapes, or like the heads of different kinds of animals. The French diſtinguiſh their calibres by the different forms of their *caſcables*; in England they are made with a button and a few breech-mouldings.

CASCADE, a ſteep fall of water, from a higher into a lower place.

The word is French, formed of the Italian *caſcata*, which ſignifies the ſame; of *caſcare, to fall*; and that from the Latin *cadere*.

Caſcades are either natural, as that of Tivoli, &c. or artificial, as thoſe of Verſailles, &c. and either falling with a gentle deſcent, as thoſe of the Sceaux; in form of a buffet, as at Trianon; or down ſteps, in form of a perron, as at St. Clou; or from baſon to baſon, &c.

A natural *caſcade*, falling with a great noiſe, is more properly called a cataract.

CASCANS, or Cascanes, in *Fortification*, are holes and cavities in form of wells, made in the terreplein, near a rampart; from whence a gallery, dug in like manner, under ground, is conveyed, to give air to the enemies mine.

CASCARILLA, a name by which ſome authors have called the Jeſuit's bark: the *quinquina* or *china-china* of other writers.

CASE, ſometimes denotes a veſſel or receptacle in form of a tomb, commonly decorated with gold and ſilver, wherein the body of a ſaint, or ſome relics of it, are preſerved.

In which ſenſe, the word is formed from the French *chaſſe*.

Originally theſe *caſes* were made in the figure of little Gothic churches, purſuant to that ancient Chriſtian maxim, that the ſaints having been the living temple of the Holy Ghoſt, are entitled, after their death, to have their bones encloſed in the figure of the viſible houſe of God.

The *caſe* of St. Genevieve is never brought down without great ceremony, nor except in time of extreme public dangers or calamities.

Case, in *Grammar*, is underſtood of the different inflexions or terminations of nouns; ſerving to expreſs the different ſtates or relations they bear to each other, and to the things they repreſent. For the reaſon of the name, ſee Declension.

There is a great diverſity among grammarians, with regard to the nature and number of *caſes:* they generally find ſix *caſes* even in moſt of the modern languages, which they call the *Nominative*, *Genitive*, *Dative*, *Accuſative*, *Vocative*, and *Ablative:* but this ſeems only in compliance with their own ideas, which are formed on the Greek or Latin, and which they transfer to other languages.

The truth is, if, by *caſe*, be only meant an occaſional change in the termination of a noun, or name, which ſeems to be the juſt idea of *caſe*; there will, in this ſenſe, be juſt as many *caſes* as there are different terminations of nouns in the ſame number, i. e. in ſome languages more, in others leſs, and in others none at all.

Indeed, the generality of authors either have not any preciſe notion of *caſes* at all, or they wander ſtrangely from that notion: for they always reckon five *caſes* of nouns in the Greek, and ſix in the Latin: though ſeveral of theſe *caſes* be frequently alike, as the genitive and dative ſingular, of the firſt declenſion of the Latin; the dative and ablative plural of the ſecond, &c. the genitive and dative dual of the Greek, &c. So that the termination is not the ſole criterion of the *caſe*.

It ſeems, however, much more agreeable to the principles of grammar, which only conſiders words materially, to make as many different *caſes*, as there are changes in the terminations of a name; which would free the Engliſh, and other modern tongues, from the embarraſſment of *caſes*; moſt of them expreſſing the various relations, not by changes in termination, as the ancients; but by the ſituation of the ſubſtantive, as in the nominative and accuſative caſes, or by the appoſition of articles and prepoſitions. On this footing it is certainly wrong to ſay, v. g. that *of a father*, is the genitive *caſe* of father; and *to a father*, the dative; for *of* and *to* are no part of the noun *father*; they are no cloſes or terminations, but articles or modificatives, which ſhew the different relation of the word *father*. And the ſame may be ſaid of the *caſes* of nouns, in the French, Italian, Spaniſh, Portugueſe tongues, &c. Nevertheleſs, the relation of poſſeſſion, which anſwers to the genitive *caſe*, is often expreſſed by a different termination of the ſubſtantive: as "God's grace," or, as it was formerly written, "Godis grace," the grace of God. So that the Engliſh ſubſtantives may be conſidered as having two terminations for *caſes*; that of the nominative, and that of the genitive or poſſeſſive *caſe*. In this reſpect it bears ſome reſemblance to the German, which is probably derived from the ſame Teutonic original.

But it is otherwiſe in the Greek name πατρὸς, or the Latin *patris*; which are real *caſes* of the words πατὴρ, and *pater*, and different from thoſe words: and ſomewhat like this may be ſaid of the Hebrew, Arabic, Armenian, Poliſh, and German languages; which in the ſame number admit of changes, in the terminations of words: and yet in theſe languages, *caſes* are different from what they are in the Greek and Latin. The Hebrew names, for inſtance, are not properly declined by *caſes:* the relation expreſſed by the genitive *caſe*, it is true, occaſions an alteration in them; but then this alteration, inſtead of being in the noun governed, as in the Latin, in the Hebrew is in that which governs; as דְּבַר שֶׁקֶר, *verbum falſitatis*; where the change is not in שֶׁקֶר, *falſitas*, but in דְּבַר for דָּבָר, *verbum.*

It muſt be obſerved, however, that though many of the languages have not properly any *caſes* of nouns; yet moſt, if not all of them, have a kind of *caſes* in their pronouns, without which it would be hard to conceive the connexion, or ſyntax, of a diſcourſe; and which, therefore, make a neceſſary part of grammar: thus, in Engliſh, *I* and *me*; and in French, *Je* and *moi*. See the relations expreſſed by each *caſe*, under its proper head, Nominative, Genitive, Dative, &c.

Case, in *Printing*, a large, flat, oblong frame, placed aſlope, divided into ſeveral compartments, or little ſquare cells; in each of which are lodged a number of types, or letters of the ſame kind; whence the compoſitor takes them out, each as he needs it, to compoſe, and make a page, or form.

A frame of *caſes*, in printing, uſually conſiſts of two pair, viz. an upper and lower, Roman and Italic. A ſhallow *caſe* ſhews the letter beſt, as being leaſt ſhadowed by the ſides of the boxes. A deep *caſe* has the advantage of holding a great number of letters, ſo that the compoſitor need not diſtribute ſo often.

They ſay, *a caſe*, or rather *pair of caſes*, of Greek, of Hebrew, of Pica, &c.

Case of a ſilk-worm, is a lodge framed within its web, wherein to depoſit its *ova*.

Case is alſo uſed for a certain numerous quantity of divers things: a *caſe* of piſtols implies a brace; a *caſe* of glaſs, &c. ſee Glass.

Case is alſo uſed for a frame ſurrounding a door, window, or the like. In which ſenſe we ſay a door-*caſe*, window-*caſe*, &c.

Case, *action upon the*, in *Law*. See Action.

Case, *ſpecial*, in *Law*, relates to a kind of ſpecial verdict, in which the jury generally find a verdict for the plaintiff, but ſubject nevertheleſs to the opinion of the judge or the court above, on a *ſpecial caſe* ſtated by the counſel on both ſides with regard to a matter of law.

Case *ſtated out of Chancery*, reſpects a queſtion of law in the proceſs of any cauſe referred by this court to the opinion of the judges of the court of King's Bench; before whom it is heard, and who certify their opinion to the chancellor in order to a decree.

CASE-HARDENING, a method of preparing iron, ſo as to render its outer ſurface hard, and capable of reſiſting the file, or any edged tool. It is uſed by file-cutters for coarſe files; by gun-ſmiths, to harden the barrels of guns; and by others, on other occaſions.

The proceſs of *caſe-hardening*, which is no other than a ſuperficial converſion of iron into ſteel, depends on the cementation of it with vegetable or animal coals. See Hardening and Steel.

CASE-SHOT, are muſquet-balls, ſtones, old pieces of iron, or the like, put up into caſes, and ſo ſhot out of great guns.

Caſe-ſhot is chiefly uſed at ſea, to clear the enemies decks when they are full of men.

CASEI *di cavallo*, the name of a peculiar cheeſe, famous in Italy and many other places, and made of the milk of the female buffalo, that ſpecies being as commonly tamed and kept there as the ox and heifer with us.

CASEMATE, or Casement, in *Architecture*, the ſame with *cavetto*, denotes a hollow moulding, which ſome architects make one ſixth of a circle, and others one fourth.

Casemate, or Cazemate, in *Fortification*. See Cazemate.

CASEMENT, is uſed in building for a little moveable window uſually within a larger, being made to open or turn on hinges. We ſay, a ſingle *caſement*; a folding *caſement*; a *caſement* with a lock, with a turn-about or turn-buckle; a *caſement* with a cock-ſpur or pull-back at the hind-ſide, wherewith to draw it to.

CASEOUS, ſomething that partakes of the nature or qualities of cheese.

Milk conſiſts of a *caſeous*, a butyrous, and a ſerous part.

Wax, according to ſome naturaliſts, is formed of the *caſeous* parts of the juices of plants, ſeparated by the bees from the ſerous parts, which make the honey. Phil. Tranſ. Nº 224. p. 368.

Cataracts are by ſome divided into milky, and *caſeous*, differing only in the degree of hardneſs or conſiſtence.

Konig gives a caſe of a *caſeous* empyema.

CASERNS, or Cazerns, in *Fortification*, little rooms, or huts, erected between the ramparts, and the houſes of fortified towns, or even on the ramparts themſelves: to ſerve as lodgings for the ſoldiers of the garriſon, to eaſe the garriſon.

There are uſually two beds in each *caſern*, for ſix ſoldiers to lie, who mount the guard alternately; the third part being always on duty.

CASES *reſerved*, in the *Romiſh Polity*, are conſiderable ſins, the abſolution of which is *reſerved* by the ſuperiors to themſelves, or their vicars.

There are ſome *caſes reſerved* by the pope, and others by the biſhops: in convents ſome are *reſerved* by the chapter, &c. None but theſe, or their vicars, can abſolve in ſuch *caſes*; except at the article of death, when all *reſerved caſes* are abſolvable, by the ordinary.

CASH, in *Commerce*, the ſtock or ready money, which a merchant, or other perſon, has in his preſent diſpoſal, to negotiate; ſo called from the French term, *caiſſe*, i. e. *cheſt*, or *coffer*, for the keeping of money.

M. Savary ſhews, that the management of the *caſh* of a company, is the moſt conſiderable article; and that whereon its good or ill ſucceſs chiefly depends.

Cash-*book*. See Book.

CASHEW-*Nut*. See Acajou and Anacardium.

CASHIER, the *caſh-keeper*; he who is charged with the receiving and paying the debts of a ſociety.

In the generality of foundations, the *caſhier* is called *treaſurer*.

CASHIERS *of the Bank*, are officers who ſign the notes that are iſſued out, examine and mark them when returned for payment, &c.

CASHOO, a medicinal and aromatic drug, which is reckoned among perfumes. All that has yet been aſſerted about the origin and compoſition of this drug, is entirely fabulous. What follows will ſufficiently acquaint phyſicians, apothecaries, and druggiſts with what they ought to know of it. *Caſhoo* is extracted from a tree which is called *catee* in the country where it grows, which is a province of Indoſtan called Behar, the capital of which is Patna. This province, which is croſſed by the famous river Ganges, lies a hundred leagues above the kingdom of Bengal. *Caſhoo* is properly an extract made by a decoction and maceration of the ſeveral parts of this tree, and rendered ſolid by evaporation. There are two ſorts of ſimple *caſhoo*, the rough, and the purified or refined; the latter is a compoſition of purified *caſhoo*, mixed with aromatic drugs, and made into lozenges. This *caſhoo* is made for the uſe of the Indians, who chew it either alone, or mixed with pinang or areca. Rough *caſhoo* is a commodity which is brought down the Ganges as far as Bengal; whence it is diſtributed throughout the Indies, where there is a great conſumption of it; and to the Europeans, who ſend it into Europe. What is ſent into Europe, however, is moſtly purified; for *caſhoo* is not uſed rough any where.

Caſhoo is much valued in medicine: among other effects aſcribed to it, is the ſtopping a cough, and ſtrengthening the ſtomach; beſide which it ſweetens the breath, when being reduced to an impalpable powder, mixed with ambergriſe, and mucilages of gum adragant, it is made into paſtils. *Caſhoo* muſt be choſen of a tanned red on the outſide, of a bright red within, very ſhining, and not burnt. Kœmpfer obſerves, that they prepare at Odowara perfumed *caſhoo*, of which they make pills, ſmall idols, flowers, and other figures, which they put into little boxes for ſale. The women are very fond of it, and uſe a great deal of it, becauſe it faſtens the teeth, &c. The thickened juice is carried to Japan, by the Dutch and Chineſe; and after it has been prepared at Macao, or at Odowara, they buy it again, and carry it to other places.

CASI, in the *Perſian Policy*, one of the two judges under the nadab, who decide all religious matters, grant all divorces, and are preſent at all public acts; having deputies in all cities of the kingdom.

CASIA, in *Botany*, the name of a genus of plants, of which there are two ſpecies: 1. The Montpelier poetic *caſia*, called the berry-bearing ſhrub oſyris. See Poet's *caſia*. 2. The tall myrtle-leaved Spaniſh *caſia*.

CASING, among *Hunters*, denotes the ſtripping off the ſkin of a hare, fox, or badger. They ſay, *flay* a deer, *caſe* a hare, and all ſorts of vermin. This is done by beginning at the ſnout or noſe of the beaſt, and ſo turning his ſkin over his ears down to the body, and the very tail.

Casing *of Timber-work*, is the plaſtering a wooden houſe all over on the outſide with mortar, and ſtriking it, yet wet, by a ruler, with the corner of a trowel, or the like inſtrument, to make it reſemble the joints of free-ſtone; by which means, the whole houſe appears as if built thereof. It is beſt done on heart-laths, becauſe the mortar is apt to decay the ſap-laths in a ſhort time. It is commonly laid on at two thickneſſes, the ſecond before the firſt is dry.

CASINGS, a country word for cow-dung dried, and uſed as fewel.

CASK, a piece of defenſive armour, wherewith to cover the head, and neck; otherwiſe called *helmet*, and *head-piece*. The word is French, *caſque*, formed from *caſſicum*, or *caſſicus*, a diminutive of *caſſis*, *a helmet*.

Le Gendre obſerves, that anciently, in France, the *gens d'armes* all wore *caſks*. The king wore a *caſk* gilt; the dukes and counts, ſilvered; gentlemen of extraction wore them of poliſhed ſteel; and the reſt of plain iron.

The *caſk* is frequently ſeen on ancient medals; where we may obſerve great varieties in the form and faſhion thereof; as the Greek faſhion, the Roman faſhion, &c.

F. Joubert makes it the moſt ancient of all coverings of the head, as well as the moſt univerſal: kings, emperors, and even gods themſelves, are figured therewith. That which covers the head of Rome, has uſually two wings, like thoſe of Mercury: and that of ſome kings is furniſhed with horns, like thoſe of Jupiter Ammon; and ſometimes barely bulls or rams horns, to expreſs uncommon force.

Cask, in *Heraldry*, the ſame with helmet.

Cask is alſo uſed as a common name for vessels of divers kinds; in contradiſtinction from the liquor, or other matter contained therein.

Thus a hogſhead of ſpirits, &c. is ſaid to weigh 4 C. ½ and 22 *lb.* *caſk* and liquor; a puncheon, 6 C. ¼ and 2 *lb.* *caſk* and liquor. See Tun, &c.

Cask *of Sugar*, is a barrel of that commodity, containing from eight to eleven hundred weight.—A *caſk* of almonds is about three hundred weight.

No one ſhall tranſport any wine *caſk*, &c. except for victualling ſhips, under a certain penalty, by 35 Eliz.

CASKET, in a general ſenſe, a little coffer, or cabinet.

Caskets, in *Sea-Language*, are ſmall ropes made of ſinnet, and faſtened to gromets, or little rings upon the yards; their uſe is to make faſt the ſail to the yard when it is to be furled.

Caskets, *breaſt*, are the longeſt and higheſt of theſe, or thoſe in the midſt of the yard, betwixt the ties.

CASLEU, in the *Hebrew Chronology*. See Cisleu.

CASPARGUS, in *Ichthyology*, a name given by Salvian, from Ælian, to the fiſh commonly called by authors, *ſparus*, and by the Italians, *ſparo*. It is diſtinguiſhed by Artedi by the name of the plain yellowiſh sparus, with a large annular ſpot near the tail.

CASQUE, in *Natural Hiſtory*, a name given to a kind of murex, called the helmet-ſhell. There are ſeveral ſpecies of this ſhell, and they all approach ſomewhat to a triangular figure, and are ſmoother than the other murexes; yet they have all a ſort of tubercles near the lip.

CASSADA, or **Cassava**, *Jatropha*, in *Botany*, a genus of the *monaecia monadelphia* claſs. Its characters are theſe: it hath male and female flowers on the ſame plant; the male flowers are ſalver-ſhaped, of one petal, whoſe brim is cut into five roundiſh ſegments which ſpread open: they have ten awl-ſhaped ſtamina, five alternately ſhorter than the other. The female flowers which are ſituated in the ſame umbrel, have five petals ſpreading open like a roſe: in the centre is a roundiſh germen with three deep furrows, which afterward becomes a roundiſh capſule with three cells, each containing one ſeed. There are eight ſpecies.

All theſe plants are natives of the warm parts of America, ſo are too tender to thrive in the open air in England. The firſt ſort is cultivated in the Weſt Indies for food; where it is propagated by cutting the ſtalks into lengths of ſeven or eight inches, which take root when planted.

They plant this ſhrub in new grounds deſigned for cacao walks, not only becauſe they are abſolutely neceſſary for a planter as food for his negroes; but alſo to prevent the growing of weeds, and to ſhade the young cacao plants as they come up, which would not otherwiſe be able to bear the exceſſive heat of the ſun: for which reaſon they delay planting the cacao nuts until the *caſſada* ſhrub be grown high enough to ſhade them.

They generally take up the *caſſada* roots within a year or thereabout after planting: at the foot of every ſhrub are found ſeveral roots, of a fleſhy ſubſtance, without any ſenſible fibres. They waſh theſe roots well in water, and having ſcraped them as we do carrots, they raſp them with large copper raſps. The raſpings are afterward put into a bag made of coarſe cloth or ruſhes, and placed under a preſs, to expreſs all the moiſture, which is hurtful to animals, and even poiſonous: they then dry the remaining matter over the fire, and when it is ſufficiently dreſſed, they make it into cakes, which being dried either in the ſun, or by artificial heat, are the *caſſada* bread; which is very nouriſhing, and will keep without moulding, as well as biſcuit.

The uſe of it is apt to contract the throat, if eaten dry, and ſometimes brings on a danger of choaking; the beſt method is to moiſten it in broth, or otherwiſe, before it is eaten, or elſe to have a bottle of water at hand to waſh down every mouthful.

The juice expreſſed in preparing this root for bread, will kill any animal that drinks it crude; but it may be boiled over the fire till a great part is evaporated, and the remainder, if it be far evaporated, will be ſweet, and ſerve in the place of honey; if leſs evaporated, and ſet by to ferment, it will make a very good and wholeſome vinegar. The juice of the roucou or annotto is ſaid to be a counter-poiſon for it.

The thicker cakes of *caſſada* bread are eaten by the poorer ſort: the thinner, called *ſciam*, are eaten by the rich. There is a kind of it which may be eaten raw, and which is now getting into uſe; inſtead of the other, which is a ſpeedy poiſon, if eaten with its juice.

CASSAMUNAIR, or **Cassumuniar**, in *Medicine*, an aromatic vegetable drug, brought from the Eaſt Indies, highly valued as a nervine and ſtomachic, and reputed a ſpecific in epileptic and convulſive diſeaſes. It is ſuppoſed by ſome to be a ſpecies of galangal, by others of zedoary: its true name is not known, that of *caſſamunair* being apparently feigned to hide it: of late it has been imported by the name of *bengalle*.

CASSANDRA, in *Natural Hiſtory*, a name given by ſeveral authors to a very elegant ſea-ſhell of the *concha globoſa*, or *dolium* kind, more uſually known under the name of the LYRA, or harp-ſhell. It is ſuppoſed to be called *caſſandra*, becauſe of its being found on the ſhores of the iſland of Caſſan. There are three ſpecies of it.

CASSAON, in *Zoology*, the name of a ſmall fiſh of the ſhark kind, but leſs miſchievous, called CUCURI by the Braſilians.

CASSATION, in the *Civil Law*, the act of abrogating, or annulling any act or procedure.

The word comes from the Latin *quaſſare, to quaſh*, or *ſhake down*.

The occaſions of *caſſation* are, 1ſt, When a decree is directly contrary to another decree; and both againſt the ſame party. 2dly, When decrees are directly contrary to the expreſs deciſion of ſtatutes, or cuſtoms. 3dly, When the formalities preſcribed by the laws have not been obſerved.

CASSETTES, or COFFINS, in the *Manufacture of China Ware*, are utenſils made of Stourbridge or other good potter's clay with a third of ſand, in which the China ware is baked. They are generally made of a round form, with a flat bottom. They are either turned or formed in a mould. See PORCELAIN.

CASSIA, *wild ſenna*, in *Medicine* and *Pharmacy*, a purgative fruit, brought from the Eaſt, being the produce of a tree of the ſame name, called in Engliſh the *pudding-pipe-tree*.

This is ſometimes more particularly denominated *caſſia fiſtularis*, κασσια συριγξ, by way of diſtinction from another drug called *caſſia lignea*.

It is a genus of the *decandria monogynia* claſs. Its characters are theſe: the flower hath five roundiſh concave petals, which ſpread open; it hath ten declining ſtamina, of which three of the lower are long, and three upper ſhorter; the ſummits of the three lower are large, arched, beaked, and ſeparated at their points. In the centre is ſituated a long taper germen, which afterward becomes a long pod, divided by tranſverſe partitions, each containing one or two roundiſh ſeeds, faſtened to the margin of the upper valve. Miller enumerates ſixteen ſpecies.

There are four kinds of *caſſia*, alike in properties, and nearly in figure; being all in long black pods: but very different, if conſidered with regard to the trees that produce them. Theſe are, the *caſſia* of the Levant, that of Egypt, that of Braſil, and that of the Antilles iſlands.

CASSIA *of the Levant*, is the fruit of a very high tree, whoſe bark is aſh-coloured, its wood very firm, and its grain cloſe; towards the centre, its wood is of an ebony black, towards the circumference yellowiſh: its flowers are yellowiſh, and produce a fruit in form of a long pod, rounded and maſſive; of a reddiſh colour, bordering on black. When ripe, it is full of a black, ſweetiſh pulp, divided by little woody cells: in this pulp are found little hard grains, in manner of ſtones, ſhaped like hearts, which are the ſeeds of the tree. This *caſſia* muſt be choſen new, in large pods, heavy, and of a tan colour; the bark, when broken, fine and white within, full of a black ſoft pulp of a ſweetiſh taſte.

CASSIA *of Egypt*, is like that of the Levant, except that the tree is higher, and the leaves narrower; the fruit ſmaller, and the bark ſofter.

CASSIA *of Braſil*, is the largeſt of all: ſome of the pods are found four or five inches in circumference. This kind is not very common in the ſhops.

CASSIA *of the Iſlands*, is that now chiefly uſed; though heretofore the popular *caſſia* was the Levantine. It is ſent from the Antilles; where it is produced in ſuch abundance, that the veſſels, in their home voyages, uſe it as ballaſt; whence it is, that we find it ſo often foul and dirty: the tree that yields it reſembles a peach-tree. Its flowers, which are yellow, grow in cluſters; and, as they decay, leave behind them a fruit or pod an inch thick, and a foot (ſometimes two) long. The fruit, while in its growth, is green; when ripe, it becomes of a dark violet colour. It is choſen in the ſame manner as that of the Levant.

When the pod is entire, and the pulp not yet taken out, it is moſt properly called *caſſia fiſtularis*, or *caſſia in the cane*. For uſe, the pulp is taken out, and driven through a hair ſieve. The apothecaries have little of the better kind, but what is old, and boiled up with ſugar, to make it keep.

Caſſia, when green, as alſo the flowers of the *caſſia*-tree, are candied in the Levant, and the iſlands; and have almoſt the ſame effects with the common *caſſia*, which is the baſis of moſt of the purgative electaries.

CASSIA, *the tincture of*, is a ſlight infuſion of the pulp with the ſeed.

CASSIA, *the extract of*, is nothing but the pulp ſeparated from the ſhell and the ſeeds; with the addition of a certain quantity of ſugar, to preſerve it from turning ſour. Officinal preparations from *caſſia*, are, the *caſſia extracta cum vel ſine foliis ſenæ*; and the *diacaſſia cum manna*: it is alſo a principal ingredient in the lenitive electary.

CASSIA *Caryophyllata*. See CLOVE-*Tree*.

CASSIA *Lignea*, or XYLOCASSIA, is the bark of a tree much like that which bears the cinnamon; growing promiſcuouſly with it in the iſland of Ceylon: but more properly the cinnamon of Sumatra, Java, and Malabar. Phil. Tranſ. vol. xlvii. p. 301.

The ancients had two kinds of this bark; the κασσία σύριγξ, and the other the *xylocaſia*. But they were only the names of the ſame thing collected in a different manner: however, they are applied by the moderns to different ſubſtances.

The two barks are gathered and dried in the ſame manner; in ſmell and taſte are nearly alike; they are equally ſweet, poignant, and agreeable; and their colour, form, and thickneſs ſcarce differ at all. But the *caſſia* is the fatter, and more mucilaginous; and in chewing diſſolves in the mouth, without leaving any thing woody behind; whereas the woody part of cinnamon ſtill remains, though ever ſo well chewed.—Some authors will have the tree which bears cinnamon bear the *caſſia* too; and make the only difference between them to conſiſt in this, that the firſt comes from Ceylon, and the latter from the coaſt of Coromandel. Of this opinion is Mr. White, who maintains that the difference in their produce is merely the effect of culture, and of the different manner of curing the plant. Phil. Tranſ. vol. l. part ii. N° 116. See CINNAMON.

CASSIA *ſtake*, in the *Glaſs Trade*, is that iron with a piece of wood placed on it, on which they lay the glaſs after they have taken it off the pipes, and on which they turn the glaſs, to faſten the pontee to it.

CASSIANI, a ſect in *Civil Law*, who adhered to the ſyſtem and interpretations of Caſſius, a celebrated lawyer, in oppoſition to thoſe of Proculus, whoſe adherents were denominated *Proculiani*.

CASSIANISM, from *Caſſian*, a teacher in Gaul to thoſe who were called Semipelagians towards the cloſe of the fifth century, is ſometimes uſed for SEMIPELAGIANISM.

CASSIDA, in *Botany*. See SKULL-*cap*.

CASSIDA, in *Zoology*, the name given by Dr. Hill to a genus of BEETLES, called in Engliſh the tortoiſe-beetles, but comprehended by Linnæus under the order of *coleoptera*, in the claſs of inſects. See SCARABÆUS.

Under this genus are comprehended all the clypeated beetles, or thoſe covered with a hard cruſt; of which there are a great many ſpecies.

CASSIDARIUS, in the *Ancient Armories*, he who had the care and cuſtody of the *caſſides*, or helmets.

Spon gives an ancient inſcription found at Rome, on a tomb erected to a *caſſidarius* of the emperor Domitian.

CASSIDONY, a name given by the Italians and Germans to a ſort of beads made of the yellow and red chalcedony, a very beautiful ſtone, or of an agate ſomething reſembling it in colour. They alſo call the ſtones themſelves by this name; but are by no means determinate in the meaning of the word, not reſtraining it to any one peculiar ſpecies.

CASSIDONY, *Stæchas*, in *Botany*; Tourn. Inſt. R. H. 201. tab. 95. Its characters are theſe: the flower has an oval permanent empalement, whoſe brim has ſome obſcure indentures; it is of the lip kind, having a cylindrical tube longer than the empalement, whoſe brim ſpreads open. The upper lip is large, bifid, and open; the under cut into three roundiſh, almoſt equal ſegments. It has four ſtamina within the tube, which are turned aſide, two of them ſhorter than the other, terminated by ſmall ſummits; and a quadrifid germen ſupporting a ſlender ſtyle the length of the tube, crowned by an obtuſe indented ſtigma. The germen turns to four almoſt oval ſeeds, which ripen in the empalement. To which the following notes muſt be added: the flowers are ranged in ſeveral ſeries, and the ſpikes terminated by tufts of leaves. There are three ſpecies. See *Tab*. V. *of Botany*, *Claſs* 4.

Linnæus has joined this genus to *lavendula* or LAVENDER. The flowers of the *ſtæchas* are much uſed in medicine, in diſeaſes of the head and nerves, eſpecially in ſuch as are ſuppoſed to ariſe from cold cauſes. They alſo promote the evacuation by urine, and by the menſes; and in ſome places are eſteemed one of the greateſt antidotes, and given in large doſes againſt the effect of poiſons, and the bites of venomous animals. Meſue, and the Arabians in general, ſpeak of it as a purge, and particularly as good in caſes where phlegm was to be evacuated; though they ſay it did this but ſlowly and weakly. At preſent, we do not acknowlege any purging quality in it. There is a very fragrant oil drawn from the flowers and tops of this plant, in the ſame manner as that from lavender; but it is not much in uſe with us. The flowers are an ingredient in the Venice treacle, mithridate, and ſome other of the officinal compoſitions.

It is to be obſerved that there is another plant, called *ſtæchas*, in the ſhops; and by the writers on the materia medica, this has the epithet *citrina*, for its diſtinction from the *ſtæchas* we have been treating of, which is either called *ſtæchas* without any addition, or *ſtæchas Arabica*. The *citrine ſtæchas* has none of the virtues of this kind, nor is it of the ſame genus of plants, but of the ELICHRYSUM kind.

The ſeveral ſpecies of *ſtæchas* are propagated by ſowing the ſeeds in March, in a bed of dry light earth; when the young plants are about three inches high, they muſt be removed into other beds, and placed at about ſix inches diſtance, watering and ſhading them till they have taken root. They muſt after this be kept clear from weeds, and ſheltered from the ſeverity of the winter by mats, or a light covering of peas, haulm, or other ſuch matter; and in March, or the beginning of April, they may be removed into the places where they are to remain. The poorer the ſoil is, in which they are planted, the better they will ſtand the winter, and the more fragrant will be their flowers. They may be propagated by cuttings planted in ſpring, but the ſeeds ripening very well with us, the raiſing them from thoſe is the much better way.

CASSIDONY, *mountain.* See CUDWEED.

CASSILI, in *Natural Hiſtory*, a name given by the inhabitants of the Philippine iſlands to a ſpecies of water-raven, called alſo *colocolo*.

CASSINE, in the *Military Language*, is a farm-houſe, where a number of ſoldiers have poſted themſelves, in order to make a ſtand againſt the approaches of an enemy.

CASSIOBURY-*buſh*, *Caſſine*, in *Botany*, a genus of the *pentandria trigynia* claſs. Its characters are theſe: the flower hath but one petal, which is cut into five obtuſe ſegments: it hath five ſtamina, which ſpread from each other; and a conical germen, which afterward becomes an umbilicated berry with three cells, each containing a ſingle ſeed. There are two ſpecies.

In South Carolina, it is called *caſſena*, or South ſea thea. The inhabitants of that country do not make ſo great uſe of this tea, as thoſe of Virginia and North Carolina; in the laſt of which the white people have it in as great eſteem as the Indians, and make as conſtant uſe of it.

CASSIOPEA, in *Aſtronomy*, one of the conſtellations of the northern hemiſphere, ſituate next to Cepheus.

In 1572, there appeared a new ſtar in this conſtellation, which at firſt ſurpaſſed in magnitude and brightneſs Jupiter himſelf; but it diminiſhed by degrees, and at laſt diſappeared, at the end of eighteen months. It alarmed all the aſtronomers of that age, many of whom wrote diſſertations on it; among the reſt Tycho Brahe, Kepler, Maurolycus, Lycetus, Gramineus, &c. Beza, the landgrave of Heſſe, Roſa, &c. wrote to prove it a comet, and the ſame which appeared to the Magi, at the birth of Jeſus Chriſt, and that it came to declare his ſecond coming: they were anſwered on this ſubject by Tycho.

The ſtars in the conſtellation *Caſſiopea*, in Ptolemy's Catalogue, are thirteen; in Hevelius's, thirty-ſeven; in Tycho's, forty-ſix; but in the Britannic Catalogue, Mr. Flamſtead makes them fifty-five. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude.			Magnitude.
			°	′	″	°	′	″	
	e	♈	21	6	45	56	46	0 N	6
			21	29	16	56	26	10	7
			23	5	5	54	38	32	6

55.									

CASSIS, in *Antiquity*, a plated, or metalline helmet, different from the *galea*, which was of leather.

CASSIS *lævis*, the *ſmooth helmet-ſhell*, a name given by Rumphius, though very improperly, to the genus of ſhells called *dolia* and *conchæ globoſæ*. Theſe have no alliance at all with the helmet-ſhells; and what makes the name ſtill worſe, is, that *caſſis* itſelf is not a generical name, though uſually ſo underſtood, all the *caſſides* or helmet-ſhells being only a peculiar kind of MUREX, as the figure of their mouths, and their rudiments of ſpines or protuberances evidently ſhew.

CASSITERIA, in *Natural Hiſtory*, the name of a genus of cryſtals. The word is derived from κασσιτερος, *tin*; and expreſſes cryſtals which are influenced in their figures by an admixture of the particles of that metal. See *Tab. of Foſſils, Claſs* 3.

Theſe are all pyramidal, without columns, and compoſed only of four ſides or planes. Of this genus there are only two known ſpecies.

CASSOCK, a kind of ſurtout, or long upper garment, worn over the reſt of the habit; particularly by the clergy, and anciently likewiſe by the laity.

The word comes from the French *caſaque*, *a horſeman's coat*: ſome derive them again, by corruption, from a garment of the Coſſacks: others derive the name *caſſock*, as well as the thing, from the ancient *caracalla*, a ſort of upper garment which hung to the heels.

CASSONADE, in *Commerce*, caſk ſugar, or ſugar put into caſks or cheſts, after the firſt purification, but which has not been refined. It is ſold either in powder or in lumps; the whiteſt, and that of which the lumps are largeſt, is the beſt. Many imagine it to ſweeten more than loaf ſugar; but it is certain that it yields a great deal more ſcum.

CASSOWARY, in *Ornithology*, the name of an African bird of the oſtrich kind, but not quite ſo tall, though larger bodied; called alſo by many authors *emeu*, *eme*, or *ema*, and *caſoarius*. It has a crown on the middle of its head; and its head and neck are almoſt naked, having only a few hairs, which are ſet ſtraggling; the ſkin is of a purpliſh blue, but toward the bottom of the neck, on the hinder part, it is a little reddiſh. At the bottom of the neck, there are alſo two fleſhy protuberances which hang over the breaſt; its mouth opens very wide; its legs are very long and very robuſt; it has three toes on each foot, all placed before; it has the rudiments of wings, but they are very ſhort, and have only five quills each, which are almoſt naked. It has no tail; its body is large, and is thinly covered with browniſh feathers, which have more the appearance of briſtles, than of real feathers, to a ſlight obſerver. It is very common in Africa, and is caught alſo in many parts of the Eaſt Indies. It feeds on fleſh or vegetables, and is eaſily made tame. See *Tab. of Birds*, N° 20.

CASSUMUNAR, in the *Materia Medica*, a root approaching to the nature of zedoary, though belonging to a different ſpecies of plants.

We have it from the Eaſt Indies; its ſurface is ſomewhat wrinkled, and is marked at certain diſtances with circular rings, which ſurround it, and riſe prominent above the reſt of the ſurface. It is of a very compact nature, hard and heavy; not eaſily cut through with a knife, or powdered in a mortar. When cut, it ſhews a very ſmooth and ſhining ſurface; and when broken, is found to be much yellower within.

It has a fragrant, aromatic ſmell; and is a very famous medicine in nervous caſes, being accounted an excellent cardiac and ſudorific. It is alſo given as a ſtomachic and carminative with ſucceſs, and is moſtly preſcribed in powder, boluſſes, or infuſions.

CASSYTA, in *Botany*, a genus of the *enneandria monogynia* claſs. The corolla is in the form of a calyx, divided into ſix ſegments: the nectarium is compoſed of three truncated glands encompaſſing the germen: the interior filaments are glandular: and the drupe contains a ſingle ſeed. There is one ſpecies.

CAST is particularly uſed to denote a figure, or ſmall ſtatue of BRONZE.

CAST, among *Wax-Chandlers*, denotes a ladleful of melted wax, poured on the wicks of candles made by the ladle.

CAST, among *Founders*, is applied to tubes of wax, fitted in divers parts of a mould of the ſame matter, by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before poſſeſſed.

CAST, among *Bowlers*. See BOWLING.

CAST alſo denotes a cylindrical piece of braſs, or copper, ſlit in two, lengthwiſe, uſed by the founders in ſand to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be caſt.

CAST, among *Plumbers*, denotes a little brazen funnel, at one end of a mould, for caſting pipes without ſoldering, by means of which the melted metal is poured into the mould.

CAST *of the country*, with *Miners*, the colour of the earth.

CAST, in *Falconry*, denotes a ſet or couple of hawks.

To *caſt* a hawk to the perch, ſignifies to ſet her upon it.

CAST, or CASTE, in ſpeaking of the Eaſtern affairs, denotes a tribe, or number of families, of the ſame rank and profeſſion.

The diviſion of a nation into *caſts* chiefly obtains in the empire of the Great Mogul, kingdom of Bengal, iſland of Ceylon, and the great peninſula of India oppoſite thereto. In each of theſe, there are, according to father Martin, four principal *caſts*; viz. the *caſt* of the *bramins*, which is the firſt and moſt noble; the *caſt* of the *rajas*, or princes, who pretend to be deſcended from divers royal families; the *caſt* of the *choutres*, which comprehends all the artificers; and that of the *parias*, the loweſt and moſt contemptible of all: though Henry Lord, it muſt be obſerved, divides the Indians about Surat into four *caſts*, ſomewhat differently from Martin; viz. into BRAMINS, or prieſts; *cuttery*, or ſoldiers; *ſoudery*, which we call banians, or merchants; and *wyſe*, the mechanics, or artificers.

Every art and trade is confined to its proper *caſt*, nor is allowed to be exerciſed by any but thoſe whoſe fathers profeſſed the ſame. So that a taylor's ſon can never riſe to be a painter, nor a painter's ſon fall to be a taylor Though there are ſome employments which are common to all the *caſts*: e. g. every body may be a ſoldier or a merchant. There are alſo divers *caſts* which are allowed to till the ground, but not all.

CASTAGNOLE, in *Ichthyology*, a name given by the Italians to the fiſh called by the generality of authors CHROMIS, and reduced by Artedi to the genus of the SPARUS: he diſtinguiſhes it by the name of the ſparus with the ſecond ray of each belly-fin carried out into a great length.

CASTALDUS. }
CASTALDY. } See GASTALDUS.

CASTALOGNE, or CASTELOGNE, a coverlid made of fine wool, on the weaver's loom.

CASTANEA. See CHESTNUT.

CASTARON, a name given by the old Arabian writers to the ſerrata, or SAW-*wort*.

CASTANETS, CASTAGNETTES, or CASTANETTAS, a kind of muſical inſtrument, wherewith the Moors, Spaniards, and Bohemians, accompany their dances, ſarabands, and guittars. It conſiſts of two little round pieces of wood dried, and hollowed in manner of a ſpoon, the concavities whereof are placed on one another, faſtened to the thumb, and beat from time to time with the middle finger, to direct their motion and cadences. The *caſtanets* may be beat eight or nine times in the ſpace of one meaſure, or ſecond of a minute.

CASTELLAIN, *Caſtellanus*, the lord, owner, or captain of a caſtle; and ſometimes the conſtable of a fortified houſe. Bract. lib. v. tract. 2. c. 16. 3 Edw. I. c. 7. It has likewiſe been taken for him that hath the cuſtody of one of the king's manſion-houſes, called by the Lombards *curtes*, in Engliſh courts; though they are not caſtles or places of defence. 2 Inſt. 31. And Manwood, in his Foreſt Laws, ſays there is an officer of the foreſt called *caſtellanus*.

CASTELLAN, the name of a dignity or office in Poland. The *caſtellans* are ſenators of the kingdom, but ſenators of the lower claſs; and in diets ſit on low ſeats behind the palatines, or great ſenators. They are a kind of lieutenants of provinces, and command a part of a palatinate under the PALATINE.

CASTELLANY, the diſtrict or extent of land under the juriſdiction of a lord caſtellian.

The province of Flanders is divided into ſo many *caſtellanies*, each of which bears the name of the capital; as the *caſtellany* of Liſle, of Ypres, of Ghent, &c. The court of *caſtellany* was anciently compoſed of the caſtellan, a fiſcal, procurator, notary, regiſter, &c.

In Poland, a *caſtellany* is a petty government under the adminiſtration of a CASTELLAN.

CASTELLARIUS, the keeper, or curator, of a caſtellum. Gruter gives an ancient ſepulchral inſcription in memory of a *caſtellarius*.

CASTELLATION, *Caſtellatio*, in *Middle Age Writers*, the act of building a caſtle, or of fortifying a houſe, and rendering it a CASTLE.

By the ancient Engliſh laws, *caſtellation* was prohibited, without the king's eſpecial licence. Du-Cange.

CASTELLORUM *operatio*, caſtle work, or ſervice and labour done by inferior tenants for the building and upholding of caſtles of defence; toward which ſome gave perſonal aſſiſtance, and others paid their contributions. This was one of the three neceſſary charges, to which all lands among our Saxon anceſtors were expreſsly ſubject.

CASTIGATION, *Caſtigatio*, among the Romans, the puniſhment of an offender by blows, or beating, with a wand or ſwitch.

Caſtigation was chiefly a military puniſhment, the power of inflicting which on the ſoldiery was given to the tribunes. Some make it of two kinds; one with a ſtick or cane, called *fuſtigatio*; the other with rods, called *flagellatio*: the latter was moſt diſhonourable.

CASTIGATIONS, in a *Literary Senſe*, denote corrections, or emendations of the text of an ancient writer.

CASTIGATORY. See CUCKING-*ſtool*.

CASTILLAN, a gold coin, current in Spain, valued at fourteen rials and a half.

CASTILLAN alſo denotes a weight uſed by the Spaniards in the weighing of gold, containing the hundredth part of a Spaniſh pound. It is alſo uſed at Buenos Ayres, and the mines of Chili and Potoſi.

CASTING is ſometimes uſed for the quitting, laying, or throwing aſide any thing; thus, deer *caſt* their horns, ſnakes their ſkins, lobſters their ſhells, hawks their feathers, &c. annually.

CASTING *of feathers*, is more properly called *moulting* or *mewing*.

A horſe *caſts* his hair or coat, at leaſt once a year, viz. in the ſpring, when he *caſts* his winter-coat; and ſometimes at the cloſe of autumn, he *caſts* his ſummer-coat, in caſe he hath been ill kept.

Horſes ſometimes alſo *caſt* their hoofs, which happens frequently to coach-horſes brought from Holland; which being bred in a moiſt, marſhy country, have their hoofs too flabby; ſo that coming into a drier ſoil, and leſs juicy provender, their hoofs fall off, and others, that are firmer, ſucceed.

Casting is alſo uſed for overthrowing.

In which ſenſe we ſay, to *caſt* a horſe, an ox, or the like.

Casting is alſo uſed for diſtributing or diſpoſing the parts of a thing to the beſt advantage.

The *caſting* of a building is more properly called **COMPARTITION**.

Theatrical writers ſpeak of *caſting* a play, i. e. diſpoſing the ſeveral parts or characters to proper actors.

Casting *of candles*, ſignifies filling the moulds with tallow.

Casting *a colt* or *foal*, denotes the abortion of a mare.

Casting *of drapery*, among *Painters*, a free, eaſy, negligent way of cloathing a figure.

Casting, in *Falconry*, is any thing given an hawk to purge and cleanſe his gorge.

Of theſe there are two kinds, viz. plumage, i. e. feathers; and cotton: the latter whereof is generally in pellets about the bigneſs of hazel-nuts, made of ſoft fine cotton, and conveyed into her gorge after ſupper. In the morning ſhe will have *caſt* them out; at which time they are to be obſerved, and from the colour and condition they are found in, the ſtate of her body is conjectured. If they be *caſt* out round, white, and not ſtinking, nor very moiſt, it is an indication all is well; if otherwiſe, particularly if black, green, ſlimy, or the like, ſhe is diſtempered. The *caſting* of plumage is obſerved after the ſame manner as that of cotton.

Casting *a figure*, among *Aſtrologers*, the erecting a celeſtial theme, and dividing the heavens into houſes.

Casting, in *Foundery*, is the running of a melted metal into a mould prepared for that purpoſe.

Casting *of gold, ſilver*, or *copper*, in plates. See **Coining**.

Casting, in *Joinery*, &c. Wood is ſaid to be *caſt* or warped, when, either by its drought or moiſture, or the drought or moiſture of the air, or other accident, it ſhoots or ſhrinks; in prejudice to its flatneſs or ſtraitneſs.

Casting *of lead on cloth*, is the uſing a frame or mould covered with woollen cloth and linen over it, to caſt the lead into very fine ſheets.

Casting *of lead on ſand*, is done by means of a large frame or trough nearly full of ſand, which is made perfectly level, and imprinted with any device from moulds preſſed down in the ſand: the lead is then turned out of the kettle into a receiver or trough, and poured on the ſand, whilſt two perſons ſlide a gauge or lath, of ſuch thickneſs as to leave a ſpace between it and the ſand anſwering to the ſubſtance of the lead, along the edges of the frame; the ſurplus runs into reſervoirs by channels made in the ſand.

The goldſmiths uſe the bone of the **cuttle**-*fiſh*, to mould and caſt their leſſer works of gold and ſilver; that bone, when dried, being reducible to a kind of a fine pumice, very ſuſceptible of all impreſſions.

Casting *in ſtuc* or *plaiſter*, is the filling with fine liquid plaiſter, a mould that had been taken in pieces from off a ſtatue or other piece of ſculpture, and run together again. There are two things to be obſerved with regard to the mould: the firſt, that it be well ſoaked with oil before the plaiſter be run, to prevent its ſticking: the ſecond, that each piece whereof it conſiſts, have a packthread, to draw it off the more eaſily when the work is dry.

Casting *of metals, of letters, bells, figures, &c.* See **Foundery**.

Casting, in *Navigation*, denotes the motion of falling off, ſo as to bring the direction of the wind on either ſide of the ſhip, after it had blown for ſome time right a-head.

Casting-*net*, a ſort of fiſhing-net, ſo called becauſe it is to be *caſt* or thrown out, which when exactly done, nothing eſcapes it, but weeds, and every thing within its extent, is brought away.

Casting *a point of traverſe*, among *Seamen*, ſignifies the pricking down on a chart the point of the compaſs any place bears from you; or finding what point of the compaſs the ſhip bears at any inſtant, or what way the ſhip has made.

Casting *of timber-work*. See **Casing**.

CASTLE, *Caſtellum*, in *Ancient Writers*, denotes a town or village ſurrounded with a ditch and wall, furniſhed with towers at intervals, and guarded by a body of troops.

The word is originally Latin, *caſtellum*, a diminutive of *caſtrum*.

Caſtellum originally ſeems to have ſignified a ſmaller fort, for a little garriſon. Though Suetonius uſes the word where the fortification was large enough to contain a cohort.

The *caſtella*, according to Vegetius, were often like towns, built in the borders of the empire, and where there were conſtant guards, and fences againſt the enemy.

Horſley takes them for much the ſame with what were otherwiſe denominated ſtations.

Castle, or **Castle**-*ſteed*, is alſo an appellation given by the country people in the North to the Roman *caſtella*, as diſtinguiſhed from the *caſtra ſtativa*, which they uſually call *cheſters*. Horſley repreſents this as an uſeful criterion, whereby to diſcover, or diſtinguiſh, a Roman camp or ſtation.

Castle, in a modern ſenſe, is a place fortified by nature, or art, either in a city or country, to keep the people in their duty, or to reſiſt an enemy.

A *caſtle* is a ſort of little **citadel**.

Castle, in *Sea Language*, denotes an elevation on the deck of a veſſel; or a part of the deck, fore and aft, raiſed above the reſt.

Fore-**Castle**, *Caſtello di prora*, &c. See **Fore**-*caſtle*.

Hind-**Castle**, *Caſtello di poppa*. See **Poop**.

Castle-Ward, or **Castle-Guard**, *Caſtelgardum*, or *Wardum Caſtri*, an impoſition laid on ſuch as dwell within a certain compaſs about any *caſtle*, towards the maintenance of thoſe who watch and ward the *caſtle*.

The word is ſometimes alſo uſed for the circuit itſelf, inhabited by ſuch as are ſubject to this ſervice.

Castle, *Water*, a piece of hydraulic work finiſhed with one or more fronts of building, with ſeeming windows and the like, containing a reſervoir which gives play to caſcades, &c.

Or, a *water-caſtle* may be defined a receptacle of the public water furniſhed by an **aquæduct**, or otherwiſe, in which are incloſed the cocks of ſeveral water-pipes with a little baſon; contrived to diſtribute and ſend it to different parts.

The *caſtella* of the ancient aquæducts are ſtill viſible at Rome, though half ruined. They are lined with a durable kind of cement, which, according to Pliny, ſurpaſſes in hardneſs the ſtones themſelves. It is made of lime ſlacked in wine, and beaten up with hog's greaſe, and the juice of figs or pitch.

Modern writers on hydraulics treat of the laws of the efflux of water out of *caſtella* into pipes, canals, &c.

Signior Poleni has a treatiſe expreſs on *caſtles*, or reſervoirs, whereby the waters of rivers are derived, the ſides of which *caſtles* are made converging.

CASTOR, in *Zoology*. See **Beaver**.

Castor-*ſkin*. See **Beaver**, &c.

Castor, in *Aſtronomy*, a moiety of the conſtellation **Gemini**; called alſo **Apollo**.

Its latitude northwards, for the year 1700, according to Hevelius, was 10° 4′ 23″; and its longitude, of Cancer, 16° 4′ 14″.

It is alſo called *Raſalgenze, Apollo, Aphellan, Avellar*, and *Anelar*.

Castor *and Pollux*, in *Meteorology*, a fiery meteor, which at ſea appears ſometimes ſticking to a part of the ſhip, in form of one, two, or even three or four fire-balls: when one is ſeen alone, it is more properly called *Helena*; two are denominated *Caſtor and Pollux*, and ſometimes *Tyndaridæ*.

Caſtor and Pollux are called by the Spaniards, *San Elmo*; by the French, *St. Elme, St. Nicholas, St. Clare, St. Helena*; by the Italians, *Hermo*; by the Dutch, *Vree Vuuren*.

Caſtor and Pollux are commonly judged to portend a ceſſation of the ſtorm, and a future calm; being rarely ſeen till the tempeſt is nigh ſpent. *Helena* alone portends ill, and witneſſes the ſevereſt part of the ſtorm yet behind.

When the meteor ſticks to the maſts, yards, &c. they conclude, from the air's not having motion enough to diſſipate this flame, that a profound calm is at hand; if it flutter about, it indicates a ſtorm.

Castor *oil*, in *Pharmacy*. See **Palma** *Chriſti*.

This oil is the product of the **Ricinus** *Americanus fructu racemoſo hiſpido* of Sir Hans Sloane; or of the **Palma** *Chriſti* of Du-Tertre, Frezier, and Labat. It is variouſly prepared in the Weſt Indies. It is drawn from the ſhrub in the manner in which we make birch wine; it is prepared by expreſſion, which is the preferable method; as oils of all kinds have their acrimony heightened by the action of fire. At other times the ſeeds are collected ripe, when moſt replete with this pinguecous juice, cleanſed from the huſks, bruiſed in a mortar, and beat into a paſte. They are then boiled with a ſufficient quantity of water, when the oil riſes to the ſurface, and is ſkimmed off whilſt any continues to appear.

It ſeems particularly adapted for the common complaints of infant children, and the cure of bilious diſorders; and certainly is by all accounts a very valuable medicine. It was known to Dioſcorides and Pliny, who gave it the name of *oleum cicinum*; the Arabs call it *oleum de therva.* Dr. Fraſer has given an account of its preparation and virtues, confirmed by a letter of the Rev. Mr. Monod of Guadaloupe to Dr. Maty, in the Lond. Medic. Obſerv. &c. vol. ii. p. 235.

Dr. Canvane has publiſhed a Diſſertation on *Caſtor Oil*, its hiſtory and virtues, and ſtrongly recommended it in all bilious, calculous, and nephritic diſorders. The doſe for adults is from two to three or four ſpoonfuls, in two ſpoonfuls of pepper-mint water, or the *tinct. ſtomachica* of the London Diſpenſatory. It may be made into a *potio alba* by mixing two or three ſpoonfuls with a ſufficient quantity of the yolk of eggs, to incorporate it thoroughly, and then adding two ounces of ſimple, and two or three drams of compound pepper-mint water. It may be given to children mixed with honey; and it acts ſo mildly, that new-born infants may take it in about a tea-ſpoonful for a doſe.

There is a paper on the effects of *caſtor oil* and the Peruvian bark in the hooping-cough, in the Lond. Med. Obſ. &c. vol. iii. p. 281.

CASTOREA, in *Botany*, the name given by Plumier to a genus of plants ſince called by Linnæus DURANTA.

CASTOREUM, or Castorium, in *Pharmacy*, a medicinal matter incloſed in bags or purſes, near the anus of the caſtor, or beaver; falſely taken for the teſticles of that animal. See Beaver.

The bags in which the *caſtoreum* is contained, are about the bigneſs of a gooſe egg, and found indifferently in males and females; the liquor incloſed ſerves to give the caſtor an appetite, being preſſed out of its receptacles, on occaſion, by the foot: when taken off, the matter dries and condenſes, ſo that it may be reduced to a powder; by hanging in the chimney it ſoon becomes of the conſiſtence of wax. It is oily, of a ſharp, bitter taſte, and a ſtrong diſagreeable ſmell. It is uſed to fortify the head and nervous parts: it raiſes the languiſhing ſpirits, reſiſts poiſons, and provokes the menſes in women. It is uſed in lethargies, apoplexies, vertigos, tremblings, ſuffocations of women, and on other occaſions. Bartholine, and other authors, aſcribe to it a wonderful property of precipitating things to the bottom of the water.

For the choice of *caſtoreum*, the beſt is that of Ruſſia; that of Canada is much inferior; the largeſt bags, and thoſe that ſmell ſtrongeſt, are the moſt eſteemed, eſpecially when heavy, and well fleſhed. Care is to be taken, that it has not been adulterated with honey, or other drugs, to increaſe its weight, which is known by ſqueezing it; the ſophiſticated being ſoftiſh, and yielding a liquid, ſtinking honey; and the natural, hard and heavy, of a briſk ſmell, and full of filaments.

Caſtoreum is uſed in the compoſition of Venice treacle and mithridate, beſide various other hyſteric and cephalic medicines. They draw an oil from it, called *oil of caſtor*; and it is alſo uſed abroad while in its liquid ſtate, to make ſeveral kinds of unguents.

The Ruſſian way of curing *caſtoreum* is deſcribed in the Philoſophical Tranſactions thus: "To prepare the mat-
"ter of the beaver's ſtones (the bags it ſhould be), boil
"a proper quantity of water, with half a ſhovel full of
"wood-aſhes, tie the bags in couples, and put them in
"the boiling water for half a quarter of an hour. Lay
"birch-bark on the fire, and ſmoke the bags well over
"it for an hour, till they be well dried; hang them up
"for a week or more, till perfectly dry and hard; they
"may then be packed up for uſe or exportation."

CASTRAMETATION, the art, or act of encamping, i. e. of placing and diſpoſing an army in camp. See Camp.

The word is more uſed in ſpeaking of the encampments of the ancients, than thoſe of the moderns. It comes from the Latin *caſtrum, camp*, and *metari, to meaſure*, or *lay out*.

CASTRATING *a book*, among *Bookſellers*, is the taking out ſome leaf, ſheet, or the like, which renders it imperfect, and unfit for ſale. The word is alſo applied to the taking away particular paſſages, on account of their obſcenity, too great freedom with reſpect to government, &c.

Castrating is alſo uſed among *Gardeners*, in ſpeaking of melons and cucumbers; where it ſignifies the ſame with PRUNING or PINCHING of other plants.

CASTRATION, in *Chirurgery*, the operation of gelding, i. e. of cutting off the teſticles, and putting a male animal out of a capacity of generation.

Caſtration is much in uſe in Aſia, eſpecially among the Turks, who practiſe it on their ſlaves, to prevent any commerce with their women. The Turks often make a general amputation.

Caſtration alſo obtains in Italy, where it is uſed with a view to preſerve the voice for ſinging. See Eunuch, and Conservatorios.

The Perſians, and other Eaſtern nations, have divers methods of making eunuchs, different from thoſe which obtain in Europe: we ſay, of making eunuchs, for it is not always done among them by cutting, or even colliſion. Cicuta and other poiſonous herbs do the ſame office, as is ſhewn by Paulus Ægineta. Thoſe eunuchiſed in this manner are called *thlibiæ*. Beſides which there is another ſort named *thlaſiæ*, in whom the genitals are left entire, and only the veins which ſhould feed them are cut; by which means the parts do indeed remain, but ſo lax and weak, as to be of no uſe.

Caſtration was for ſome time the puniſhment of ADULTERY.

By the laws of the Viſigoths, ſodomites underwent the ſame puniſhment.

By the civil law, it is made penal in phyſicians and ſurgeons to *caſtrate*, even with conſent of the party, who is himſelf included in the ſame penalty, and his effects forfeited. The offence of mayhem by *caſtration* is, according to all our old writers, felony; though committed upon the higheſt provocation. See a record to this purpoſe of Henry III. tranſcribed by Sir Edward Coke, 3 Inſt. 62. or Blackſtone's Com. vol. iv. p. 206.

Caſtration is ſometimes found neceſſary on medicinal conſiderations, as in mortifications, and ſome other diſeaſes of the teſticles, eſpecially the *ſarcocele* and *varicocele*. Some have alſo uſed it in maniac caſes.

Castration is alſo in ſome ſort practiſed on women. Athenæus mentions, that king Andramytes was the firſt who *caſtrated* women. Heſychius and Suidas ſay Gyges did the ſame thing. Galen obſerves, that women cannot be *caſtrated* without danger of life: and Dalechampius, on the forementioned paſſage of Athenæus, holds, that it is only to be underſtood of ſimple padlocking.

Castration, in reſpect of brutes, is called GELDING, and SPAYING. See alſo Fish.

Castration is alſo uſed by ſome phyſicians for correcting the more violent medicines, eſpecially purgatives. See Correction and Correctors.

Castration alſo denotes the art of retrenching, or cutting away any part of a thing from its whole.

CASTREL, a kind of HAWK reſembling the lanner in ſhape, but the hobby in ſize. The *caſtrel*, called alſo *keſtrel*, is of a ſlow and cowardly kind; her game is the growſe, though ſhe will kill a partridge. See Falconry.

CASTRENSIANI, or Castrenses, in *Antiquity*, an order of ſervants in the Greek emperor's houſhold, to whom belonged the care and ſervice of what related to his table, and clothing. They were thus called either on account of their attending the emperor, when in camp, or becauſe they obſerved a ſort of camp-diſcipline in the court; or rather becauſe they were conſidered as ſoldiers, were paid as ſuch, and had the privileges belonging to the military body. The *caſtrenſiani* were alſo called *caſtrenſes miniſtri*, and *miniſteriani*.

To this order belonged the bakers, butlers, waiters, fullers, taſters, &c. They had a head, or ſuperior, who was called *comes caſtrenſis*, which was a palatine dignity under the chamberlain.

CASTRENSIS, in *Medicine*, an appellation given to certain contagious and epidemic diſeaſes, eſpecially fevers. See Camp-*diſeaſe*, &c.

CASTRUM *Doloris*, in *Middle Age Writers*, denotes a catafalco, or a lofty tomb of ſtate, erected in honour of ſome perſon of eminence, uſually in the church where his body is interred; and decorated with arms, emblems, lights, and the like.

Eccleſiaſtical writers ſpeak of a ceremony of conſecrating a *caſtrum doloris*; the edifice was to be made to repreſent the body of the deceaſed, and the prieſt and deacon were to take their poſts, and ſay the prayers after the ſame manner as if the corpſe were actually preſent.

CASTS may be taken very well from medals on calces of lead melted with ſulphur, which form a blackiſh maſs, conſiderably more tough than ſulphur alone. See an account of the proceſs for making this matter, &c. in Lewis's Commerc. Phil. Techn. p. 354. See *Impreſſions of* Medals.

CASU *Conſimili*, in *Law*, a writ of entry, where a tenant by courteſy, or for life, aliens in fee or in tail, or for another's life: it takes its name hence, that authority being given by ſtat. Weſt. 2. to the clerks in chancery, to make new forms, as often as any new caſe ſhould ariſe, not under any of the old forms; they framed this writ to the likeneſs of the other called *Caſu proviſo*.

Casu *Proviſo*, a writ of entry, given by the ſtatute of Gloceſter, in caſe where a tenant in dower aliens in fee, or for term of life, in tail: and lies for him in reverſion againſt the alienee.

CASUAL, ſomething that happens fortuitouſly, or without any deſign, or meaſures taken to bring it to paſs.

Casual *death*. See Deodand.

Casual *ejector*, in *Law*, a nominal deſcendant in ejectment,

ment, and who continues ſuch until appearance by or for the tenant in poſſeſſion. Blackſt. Com. vol. iii. p. 202.

CASUAL *revenues*, are thoſe which ariſe from forfeitures, confiſcations, deaths, attainders, &c.

CASUAL *theology*, a denomination given by ſome to what is more frequently called caſuiſtry. See CASUIST.

Adam Oſiander, chancellor of the univerſity of Tubingen, has publiſhed a ſyſtem of *caſual theology*, containing the ſolution of dubious queſtions, and caſes of conſcience. Theologia Cauſalis, 6 vols. 4to. Tubing. 1682.

CASUALTY, in the *Tin Mines*, a word uſed to denote the earth and ſtony matter which is, by waſhing in the ſtamping-mills, &c. ſeparated from the tin ore, before it is dried and goes to the crazing mill.

CASUIST, a perſon who profeſſes to reſolve caſes of conſcience. Eſcobar has made a collection of the opinions of all the *caſuiſts* before him.

To *caſuiſtry* belong the deciſion of all difficulties ariſing about what a man may conſcientiouſly do, or not do; what is ſin, or not ſin; what things a man is obliged to do in order to diſcharge his duty, and what he may let alone without breach of it.

M. le Feore, preceptor of Lewis XIII. called the books of the *caſuiſts* the art of quibbling with God; which does not ſeem far from the truth; by reaſon of the multitudes of diſtinctions and ſubtilties with which they abound.

CAT, in *Zoology*. See FELIS.

The *domeſtic cat* is diverſified with an almoſt infinite variety of colours and ſtreaks; but the natural colour, in a wild ſtate, is a brown tawny, variegated with ſtreaks of a pale whitiſh colour. In France the *cats* are all of a bluiſh lead colour, and in the north of Europe they are all white.

CAT, in *Sea Language*, denotes a ſhip formed on the Norwegian model, and employed in the coal-trade. It is diſtinguiſhed by a narrow ſtem, projecting quarters, a deep waiſt, and by having an ornamental figure on the prow. Theſe veſſels uſually carry from four to ſix hundred tons.

CAT, in a ſhip. See CAT-*heads*.

CAT, *ſea*. See SEA-*cat*.

CAT's *eye*, among *Naturaliſts*, a kind of precious ſtone, of a lucid texture, whoſe colours are variable, according to the poſition of the ſtone to the light.

Cat's eye is by the Latins called *oculus cati*, and ſometimes *onycopalus*, as having white zones or rings like the ONYX; and its colours variable like OPAL, from which laſt it differs chiefly by its ſuperior hardneſs.

The *cat's eye* is of a gliſtering grey, interchanged with a ſtraw colour, and anſwers the deſcription given by Pliny of the aſteria, between which and our *cat's eye* there appears no other difference than that the ancients took their denomination from the brightneſs and ſhining of the ſtone, whereas the modern name is taken from the figure of it. See ASTERIA.

CAT-*gut*, a denomination given to ſmall ſtrings for fiddles, and other inſtruments, made of the inteſtines of ſheep or lambs dried and twiſted, either ſingly, or ſeveral together.

Theſe are ſometimes coloured red, ſometimes blue, but are commonly left whitiſh or browniſh, the natural colour of the gut. They are uſed alſo by watch-makers, cutlers, turners, and other artificers. Great quantities are imported into England, and other northern countries, from Lyons and Italy.

CAT-*harpings*, are ſmall ropes running in little blocks from one ſide of the ſhrowds to the other, near the deck: their uſe is to force the ſhrowds, and make them tight, for the greater ſecurity of the maſts, and to afford room for drawing the yards in more obliquely, to trim the ſails for a ſide-wind, when they are ſaid to be cloſe hauled.

CAT-*heads*, in a ſhip, are two ſtrong ſhort beams of timber, which project almoſt horizontally over the ſhip's bows, on each ſide of the bowſprit. One end of the *cat-head* reſts on the fore-caſtle, and is bolted to the beams; the other part projects like a crane, and carries in its extremity two or three ſmall ſheaves, about which a rope called the *cat-fall* paſſes, communicating with the *cat-block*, which alſo contains three ſheaves, and is fitted with a large ſtrong hook, ſometimes called *cat-hook*, which catches the ring of the anchor when it is to be drawn up. The machine formed by this combination of pullies is called the *cat*, and ſerves to pull the anchor up to the *cat-head*, without tearing the ſhip's ſide with its flukes. The *cat-head* alſo ſerves to ſuſpend the anchor clear of the bow, when it is neceſſary to let it go.

CAT's *head* is alſo a denomination given to a ſort of waſte ſtony lumps, not inflammable, found in coal-mines. In theſe there are frequently impreſſions of ferns. Phil. Tranſ. Nº 360. p. 970.

CAT-*holes*, in a ſhip, are over the ports, as right with the capſtan as they can be: their uſe is to heave the ſhip aſtern upon occaſion, by a cable or a hawſer called ſtern-faſt.

CAT *of mountain*, the name of a beaſt of prey approaching to the leopard-kind. See CATUS *Pardus*, and CANIS.

CAT-*mint*. See CATMINT.

CAT's-*paw*, denotes a ſlight breath of wind, perceived at a diſtance in a calm, by the impreſſion made on the ſurface of the ſea, which ſoon decays.

CAT-*ſalt*, a name given by our ſalt-workers to a very beautifully granulated kind of common ſalt. It is formed out of the bittern or leach brine, which runs from the ſalt when taken out of the pan. When they draw out the common ſalt from the boiling pans, they put it into long wooden troughs, with holes bored at the bottom for the brine to drain out; under theſe troughs are placed veſſels to receive this brine, and acroſs them are placed certain ſmall ſticks, to which the *cat ſalt* affixes itſelf in very large and beautiful cryſtals. This ſalt contains ſome portion of the bitter purging ſalt, and is very ſharp and pungent, and is white when powdered, though pellucid in the maſs. It is uſed by ſome for the table, but the greateſt part of what is made of it is uſed by the makers of hard ſoap.

CAT-*ſilver*, a name given to certain foſſile ſubſtances, uſually called alſo *glimmer*, and in Latin, *micæ*. They are various ſpecies of the *bractearia*, or foliaceous talcs, in ſmall ſpangles. See MICA.

CATABAPTIST, a perſon averſe from baptiſm; particularly from that of infants.

The word is compounded of the prepoſition κατα, which, in compoſition, ſignifies *againſt*, and βαπτω, *I waſh*.

CATABASION, in the Greek *Church*, a place under the altar, wherein the relics are kept.

The word is formed from καταϐαινω, *I deſcend*; becauſe they went down into it.

CATABATHMOS, in *Antiquity*, a ſteep valley, dividing Egypt from Africa.

The word is formed from καταϐαινειν, *to deſcend*, on account of the haſtineſs and precipitation of its deſcent.

CATABIBAZON, in *Aſtronomy*, the moon's deſcending node; called alſo DRAGON'S *tail*.

CATABULENSES, in the *Middle Age*, a ſort of miniſters or ſervants of the empire, appointed to conduct the public carriage from one *catabulum*, or ſtage, to another.

The *catabulenſes* appear alſo to have had the charge of conveying the public corn to and from the mills; whence in the Theodoſian code they are joined with bakers.

CATABULUM, in the *Middle Age*, a kind of ſtable or building, wherein beaſts, eſpecially of burden and carriage, were kept for the public ſervice.

The ancient Chriſtians were ſometimes condemned to ſerve in the *catabula*, that is, to work at the cleaning of them, attending the beaſts, &c.

CATAC, in *Botany*, a name by which ſome authors call AGRIMONY.

CATACAUSTIC *curves*, in the *Higher Geometry*, the ſpecies of CAUSTIC *curves* formed by *reflexion*.

CATACHRESIS, a figure in *Rhetoric*, whereby an improper word is uſed inſtead of a proper one.

The word is formed from καταχραομαι, *abutor*, *I abuſe*; of κατα, *againſt*, or *contrary to*; and χραομαι, *I uſe*.

The *catachreſis* is, when for want of a word proper to expreſs a thought, we uſe, or rather abuſe, a word that comes ſomewhat near it: as when we call a perſon who has killed his mother, maſter, or prince, *parricide*; which word, in propriety, is only applicable to him who has murdered his father: and *vir gregis ipſe caper*, is alſo a *catachreſis*.

CATACLASIS, from κατακλαω, *I diſtort*, in *Medicine*, denotes a diſorder of the eye, wherein the eye-lid is inverted by a convulſion of the muſcles that cloſe it; called alſo *campylon*.

CATACLEIS, in *Anatomy*, a cartilaginous bone, or rather a cartilage in the juncture of the *omoplata*, or ſhoulder-blade.

CATACLYSMUS, from κατακλυζω, *I deluge*, a Greek name for a deluge, or inundation of waters.

CATACOMBS, or CATACUMBS, CATACUMBÆ, denote grottos, or ſubterraneous cavities, for the burial of the dead.

Some derive the word from the Greek κατα, and κυμϐος, a *hollow*, *cavity*, or the like.

Catacombs are alſo denominated *cryptæ*, and *cœmeteria*.

Anciently, the word *catacomb* was only underſtood of the tombs of St. Peter and St. Paul; and M. Chaſtelain obſerves, that among the more knowing of the people of Rome, the word *catacomb* is never applied to the ſubterraneous burying-places hereafter to be mentioned, but only to a chapel in St. Sebaſtian, one of the ſeven ſtational churches; where the ancient Roman calendars ſay the body of St. Peter was depoſited, under the conſulate of Tuſcus and Baſſus, in 258.

CATACOMB is more particularly uſed, in Italy, for a vaſt aſſemblage of ſubterraneous ſepulchres about Rome, chiefly at about three miles from that city in the Via Appia, ſuppoſed to be the ſepulchres of the martyrs; and which are viſited accordingly out of devotion; and reliques are taken thence, and diſperſed throughout the catholic countries, after having been firſt baptized by the pope, under the name of ſome ſaint.

Theſe *catacombs* are ſaid by many to be caves, or cells, wherein the primitive Chriſtians hid, and aſſembled themſelves together; and where they interred ſuch among them as were martyred. Each *catacomb* is three feet broad, and eight or ten high; running in form of an alley, or gallery, and communicating with others: in many places, they extend within a league of Rome. There is no maſonry or vaulting therein, but each ſupports itſelf: the two ſides, which we may look on as the parietes, or walls, were the place where the dead were depoſited; which were laid lengthwiſe, three or four rows over one another, in the ſame *catacomb*, parallel to the alley. They were commonly cloſed with large thick tyles, and ſometimes pieces of marble, cemented in a manner inimitable by the moderns. Sometimes, though very rarely, the name of ſome of the deceaſed is found on the tyle: frequently, a palm is ſeen, painted or engraven; or the cypher Xp, which is commonly read *pro Chriſto*.

Mr. Monro, in the Philoſophical Tranſactions, ſuppoſes the *catacombs* to have been originally the common ſepulchres of the firſt Romans, and dug in conſequence of theſe two opinions; that ſhades hate the light, and they love to hover about the places where the bodies are laid.

The *catacombs* of Rome have made the greateſt noiſe in the world; but there are ſuch belonging to many other cities. Biſhop Burnet deſcribes thoſe of Naples, which he ſays are without the city, and much more noble and ſpacious than thoſe of Rome. The like are alſo ſaid to be in the neighbourhood of all the great towns in that part of Italy; and others have been diſcovered at Syracuſe and Catanea in Sicily, and in the iſland of Malta.

The largeſt, and thoſe commonly ſhewn ſtrangers, are the *catacombs* of San Sebaſtiano, thoſe of St. Agneſe, and the others in the fields a little off St. Agneſe: as to the *catacombs* in the church-yards of the Vatican, women are only allowed to go into them one day in the year, viz. on Whitſun-Monday, on pain of excommunication. There are men kept conſtantly at work in the *catacombs*. As ſoon as theſe labourers diſcover a grave, with any of the ſuppoſed marks of a ſaint about it, intimation is given to the cardinal Camerlingo, who immediately ſends men of reputation to the place, where finding the palm, the monogram, the coloured glaſs, &c. the remains of the body are taken up with great reſpect, and tranſlated to Rome. After the labourers have examined a gallery, they ſtop up the entry that leads into it; ſo that moſt of them remain thus cloſed; there being only a few left open, to keep up the trade of ſhewing them to ſtrangers. This, they ſay, is done to prevent people's loſing themſelves in theſe ſubterraneous labyrinths, which has often happened: but more probably to deprive the public of the means of knowing whither and how far the *catacombs* are carried. Monro, in Phil. Tranſ. Nº 265. p. 644.

Laying up the bodies in caves, is certainly the original way of diſpoſing of the dead; and appears to have been propagated by the Phœnicians, throughout the countries to which they ſent colonies: the interring, as we now do, in the open air, or in temples, was firſt introduced by the Chriſtians. When an ancient hero died, or was killed in a foreign expedition, as his body was liable to corruption, and for that reaſon unfit to be tranſported entire, they fell on the expedient of burning, in order to bring home the aſhes, to oblige the manes to follow; that ſo his country might not be deſtitute of the benefit of his tutelage. It was thus burning ſeems to have had its original; and by degrees it became common to all who could bear the expences of it, and took place of the ancient burying: thus *catacombs* became diſuſed among the Romans, after they had borrowed the manner of burning from the Greeks; and now, none but ſlaves were laid in the ground.

Places thus prepared, might afford convenient retreats to the primitive Chriſtians; but could never be built by them. When the empire became Chriſtian, they were again diſuſed; till the reading of ſome author, who mentions them, occaſioned them to be again looked into. —As to the famed cyyher Xp, it is obſerved to have been in uſe among the ancients, long before Chriſtianity aroſe. The abbot Bencini ſays, it was compoſed of the Greek letters XP, under which ſomething myſtical was comprehended; but no author gives any account what that myſtery was.

CATACOUSTICS, from κατα and ακȣω, *I bear*, called alſo CATAPHONICS, the ſcience of reflected ſounds; or that part of acouſtics, which conſiders the properties of echoes.

CATADIOPTRICAL *teleſcope*, the ſame with reflecting TELESCOPE.

CATADROMUS, from κατα and δρεμω, *I run*, in *Antiquity*, a ſtretched ſloping rope in the theatres, down which the FUNAMBULI walked, to ſhew their ſkill.

Some have taken the word to ſignify the hippodrome, or decurſorium, wherein the Roman knights uſed to exerciſe themſelves in running and fighting on horſeback.

But the moſt natural meaning is that of a rope, faſtened at one end to the top of the theatre, and at the other to the bottom, to walk or run down, which was the higheſt glory of the ancient *ſchœnobates*, or *funambuli*. Elephants were alſo taught to run down the *catadromus*. Suetonius ſpeaks of the exploit of a Roman knight, who paſſed down the *catadromus* mounted on an elephant's back. In Ner. cap. xi. p. 5.

CATADUPA, a CATARACT, or water-fall.

The word comes from κατα, *downwards*, and δυπεω, *to make a noiſe by falling*.

The appellation *catadupa* ſeems to have been peculiarly given to a place in Æthiopia joining on Egypt, where the Nile, which here firſt aſſumes that name, ruſhed down a ſteep rock into the ſubjacent plain, with a noiſe ſo impetuous, that the inhabitants are ſaid to have loſt all ſenſe of hearing. Plin. Hiſt. Nat. lib. v. cap. 9. Ammian. Marc. lib. xxii. cap. 34, &c. Senec. Nat. Quæſt. lib. iv. cap. 2.

CATADUPI, Καταδυποι, an appellation given by the ancients to the inhabitants about the cataracts of the Nile. See CATARACT.

The *catadupi* are repreſented as all deaf; being made ſo by the continual din of the falling waters.

CATAFALCO, an Italian term, literally ſignifying *ſcaffold*. It is chiefly uſed for a decoration of architecture, ſculpture, and painting; raiſed on a timber ſcaffold, to ſhew a coffin, or tomb, in a funeral ſolemnity.

CATAGMATICS, medicines proper to ſolder, and unite broken bones; by promoting the formation of a callus.

The word comes from κατα, *againſt*, and αγνυμι, *I break*.

The principal *catagmatics*, are the Armenian bole, gum tragacanth, oſteocolla, Cyprus nuts, frankincenſe, aloes, and acacia. See CONSOLIDATION.

CATAGOGION, Καταγωγιον, a heathen feſtival at Epheſus, celebrated on the twenty-ſecond of January, in which the devotees run about the ſtreets dreſſed in divers antic and unſeemly manners, with huge cudgels in their hands, and carrying with them the images of their gods; in which guiſe they raviſhed the women they met with, abuſed, and often killed the men, and committed many other diſorders, to which the religion of the day gave a ſanction. Du-Cange.

CATAGRAPHA, Καταγραφα, in *Antiquity*, denote oblique figures, or views of men's faces; anſwering to what the moderns call PROFILES.

Catagrapha are ſaid to be the invention of Simon Cleonæus, who firſt taught painters to vary the looks of their figures, and ſometimes direct them upwards, ſometimes downwards, and ſometimes ſidewards or backwards. Plin. Hiſt. Nat. lib. xxxv. cap. 8. cum Not. Harduin.

CATALECTIC, a term in poetry.—The ancients called *catalectic verſes*, thoſe which wanted either feet or ſyllables; in oppoſition to *acatalectics*, which are complete verſes, wanting nothing.

The word comes from κατα and ληγω, *I end*.

CATALEPSIS, CATALEPSY, from καταλαμβανειν, *to occupy*, in *Medicine*, a kind of apoplexy; or a drowſy diſeaſe, wherein the patient is taken ſpeechleſs, ſenſeleſs, and fixed in the ſame poſture wherein the diſeaſe firſt ſeized him; and his eyes open, without ſeeing, or underſtanding.

Catalepſis is the ſame with what is otherwiſe denominated CATOCHE, or *catochus*, and *gelatio*, or *congelatio*.

Some alſo make it the ſame with COMA *vigil*; others will have it different; though wherein the diſtinction lies it is not eaſy to aſſign.

This diſeaſe is very rare, nor is it eaſy to aſſign its cauſe. Boerhaave takes the immediate cauſe to be an immobility of the common ſenſory, in the ſituation of the firſt acceſs; whence comes an abſolute ſtagnation of the blood in the brain, and a ceſſation of all the functions of the brain, as well as thoſe depending thereon; the muſcles alone remaining in their firſt tenſion; and reſpiration, and the pulſe, preſerved, though generally weak.

It is uſually preceded by a long intermitting fever, a melancholic dry temperature, a ſuppreſſion of the menſes, or hæmorrhoids, great frights, and intenſe, continued meditations on one object.

Upon diſſection, the arteries and veins of the cerebrum are found very turgid, and the blood cloſe rammed in them: it is ſometimes cured by copious hæmorrhages of the noſe; ſternutatories, vomitives, and veſicatories, are likewiſe applied to good purpoſe.

It ſeldom paſſes into any other diſeaſe; though ſometimes into an epilepſy, convulſions, madneſs, or atrophy; but it commonly ends in death.

In the Hiſtory of the Royal Academy of Sciences at Paris, we have an account of a woman who had a ſurpriſing *catalepſy*, her members keeping all the poſtures they were put into, as if ſhe had been made of wax. Ann. 1738.

CATALOGUE, a liſt, or enumeration of the names of ſeveral books, men, or other things; diſpoſed according to a certain order.

Catalogues of books are digeſted in different manners, ſome according to the order of the times when the books were printed, as that of Maittaire; others according to their form and ſize, as the common bookſellers *catalogues*; others according to the alphabetical order of the author's names, as Hyde's *Catalogue* of the Bodleian Library; others according to the alphabetical order of matters or ſubjects, which are called real or claſſical *catalogues*, as thoſe of Lipenius and Draudius; laſtly, others are digeſted in a mixed method, partaking of ſeveral of the former, as de Seine's *catalogue* of cardinal Sluſius's library, which is firſt divided according to the ſubjects or ſciences, and afterwards the books in each are recited alphabetically.

The moſt applauded of all *catalogues* is that of Thuanus's library, in which are united the advantages of all the reſt. It was firſt drawn up by the two Puteani in the alphabetical order, then digeſted according to the ſciences and ſubjects, by Iſhm. Bullialdus, and publiſhed by F. Queſnel at Paris in 1679; and reprinted, though incorrectly, at Hamburg, in 1704. The books are here ranged with juſtneſs under their ſeveral ſciences and ſubjects, regard being ſtill had to the nation, ſect, age, &c. of every writer. Add, that only the beſt and choiceſt books in every ſubject are found here, and the moſt valuable editions. Yet the *catalogue* of M. le Telliers, archbiſhop of Rheims' library, made by M. Clement, is not inferior to any publiſhed in our age, either on account of the number and choice of the books, or the method of its diſpoſition. One advantage peculiar to this *catalogue*, is the multitude of anonymous and pſeudonymous authors detected in it, ſcarce to be met with elſewhere. Some even prefer it to Thuanus's *catalogue*, as containing a greater variety of claſſes and books on particular ſubjects. Bibliotheca Thuanea, Par. 1679, 8vo. 2 vols. and Hamb. 1704, fol. and 8vo.

The conditions required in a *catalogue* are, that it indicate at the ſame time the order of the authors and of the matters, the form of the book, the number of volumes, the chronological order of the editions, the language it is written in, and its place in the library; ſo as that all theſe circumſtances may appear at once, in the ſhorteſt, cleareſt, and exacteſt manner poſſible. In this view, all the *catalogues* yet made will be found to be defective.

An anonymous French writer has laid down a new plan of a *catalogue*, which ſhall unite all the advantages, and avoid all the inconveniencies of the reſt. Lett. à l' Abbé ***, ſur un Nouveau Projet de Catalogue de Bibliotheque. Par. 1712.

The Jeſuits of Antwerp have given us a *catalogue* of the popes; which makes what they call their *Propylæum*.

CATALOGUE *of the ſtars*, is a liſt of the fixed ſtars, diſpoſed in their ſeveral conſtellations; with the longitudes, latitudes, &c. of each.

The firſt who undertook to reduce the fixed ſtars into a *catalogue*, was Hipparchus Rhodius, about one hundred and twenty years before Chriſt; in which he made uſe of the obſervations of Timocharis and Ariſtyllus, for about one hundred and eighty years before him. Ptolemy retained Hipparchus's *catalogue*, containing 1026 fixed ſtars; though he himſelf made abundance of obſervations, with a view to a new *catalogue*, A. D. 140. About the year of Chriſt 880, Albategni, a Syrian, brought down the ſame to his time. Anno 1437, Ulugh Beigh, king of Parthia and India, made a new *catalogue* of 1022 fixed ſtars; ſince tranſlated out of Perſian into Latin, by Dr. Hyde. The third who made a *catalogue* from his own obſervations, was Tycho Brahe; who determined the places of ſeven hundred and ſeventy-ſeven ſtars, for the year 1600, which Kepler, from other obſervations of Tycho, afterwards increaſed to the number of one thouſand, in the Rudolphine tables; adding thoſe of Ptolemy, omitted by Tycho, and of other authors, ſo that his *catalogue* amounts to above 1160. At the ſame time, William landgrave of Heſſe, with his mathematicians, Chriſtopher Rothmannus, and Juſtus Byrgius, determined the places of four hundred fixed ſtars, by his own obſervations, with their places rectified for the year 1593; which Hevelius prefers to thoſe of Tycho's. Ricciolus, in his Aſtronomia Reformata, determined the places of one hundred and one ſtars, for the year 1700, from his own obſervations: for the reſt he followed Tycho's *catalogue*; altering it where he thought fit. Anno 1667, Dr. Halley, in the iſland of St. Helena, obſerved three hundred and fifty ſouthern ſtars, not viſible in our horizon. The ſame labour was repeated by F. Noel, in 1710, who publiſhed a new *catalogue* of the ſame ſtars conſtructed for the year 1687.

Bayer, in his Uranometria, publiſhed a *catalogue* of 1160 ſtars, compiled chiefly from Ptolemy and Tycho, in which every ſtar is marked with ſome letter of the Greek alphabet; the biggeſt ſtar in any conſtellation being denoted by the firſt letter, the next by the ſecond, &c. and if the number exceeds the Greek alphabet, the remaining ſtars are marked by letters of the Roman alphabet, which letters are preſerved by Flamſtead and by Senex on his globes. The celebrated Hevelius compoſed a *catalogue* of 1888 ſtars, 1553 of which were obſerved by himſelf; and their places were computed for the year 1660.

The laſt, and greateſt, is the Britannic *catalogue*, compiled from the obſervations of the accurate Mr. Flamſtead; who for a long ſeries of years devoted himſelf wholly thereto. As there was nothing wanting either in the obſerver, or apparatus, we may look on this as a perfect work, ſo far as it goes. It is pity the impreſſion had not paſſed through his own hands: that now extant, was publiſhed by authority, but without the author's conſent: it contains 2734 ſtars. There was another publiſhed in 1725, purſuant to his teſtament; containing no leſs than 3000 ſtars, with their places rectified for the year 1689: to which is added Mr. Sharp's *catalogue* of the ſouthern ſtars not viſible in our hemiſphere, adapted to the year 1726. See vol. iii. of his Hiſtoria Cæleſtis, in which are printed the *catalogues* of Ptolemy, Ulugh Beigh, Tycho, the Prince of Heſſe, and Hevelius; together with an account of each of them in the Prolegomena.

CATALONGAY, in *Botany*, the name given by ſome authors to the plant which produces the *faba ſancti Ignatii*, or St. Ignatius's beans of the ſhops.

CATALLIS *captis nomine diſtrictionis*, in *Law*, a writ, which lies where a houſe is within a borough, for rent iſſuing out of the ſame, and warrants the taking of doors or windows by way of diſtreſs.

CATALLIS *Reddendis*, in *Law*, a writ that lies where goods, being delivered to perſons to keep till a certain day, are not on demand delivered on that day.

CATALS, *Catalla*, denotes goods or CHATTELS.

CATAMARAN, *Catimoran*, in *Sea Language*. See FLOAT.

CATAMENIA, from κατα and μην, *month*, in *Medicine*, women's monthly purgations, called alſo MENSES.

CATANADROMI, in *Ichthyography*, a term of the ſame ſignification with the more common word *anadromi*, the diſtinctive term of a ſet of fiſhes, which at times leave the freſh water for the ſalt, and afterwards return to the freſh water again. See ANADROMOUS.

CATANANCHE, in *Botany*. See *Candia* LION'*s foot*.

CATAPAN, or CATIPAN, a name the later Greeks, about the twelfth century, gave the governor of their dominions in Italy.

Ughellus and others ſay, *catapan* was the ſame with *capitaneus*; formed therefrom by metatheſis, or tranſpoſition: others derive it from κατα, *juxta*, and ϖαν, *omne*; in which ſenſe, *catapan* was a governor-general, or magiſtrate, who had the direction of all: others will have it derived from κατα ϖαντοκρατορα, that is, *next after the emperor*. In which ſenſe, *catapan* was a ſecond maſter, *ſecundus dominus*. Du-Cange derives it from κατεπανω, *captain*; which the Greeks applied to every governor, and even every man of quality.

CATAPASM, a dry medicine, compoſed of a mixture of powders to be ſprinkled on the body.

The word comes from κατα, *in*, and ϖασσω, *I ſprinkle*. There are *catapaſms* of divers kinds: ſome odoriferous, uſed in the way of perfume; others fortifying, applied to the ſtomach, heart, or head; and others eſcharotic, for eating off dead fleſh.

CATAPELTA, an inſtrument of puniſhment, in uſe among the ancients. It conſiſted of a kind of preſs, compoſed of planks, between which the criminal was cruſhed to death.

CATAPELTÆ, in *Ancient Writers*, ſometimes denote arrows, and ſometimes engines wherewith either arrows, ſtones, or even huge pieces of timber were caſt. Pliny aſcribes the invention of the *catapeltæ* to the Syrians; Plutarch and Diodorus to the Sicilians.

It is more frequently written CATAPULTA.

CATAPHORA, in a theme of the heavens, an appellation given to the houſes falling from the third, ſixth, ninth, and twelfth angles. In which ſenſe, the word ſtands oppoſed to *anaphora*.

CATAPHORA, a kind of lethargic, or drowſy diſeaſe; the ſame with what is otherwiſe called COMA. See alſo CARUS.

The word is compounded of κατα, or κατω, *downwards*, and φερω, *to bear*.

CATAPHRACTA, from κατα, and φρασσω, *I fortify*, or *arm*, in the *Ancient Military Art*, a piece of heavy defenſive armour, formed of cloth or leather, fortified with iron ſcales or links, wherewith ſometimes only the breaſt, ſometimes the whole body, and ſometimes the horſe too, was covered.

It was in ancient uſe among the Sarmatians, Perſians, and other Barbarians. The Romans alſo adopted it early for their foot; and, according to Vegetius, kept to it till the time of Gratian, when the military diſcipline growing remiſs, and field exerciſes and labour diſcontinued, the Roman foot thought the *cataphracta*, as well as the helmet, too great a load to bear, and therefore threw both by, chooſing rather to march againſt the enemy bare-breaſted: by which, in the war with the Goths, multitudes were deſtroyed. Tacit. Hiſt. lib. i. cap. 79. Veget. de Re Mil. lib. i. cap. 20.

CATAPHRACTA, among *Surgeons*, denotes a BANDAGE of the thorax; thus denominated from its reſemblance to a Roman breaſt-plate, called *cataphracta*.

CATAPHRACTÆ *naves*, thoſe armed and covered in fight, ſo that they could not be eaſily damaged by the enemy.

They were covered over with boards or planks, on which the ſoldiers were placed to defend them. The rowers ſitting underneath, thus ſkreened from the enemies weapons.

CATAPHRACTUS, denotes a thing defended or covered on all ſides with armour.

CATAPHRACTUS, or **CATAPHRACTARIUS**, more particularly denotes a horſeman, or even horſe, armed with a CATAPHRACTA.

The *cataphracti equites* were a ſort of cuiraſſiers, not only fortified with armour themſelves, but having their horſes guarded with ſolid plates of braſs or other metals, uſually lined with ſkins, and wrought into plumes or other forms. Their uſe was to bear down all before them, to break in upon the enemies ranks, and ſpread terror and havock wherever they came, as being themſelves invulnerable and ſecure from danger. But their diſadvantage was their unwieldineſs, by which, if once unhorſed, or on the ground, they were unable to riſe, and thus fell a prey to the enemy.

CATAPHRACTUS *pogge*, in *Zoology*. See POGGE.

CATAPHRYGIANS, a ſect in the ſecond century, ſo called, as being of the country of Phrygia.

They were orthodox in every thing, ſetting aſide this, that they took Montanus for a prophet, and Priſcilla and Maximilla for true propheteſſes, to be conſulted in every thing relating to religion; as ſuppoſing the Holy Spirit had abandoned the church. See MONTANIST.

CATAPLASM, popularly called *poultice*, an external medicine, in form of a pulp; of a ſoft conſiſtence, like an unguent, or cerat; compoſed of various liquors, parts of plants, oils, unguents, &c. according to the variety of intentions.

The word comes from the Greek καταπλασσω, *illino*, *I ſmear*, or *apply outwardly*.

Its ordinary uſes are, to aſſuage pain, and ſoften, reſolve, diſcuſs, or ſuppurate, matter collected in the external parts of the body.

The common *cataplaſm* for theſe intentions, is compoſed of white bread, milk, yolks of eggs, ſaffron, and oil of roſes.

CATAPLASMA *è cymino*, the *cummin-ſeed cataplaſm*, a form of medicine preſcribed in the late London Diſpenſatory, and meant as a ſubſtitute for the London treacle of former Diſpenſatories, which has of late been uſed only externally, and for ſuch purpoſes as it is thought this will better ſerve for. The compoſition is this: take cummin-ſeeds, half a pound; bay-berries and leaves of ſcordium dried, of each three ounces; of cloves, one ounce; honey, three times the weight of the whole: mix all together into a *cataplaſm*.

CATAPLASMA *maturans*, a form of medicine in the late London Pharmacopœia, ordered to be made in the following manner: take dried figs, four ounces; yellow baſilicon, one ounce; ſtrained galbanum, half an ounce: beat well the figs with a little wine, or ſtrong ſtale beer, and then carefully mix in the ointment, firſt melted with the galbanum.

CATAPOTIA, from καταπινω, *I ſwallow*, dry medicines, in a form fit to be ſwallowed whole; otherwiſe called *pills*.

CATAPULTA, a military machine, uſed among the ancients, for throwing huge ſtones, and ſometimes large darts, and javelins, twelve or fifteen feet long, on the enemy.

The word is originally Greek, from κατα and πελτη, and, according to Heſychius, denotes a ſpear or dart. Hence it is ſometimes alſo written *catapelta*.

The *catapeltæ* were alſo denominated οξυβολεις, becauſe they threw ſharp wooden weapons; whereas thoſe caſt by the *baliſtæ* were obtuſe, viz. ſtones.

The *catapulta* conſiſted of two huge timbers, like maſts of ſhips, placed againſt each other, and bent by an engine for the purpoſe; theſe being ſuddenly unbent again by a ſtroke of an hammer, threw the javelins with incredible force. Its ſtructure, and the manner of working it, are deſcribed by Vitruvius; and a figure of it is alſo given by Perrault. M. Folard aſſerts, that the *catapulta* made infinitely more diſorder in the ranks, than our cannon loaden with cartridges. Vid. Vitruv. de Archit. lib. x. cap. 15. & cap. 18. Perr. Not. ad eund. p. 335.

The *catapulta* is ſaid to be the invention of the Syrians. Some authors make it the ſame with the *balliſta*; others different.

CATAPUTIA, a medicinal plant, commonly called the *leſſer* SPURGE. It purges with ſuch a violence, both upwards and downwards, that few phyſicians now venture to preſcribe it.

CATARACT *of water*, a fall, or precipice, in the channel, or bed of a river; cauſed by rocks, or other obſtacles, ſtopping the courſe of its ſtream: from whence the water falls with a noiſe and impetuoſity.

The word comes from καταῤῥασσω, *I tumble down with violence*; compounded of κατα, *down*, and ῥασσω, *dejicio*, *I throw down*.

Such are the *cataracts* of the Nile, the Danube, Rhine, &c.

In that of Niagara, the perpendicular fall of the water is 137 feet: and in that of Piſtill Rhaiadr, in North Wales, the fall of water is near 240 feet from the mountain to the lower pool.

Strabo calls that a *cataract*, which we call a *caſcade*; and what we call a *cataract*, the ancients uſually called a *catadupa*. Herminius has an expreſs diſſertation, De admirandis mundi Cataractis ſupra & ſubterraneis; where he uſes the word in a new ſenſe; ſignifying, by *cataract*, any violent motion of the elements.

CATARACT, from καταρασσω, *I confound*, in *Medicine*, a ſuffuſion of ſight, ariſing, according to the opinion of the ancients, from a little film, or pellicle, which, ſwimming in the aqueous humour of the eye, and getting before the pupil, intercepts the rays of light.

They ſuppoſed that the *cataract* was formed by a condenſation of the more viſcous parts of the aqueous humour, between the uvea and the cryſtalline: though ſome take it to be a pellicle, detached from the cryſtalline itſelf; which is only an aſſemblage of ſeveral little pellicles, laid over one another.

There are two kinds of *cataracts*, the *genuine* and *ſpurious*; the firſt owing to an humour amaſſed in the eye, coagulated and fixed therein, and deſtroying its uſe: the latter ariſing from fumes or vapours thrown upon the eye by ſome accident; as in a fever, &c. The genuine *cataract* has ſeveral degrees, and ſeveral names: at firſt the patient ſees, as it were, clouds, moats, flies, &c. diffuſed over the objects in view: thus far the *cataract* is called *imaginary*; there being nothing yet appearing to the eye of another perſon. As the ſuffuſion increaſes, the pupil begins to appear of a ſea-green colour; ſometimes like the air full of clouds; and then the *cataract* is called *water*, or *water-fallen*: when the evil is arrived at its height, and the matter is ſufficiently coagulated, the patient loſes all ſight; the pupil ceaſes to be tranſparent, and becomes white, or brown, or of ſome other colour: this laſt ſtate is what we properly denominate a *cataract*.

But the modern anatomiſts and ſurgeons, ſuch as Heiſter, Briſſeau, and others, have adopted and eſtabliſhed a new ſyſtem, with reſpect to the cauſe and ſeat of this diſorder. Obſerving the beginning and progreſs of a *cataract*, it has been found, that at firſt it lies ſo deep as ſcarcely to be diſtinguiſhed; whereas, if it was a membrane or an inſpiſſation of the aqueous humour, and ſituated in the poſterior chamber of the eye behind the iris, it might be eaſily perceived, nor would it appear to lie ſo far within the eye. In the progreſs of the diſorder, and when the patient complains of dimneſs of ſight, a whiteneſs is obſerved very deep on the inſide, without any apparent inſpiſſation of the aqueous humour; a circumſtance which ſeems to prove, that the cryſtalline humour begins to become opake: afterwards the cryſtalline advances towards the hole of the pupil, and the ſight leſſens gradually, till the *cataract* comes near the pupil and cloſes it. No ſuch change of ſituation, it has been obſerved, could take place, were the diſeaſe occaſioned by a membrane produced in the aqueous humour, or by an inſpiſſation of this humour. It has alſo been found in the operation for the *cataract*, that, after it has been depreſſed and the needle raiſed, an opake body, in the form of the cryſtalline humour, appears through the hole of the pupil, adhering to the end of the needle. To which we may add, that, in an operation of this kind, when the eye was drawn out of the orbit and opened, the cryſtalline humour was found in the bottom of the globe of the eye, at the poſterior and inferior part of the pupil, to which place the operator had depreſſed it: it is likewiſe added, that after the *cataract* is depreſſed, the patient cannot ſee without the aſſiſtance of a lens to ſupply the defect of the cryſtalline.

A true *cataract* is therefore defined to be an alteration of the cryſtalline humour, which loſes its natural tranſparence, becomes opake, and at length hinders the rays of light from paſſing to the bottom of the eye, to make the neceſſary impreſſion on the retina. It muſt be remembered, however, that, though the *cataract* is impervious to the rays of light, ſome of them paſs obliquely between the iris and *cataract*, ſo that the eye is ſtill able to diſtinguiſh light and glaring colours. The cryſtalline, in this diſeaſe, is changed into a cream colour, a pearl colour, a yellow colour, or a darkiſh grey, &c. It has been ſaid that it ſometimes becomes greeniſh, though Mr. Sharp, in a great number of *cataracts*, never met with a ſingle inſtance of this kind: and on this account, it is called by the Greeks *glaucoma*, which is the ſame diſeaſe with the *cataract*.

In ſome caſes, the *cataract* adheres to the iris; and if there be a complete adheſion of theſe parts, the eye is incapable of ſeeing at all; and, therefore, as no judgment can be formed of the ſtate of the retina or of the vitreous humour, Mr. Warner thinks, theſe are ſufficient reaſons for forbidding the operation of *couching*; and he obſerves, with reſpect to the operation of dividing the iris from the *cataract*, which was invented and recommended by Mr. Cheſelden, that he never ſaw a ſingle inſtance of ſucceſs from it, and therefore that it is in no circumſtance adviſeable.

Cataracts ſpring from very different cauſes: ſometimes they are the conſequences of blows, wounds, or punctures, but not often. When they are produced by external cauſes, little relief can be obtained from manual operation, becauſe other parts of the eye may be injured, and the diſeaſe is truly complicated. When the *cataract* ariſes from an internal cauſe, it is always the conſequence of obſtructions in the nutrient and ſecreting veſſels of the cryſtalline humour; and when this is the only viſible defect in the eye, the patient derives great advantages from an operation.

Though it be, generally ſpeaking, true, that the cauſe of *cataracts* is the opacity of the cryſtalline humour; yet it is certain, that a real membrane has been ſometimes, though rarely, found, covering the pupil, or the ſocket of the vitreous humour which lies behind the cryſtalline, or formed by a kind of pus extravaſated into the aqueous humour, in conſequence of an inflammation of the choroides.

Cataracts have been diſtinguiſhed, by ſurgeons and oculiſts, into various ſorts; as into recent and inveterate, incipient and confirmed, mature and immature, ſimple and complicated, immoveable and ſhaking, milky and purulent, true and ſpurious, curable and incurable: but moſt of theſe diſtinctions, as far as they relate to the nature of the diſeaſe, have no ſufficient foundation in nature, owing their diverſity of character more to the imagination of writers, than to any real variety of the diſeaſe itſelf.

Celſus, and after him Heiſter, have recommended the uſe of medicinal remedies in an incipient *cataract*. In a caſe of this kind, whatever is capable of attenuating the juices, of unloading the diſtended veſſels, and of driving a portion of their juices to diſtant parts of the body, appears to be capable of doing conſiderable ſervice, though it may be little depended on in a confirmed *cataract*. But when the diſorder is grown mature and inveterate, recourſe muſt be had to manual operation: in order to the ſucceſs of which, much depends on the nature of the diſeaſe, and the degree of its maturity. If the adheſion of the *cataract* to the iris be partial, and the retina be perfect, there will be a ſufficient quantity of the rays of light tranſmitted obliquely, between the iris and the *cataract*, to the lateral parts of the retina, to enable the patient to diſtinguiſh light, and ſometimes too ſuch bodies as are white or red. To judge of this, when the operator cannot diſtinguiſh it by his ſight, let him ſhut the patient's eye, and rub the lids a little; then, ſuddenly opening it, he will perceive the pupil to contract, if the cryſtalline humour does not prevent the action by its adheſion. The general criterion of the fitneſs of *cataracts* for the operation is taken from their colour; the pearl-coloured, and thoſe of the colour of burniſhed iron, are eſteemed proper to endure the needle: and the maturity of the *cataract* may be judged of by its appearing in every part of an equal opacity; by the patient's not diſtinguiſhing an object preſented to him, when he is placed with his back to the light, provided the diſeaſe be not one of thoſe *cataracts*, in which the cryſtalline remains in the middle of the poſterior chamber of the eye. The operator ſhould likewiſe examine the diſeaſed eye expoſed to the light; if he finds the cryſtalline of an equal opacity, let him cloſe the patient's eye with his thumbs, then rub the upper lid of that eye which has the *cataract*, and, keeping the other eye ſhut, let him open the lids: if he finds the light, which falls on the pupil, makes the iris contract; and though expoſed to the ſame light, it dilates to the half, or the quarter, of that degree to which it was contracted; he may be aſſured the *cataract* is ripe.

CATARACTS, *couching of*. This operation is performed by penetrating the globe of the eye with the *couching* needle through the *tunica conjunctiva*, and *albuginea*, at a very ſmall diſtance beyond the circumference of the *tunica cornea*, and as exactly as poſſible in a line with the moſt external part of the circle of the pupil. The needle ſhould be introduced through the coats of the eye, viz. the *tunica conjunctiva*, *albuginea*, *ſclerotica*, *choroides*, and *tunica retina*, with the flat ſurfaces of the inſtrument directed upwards and downwards, as leſs violence will be done to the coats of the eye in this way, than if the blade had penetrated the eye in a tranſverſe direction. The inſtrument ſhould then be cautiouſly puſhed forwards, till it appears behind the pupil, which it will always do, when the eye remains tranſparent, and the eye-lids are kept open. The operator next endeavours to preſs the *cataract* gently downwards, and a little outwards, with the flat ſurface of the inſtrument; and if the *cataract* ſhould not readily ſubmit, the needle muſt be carefully moved under it, and gently raiſed up, by which means the *cataract* may be ſeparated from the *proceſſus ciliares*, and *aranea* below, and at the ſame time be diſengaged from the inferior portion of the *tunica iris*, ſuppoſing it to be ſlightly connected with that membrane. After the *cataract* is thus lifted up, the poſition of the *couching* needle muſt be altered, and directed a little above the upper portion of the circle of the pupil; afterwards inclining the inſtrument downwards, and obliquely outwards. Great care ſhould be taken not to wound the *iris*, or the *proceſſus ciliares*. Thus the *cataract* will ſometimes be ſo effectually diſlodged from the bed of the vitreous humour, and its nutrient veſſels ſo perfectly deſtroyed, as to bring on its gradual decay. When the operation is finiſhed, the patient's eye-lids muſt be ſhut, and covered with a rag, dipped in a ſolution of *ſaccharum ſaturni*, or the *pulvis è ceruſſâ compoſ.* in cold roſe-water, or the *extractum ſaturni* mixed with brandy, which muſt be very gently bound on with a ſoft linen roller. The patient ſhould be let blood, and kept in a dark place during the continuance of the inflammation. He ſhould ſit up for ſome hours after the operation, in order to prevent the riſing of the *cataract*, and live abſtemiouſly, taking only ſuch food as requires little chewing. The *cataract* is ſometimes apt to riſe again, after it has been depreſſed, ſo that it has been neceſſary to repeat the operation; for the prevention of which particular care ſhould be taken to deſtroy as effectually as poſſible the *aranea*, by moving the blade of the inſtrument in different directions. Warner. See *Couching* NEEDLE, and SPECULUM *oculi*.

CATARACTS, *extracting of*. M. Daviel, in 1745, firſt began this operation for the cure of the *cataract*; and out of a hundred and fifteen different operations, a hundred ſucceeded. Though it is ſaid that Mr. St. Yves practiſed it about ſixty years before. It is thus deſcribed by Dr. Hope, who ſaw M. Daviel perform it. After having placed the patient in a right line in the chair, he places himſelf over againſt, and ſomewhat higher than the patient: an aſſiſtant holds the head ſteady, and another keeps the upper eye-lid open, whilſt he, with his left-hand, keeps open the lower eye-lid. Then he takes an inſtrument like a lancet, of a myrtle-form point, a little crooked upwards, and fixed in a handle; and, making the patient look upwards, he pierces the *cornea tranſparens* at its lower circumference, juſt where it joins the *ſclerotica*, and conveys the point of the inſtrument between the *cornea* and *iris* upwards, beyond the pupil. He enlarges this opening on each ſide by the ſame inſtrument; taking out this inſtrument, he introduces another in the ſhape of a narrow lancet, made round at the point, and fixed in a handle; with this he enlarges the opening. When this is removed, he introduces a pair of crooked ſciſſars, with which the opening is enlarged on each ſide by different ſnips, always as near as poſſible to the circumference of the cornea, until he has made the opening round two thirds of the cornea. He then takes out the ſciſſars, and with a ſmall inſtrument like an ear-picker raiſes the cornea, and with a *cataract* needle in his hand, broader and ſtronger than the common, and pointed like a lancet, he cuts the capſula of the cryſtalline through the pupil: then preſſing gently the globe of the eye with his finger from below upwards, the cryſtalline ſlips out of the capſula, and drops out of the eye. The aqueous humour is diſcharged upon the firſt puncture, and the cornea and iris join together. Great ſkill and care are neceſſary, in order to avoid wounding the iris, which would endanger the eye. The whole operation requires about two minutes, and is attended with little or no pain. This operation is in many reſpects preferable to *couching*; as it may be performed at all times, and in all kinds of *cataracts*, whether they are come to maturity or not, and many accidents are avoided. The principal accident to which this operation is liable, is an exceſſive evacuation of the vitreous humour at the time of performing it, which may occaſion a ſinking down of the globe of the eye, a deformity, and an irrecoverable loſs of ſight. Phil. Tranſ. vol. xlvii. p. 530; and Warner's Deſcription of the human Eye, &c. and Diſeaſes, &c. p. 100, &c.

Thoſe who would be farther informed on this ſubject, may conſult Heiſter, Sharp, Warner, &c.

CATARACTA, in *Zoology*, the name of a bird of the LARUS or *ſea-*GULL kind, very much approaching to the nature of our *gannet*, but ſmaller, and with ſhorter and weaker claws. It much reſembles the *goſhawk*. Its back and wings are variegated with brown, yellow, and white; its breaſt and belly are white, variegated with brown ſpots; its wings are long, and, when folded, reach to the end of the tail; its legs are grey; its feet webbed, and its clawks crooked and ſmall. Aldrovand. de Avib.

CATARACTES, in *Zoology*, a name by which ſome authors have called the large SEA-*gull*; called in Cornwall, where it is very common, the GANNET.

CATARRH, in *Medicine*, an extraordinary diſtillation, or defluxion of a ſharp, ſerous humour, from the glands, eſpecially about the head and throat, upon the parts ſubjacent.

The word is formed from καταῤῥέω, *defluo, I flow down.*

Catarrhs are generally occaſioned by a diminution of inſenſible perſpiration on taking cold; the effect whereof is, that the lymph, that ſhould paſs by the ſkin, ouſes out upon thoſe glands; and being thus extravaſated, occaſions irritations, coughs, and all the uſual ſymptoms. See COUGH.

Degory deduces all diſeaſes from *catarrhs*, which he looks upon as the ſeminary of moſt diſorders of the body.

Catarrhs are of as many ſpecies as the parts on which the rheum or matter falls. Hippocrates enumerates eight kinds of defluxions from the head, viz. on the eyes, noſe, ears, breaſt, abdomen, ſpinal marrow, *vertebræ*, and muſcles of the loins, and *os ſacrum*. The moderns allow only of three ſorts under the name of *catarrhs*; the firſt, wherein the matter falls on the noſe, more properly called CORYZA; the ſecond, on the *fauces*, called BRANCHUS; and the third on the *thorax*, or breaſt, more particularly denominated a *catarrh*. The ſum of which is couched in the following diſtich:

Si fluit ad pectus dicatur rheuma catarrhus,
Ad fauces branchus, ad nares eſto coryza.

Etmuller diſtinguiſhes a *hot* and a *cold catarrh*; the firſt attended with an unnatural heat and pain, and a phlogoſis of the whole body; the excreted lymph being exceeding thin and ſharp: in the cold kind, all the ſymptoms are more remiſs.

Catarrhs are cured by ſoftening the ſerous humours, and augmenting tranſpiration, by means of diaphoretics, narcotic medicines, and diuretics. Smoaking of tobacco is recommended as excellent in all *catarrhal* affections: in obſtinate *catarrhs*, recourſe is ſometimes had to iſſues and bliſters.

Catarrhous diſorders, as well as all other feveriſh indiſpoſitions, are to be treated in a very mild and gentle manner. The patient is to be kept moderately warm, either in bed, or by means of a fire; he is to abſtain from medicines which are too hot, draſtic, and productive of commotions, as alſo from a hot regimen; becauſe by theſe the acrid matter is put into commotions, and a fervid diſpoſition conveyed to the parts. The diet is to be ſpare, and the drink tepid and wholeſome. In the decline of the diſeaſe, however, when the excretions are begun, it has been obſerved, that good wine, freely drank, has proved beneficial; as it promotes the circulation of the blood, and maintains an equable perſpiration.

When during the diſorder the fæces are indurated, and the patient coſtive, beſide water-gruel, decoctions of manna, prunes, and raiſins, nothing is more proper than emollient clyſters. When the cough is violent and racking, it is to be allayed with recent oil of ſweet almonds, mixed with ſyrup of maidenhair.

Catarrhs do not ariſe from the head only, but ſometimes alſo from other parts of the body; the lymphatic veſſels, wherein the ſeroſities are contained, as well as the glands that ſeparate them, being diſtributed all over the body.

CATARRH, *ſuffocative*, in *Medicine*, the name of a diſeaſe, which conſiſts in a copious eruption of a ſerous and mucous humour into the veſicles of the lungs; which takes its origin from a ſudden congeſtion of humours about the breaſt, and a flaccid and weak ſtate of the breaſt and lungs.

CATARRH, *ſigns of a ſuffocative*. This diſeaſe always ſeizes the patient at once, without any previous notice; his breath becomes extremely difficult, and the fulneſs of the breaſt is eaſily diſtinguiſhed by a ſound of rattling of a frothy matter at the time of drawing in the breath. There is an immediate debility and loſs of ſtrength and ſpirits, as the patient calls it, but there is in reality a ſpaſmodic tenſion; this is followed by a reſtleſſneſs, ſo that the patient cannot ſuffer his limbs to lie a minute in the ſame poſture or place; and there is always a deſpondency in the mind, and the patient thinks he is certainly going to die. There is uſually either no cough at all, or, at utmoſt, only a very ſlight and inſufficient one, and the very ſtrength to cough is wanting. The breaſt, and even the ribs, are ſenſibly affected by this diſeaſe, and the eyes always look red and tumid.

Perſons ſubject to it. Scarce any one is ever ſeized with this diſeaſe, except ſuch as are, according to the common acceptation of the word, troubled with habitual *catarrhs*, or have for many years been ſubject to defluxions from the head upon the fauces and lungs; and the perſons moſt of all ſubject to it, are old men of a phlegmatic and plethoric habit, and who are of that kind of temperament which ſubjects people, at other times, to palſies and apoplexies. Lean perſons are ſcarce ever afflicted with this diſorder, unleſs they have long laboured under a violent cough, or have ulcerous diſorders of the lungs. Young people are alſo very little ſubject to this diſeaſe, excepting only ſuch as are very corpulent and phlegmatic, and already habituated to large defluxions of this kind. Infants alſo, which are very fat, and have had a ſudden ſuppreſſion of their natural ſweats, ſometimes fall into this diſeaſe, but with them it is not ſo violent.

Cauſes of it. The occaſional cauſes of this diſeaſe are ſeen in what has been already obſerved, but its true origin is to be ſought for in the head, not in the breaſt or lungs; yet, though it is eaſy to ſee what may occaſion a congeſtion of ſuch ſerous humours in the upper parts, it is difficult to ſay how the lungs become rendered fit to receive it all at once in this dangerous manner. It is accidentally brought on in children, as well by the repulſion of their cutaneous eruptions, as by the ſtopping their ſweats; and in grown people, from the omiſſion of habitual bleedings, from coldneſs and dampneſs in the air, from frequent drunkenneſs, and from an injudicious treatment of cutaneous humours, and particularly from drying up runnings of the eyes. Juncker's Conſp. Med. p. 509.

Prognoſtics in it. It is a very terrible diſeaſe, and very ſpeedily proves fatal; for the patient, if not relieved, uſually dies in twenty-four hours. Sometimes it degenerates into a fever, and the patient ſeems cured by the change; but the remedy in this caſe proves as bad as the diſeaſe; for the fever proves incurable, and becomes a ſettled hectic, attended with terrible difficulty of breathing, and finally carries off the patient, after making him endure, for ſome time, a life of terrible pain. Sometimes it goes off into an aſthmatic laxity of the breaſt, attended with a cough, and a continual diſcharge of large quantities of mucous matter by ſpitting; and ſometimes into an abſolutely cachectic flaccidity of the body: and in general, if not carefully treated from the beginning, it either entails ſome of theſe diſorders upon the patient, or leaves him in ſo poor and weak a conſtitution, that he becomes eaſily liable to all the diſeaſes of this kind from the ſlighteſt occaſions.

Grown perſons are ſooner taken off by this diſeaſe than young children, with whom it ſometimes continues above a week or a fortnight. In old people, the fatal event of the diſeaſe is ſo ſudden, that it is often dubious whether it were this diſorder, or an apoplexy; and in general it ſeems probable, that many of the perſons, ſaid to die of apoplexies, die, in reality, of the violent attacks of this terrible diſeaſe.

Method of cure. In the time of the fit a ſtimulating clyſter muſt be given, made of a decoction of marjoram, and other warm herbs, with colocynth, and a few grains of euphorbium, in order to abate the infarction of the breaſt, and give a new courſe to the matter that might add to it;

and when there appears to be a plethora beſides, a vein muſt be immediately opened after the clyſter. After this, if the ſtomach be nauſeating and uneaſy, let a ſcruple of ſalt of vitriol be given as a vomit, with a large quantity of warm water; and if the patient is of a very phlegmatic habit, a few grains of gamboge may be added to this, to carry the humour off downward; or, if the caſe be very preſſing, a draught of a decoction of aſarum, or of tobacco, may be taken, the bad effects of which laſt are taken off by a draught of wine with the ſpices; and all this time there may be frictions and ſinapiſms applied to the lower extremities: and finally, to attenuate and diſcuſs the mucous ſtaſis, gentle alexipharmics and ſudorifics may be given, ſuch as the eſſence of amber, tincture of ſalt of tartar, and tartariſed tincture of antimony; and all nitrous medicines are alſo of the greateſt uſe, as they partly mitigate the cauſes, and partly prepare the humours for evacuation; and after all theſe, the *cortex eleutheriæ* is of great uſe in diſcuſſing and mitigating the pain.

As ſoon as the fit is over, the corroborating medicines are to be given, and all things that can reſtore the parts to their due tone: of this number are the milder chalybeats, and the like; and with theſe analeptics are to be given, to recruit the fleſh and ſtrength, ſuch as emulſions, and a proper diet; and in ſuch as are uſed to wine, the richeſt wines, in moderate quantities, and the higheſt foods, will be of ſervice. If there be perceived a fever after the other ſymptoms are gone off, this muſt be cured by the gentle alexipharmics, and by powders of nitre, and the abſorbents; and if a chronic indiſpoſition ſeems left behind, then the gums, which act as diſcutients, are to be given for ſome time, ſuch as the ammoniacum and ſagapenum, and a warm regimen is to be recommended. And finally, to prevent a return of the diſeaſe, bleeding is very proper in the ſpring and autumn, and purging medicines taken in the intermediate time; the patient muſt alſo avoid all violent paſſions of the mind, and muſt never ſleep in a damp air. We are not to fear bleeding in the time of the fit, becauſe of the patient's complaining of want of ſtrength; for as the danger of ſuffocation is ſudden and imminent, it muſt be ſuddenly removed, and when that is done, the patient's ſtrength will return in good time: the ſame is alſo to be alleged in favour of the violent vomits. In people of a very phlegmatic habit, bleeding is not neceſſary nor proper; but in theſe caſes a vomit is ſafe and right, and uſually gives great relief, eſpecially if the patient has eaten heartily ſome little time before. Juncker. Conſp. Med. p. 513.

CATARRHAL *fever*, a ſecondary or ſymptomatic fever, by means whereof nature endeavours to correct the vitious quality of the lymph, and expel it the body.

There is alſo a malignant *catarrhal* fever, nearly akin to the *petechial* FEVER.

CATASARCA, from κατα, *under*, and σαρξ, *fleſh*, in the Greek *Church*, denotes the undermoſt altar-cloth, or that next the ALTAR.

Over the *cataſarca* is the ANTIMENSA.

CATASCOPIUM, from κατασκοπεω, *I explore*, in *Antiquity*, an exploratory veſſel, anſwering in ſome meaſure to a brigantine among us. See BRIGANTINE.

We find *cataſcopium* uſed in this ſenſe by Cicero, ad Attic. lib. v. ep. 11.

CATASCOPUS, in *Antiquity*, denotes a SPY.

In *Eccleſiaſtical Writers*, *cataſcopus* is ſaid ſometimes to denote an archdeacon.

CATASTA, from καθιςημι, *I place*, in *Antiquity*, a wooden ſcaffold, wherein ſlaves were placed for ſale naked, that thoſe diſpoſed to purchaſe might ſee every limb and part. The word was alſo uſed for an elevation, on which perſons were executed; and for an engine of torture, otherwiſe called EQUULEUS.

The *cataſta* does not appear to have been the ſame with the *equuleus*, but rather a kind of frame or ſcaffold, on which the *equuleus* was mounted, to render the executions more public and viſible. Prudentius calls the *cratis*, or grid-iron, on which ſome of the martyrs were broiled, *ignea cataſta*.

CATASTASIS, in *Poetry*, the third part of the ancient drama; being that wherein the intrigue, or action, ſet on foot in the epitaſis, is ſupported, carried on, and heightened, till it be ripe for the unravelling in the cataſtrophe.

The word comes from κατασασις, *conſtitution*; this being, as it were, the mean, tenor, ſtate, or conſtitution, of the piece.

CATASTROMATA, from καταςρωννυμι, *I cover*, in *Ancient Military Writers*, a ſort of ſcaffolds or floorings in ſhips of war, whereon the ſoldiers were poſted for their defence in fight.

The *cataſtromata* appears to have been chiefly erected over the head and ſtern of the veſſel, it being in theſe parts that the ſoldiers were moſt commonly poſted.

CATASTROPHE, from καταςρεφω, *I finiſh*, in *Poetry*, the change or revolution of a dramatic poem: or the turn which unravels the intrigue, and terminates the piece.

The *cataſtrophe* made the fourth and laſt part in the ancient drama; or that immediately ſucceeding the cataſtaſis.

The *cataſtrophe* is either *ſimple*, or *implex*; whence alſo the fable and action are denominated.

In the firſt there is no change in the ſtate of the principal perſons, nor any diſcovery, or unravelling; the plot being only a mere paſſage out of agitation, to quiet and repoſe. This *cataſtrophe* is rather accommodated to the nature of the epopea, than of tragedy. Indeed we meet with it in ſome of the ancients, but it is rejected by the moderns. In the ſecond, the principal perſon undergoes a change of fortune; ſometimes by means of a diſcovery, and ſometimes without.

The qualifications of this change, or peripetia, are, that it be probable and neceſſary: in order to be probable, it is required to be the natural reſult or effect of the foregoing actions; i. e. it muſt ſpring from the ſubject itſelf, or take its riſe from the incidents; and not to be introduced merely to ſerve a turn. The diſcovery in the *cataſtrophe* muſt have the ſame qualifications as the *cataſtrophe* itſelf, whereof it is a principal part: it muſt be both probable and neceſſary. To be probable, it muſt ſpring out of the ſubject itſelf; not be effected by means of marks, or tokens, rings, bracelets, or by a mere recollection, as is frequently done, both by the ancients and moderns. To be neceſſary, it muſt never leave the perſons it concerns in the ſame ſentiments they had before, but always produce either love or hatred. Sometimes the change conſiſts in the diſcovery; ſometimes it follows at a diſtance; and ſometimes reſults immediately from it, which laſt is the moſt beautiful kind; and thus it is in Œdipus.

Mr. Dryden thinks a *cataſtrophe* reſulting from a mere change in the ſentiments and reſolutions of a perſon, without any further machinery, may be ſo managed as to become exceeding beautiful, nay preferable to any other.—It is a diſpute among the critics, whether the *cataſtrophe* ſhould always fall out happily, and favourably on the ſide of virtue, or not? i. e. whether virtue is always to be rewarded, and vice puniſhed, in the *cataſtrophe?* But the reaſons on the negative ſide ſeem the ſtrongeſt. Ariſtotle prefers a ſhocking *cataſtrophe* to a happy one; becauſe the moving of terror and pity, which is the aim of tragedy, is better effected by the former than the latter.

Boſſu divides the *cataſtrophe*, at leaſt, with regard to the epopea, into the unravelling, or *denouement*, and the *achevement*, or finiſhing; the laſt of which he makes the reſult of the firſt, and to conſiſt in the hero's paſſage out of a ſtate of trouble and agitation, to reſt and quiet. This period is but a point without extent, or duration; in which it differs from the firſt, which comprehends every thing after the knot, or plot laid. He adds, that there are ſeveral unravellings in the piece; becauſe there are ſeveral knots, which beget one another: the finiſhing is the end of the laſt unravelling.

CATCH-FLY, *Silene*, in *Botany*. See CAMPION.

CATCH-LAND, ſuch land, particularly in Norfolk, with reſpect to which it is not certainly known to what pariſh it belongs; ſo that the perſon who firſt gets the tythes there, enjoys it for that year, by right of preoccupation.

CATCH-POLE, or CATCH-POLLE, a term now uſed, by way of reproach, for a BAILIFF's follower, or aſſiſtant. Anciently, it was a term of credit, applied to thoſe we now call *ſerjeants of the mace*, *bailiffs*, or any other that uſe to arreſt men on any action.

CATCH-WORD, among *Printers*, denotes the firſt word of a page, which is put alſo at the bottom of the preceding page, in order to ſhew how the leaves and ſheets follow each other, and facilitate the folding and binding.

The French ſometimes only put the *catch-words* at the end of each ſheet, or even quire or gathering.

CATCHES, in *Clock Work*, thoſe parts of a clock that hold by hooking, and *catching* hold.

CATE, in *Botany*, a name given by ſome authors to the LYCIUM *Indicum*, or Indian thorn.

CATECHESIS, from κατηχεω, *I teach firſt principles*, in a general ſenſe, denotes an inſtruction given any perſon in the firſt rudiments of an art or ſcience, but more particularly in the principles of the Chriſtian religion.

Thoſe who give ſuch inſtructions are called CATECHISTS, and thoſe who receive them CATECHUMENS.

CATECHESIS is alſo uſed for a book containing the rudiments of the Chriſtian religion, adapted to the uſe and inſtruction of novices. See CATECHISM.

The *Catecheſes* of St. Cyril, are the principal works of that father.

CATECHETIC, or **CATECHETICAL**, ſomething that relates to oral inſtruction in the rudiments of Chriſtianity. In the early ages of the church there were *catechetic* ſchools, wherein ſacred learning and philoſophy were taught. Theſe were public auditories, diſtinct from the church, but probably adjoining thereto. In a novel of the emperor Leo, they are called κατηχȣμενα, and repreſented as a ſort of edifices belonging to the church. St. Ambroſe ſpeaks of theſe auditories as held in the baptiſtery. Bingh. Orig. Eccleſ. lib. iii. cap. 10. § 4.

CATECHISM, *Catechiſmus*, in its primary ſenſe, an inſtruction or inſtitution in the principles of the Chriſtian religion, delivered *viva voce*, and ſo as to require frequent repetitions from the diſciple or hearer of what had been ſaid.

Anciently the candidates of baptiſm were only to be inſtructed in the ſecrets of their religion by tradition, *viva voce*, without writing; as had alſo been the uſage among the Egyptian prieſts, and the Britiſh and Gauliſh druids, who only communicated the myſtery of their theology by word of mouth. Shaftſb. Charact. vol. iii. p. 241. not.

CATECHISM is more frequently uſed in modern times, for an elementary book, wherein the principal articles of religion are ſummarily delivered in the way of queſtion and anſwer.

CATECHIST, *Catecheta*, he that catechiſes, i. e. inſtructs novices in the principles of religion.

CATECHIST more particularly denotes a perſon appointed by the church to inſtruct thoſe intended for baptiſm, by word of mouth, in the fundamental articles of the Chriſtian faith.

The *catechiſts* of churches were miniſters uſually diſtinct from the biſhops and preſbyters, and had their auditories or *catechumena* apart. Their buſineſs was to inſtruct the catechumens, and prepare them for the reception of baptiſm. But the *catechiſts* did not conſtitute any diſtinct order of the clergy, but were choſen out of any other order.

CATECHU, a medicinal aromatic ſubſtance brought from the Eaſt Indies; called alſo *cachew*, and *japan-earth*, and when prepared, ranked in the number of perfumes. It is of a dark purple colour; very auſtere upon the palate, ſeeming to melt in the mouth, and leaving ſomewhat of a ſweetiſh taſte behind it. It is the juice of a vegetable, not an earth, as its name imports.

Notwithſtanding the great uſe of *catechu*, before that of coffee and tea, and its being ſtill frequently uſed by many people, eſpecially in France, its nature and origin was long but little known, even among the ableſt phyſicians. Some, from its being called *Japan earth*, ranked it among the medicinal earths, and pretend it is found on the tops of mountains, covered with the roots of cedars, ſerving, as it is ſaid, for their nutrition; and that being waſhed in the rivers, and dried in the ſun, it was formed into a kind of paſte; which, brought into Europe, ſerved as the baſis of ſeveral peſtels, or lozenges, called *cachew*. Others, with more probability, rank it among the gums; and maintain it to be formed of the inſpiſſated decoction of a tree in the Eaſt Indies, called *cachous*; growing chiefly in the kingdom of Cochinchina. Laſtly, others took it to be a factitious compoſition of ſeveral other drugs; eſpecially of the juice of areca, extract of liquorice and calamus aromaticus, and the bark of a tree called by the Indians *catechu*.

Cachew, or *catechu*, is of much eſteem in medicine. It is famous for ſtopping fluxes of all kinds; and among other effects attributed to it, it is ſuppoſed to ſtop a cough, and fortify the ſtomach: beſides its ſweetening and perfuming the breath, when taken in an impalpable powder, mixed with gum tragacanth.

CATECHUMEN, a candidate of baptiſm; or a perſon who prepares himſelf for receiving it.

The word is compounded of κατα, and ηχεω, *I ſound*.

The *catechumens* were diſtinguiſhed from the *fideles*, not only by name, but alſo by their place in the church: they were diſpoſed, with the penitents, in the portico, or gallery, at the extremity of the church, oppoſite to the choir. They were not allowed to aſſiſt at the celebration of the euchariſt; but after ſermon, the deacon diſmiſſed them with this formula, proclaimed three times, *Ite, Catechumeni; miſſa eſt*.

There were divers orders or degrees of *catechumens*, in thoſe churches and ages where the term of catechizing for two or three years was obſerved: but what the preciſe number and appellations of theſe orders were, is not agreed on. See BELIEVERS.

CATECHUMENUM, a name given to an upper gallery in the ancient churches.

The name *catechumenum* was alſo given to a ſort of ſchoolhouſe near the church, where the *catechumens* met to receive the inſtructions of the catechiſts.

CATEGOREMA, from κατηγορεω, *I declare*, is defined a noun ſubſtantive, ſo abſolute and independent, that it may ſtand at the head of a claſs apart.

CATEGOREMA properly denotes the name whereby a CATEGORY, or claſs of beings, is repreſented.

CATEGORIÆ, in *Literary Hiſtory*. Ariſtotle has a book extant under the title of Κατηγοριαι, which Curio, Tonſtius, Vives, and others, deny to be written by him, and aſcribe to Andronicus; but without much foundation, ſince that work is cited as Ariſtotle's by Simplicius, Ammonius, and Lucianus.

CATEGORIARES, a miniſter in the Greek church, whoſe buſineſs it is to publiſh or proclaim the feaſt days. He had alſo the care of the lights, and to ſee the church kept clean.

CATEGORICAL, in a general ſenſe, is applied to thoſe things ranged under a CATEGORY.

CATEGORICAL alſo imports a thing to be ABSOLUTE, and not reſtrained to conditions.

In which ſenſe it ſtands oppoſed to HYPOTHETICAL and CONDITIONAL.

A *categorical* anſwer denotes an expreſs and pertinent anſwer, made to any queſtion or objection propoſed.

CATEGORUMENUM, denotes the PREDICATE, or that part of a propoſition which is affirmed of the ſubject.

Some miſtakenly call this *categorema*.

CATEGORY, in *Logic*, a ſyſtem, or aſſemblage, of all the beings contained under any *genus*, or kind; ranged in order.

The word *category* was borrowed by the ſchools from the *forum*, or courts of juſtice: for as, in a trial, the plaintiff, or proſecutor, in accuſing the criminal, or priſoner, muſt charge him expreſly, or affirm that he did this or that, in poſitive terms: whence the word *category*, viz. from κατηγορειν, *to aver*, or *declare a charge of accuſation*: ſo in the doctrine of *categories* every higher may be expreſly, and abſolutely predicated, or affirmed, of every lower.

The ſchool philoſophers diſtribute all beings, all the objects of our thoughts or ideas, into certain genera, or claſſes, in order to get a more diſtinct and preciſe notion thereof; which claſſes the Greeks call *categories*, and the Latins *predicaments*.

The ancients, after Ariſtotle, generally make ten *categories*: under the firſt, all ſubſtances are compriſed; and all accidents under the nine laſt; viz. quantity, quality, relation, action, paſſion, time, place, ſituation, and habit; which are uſually expreſſed, or ſignified, by the following technical diſtich:

> *Arbor, ſex, ſervos, ardore, refrigerat, uſtos,*
> *Ruri, cras, ſtabo, nec tunicatus ero.*

But as theſe ten *categories* of Ariſtotle, which logicians make ſuch myſteries of, are arbitrary, they are now almoſt excluded. Accordingly, ſome philoſophers think all nature may be better conſidered under theſe ſeven things, ſpirit, matter, quantity, ſubſtance, figure, motion, and reſt: and others make but two *categories*, ſubſtance and attribute, or ſubject and accident. See on the ſubject, and in vindication of the *Categories* of Ariſtotle, Harris's Philoſophical Arrangements, chap. ii.

CATEIA, in *Ancient Writers*, a kind of dart or javelin, in uſe among the ancient Gauls and Germans, made of heavy matter, and therefore not fitted to fly far, but doing great execution where it did reach, having withal an apparatus by which the perſon who threw it might draw it back again. It is ſpoken of by Virgil, Æn. lib. vii. ver. 741.

> *Teutonico ritu ſoliti vibrare* cateias.

CATEMIA, a name given by ſome of the writers of the middle ages to a ſoft black ſtone uſed in the ſoldering of ſilver, and ſome other metals, and more commonly called *horcus lapis*. We do not at this time know what ſtone they mean.

CATENA, in a general ſenſe, a CHAIN.

CATENA, in *Anatomy*, a muſcle, otherwiſe called TIBIALIS *anticus*.

CATENA *patrum*, in *Eccleſiaſtical Writers*, denotes a ſort of commentary on Scripture, compoſed of ſeparate paſſages or interpretations of the fathers, reduced to the order of chapters and verſes of the book.

The firſt who uſed *catena* in this ſenſe was Thomas de Aquinas. The reaſon of the appellation ſeems to be this: that as a chain conſiſts of ſeveral links connected together, ſo do theſe commentaries conſiſt of a number of different paſſages, or the ſentiments and expoſitions of different writers, tacked together ſo as to form one work. Fabr. Bibl. Græc. tom. vii. lib. v. cap. 17.

CATENARIA, in the *Higher Geometry*, a mechanical curve line, which a chain, or rope, forms itſelf into, by its own weight, when hung freely, between two points of ſuſpenſion, whether thoſe points be horizontal or not.

The nature of this curve was inveſtigated by Galilæo, who ſuppoſed it to be the ſame with the parabola; but though Jungius detected this miſtake, it was not diſcovered till the year 1691, when M. J. Bernouilli publiſhed it as a problem in the Acta Eruditorum. Dr. D. Gregory, in 1697, publiſhed a method of inveſtigating the properties before diſcovered by Bernouilli and Leibnitz. Phil. Tranſ. abr. vol. i. p. 39, &c. Where he ſhews, that an inverted *catenaria* is the beſt figure for an arch. Bernouilli Opera, vol. i. p. 48, &c. and vol. iii. p. 491, &c. To conceive the general nature or character of this curve, ſuppoſe a line heavy and flexible (See *Tab. Geom. fig.* 25.) the two extremes of which, F and D, are firmly fixed in thoſe points; by its weight it is bent into a certain curve FAD, which is called the *catenaria*.

Let BD and bd be parallel to the horizon, AB perpendicular to BD, and Dδ parallel to AB; and the points B, b infinitely near to each other. From the laws of mechanics, any three powers in equilibrio, are to one another, as the lines parallel to the lines of their direction (or inclined in any given angle), and terminated by their mutual concourſes: hence, if Dd expreſs the abſolute gravity of the particle Dd (as it will, if we allow the chain to be every way uniform), then Dδ will expreſs that part of the gravity, that acts perpendicularly upon Dd; and by the means of which, this particle endeavours to reduce itſelf into a vertical poſition; and as it proceeds from the ponderous line DA, it is, *cæteris paribus*, proportional to the line AD, which is the cauſe of it. Farther, the lineola $d\delta$, will expreſs the force which acts againſt that conatus of the particle Dd, by which it endeavours to reſtore itſelf into a poſition perpendicular to the horizon, and hinders it from doing ſo. This force is conſtant, being no other than the reſiſtance of the point A; and may therefore be expreſſed by any given right line a. Suppoſing the curve FAD, therefore, as before, whoſe vertex (the loweſt point of the *catena*) is A, axis AB, ordinate BD; fluxion of the axis Dδ=Bb; fluxion of the ordinate $d\delta$; the relation of theſe two fluxions is thus, viz. Dδ : δd :: DA curve : a; which is the fundamental property of the curve, and may be thus expreſſed (putting AB=x, and BD=y, and AD=c)

$$\dot{y}=\frac{a\dot{x}}{c}.$$

CATERER. See PURVEYOR.

CATERGI, the name of the public carriers in the Grand Seignior's dominions, who give earneſt to the merchants, and others, as a ſecurity that they will carry their goods, or not ſet out with them.

CATERPILLAR, *Eruca*, in *Inſectology*. The *caterpillar* ſtate is that through which every butterfly muſt paſs before it arrives at its perfection and beauty, and in the ſame manner all the known winged animals, except only the PUCERON, paſs through a reptile ſtate, none of them, except this, being produced in their winged form. The change from caterpillar to butterfly was long eſteemed a ſort of metamorphoſis, a real change of one animal into another; but this is by no means the caſe. The egg of a butterfly produces a butterfly, with all the lineaments of its parent, only theſe are not diſcloſed at firſt, but, for the greater part of the animal's life, they are covered with a ſort of caſe, or muſcular coat, in which are legs for walking, which only ſuit it in this ſtate; but its mouth takes in nouriſhment, which is conveyed to the included animal, and, after a proper time, this covering is thrown off, and the butterfly, which all the while might be diſcovered in it by an accurate obſerver, with the help of the microſcope, appears in its proper form. Before it paſſes into this ſtate, however, there requires a time of reſt for the wings to harden, and the ſeveral other parts to acquire their proper firmneſs; this is tranſacted in a time of perfect reſt, when the animal lies in what is called the nymph or chryſalis ſtate, in appearance only a lump of unenlivened matter. There is a ſettled and determinate time for each of theſe changes in every ſpecies; but in the ſeveral different kinds the periods are very different. Some *caterpillars* are produced from the eggs of their parent butterfly in ſpring, as ſoon as the trees, on whoſe leaves they are to feed, begin to bud; after a life of thirteen days, they paſs into their chryſalis ſtate; and, after remaining at reſt three weeks in that, they iſſue forth with wings, with all the beauty of their parents.

As ſoon as they arrive at this their final ſtate, their wings are ſcarce dry before they ſeek to copulate or propagate their ſpecies; this done, the male dies, and the female only lives to depoſit her eggs, and then follows him. This is their whole buſineſs; nature never intending that they ſhould eat in this ſtate, has given them no organs for that purpoſe; ſo that they muſt neceſſarily die of hunger ſoon, could they eſcape their natural death, or the great devourers of them the birds. Many ſpecies of theſe ſpring butterflies have no farther being, except in the embryo included in the egg, till the ſucceeding ſpring; they lay their eggs very carefully, and in extremely nice order, round about the ſtalk of a perennial plant, or the young branch of a tree, and there they remain through the heats of the ſummer, and colds of the winter, and are never hatched till the ſucceeding ſpring; and though thus expoſed, it is obſervable that the ſevereſt winters do them no harm. Other ſpecies of theſe are ſooner hatched from the egg, and live the remainder of the ſummer on the leaves of the trees. They, after this, paſs the whole winter in the caterpillar-ſtate, uſually hiding themſelves in ſome ſheltered place, covered with webs of their own ſpinning. Theſe remain torpid all the winter, and, at the return of ſpring, leave their webs as the others do their eggs, and feed a few weeks longer, after which they paſs through the chryſalis ſtate to their perfect form. The butterfly of this ſpecies, therefore, enjoys a much longer time of life than the other which remains ſo long in the egg; though the ultimate duration of the animal, from its excluſion from the parent, till its death, is much the ſame; ſo great a part of it being paſſed in the egg-ſtate by the one, and ſo ſmall a part by the other.

Other ſpecies of theſe animals remain the whole winter in the chryſalis ſtate, and are butterflies in ſpring, and, after paſſing the middle of ſummer in the egg, are *caterpillars* in the autumn. The difference of this ſtage of life is remarkably great, in proportion to the whole duration of the animal; in ſome ſpecies it does not exceed a fortnight, and in others continues eleven months.

There is no ſign of ſex in the animal, while in the caterpillar-ſtate; the propagation of the ſpecies is the buſineſs of the creature in its ultimate perfection, and, till that, theſe parts are never excluded. One female butterfly, when ſhe has been impregnated by the male, will produce three hundred or four hundred eggs, or even more.

There is no way of knowing the different ſexes of theſe little creatures, by viewing the parts; but the whole figure and manner of the animal makes the difference. The females are always larger than the males; they are alſo more ſlow in their motions; and ſome of them have no wings, or, at the utmoſt, only very ſmall ones. The males, however, have a ſort of beards, more beautiful than the *antennæ*, or horns of the females; the female is much ſtronger, as well as bigger, than the male, and not unfrequently, at the approach of danger or diſturbance, flies away with him in the time of copulation.

On diſſecting the female, her *uterus* affords an aſtoniſhing ſight; the number of eggs in the tubes is amazing; but theſe have not all the ſame figure; and in ſome ſpecies, as the ſilk-worm, &c. the eggs are of a beautiful blue; if any yellowiſh ones are ſeen among them, they are judged to be defective. See STIGMATA.

The care of all the butterfly-tribe, to lodge their eggs in ſafety, is ſurpriſing. Thoſe whoſe eggs are to be hatched in a few weeks, and are to live in the *caterpillar* ſtate during part of the remaining ſummer, always lay them on the leaves of ſuch plants as will afford them a proper nouriſhment; but, on the contrary, thoſe whoſe eggs are to remain unhatched till the following ſpring, always lay them on the branches of trees and ſhrubs, and uſually are careful to ſelect ſuch places as are leaſt expoſed to the rigours of the enſuing ſeaſon, and frequently cover them from it in an artful manner. Some make a general coat of a hairy matter over them, taking the hairs from their own bodies for that purpoſe; others hide themſelves in hollow places in trees, and in other ſheltered cells, and there live in a ſort of torpid ſtate the whole winter, that they may depoſit their eggs in the ſucceeding ſpring, at a time when there will be no ſeverities of weather for them to combat. The day-butterflies only do this, and of thoſe but a very few ſpecies; but the night ones, or *phalenæ*, all without exception, lay their eggs as ſoon as they have been in copulation with the male, and die immediately afterwards.

It is well known that the common and natural food of theſe creatures is the leaves and verdure of vegetables; yet as weak and harmleſs as they ſeem, they will many of them deſtroy their fellows whenever they get an opportunity. Reaumur gives us an inſtance of this in twenty *caterpillars* of the oak, which he kept in a box, with a ſufficient quantity of their natural food, yet their numbers daily decreaſed, till at length there remained only one. This is, however, only the caſe in ſome few ſpecies, the generality of theſe animals being very peaceable, many ſpecies living together in the ſame place, without moleſting one another. Theſe ſpecies, however, though freed from theſe dangers, are expoſed to others of a much more terrible kind; the worms or maggots of ſeveral ſorts of flies are frequently found about them, ſome preying upon their outſide, others lodged within them, under the ſkin, but both kinds eating the poor defenceleſs creature up alive. Thoſe which feed on the outſides are eaſily diſcovered, the others are more hid, and frequently the *caterpillar*, which ſeems very hearty and vigorous, and very fleſhy, ſhall be found, upon opening, to be a mere ſkin, the internal parts being all eaten away, and all the food that he ſwallows ſerving only to feed a vaſt number of worms, or maggots, which crawl about at liberty within him. Theſe devouring worms are of many different ſpecies, ſome being of the gregarious, ſome of the ſolitary kinds, and ſome ſpinning webs of their own ſilk to transform themſelves in, others undergoing that change without any ſuch covering. The beautiful *cabbage-caterpillar* is one of thoſe unhappy kinds which frequently are infeſted with the gregarious kinds, large numbers of which ſpin themſelves webs one after another, and afterwards come out in the ſhape of the parent-fly, to whoſe eggs they owed their origin.

Theſe inteſtine enemies are a ſure prevention of the butterfly's appearing at its proper time; and as many of the former naturaliſts, who knew what butterfly to expect from a peculiar ſpecies of *caterpillar* which they preſerved, often ſaw a parcel of flies come out in the place of it, they having no idea that the fly had laid its eggs in the fleſh of the poor creature, ſuppoſed that this was one of the natural transformations of the creature, and that certain ſpecies of *caterpillars* ſometimes produced butterflies, ſometimes ſmall flies.

Theſe, and many other deſtroyers, among which the birds are to be reckoned in the principal place, ſerve a noble purpoſe in preventing the too great numbers of theſe miſchievous animals. Their uſual habitation being the leaves and flowers of plants, they are, in their feeding, much expoſed to all thoſe deſtroyers; yet nature has taken care to preſerve a great number, by making many of them ſo exactly of the colours of the leaves they feed on, that they are not eaſily diſtinguiſhed from them; and by giving others a caution of keeping on the under part of the leaves, and being, by that means, out of ſight. But ſome ſpecies are much leſs expoſed, and of much more miſchief to the plants they feed on, by devouring more eſſential parts of them. Of theſe ſome eat the roots, and others the interior part of the trunk, deſtroying the veſſels that imbibe, and thoſe that diſtribute the juices. Theſe are different from the common *caterpillars*, in that their ſkin is much leſs tough and hard, and theſe are ſecure from our obſervation, and, in general, from their great deſtroyers the birds. They are not, however, abſolutely ſafe from the common dangers of the other ſpecies; for there are a kind of worms that find their food and habitation even in the bodies of theſe.

The root-*caterpillars*, and thoſe which live within the branches of plants, are much more eaſily found out. The roots of ſcrophularia, and the ſtalks of lettuces, and ſome other plants, afford *caterpillars* which ſeem all of the ſame ſpecies. Thoſe found in the lettuces are extremely plentiful ſome years, and deſtroy vaſt quantities of that plant. Theſe uſually have their firſt habitation in the ſtalk, near the root.

Nothing more ſurpriſes us, in regard to inſects, than their induſtry; and in this the *caterpillars* yield to no kind, not to mention their ſilk, the ſpinning of which is one great proof of it. The ſheaths and caſes which ſome of theſe inſects build for the paſſing their transformations under, are, by ſome, made of the ſilk, with their own hair, mixed with pieces of bark, leaves, and other parts of trees, with paper, and other materials; and the ſtructure of theſe is well worthy our attention.

There are others whoſe workmanſhip, in this article, far exceeds theſe. There is one which builds in wood, and is able to give its caſe a hardneſs greater than that of the wood itſelf in its natural ſtate. This is the ſtrange horned *caterpillar* of the willow, which is one of thoſe that eat their *exuviæ*. This creature has extremely ſharp teeth, and with theſe it cuts the wood into a number of ſmall fragments; theſe fragments it afterwards unites together into a caſe, of what ſhape it pleaſes, by means of a peculiar ſilk, which is no other than a tough and viſcous juice, which hardens as it dries, and is a ſtrong and firm cement. The ſolidity of the caſe being thus provided for, we are to conſider, that the *caterpillar* incloſed in it is to become a butterfly, and the wonder is, in what manner a creature of this helpleſs kind, which has neither legs to dig, or teeth to gnaw with, is to make its way out of ſo firm and ſtrong a lodgment as this, in which it is hatched. It has been ſuppoſed by ſome, that the butterfly, as ſoon as hatched, diſcharged a liquor which ſoftened the viſcous matter that holds the caſe together, and ſo its ſeveral fragments falling to pieces, the way out lies open. This is evidently the truth of the caſe, though thoſe who ſuppoſed it, did it by mere conjecture; for, on a ſtrict examination, this liquor is always to be found in the animal, and is of the moſt proper kind for ſuch a ſervice. Reaumur judged, from the effects, that this liquor muſt be of a ſingular nature, and very different from the generality of animal fluids; and in diſſecting this creature in the *caterpillar* ſtate, there will always be ſound near the mouth, and under the *œſophagus*, a bladder, of the bigneſs of a ſmall pea, full of a limpid liquor, of a very quick and penetrating ſmell, and which, upon divers trials, proves to be a very powerful acid; and, among other properties, which it has in common with other acids, it ſenſibly ſoftens the glue of the caſe, on a common application.

It is evident that this liquor, beſides its uſe to the *caterpillar*, remains with it in the chryſalis ſtate, and is the very thing that gives it a power of diſſolving the ſtructure of the caſe, and making its way through in a proper manner, at the neceſſary time. Dr. Boerhaave has adopted the opinion, that there are no true acids in animals, except in the ſtomach, or inteſtines; but this familiar inſtance proves the error of that determination. Phil. Tranſ. abr. vol. ix. p. 39, &c.

Another very curious and myſterious artifice, is that by which ſome ſpecies of *caterpillars*, when the time of their changing into the chryſalis ſtate is coming on, make themſelves lodgments in the leaves of the trees, by rolling them up in ſuch a manner as to make themſelves a ſort of hollow cylindric caſe, proportioned to the thickneſs of their body, well defended againſt the injuries of the air, and carefully ſecured for their ſtate of tranquillity.

Beſides theſe *caterpillars*, which in this manner roll up the leaves of plants, there are other ſpecies which only bend them once, and others which, by means of thin threads, connect many leaves together to make them a caſe. All this is a very ſurpriſing work, but all much inferior to this method of rolling.

The different ſpecies of *caterpillars* have different inclinations, not only in their ſpinning, and their choice of food, but even in their manners and behaviour one to another. Some never part company from the time of their being hatched to their laſt change, but live and feed together, and undergo together their laſt change into the chryſalis-ſtate. Others ſeparate one from another as ſoon as able to crawl about, and each hunts its fortune ſingle; and there are others which regularly live to a certain time of their lives in community, and then ſeparate each to ſhift for itſelf, and never to meet again in that ſtate. Reaumur, Hiſt. Inſect. vol. ii. *paſſim.*

Caterpillars are very deſtructive and pernicious in gardens, particularly thoſe of two ſpecies. The one of theſe is that which afterwards becomes the common white butterfly. This is of a yellowiſh colour, ſpotted with black, and infeſts the leaves of cabbages, cauliflowers, and the Indian creſs, of which it eats off all the tender parts, leaving only the fibres entire, ſo that whole plantions are often ſeen deſtroyed by them in autumn, eſpecially ſuch as are near large buildings, or are crouded with trees. There is no remedy againſt this evil, but the pulling the creatures off before they are ſpread from their neſts, and watching the butterflies, which are daily, in the hot weather, depoſiting their eggs on theſe plants. Theſe, however, feed principally on the outſide of the leaves of the plants, and are therefore the eaſier taken off; but the other kind lives near the center, and therefore is with much more difficulty diſcovered. This is much larger, and the ſkin is very tough, and of a brown colour. It is called, by the gardeners, a grub, and is extremely pernicious. The eggs which produce it are uſually depoſited in the very heart, or center, of the plant, particularly in cabbages; and the creature, when formed, and grown to ſome ſize, eats its way through all the leaves, and leaves its dung in great quantity behind it, which ſpoils the cabbage. This inſect alſo burrows under the ſurface of the ground, and makes ſad havock among young plants, by eating off their tender ſhanks, and drawing them into the holes. This miſchief is chiefly done in the night; but wherever a plant is ſeen thus deſtroyed, if the earth be ſtirred with a finger an inch deep, the creature will be certainly found, and this is the only way of deſtroying them. Miller.

When theſe inſects attack fruit-trees, the beſt method of driving them off is to boil together a quantity of rue, wormwood, and the common tobacco, of each equal parts, in common water; to make the liquor very ſtrong, and ſprinkle it on the leaves and young branches every night and morning, during the time when the fruit is ripening.

In Dr. Hawkeſworth's Account of the Voyages to the South Seas, vol. iii. p. 520, we have the following account of a kind of ſmall green *caterpillar*, which the voyagers found in great numbers, on the true Weſt Indian mangroves. Their bodies were thick ſet with hairs, and they were ranged on the leaves ſide by ſide like files of ſoldiers, to the number of twenty or thirty together. When they touched them, they found that the hair on their bodies had the quality of a nettle, and gave them a much more acute, though leſs durable pain.

Caterpillar, *Connaught*. See *Connaught* Worm.

Caterpillars, *water*, *Erucæ aquaticæ*.—It might ſeem incredible that there is any ſuch creature as a *caterpillar*, whoſe natural habitation is under water; but experience and obſervation prove that there are ſuch, and that they feed on the water-plants as regularly as the common kinds do on thoſe at land. Theſe are not named at random, like many of the aquatic animals of the larger kinds, the ſea-wolf, and the ſea-horſe, &c. which might as well be called any thing elſe as wolves and horſes, but they are properly what they are called, and do not reſpire in the manner of the fiſh-tribe, but by their ſtigmata, as other *caterpillars*. M. Reaumur, in his obſervations, met with two ſpecies of theſe, the one upon the potamogiton, or pond-weed, the other upon the lenticula, or duck-meat. Theſe are both very induſtrious animals; but the firſt being much the larger, its operations are more eaſily diſtinguiſhed.

This, though truly an aquatic animal, ſwims but badly, and does not at all love to wet itſelf. The parent-butterfly lays her egg on a leaf of the potamogiton, and, as ſoon as the young *caterpillar* is hatched, it gnaws out a piece of the leaf of a roundiſh ſhape. This it carries to another part of the ſame leaf, and lays it in ſuch a manner, that there may be a hollow between, in which it may lodge. It then faſtens down this piece to the larger leaf with ſilk of its own ſpinning, only leaving certain holes at which it can put out its head, and get to gnaw any of the leaves that are near. It eaſily gets out, though the aperture be naturally ſmall, ſince a little force from its body bends up the upper leaf, and bends down the lower, both being flexile; and when the creature is out, it has a ſort of down that defends itſelf from being wetted, and the natural elaſticity of the leaves, and of the ſilk, join the aperture up again, ſo that no water can get in. The leaves of this kind of plant are alſo naturally very ſlippery, and not eaſily wetted by water. It ſoon happens, that this habitation becomes too ſmall for the animal, in which caſe it makes juſt ſuch another, and after that, at times, ſeveral others, each being only made fit for it at the ſize it is then of. The changes of this creature into the chryſalis and butterfly ſtate, are in the common method. The butterfly gets out of a chryſalis which was placed on the ſurface of the water, the lightneſs of the animal eaſily ſuſtains it on the water till its wings are dried, and it then leaves that element never to return to it again. Mem. Acad. Par. 1736.

Caterpillars, *wood*, *Erucæ ſylveſtres*, the name of a genus of *caterpillars* which do not live in the manner of others on leaves of trees or plants, or open to our obſervation, but under the bark, in the trunk and branches, and in the roots of trees, and ſometimes in the body of fruits.

Theſe are eaſily diſtinguiſhed from thoſe worms and maggots which are found in roots and fruits, and owe their origin to flies of another kind; but are ſubject to be confounded with a ſort of animals, called by M. Reaumur, *falſe* or *baſtard caterpillars*, which carry a great reſemblance in their figure to the real *caterpillars*, but which have more legs than any of the true ones have, and are finally transformed into four-winged flies, which are not true butterflies.

The butterflies which are the parents of thoſe *caterpillars* which live immured in trees or fruits, lay their eggs on the ſurface, and the young *caterpillars*, when hatched, eat their way in.

What appears ſomething ſurpriſing, however, in this, is, that there uſually is only one *caterpillar* in a fruit, which is large enough to afford food to a large number; and if there are ſometimes found two creatures within, one is uſually a *caterpillar*, the other a worm of ſome other kind. The whole occaſion of which is, that the operation of penetrating into the fruit, is ſo difficult to the young animal, that it ſeldom ſucceeds in it; and though the butterfly depoſits many eggs on each fruit, and theſe all hatch, yet it is only here and there one on a fruit that can find the way into it.

Theſe creatures, when once lodged in their priſon, have nothing to do but to eat up the ſubſtances which incloſe them, leaving the outer hard ſhell unhurt, which ſtill ſerves as a caſe for them: this is a very frequent caſe in the grains of corn, where the farinaceous ſubſtance ſerves as aliment, and the hard outer ſkin becomes a firm hollow caſe afterwards for the animal. The farinaceous ſubſtance in this caſe uſually proves enough for the animal in its *caterpillar* ſtate; but if it does not, the creature has recourſe to a very ſingular expedient; it eats again its own excrements, and finds its now ſtronger ſtomach able to ſeparate nouriſhment from that very matter, which had before paſſed off from its weaker ſtomach undigeſted.

Of theſe ſpecies of *caterpillars*, ſome go out of their priſon in order to change into their chryſalis, and thence into their butterfly ſtate; but the greater number remain there, and paſs through all their changes within.

Theſe *caterpillars*, like all the other kinds, have certain fleſh-eating worms, whoſe parents are of the fly-kind, for their terrible enemies and deſtroyers; and it is not unfrequent, on opening one of theſe ſpoiled fruits, inſtead of the expected *caterpillar*, to find a fly juſt ready to come out; this has been produced from the chryſalis of a worm, which had before found its way into the fruit, and eat up the *caterpillar*, which was the original poſſeſſor of the place. A. D. S. an. 1736; and Reaumur, Hiſt. des Inſ. tom. ii.

Caterpillar-*eaters*, a name given by ſome authors to a ſpecies of worms which are bred in the body of a *caterpillar*, and eat its fleſh: theſe are owing to a certain kind of fly which lodges her eggs in this animal, and they, after their proper changes, become flies like their parents.

M. Reaumur has given us, in his Hiſtory of Inſects, ſome very curious particulars in regard to theſe little worms. This inſect is called the ICHNEUMON of *caterpillars*.

Caterpillars, *Scorpiurus*, in *Botany*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: the empalement of the flower is of one leaf, erect, blown up, lightly compreſſed, ending in five acute points. The flower is of the butterfly-kind; it has a roundiſh ſtandard, indented at the point, where it is reflexed and ſpreading; the wings are looſe, almoſt oval, having obtuſe appendages; the keel is half-moon ſhaped; the belly is gibbous, pointed, and erect, cut in two parts below. It hath ten ſtamina, nine joined, and one ſeparate, terminated by ſmall ſummits; and an oblong taper germen a little reflexed, ſupporting a riſing inflexed ſtyle, terminated by a point for a ſtigma; the germen afterward becomes an oblong, taper, leathery, rough, channelled pod, twiſted in many longitudinal cells, in ſize and appearance of a large *caterpillar*, from whence it had this title, divided within, and on the outſide contracted into knotty joints, each cell containing one ſeed. There are five ſpecies.

All theſe plants are annual, and grow naturally in moſt of the warm countries in Europe, but have been long cultivated in the Engliſh gardens.

Caterpillar-*ſhell*. See Turbo.

CATERVA, in *Ancient Military Writers*, a term uſed in ſpeaking of the Gauliſh or Celtiberian armies, denoting a body of 6000 armed men.

The word *caterva*, or *catervarius*, is alſo frequently uſed by ancient writers to denote a party or corps of ſoldiers in diſorder or diſarray: by which it ſtands diſtinguiſhed from COHORT or *turma*, which were in good order.

CATESBÆA, in *Botany*. See *Lily*-Thorn.

CATHÆRETICS, or Cathæretic *medicines*, are ſuch as ſerve to conſume, and eat off, fungous or proud fleſh growing in wounds, ulcers, and the like.

The word is formed from καθαιρω, ſometimes uſed for *depaſcor*, or *abſumo*, *I eat*, *conſume*, &c. of κατα, and αιρεω, *I take away*.

Cathæretics are otherwiſe denominated SARCOPHAGOUS *medicines*, q. d. *fleſh-eaters*.

Such are red precipitate, burnt alum, *æs uſtum*, blue vitriol, &c.

Cathæretic only differs in degree from CAUSTIC or ſeptic, which are more violent in their operation.

CATHALOGON, in the *Materia Medica*, a name by which ſome call the fruit we know by the name of faint Ignatius's *bean*.

CATHARI, in *Eccleſiaſtical Writers*, ancient Chriſtians, who made profeſſion of greater purity in diſcipline and ſanctity of life than others.

The appellation *Cathari* was chiefly given to the ſect of Novatians.

In after-times, however, the ſame was alſo applied to ſeveral other ſects, who pretended to extraordinary purity, and particularly to a fanatical ſect, who came from Greece into Italy, and were firſt diſcovered in the Milaneſe about the middle of the eleventh century. They were called in France, and other countries, Albigenses, Paterini, and Publicans. See Paulicians and Puritans.

CATHARINE, *Knights of St.* Catharine *of Mount Sinai*, an ancient military order, erected for the aſſiſtance and protection of pilgrims going to pay their devotions to the body of St. *Catharine*, a virgin of Alexandria, diſtinguiſhed for her learning, and ſaid to have ſuffered martyrdom under Maximin.

The body of the martyr having been diſcovered on mount Sinai, cauſed a great concourſe of pilgrims; and travelling being very dangerous, by reaſon of the Arabs, an order of knighthood was erected in 1063, on the model of that of the holy ſepulchre, and under the patronage of St. *Catharine:* the knights of which obliged themſelves by oath to guard the body of the ſaint, keep the roads ſecure, obſerve the rule of St. Baſil, and obey their grand maſter. Their habit was white, and on it were repreſented the inſtruments of martyrdom whereby the ſaint had ſuffered; viz. a half-wheel armed with ſpikes, and traverſed with a ſword ſtained with blood.

CATHARINE, *Fraternity of St. Catharine at Sienna*, a ſort of religious ſociety inſtituted in that city, in honour of St. Catharine, a ſaint famous for her revelations, and for her marriage with Jeſus Chriſt, whoſe wedding ring is ſtill preſerved as a valuable relick. This *fraternity* yearly endows a certain number of deſtitute virgins, and has the privilege of redeeming annually two criminals condemned for murder, and the ſame number of debtors, by paying their debts.

CATHARINE, *Order of St.* in *Modern Hiſtory*, belongs to ladies of the firſt quality in the Ruſſian court. It was inſtituted in 1714, by *Catharine* wife of Peter the Great, in memory of his ſignal eſcape from the Turks in 1711. The emblems of this order are a red croſs, ſupported by a figure of St. *Catharine*, and faſtened to a ſcarlet ſtring edged with ſilver, on which are inſcribed the name of St. *Catharine*, and the motto, *Pro fide & patria.*

CATHARMA, from καθαιρω, *I expiate*, in *Antiquity*, ſome miſerable or flagitious wretch, ſacrificed to the gods as an expiation for the plague, or other calamity. Such was the prophet Jonas, caſt into the ſea; and ſuch does St. Paul wiſh himſelf to be. See ACCURSED.

CATHARMA, Καθαρμα, from καθαιρω, *to purge*, in *Medicine*, imports the excrements purged from any part of the body; as the ſtomach, inteſtines, or bladder.

CATHARMOS, in *Medicine*, of the ſame derivation, implies purgation by medicines, or the cure of a diſorder by ſuperſtitious ceremonies or ſacrifices. The cure of the king's evil by the royal touch, if ſuch a thing had been effected, might be ſaid to be performed by a *catharmos.*

CATHARTICS, or CATHARTIC *medicines*, are remedies which promote evacuation by ſtool.

Cathartics are the ſame with what we otherwiſe denominate *purgatives.*

Cathartics are of three principal kinds, *mild*, *moderate*, and *violent:* the firſt purge gently, as caſſia, manna, tamarinds, rhubarb, ſena, &c. the ſecond pretty briſkly, as jallop, ſcammony, &c. the third ſeverely, as colocynth, hellebore, laureola, &c. See each under its proper article.

Cathartics are likewiſe divided by ſome into cholagogues, phlemagogues, melanagogues, and hydragogues; the firſt ſuppoſed to purge bile, the ſecond pituita, the third melancholy, and the fourth ſeroſities.

For the theory of *cathartics*, and the manner wherein they operate, ſee PURGATIVES.

A ſafe, pleaſant, gentle, and effectual purgative or *cathartic* may be at any time prepared in the following manner. Take a quart of Dulwich water, or any other water of a like kind, diſſolve in this over the fire an ounce of manna, and half an ounce of black tamarinds; ſtrain off the liquor, and let it be taken at ſeveral draughts, at an half hour's diſtance or leſs, the whole being drank in an hour and half, or two hours.

The purging mineral waters act with more eaſe, gentleneſs, and ſafety, than any of the ſhop medicines; all that they require is to be either concentrated by boiling away a part, or elſe quickened as in this manner; and a general trial of a purge of this kind would perhaps encourage the practiſers of phyſic to reject almoſt all the common rough purges in uſe.

CATHARTIC *extract.* See EXTRACTUM *catharticum.*

CATHARTIC *ſalt*, *ſal catharticum amarum*, a denomination given to what we improperly call EPSOM *ſalt.*

CATHEDRA, in a general ſenſe, a chair.

The word is more particularly uſed for a profeſſor's chair, and a preacher's pulpit.

CATHEDRA is alſo uſed for the biſhop's ſee, or throne, in a church.

CATHEDRA, *ex*, a phraſe uſed in ſpeaking of the ſolemn dictates or deciſions of prelates, chiefly the popes, delivered in their pontifical capacity.

The advocates for the papacy maintain, that the pope is infallible *ex cathedra*, a term of modern theology entirely unknown to the ancients. Even thoſe who uſe it do not agree in the explication of it.

CATHEDRAL, a church wherein is a biſhop's ſee, or ſeat. The word comes from the Greek καθεδρα, *chair*, of καθεζομαι, *ſedeo*, *I ſit.*

The denomination *cathedral* ſeems to have taken its riſe from the manner of ſitting in the ancient churches, or aſſemblies of primitive Chriſtians: in theſe, the council, i. e. the elders and prieſts, was called *preſbyterium*; at their head was the biſhop, who held the place of chairman, *cathedralis*, or *cathedraticus*; and the preſbyters, who ſat on either ſide, were alſo called by the ancient fathers, *aſſeſſores epiſcoporum.* The epiſcopal authority did not reſide in the biſhop alone, but in all the preſbyters, of whom the biſhop was preſident.

A *cathedral* therefore, originally, was different from what it is now; the Chriſtians, till the time of Conſtantine, having no liberty to build any temple: by their churches, they only meant their aſſemblies; and by *cathedrals*, nothing more than conſiſtories.—Whence appears the vanity of ſome authors, eſpecially the Spaniards, who pretend their *cathedrals* to have been built in the times of the apoſtles.

CATHEDRATIC *doctor*, *doctor cathedraticus*, denotes a doctor poſſeſſed of a chair or fellowſhip in ſome of the univerſities of Spain.

They ſay a *cathedratic doctor* of Salamanca, of Alcala, &c.

CATHEDRATICUM, in *Eccleſiaſtical Writers*, denotes a ſum of money, amounting to two ſhillings, anciently paid annually by the inferior clergy to their biſhops, or as often as he viſited his dioceſe, *ob honorem cathedræ*, i. e. as an argument of their ſubjection, and for the honour of the biſhop's ſee or CATHEDRA.

This was otherwiſe denominated *ſynodaticum*, and in modern writers PROCURATION.

CATHEDRATICUM alſo denotes a ſum which biſhops newly ordained gave partly to biſhops or patriarchs, by whom they were conſecrated, and partly to the clerks and notaries who officiated on the occaſion.

This was alſo called ενθρονιστικον, as being given on account of the throne, or chair, they had now obtained, and *ſynodaticum*, or SYNODALS.

Biſhops conſecrated by patriarchs or metropolitans, provided their church was not worth leſs than thirty pounds of gold, were to pay an hundred ſolidi by way of *cathedraticum.*

CATHERETIC. See CATHÆRETIC.

CATHERINE. See CATHARINE.

CATHETER, among *Surgeons*, a hollow probe, or inſtrument, uſually of ſilver, ſomewhat crooked; to be introduced into the bladder, in order to ſearch for the ſtone, or to diſcharge the urine when ſuppreſſed.

The word is formed from καθιημι, *immitto*, in regard this inſtrument is uſed to be impelled into the bladder.

Helmont rejects the common metalline *catheter* uſed by Galen and his followers, as cruel, and even noxious; and ſubſtitutes another in its place made of leather. Others have provided a flexible *catheter* made of flatted ſilver, and convoluted, in order to give a continual paſſage to the urine, and to prevent the repetition of the painful operation of paſſing the *catheter* for this purpoſe.

Dr. Hales deſcribes a *catheter* of a new ſtructure contrived for the more advantageous injection of lithontriptics into the bladder: its cavity is divided lengthways by a thin partition into two ſeparate channels, which end in two divaricating branches. By one of theſe branches the *menſtruum* is to be injected into the bladder, in the common, or rather in the hydroſtatical way, while it returns mixed with urine by the other. Hales, Hæmaſtat. p. 212. See STAFF, and LITHOTOMY.

Dr. le Cat, ſurgeon at Rouen, has invented a new *catheter.* See *Tab. Surgery*, *fig.* 1. A is its crooked end, which is ſplit lengthways into two pieces; the concave piece A is fixed, and of the ſame piece with the reſt of the inſtrument, and the convex piece C is moveable, having its fixed point joined by a hinge to the end *a* of the piece A, and its moveable part jointed at *b*, with a piece which makes the end of a ſtrong ſtilet, or wire, that runs through the center of the piece B, where it is rivetted at *e.* This piece B, the wire, and the piece C, are held in the ſituation which the operator puts them in by the ſcrew E, the end of which bears againſt the piece B. This is made of two ſolid plates of ſilver ſoldered together, in the middle of which a groove has been made to lodge the wire. The handle D is ſquare; the body G is almoſt entirely ſolid, leaving in its center but juſt room enough for the paſſage of the wire; this part is ſoldered to the piece D at H. This *catheter* is made of ſilver from the rings incluſive to F; all the reſt, together with the wire, ought to be of the hardeſt gold. *Fig.* 2. exhibits the whole mechaniſm of this *catheter*, by repreſenting it open, and ſuch as it is in the bladder, while the inciſion is making. See a fuller deſcription and account of its uſe in the Philoſophical Tranſactions, vol. xliii. p. 400.

CATHETERISMUS, a chirurgical operation, whereby either ſomething medicinal is injected into the bladder, or ſome foreign body prejudicial to the making of urine, as coagulated blood, a ſtone, or the like, is drawn away, by means of a crooked, tubular inſtrument, called a CATHETER.

CATHETOLIPES, in *Natural Hiſtory*, the name of a genus of foſſils of the claſs of the *ſelenitæ*, but differing from the common kinds in the diſpoſition of the conſtituent plates.

The word is derived from καθετος, *perpendicular*, and λεπις, a *ſcale* or *plate*, and expreſſes a ſet of theſe bodies whoſe plates are ranged perpendicularly. All the known *ſelenitæ*, except thoſe of this genus, are compoſed of a number of parallel plates, or thin flakes, ranged evenly horizontally on one another.

CATHETO-PLATEUS, in *Natural Hiſtory*, a term, with its oppoſite, which is *plagioplateus*, very much uſed by Artedi, and others who adopt his ſyſtem, in the deſcription of fiſhes: they may be very well explained in Engliſh, by the two familiar words, *compreſſed* and *depreſſed*. The heads of fiſhes are the principal part charactered by theſe terms.

CATHETUS, in *Geometry*, a perpendicular, or a line, or radius, falling perpendicularly on another line, or ſurface.

Thus, the *catheti of a rectangle triangle*, are the two ſides that include the right angle.

CATHETUS *of incidence*, in *Catoptrics*, is a right line drawn from a radiant point, perpendicular to the reflecting line, or the plane of the ſpeculum, or mirror.

CATHETUS *of reflexion*, or *of the eye*, a right line drawn from the eye, or from any point of a reflected ray, perpendicular to the plane of reflexion, or of the ſpeculum. See REFLEXION.

CATHETUS, in *Architecture*, is a perpendicular line, ſuppoſed to paſs through the middle of a cylindrical body, as a column.—See *Tab. Archit. fig.* 29. *and* 30.

Cathetus is ſometimes applied to a line in the Ionic capital, paſſing perpendicularly through the eye or center of the VOLUTE.

This is otherwiſe called the axis of the *volute*.

CATHOLIC, from κατα and ὅλος, *whole*, denotes a thing that is univerſal, or general.

Some have ſaid, that Theodoſius the Great firſt introduced the term *catholic* into the church; appointing by an edict, that the title ſhould be applied, by way of pre-eminence, to thoſe churches which adhered to the council of Nice, in excluſion of the Arians, &c.—*Catholiciſm*, however, ſoon changed hands; for under the emperor Conſtantius, Arianiſm became ſo predominant, that the Arians were called the *catholics*. But the term was uſed much more anciently, as by Polycarp and Ignatius. *Ubi fuerit Jeſus Chriſtus*, (ſays the latter) *ibi eſt eccleſia* CATHOLICA. The Romiſh church now aſſumes the diſtinguiſhing appellation of the *catholic* church.

CATHOLIC *king*, is a title which has been long hereditary to the king of Spain. Mariana pretends, that Reccarede firſt received this title after he had deſtroyed Arianiſm in his kingdom, and that it is found in the council of Toledo for the year 589. Vaſcè aſcribes the origin of it to Alphonſus in 738. Some allege that it has been uſed only ſince the time of Ferdinand and Iſabella. Colombiere ſays, it was given them on occaſion of the expulſion of the Moors. The Bollandiſts pretend, it had been borne by their predeceſſors, the Viſigoth kings of Spain; and that Alexander VI. only renewed it to Ferdinand and Iſabella. Others ſay, that Philip de Valois firſt bore the title; which was given him after his death, by the eccleſiaſtics, on account of his favouring their intereſts.

In ſome epiſtles of the ancient popes, the title *catholic* is given to the kings of France, and of Jeruſalem, as well as to ſeveral patriarchs and primates.

CATHOLIC *furnace*, is a little furnace, ſo contrived, as to be fit for all kinds of operations, which do not require an intenſe fire.

CATHOLICIANI, in *Middle Age Writers*, the officials or miniſters of the CATHOLICI, or receivers of the taxes of a dioceſe, ſometimes alſo denominated CÆSARIANI.

CATHOLICON, in *Pharmacy*, a kind of ſoft purgative electary; ſo called, as being ſuppoſed univerſal; or a purger of all humours.

Different authors give different recipes for it: that called *Catholicon Nicolai* was long in uſe; it conſiſts of ſixteen ingredients, the chief whereof are tamarinds, caſſia, ſena, and rhubarb. It was called the double *catholicon*, when there was a double portion of ſena and rhubarb.

The **CATHOLICON** *for* CLYSTERS, only differs from this, in that it had no rhubarb, and that honey was uſed in it inſtead of ſugar.

CATHOLICUS, the title of a dignitary, or magiſtrate, under the Roman emperors, who had part of the adminiſtration, and particularly the care and receipt of the revenues and taxes in Roman dioceſes.

The *catholicus* was the ſame with what was denominated by the Latins *procurator*, and *rationalis Cæſaris*. Such was the *catholicus* of the dioceſe of Africa, mentioned by Euſebius, and other ancient writers.

CATHOLICUS, among *Eccleſiaſtical Writers*, an appellation given to the primates or METROPOLITAN prelates of ſeveral churches in Aſia, ſubject to the ſee of Antioch; but whoſe juriſdiction and dioceſes are of ſuch extent that they have aſſumed the title of *catholici*, q. d. *univerſal biſhops*. See PRIMATE.

CATKIN, among *Botaniſts*, a cluſter of flowers affixed to an axis: in ſome caſes, there are ſquamæ on the axis which do the office of cups; in others the flowers are naked. This is otherwiſe called *julus*, and *amentum*.

CATLIN, among *Surgeons*, is a diſmembring knife, for cutting off any corrupted part of a body.

CATMINT, *Nepeta*, in *Botany*, a genus of the *didynamia gymnoſpermia* claſs. Its characters are theſe: the empalement of the flower is cylindrical, indented into five acute parts at the top. The flower is of the lip kind, with one petal, having an incurved cylindrical tube, gaping at the top. The upper lip is erect, roundiſh, and indented at the point. The under lip is large, concave, entire, and ſawed on the edge: it hath four awl-ſhaped ſtamina, ſituated under the upper lip; two of which are ſhorter than the other. In the bottom of the tube is ſituated a quadrifid germen, which afterward turns to four oval ſeeds, ſitting in the empalement. There are twelve ſpecies.

The whole plant has a ſtrong ſcent between mint and penny-royal. It is called *catmint*, becauſe cats are very fond of it, eſpecially when it is withered; for then they will roll themſelves on it, and tear it to pieces, chewing it with great pleaſure. Miller's Gard. Dict.

It conſiſts of warming and attenuating parts, ſomewhat like penny-royal; and like that is of great ſervice in opening obſtructions of the womb, and helping in the green ſickneſs: as alſo hyſteric fits and vapours. It promotes the birth and lochia, and is by ſome authors commended againſt barrenneſs.

CATOCHE, or CATOCHUS, from κατεχω, *I retain*, in *Medicine*, a kind of waking ſleep; or a vehement diſpoſition of the body to ſleep, without being able to attain it; the eyes ſtill remaining open, and the breath entire, but the body motionleſs, and in the ſame poſture wherein the patient was firſt ſeiſed.

The *catoche* is the ſame with CATALEPSIS. It differs from the COMA and CATAPHORA, in that the eyes are open in the former, and cloſed in the latter. See COMA.

CATOCHITES, in *Natural Hiſtory*, the name of a foſſil mentioned among the ancients, as having great virtues in medicine, and in the cure of wounds. It is ſaid to have been found in Corſica; and Pliny records this remarkable property of it, that if the hand were held upon it for ſome time, it would ſtick to it in the manner of glue. Hence it appears to have been a bitumen.

CATOCYSTUS, in *Natural Hiſtory*, a name given to one of the general diviſions of the *echinodermata*, or ſea hedge-HOGS. Theſe have their aperture for the anus not at the top of the ſhell, as the *anocyſti* have it, but in ſome part of the baſe.

For the more accurately diſtinguiſhing theſe into genera, the baſes of the ſhell are to be divided into the *regular* and *irregular*. The *regular* are thoſe which are round or oval; the *irregular*, thoſe which are made with ſinuſes and angles.

CATODON, in the Artedian ſyſtem of *Ichthyology*, the name given to a genus of the *plagiuri*, or cetaceous fiſhes, the characters of which are theſe: the teeth are placed only in the lower jaw; there is no fin upon the back; and the fiſtule is placed either in the head or the ſnout. The ſpecies of this genus are only two.

This, in the Linnæan ſyſtem, is the name of a ſpecies belonging to the genus denominated *phyſeter*, in the order of *cete*, and claſs of *mammalia*.

The word *catodon* is derived from κατα, *below*, and οδους, *a tooth*; and expreſſes that the fiſh has teeth only in the lower part of its mouth.

CATOMUM, or CATOMUS, from κατα and ωμος, *ſhoulder*, in *Middle Age Writers*, denotes that part of the body below the neck, and between the ſhoulders.

CATOPSIS, in *Medicine*, a diſorder of the ſight; more uſually called MYOPIA.

CATOPTRICS, the ſcience of reflex viſion; or that branch of optics, which delivers the laws of light, reflected from mirrors, or ſpecula.

The doctrine and laws of *catoptrics* are laid down under the head of OPTICS.

The word comes from κατοπτρον, *ſpeculum*; of κατα, and οπτομαι, *video*, *I ſee*.

CATOPTRICAL *Dial*, a dial which exhibits objects by reflected rays. See REFLECTING *Dial.*

CATOPTRIC *Teleſcope*, a teleſcope that exhibits objects by reflexion. See *Reflecting* TELESCOPE.

CATOPTRIC *Ciſtula*, a machine, or apparatus, whereby little bodies are repreſented extremely large; and near ones extremely wide, and diffuſed through a vaſt ſpace; with other agreeable phænomena: by means of mirrors, diſpoſed by the laws of *catreptics*, in the concavity of a kind of cheſt.

Of theſe there are various kinds, accommodated to the various intentions of the artificer: ſome multiply the objects; ſome deform them; ſome magnify, &c.—The ſtructure of one or two of them will ſuffice to ſhew how many more may be made.

To make a CATOPTRIC *Ciſtula to repreſent ſeveral different ſcenes of objects, when viewed at different foramina, or holes.*

Provide a polygonous ciſtula, or cheſt, of the figure of the multilateral priſm ABCDEF (*Tab. Optics, fig.* 19.), and divide its cavity by diagonal planes EB, FC, DA, interſecting each other in the center, into as many triangular locules, or ſhells, as the cheſt has ſides. Line the diagonal planes with plain mirrors: in the lateral planes make round holes, through which the eye may peep within the locules of the cheſt. The holes are to be covered with plain glaſſes, ground within-ſide, but not poliſhed, to prevent the objects, in the locules, from appearing too diſtinctly. In each locule are to be placed the different objects, whoſe images are to be exhibited; then covering up the top of the cheſt with a thin tranſparent membrane, or parchment, to admit the light; the machine is complete.

For, from the laws of reflexion, it follows, that the images of objects, placed within the angles of mirrors, are multiplied, and appear ſome more remote than others; whence the objects in one locule will appear to take up more room than is contained in the whole cheſt. By looking, therefore, through one hole only, the objects in one locule will be ſeen, but thoſe multiplied, and diffuſed through a ſpace much larger than the whole cheſt: thus every new hole will afford a new ſcene: according to the different angles the mirrors make with each other, the repreſentations will be different; if they be at an angle greater than a right one, the images will be monſtrous, &c.

The parchment that covers the machine, may be made pellucid, by waſhing it ſeveral times in a very clear lye, then in fair water, and bracing it tight, and expoſing it to the air to dry. If it be deſired to throw any colour on the objects, it may be done by colouring the parchment. Zahnius recommends verdigriſe ground in vinegar, for green; decoction of Braſil wood, for red, &c. He adds, that it ought to be varniſhed, to make it more pellucid.

To make a CATOPTRIC *Ciſtula to repreſent the objects within it prodigiouſly multiplied, and diffuſed through a vaſt ſpace.*

Make a polygonous ciſtula, or cheſt, as before, but without dividing the inner cavity into any apartments, or locules (*Tab. Optics, fig.* 19.); line the lateral planes CBHI, BHLA, ALMF, &c. with plane mirrors, and at the foramina, or apertures, pare off the tin and quickſilver, that the eye may ſee through: place any objects in the bottom MI, v. g. a bird in a cage, &c.

Here the eye looking through the aperture *hi*, will ſee each object placed at bottom, vaſtly multiplied, and the images removed at equal diſtances from one another. Hence, were a large multangular room, in a prince's palace, lined with large mirrors, over which were plain pellucid glaſſes to admit the light; it is evident the effects would be very ſurpriſing and magnificent.

CATOPTRITES, in *Natural Hiſtory*, a name given by ſome writers to a ſtone of the marble kind, which, when poliſhed, was capable of ſerving as a ſpeculum, either flat, and only uſed to repreſent the images of things; or concave, and uſed as our reflecting burning-glaſſes. The hard black marbles were moſt frequently uſed for this purpoſe; but ſometimes the reddiſh ones, and ſometimes one or other of the jaſpers. All theſe were indiſcriminately called by the name *catoptrites*, when put to this uſe.

CATOPTROMANCY, a kind of divination among the ancients; ſo called, becauſe it conſiſted in the application of a MIRROR.

The word is formed from κατοπτρον, *ſpeculum*, and μαντεια, *divinatio.*

Pauſanias ſays, it was in uſe among the Achaians; where thoſe who were ſick, and in danger of death, let down a mirror, or looking-glaſs, faſtened by a thread, into a fountain, before the temple of Ceres; then, looking in the glaſs, if they ſaw a ghaſtly disfigured face, they took it as a ſure ſign of death; on the contrary, if the face appeared freſh and healthy, it was a token of recovery. Sometimes glaſſes were uſed without water, and the images of things future, they ſay, were repreſented in them.

CATROPITÆ. See AGONISTICI.

CATTECORONDE, in the language of the Ceyloneſe, prickly cinnamon. This is a bark very much reſembling cinnamon, but produced by a tree which differs very much in the ſhape of the leaves, and is full of ſharp thorns, which the true cinnamon-tree is not. The bark has nothing either of the taſte or ſmell of cinnamon, though ſo like it externally. The natives uſe the root, leaves, and bark of this tree externally, to ſoften tumours. Phil. Tranſ. Nº 409. See CASSIA and CINNAMON.

CATTLE, a collective name, importing all quadrupeds, uſed either in tilling the ground, or for the food of man. See BEAST.

Under *cattle* ſome include all quadrupeds which aſſociate, or go in herds; as ſheep, oxen, horſes, hogs, &c. Others define *cattle* to be all tame animals which graze. *Cattle* are ſometimes divided into *great*, comprehending oxen, bulls, cows, calves, horſes, &c. and *ſmall*, including ſheep, lambs, goats, and the like.

CATTLE, *black*, more particularly denote the cow kind. Theſe are alſo denominated *neat cattle.*

The management of *cattle* makes a conſiderable branch of what is called HUSBANDRY.

The diſeaſes of *cattle* make the ſubject of that art, called by the ancients *mulo medicina*, and *veteratoria*; and by us, *farrying.*

Dr. Maneſchelli tells us, that in the plague among the *cattle* in Italy, in 1735, rue, wormwood, garlic, and ſuch other ſtrong-ſmelling plants, hung about their noſes and mouths, were eſteemed preſervatives againſt the infection. Nitrous medicines, gunpowder, ſulphur, and the ſharper aromatics did hurt. Bleeding, crude antimony with ſetons, and a diet of the moſt mild ſoftening herbs did ſervice. Med. Eſſ. Edinb. abrid. vol. ii. p. 502.

The ancient riches conſiſted wholly in the number of *cattle*; whence it is ſuppoſed to be, that the Romans called money by a name formed from that of *cattle, pecunia* from *pecus.*

The importation of *cattle* into England, whether living or dead, is prohibited on pain of forfeiture; but *cattle* may be exported, or even tranſported, paying the duties. Factors, and thoſe who ſell *cattle* for others, are prohibited to buy any, except ſwine or calves, within eighty miles of London; and none ſhall be bought and ſold again in the ſame market, on pain of forfeiture. Stat. 3 and 4 Edw. VI. c. 19. 18 Ch. II. c. 2. 22 Ch. II. c. 13. See DROVERS.

Stealing of *cattle*, or killing them with an intent to ſteal any part of the carcaſſes, or aſſiſting in ſuch offences, are now made felony without benefit of clergy. See 14 Geo. II. c. 6. and ſect. 1.

By *cattle*, in this act, is to be underſtood any bull, cow, ox, ſteer, bullock, heifer, calf, ſheep, and lamb, and no other *cattle* whatever. Stat. 15 and 16 Geo. II. c. 34.

CATTUPHUS, or COSSOPHUS, in *Ichthyology*, a name given by Ariſtotle, and other of the Greek writers, to the fiſh called by the Latin authors *merula* and TURDUS *nigricans.* It is a ſpecies of the *labrus*, eaſily known from all the others by its colour; and called, by authors who acknowlege the generical name *labrus*, the bluiſh black *labrus.*

CATTUS, or CATUS, in the *Ancient Military Art*, a kind of machine or device for covering or ſcreening the men; much, if not entirely the ſame with *vinea.* See MANTELET.

CATULUS, in the *Hiſtory of Fiſhes*, the name of a ſea-fiſh, of which authors deſcribe three ſpecies; the *major, maximus*, and *minimus.* It is properly of the GALEUS kind, and has a variouſly ſpotted ſkin, and a wide and large mouth, furniſhed with ſtrong teeth, ſharp-edged, and hollowed inward. The firſt kind is common in our ſeas, and often caught on the coaſt of Cornwall; and the two others principally in the Mediterranean, though ſometimes alſo in our ſeas. Aldrov. de Piſc. lib. iii. c. 34.

CATURUS, in *Botany*, a genus of the *dioecia triandria* claſs.

CATUS *pardus*, in *Zoology*, the name of a beaſt of prey, called alſo by ſome *catus montanus*, and by us the cat of the mountain; and, in the Linnæan ſyſtem, a ſpecies of the cat called FELIS *pardalis.* It is of the ſize of a maſtiff dog; but it reſembles in all reſpects the common domeſtic cat in ſhape, except that the tail is, in proportion to the creature's ſize, conſiderably ſhorter.

It has upright pointed ears, marked with two brown tranſverſe bars: the colour of the head, and whole upper part of the body, a reddiſh brown, marked with long narrow ſpots on the back, and with ſmall ſpots on the ſides: the belly, chin, and throat are white; the tail barred with black. The length of this animal is two feet and a half; and that of the tail, eight inches.

It is leſs fierce againſt the human ſpecies than many of the other beaſts of prey, and may even be tamed. It naturally grows very fat, and inhabits America. Ray, Syn. Quad.

The *serval* of Buffon differs in few particulars from the preceding: the orbits are white: the ſpots on the body are round. It is fierce and untameable; inhabits the woods in the mountainous parts of India; lives and breeds in trees, and leaps with great agility from one tree to another. See *Tab. Quadrupeds, fig.* 5.

CATUS *zibethicus*, in *Zoology*, a name improperly given to the creature which produces the perfume called civet; it not being of the cat, but of the wolf or dog kind. See CIVET.

CATY, CATI, or CATTI, an Eaſt India weight, uſed eſpecially in China. It is equivalent to one pound five ounces, and two drams Engliſh.

The *caty* is divided into ſixteen *taels*, and the *pic* into an hundred *caties*.

The *caty* is alſo uſed in Japan, Batavia, and other parts of the Indies, where it weighs more or leſs, according as it contains a greater or leſs number of *taels*: the *caty* of Java is equivalent to twenty *taels*; that of Cambaya, to twenty-ſeven; the *caty* of Siam is double that of China, and amounts to about 150 French pounds.

The Chineſe alſo give the denomination *caty* to the Siameſe *ſchan*.

CATY is alſo a ſmall weight whereby the lapidaries of the Eaſt weigh their emeralds, equivalent to three grains.

CATY is alſo a money of account, uſed in Java, and ſome of the neighbouring iſlands, amounting to about nineteen florins Dutch money.

In the iſland of Sumatra, *caty* is ſaid to denote a piece of money valued at ſix ſhillings and eight pence ſterling.

CAVA, in *Anatomy*, the name of a vein, the largeſt in the body, terminating in the right ventricle of the heart; where it opens with a large mouth, to convey to it the blood brought from all the parts of the body, by the branches of the other veins, which all terminate in the *cava*. See *Tab. Anat. (Splanch.) fig.* 1. *lit. o.* 12. *lit. ee. (Angeiol.) fig.* 6. *lit. b.* and *cc*.

At its entrance into the right ventricle, it has three membranous valves, called *tricuſpides*, or *triglochines*, from their triangular figure; ſo accommodated, as to allow the blood's paſſage from the *cava* to the heart, and to prevent its return.

The *cava* is divided into the *aſcending* and *deſcending* parts: the *aſcending cava*, is that which ariſes from the lower parts; ſo called, becauſe the blood hereby conveyed to the heart, mounts, or aſcends. The *deſcending cava* comes from the upper parts; and is ſo called, becauſe the blood hereby brought from the head, and other parts, deſcends.

CAVAGIRO, in *Ichthyology*, the name of a fiſh common in the Mediterranean, and brought to the markets in many places. It is ſomething of the eel ſhape, but thinner and flatter. Ray.

CAVALCADE, a formal, pompous march, or proceſſion of horſemen, equipages, &c. by way of parade, or ceremony, as to grace a triumph, public entry, or the like.

CAVALCADOUR, or CAVALCADEUR, anciently denoted a riding-maſter; but at preſent is diſuſed in that ſenſe, and only employed to denote a ſort of equerries, or officers who have the direction of princes ſtables. The French ſay, *ecuyer cavalcadeur* of the king, the duke of Orleans, &c.

Menage writes it *cavalcadour*, and derives it from the Spaniſh *cavalgador*, *a horſeman*.

CAVALET, in the *Glaſs Art*, a ſmall iron ring which ſurrounds the lumella, or hole in the center of the floor, in the tower of the LEER, uſed for annealing glaſs veſſels.

CAVALIER, or CAVALEER, a horſeman, or perſon mounted on horſeback: eſpecially if he be alſo armed and has a military appearance.

Anciently, the word was reſtrained to a knight, or *miles*. See KNIGHT.

The French ſtill uſe CHEVALIER in the ſame ſenſe.

CAVALIER, in *Fortification*, a mount, or elevation of earth, either round, or oblong; having a platform on the top, bordered with a parapet, to cover the cannon placed on it, and cut with embraſures to fire through; ſerving to overlook and command all around the place.

Cavaliers are generally placed within the baſtions, and made of the ſame form, leaving about five fathoms room between the parapets. They ſerve as a rampart to the baſtion, and their height exceeds that of the baſtion by about ſix or ſeven feet. Sometimes they are placed in the gorges, or behind the curtain, but not often.

CAVALIERS, or CAVALEERS, conſidered as a faction. See TORIES.

CAVALLERIA, among the *Ancient Spaniards*, a kind of tax, or impoſition on the inhabitants of great towns and cities, for the ſupport of horſemen.

CAVALLI *Marini*, in *Natural Hiſtory*, are little dried animals about the length of a man's thumb, found on the ſea-coaſt near Pozzuoli. The head reſembles a horſe's, and the body terminates in a tail like that of a ſhrimp. Women, it is ſaid, uſe them to increaſe their milk.

CAVALRY, a body of ſoldiers, who fight, or march on horſeback.

The word comes from the French *cavaliere*, and that from the corrupt Latin *caballus*, *a horſe*; whence *caballarius*, and *cavallarius*, in the later Latin, and καβαλλαριος, in the Greek.

The *cavalry* is uſually divided into horſe and dragoons. The horſe are either regimental, or independent troops; to which latter ſort belong the horſe-guards; and in France, the gens d'armes and muſketeers who ſerve on horſeback. The dragoons and regimental horſe form what they call the *light cavalry*; the troopers, the *heavy cavalry*. When an army is ranged in order of battle, the *cavalry* is poſted on the wings.

Bodies of *cavalry*, ranged in form of battle, are called *ſquadrons*.

The Romans, in their firſt wars, were unacquainted with the uſe of *cavalry*, and made their whole force conſiſt in infantry; inſomuch that, even in the engagement, they made their horſe diſmount, and fight on foot; never reſuming their horſes, but to purſue the enemy the better when routed. It was the *cavalry* of Pyrrhus, that firſt occaſioned them to alter their ſentiments; but eſpecially that of Hannibal, which ſtruck them with ſuch a terror, that the Roman legions durſt not attack them on even ground.

The chief uſe of the *cavalry* is to make frequent excurſions to diſturb the enemy, intercept his convoys, and deſtroy the country; in BATTLE to ſupport and cover the foot, and to break through, and put the enemy in diſorder; alſo to ſecure the retreat of the foot. Formerly the manner of fighting of the *cavalry* was, after firing their piſtols or carabines, to wheel off, to give opportunity for loading again. Guſtavus Adolphus is ſaid to have firſt taught the *cavalry* to charge through, to march ſtraight up to the enemy, with the ſword drawn in the bridle hand, and each man having fired his piece, at the proper diſtance, to betake himſelf to his ſword, and charge the enemy as was found moſt advantageous. The Grecian *cavalry* were divided into *cataphractæ*, and *non cataphractæ*, i. e. into heavy, and light armed.

Of all the Greeks, the Theſſalians excelled moſt in *cavalry*. The Lacedæmonians inhabiting a mountainous country, were but meanly furniſhed with *cavalry*, till, carrying their arms into other countries, they found great occaſion for horſes to ſupport and cover their foot. The Athenian *cavalry*, for a conſiderable time, conſiſted only of ninety-ſix horſemen: after expelling the Perſians out of Greece, they increaſed the number to three hundred, and ſome time after to twelve hundred, which was the higheſt pitch of the Athenian *cavalry*. Potter. Arch. Græc. lib. iii. cap. 3. tom. ii.

The Turkiſh *cavalry* conſiſts partly of SPAHIS, and partly of horſemen raiſed, and maintained by the ZAIMS and TIMARIOTS.

CAVATUM *Sal*, in the *Materia Medica*, a term uſed by ſome of the old Roman writers, as a name for the fineſt ſort of *ſal* GEMMÆ.

CAVAZION, or CAVASION, called alſo CAVING, in *Architecture*, the underdigging, or hollowing of the earth, for the foundation of a building. Palladio ſays, it ought to be the ſixth part of the height of the whole building. See FOUNDATION.

CAUCALIS. See *Baſtard* PARSLEY.

CAUCII *Nummi*, a baſe ſort of coin, current under the lower empire; thus called becauſe concave, like a little cup, from the barbarous Latin, *caucus*, *a cup*. Haloander and Meurſius are miſtaken in ſaying this coin was ſo called from having the figure of a cup on it. Du-Cange. The *caucii* are the ſame with what are popularly called among the Italians, *medaglie di S. Elena*, ſometimes ſuperſtitiouſly worn by the women.

CAUCON, in *Botany*, a name uſed by Pliny, and ſome other authors, for the *equiſetum*, or HORSE-*tail*.

CAUDA, in a general ſenſe. See TAIL.

CAUDA is ſometimes alſo uſed in *Anatomy* to denote the CLITORIS.

CAUDA *Capricorni*, a fixed ſtar of the fourth magnitude, in the tail of Capricorn; called alſo by the Arabs, *Dineb Algedi*. Se γ under CAPRICORN.

CAUDA *Ceti*, a fixed ſtar of the third magnitude; called alſo by the Arabs, *Dineb Kaetos*. See β under CETUS.

CAUDA *Cygni*, a fixed ſtar of the ſecond magnitude in the

Swan's tail; called by the Arabs, *Dineb Adigege*, or *El-degiagich*. See *α* under Cygnus.

Cauda *Delphini*, a fixed ſtar of the third magnitude, in the tail of the Dolphin. See *ε* under Delphinus.

Cauda *Draconis*, the Dragon's tail, in *Aſtronomy*, the name of the moon's ſouthern, or deſcending NODE.

Cauda *Equina*, in *Anatomy*, a denomination given to the loweſt part of the ſpinal marrow, from the laſt *vertebra* of the *thorax* to the end of the *os ſacrum*.

It is thus denominated from its form, which is ſuppoſed to reſemble a horſe's tail. Its ſubſtance is fibrous, and very tenacious.

Cauda *Equina* alſo denotes a medicinal herb, whoſe leaves are reputed to have a ſtrengthening virtue. This, in Engliſh, is called the HORSE-*tail*. The officinal kind is more particularly called by botaniſts EQUISETUM *majus*, in Engliſh, the great marſh horſe-tail.

Cauda *Leonis*, a fixed ſtar of the firſt magnitude in the Lion's tail; called alſo by the Arabs, *Dineb Eleced*. See *β* under Leo.

It is called alſo *Lucida Cauda*.

Cauda *Urſæ Majoris*, a fixed ſtar of the third magnitude, in the extreme part of the tail of the Great Bear, called alſo by the Arabs, *Alalioth* and *Benenath*. See *η* under Ursa *major*.

Cauda *Urſæ Minoris*, a fixed ſtar of the third magnitude, in the extreme part of the tail of the Leſſer Bear; called alſo the polar ſtar, and by the Arabs, *Alrukabah*. See *α* under Ursa *minor*.

CAUDEBEC, in *Manufactures* and *Commerce*, a ſort of hats, thus called from the town of Caudebec in Normandy, where they manufacture a great number of them. They are made of lamb's wool, of the hair or down of oſtriches, or of camel's hair.

CAUDISONA *Vipera*, in *Zoology*, a name by which authors call the RATTLE-SNAKE.

CAUDIVERBA, in *Zoology*, the name of an animal of the lizard kind, called alſo *uromaſtyx*, but more commonly known among authors by the name CORDYLUS.

CAVE, a ſubterraneous hollow place of a certain extent. Some authors diſtinguiſh between a *cave* and a *cavern*, making the firſt the effect of art, and the latter of nature.

Caves were doubtleſs the primitive habitations; before men brought themſelves to erect edifices above ground, they took ſhelter under it. The primitive manner of BURIAL was alſo to repoſite bodies in *caves*, which appears to have been the origin of the CATACOMBS. Phil. Tranſ. N° 244. p. 344.

Badmington *caves*, in Wiltſhire, conſiſt of a ſeries or row of uniform holes, wherein pieces of armour are ſaid to have been found, whence they are by many ſuppoſed to have been tombs of ancient warriors.

Caves long continued the proper habitation of ſhepherds. Among the Romans, *caves*, *antra*, uſed to be conſecrated to the nymphs, who were worſhipped in *caves*, as other gods in the temples.

The Perſians alſo worſhipped their god Mithras in a natural *cave*, conſecrated for the purpoſe by Zoroaſter.

Kircher, after Gaffarellus, enumerates divers ſpecies of *caves*, divine, human, brutal, natural, and artificial.

Of natural *caves*, ſome are poſſeſſed of a medicinal virtue, as the *Grotto de Serpente*; others are poiſonous or memphitical; others are replete with metalline exhalations, and others with waters.

Divers oracular *caves* occur among the ancients, the fumes of which intoxicated the head, and produced a ſort of furor or madneſs, which was interpreted inſpiration, prophecy, and divination. Such were the ſacred caverns at Delphi, which inſpired the Pythia. Such alſo was the Sybil's *cave* at Cumæ in Campania, ſtill ſhewn near the lake Avernus: though Borrichius takes this to be of modern date, and not the true *Antrum Sibyllæ*, ſo finely deſcribed by Virgil. Homer likewiſe gives a deſcription of Αντρον Νυμφων, the *Cave of the Nymphs*, on which Porphyry has a treatiſe ſtill extant, containing many of the ſecrets of the heathen theology, both natural and ſymbolical. Virg. Æn. lib. vi. Hom. Odyſſ. lib. xiii.

The *cave* of the nymph Egeria, where Numa held nightly converſations with that deity, is ſtill ſhewn at Rome.

The *cave* of Trophonius, originally the manſion of that celebrated Bœotian, became afterwards famous for the oracles which Apollo delivered in it. Pauſanias, who viſited it, gives a large deſcription of the ceremonies obſerved by thoſe who entered the cave to conſult that god. Vid. Potter. Arch lib. ii. cap. 10. p. 290, &c.

Cave, *dead*, *live*, in *Mining*. See Live *cave*.

CAVEA, the place in the ancient theatres where the ſpectators were ſeated.

The *cavea*, called by the Greeks κοιλον, ſtands contradiſtinguiſhed from the *ſcena*, σκηνα, which was the place for the actors.

The *cavea* was divided by partitions into three equal parts, riſing one over another: *ima cavea*, appointed for the people of quality, and magiſtrates; the middlemoſt, *media cavea*, for the commonalty; and the uppermoſt, *ſumma cavea*, for the women.

As the theatres were open at top, porticos were erected behind the *cavea*, where the audience might retire for ſhelter, in caſe of rain.

Cavea alſo denoted the middle part in amphitheatres, otherwiſe called ARENA.

Cavea was alſo uſed for the CAGE or den of a wild beaſt, kept for the amphitheatrical ſhews.

CAVEAR, Cavia, or Kavia, a kind of food, or pickle, in great uſe and repute throughout Muſcovy; and alſo introduced upon the Engliſh table.

It is formed from the Italian *caviale*, or barbarous Greek καϐιαρι, which ſignifies the ſame.

The *cavia*, or *cavear*, is the roe, or ſpawn of the ſturgeon, taken out, ſalted, and dried in the ſun, or by the fire. The Italian merchants ſettled at Moſcow, drive an incredible trade with *cavear*; the fiſh being caught in prodigious quantities at the mouth of the Volga, and other rivers which empty themſelves into the Caſpian ſea. They cure or prepare the roes on the ſpot, and thence ſend them in this form of *cavear* up the Volga to Moſcow, to be there diſtributed throughout that vaſt empire; where it is of wonderful ſervice to the people, on account of the three Lents there obſerved with great ſeverity.

The manner of making the *cavear* is by taking out of the ſpawn of the ſturgeon all the nerves or ſtrings, then waſhing it in vinegar or white wine, and ſpreading it on a table. They dry and ſalt it with the hand, and preſs it in a fine bag, that the liquor may run out; this done, they caſe it up in a veſſel with a hole at bottom, that if there be any moiſture left it may run out. In this ſtate being well preſſed and covered, it is fit for ſale.

Cavear is alſo prepared of the ſpawn of ſome other fiſhes: what we otherwiſe call BOTARGO, is a *cavear* made from a ſort of mullet caught in the Mediterranean.

According to Savary, the beſt *cavear* brought from Muſcovy is that made from the belluga, a fiſh eight or ten feet long, caught in the Caſpian ſea, which is much preferable to that made of the ſpawn of ſturgeon.

The Engliſh import conſiderable quantities of this commodity from Archangel; though not ſo much for home conſumption, as to ſupply the French and Italians. To be good, it ſhould be of a reddiſh brown colour, and very dry. It is eat with oil and lemon; ſometimes with vinegar: ſome eat it alone with bread; and others only as a ſauce, or pickle, like anchovies.

CAVEAT, in *Law*, a bill entered in the eccleſiaſtical court, to ſtop the proceeding of one who would prove a will, or obtain letters of adminiſtration, to the prejudice of another. See Probate.

It is alſo uſed to ſtop the inſtitution of a clerk to a benefice. An inſtitution after a *caveat* entered, is void by the eccleſiaſtical law; but this the temporal courts pay no regard to, and look upon a *caveat* as a mere nullity. Blackſt. Com. vol. iii. p. 246.

CAVEATING, in *Fencing*, the act or art of diſengaging, or ſhifting the ſword from one ſide of the adverſary's ſword to the other.

Caveating is a motion whereby a man brings in an inſtant his ſword which was preſented on any ſide his adverſary's, generally beneath its hilt, to the oppoſite ſide; either from within, or without, or *vice verſa*; or from having its point high, to be low, or the reverſe; and either on the ſame ſide it is preſented in, or the oppoſite ſide.

Caveating is ſo neceſſary a motion in FENCING, that without it, there could be ſcarce any offenſive part, or purſuit. It is withal ſo eaſily performed againſt the ordinary tierce and quart guards, that it gives a conſtant opportunity to make a variety of quick ſubtle FEINTS againſt them, which by reaſon of the ſmall croſs made by the weapons on theſe guards, makes the purſuit very eaſy, and the PARADE or defence very difficult.

The conſideration of this put Sir William Hope on the ſearch of a new method or GUARD, which, by reaſon of its greater croſs on the adverſary's ſword, renders the *caveating*, and making feints more ſlow, and conſequently the parade more certain. See Guard, &c.

CAVEDO, in *Commerce*, a long meaſure uſed in Portugal, and equal to $27\frac{433}{1000}$ Engliſh inches.

CAVELIN, or rather Kaveling; thus they call at Amſterdam, what we and the French ſtile a lot of merchandize.

CAVERN, Caverna. See Grotto.

CAVERNOSA *Corpora*, in *Anatomy*, called alſo *corpora nervoſa*, and *ſpongioſa*, are two cavernous bodies, of an indeterminate length and thickneſs, whereof the *penis* is principally compoſed.—See *Tab. Anat.* (*Splanch.*) *fig.* 8. *lit. aa. bb.* and *tt.*

Their internal ſubſtance is rare, and ſpongy; and when filled with blood and ſpirits, it dilates and ſwells: in which the tenſion or erection of the *penis* conſiſts. See Penis.

Cavernosum *Corpus Urethræ*, a third ſpongious body of the penis; ſo called, becauſe the *urethra*, or urinary paſſage of the *penis*, is incloſed by it. See Penis.

Its figure, contrary to that of the two corpora cavernoſa, is largeſt at its extremities, and leaſt in the middle; its upper part is in the *perinæum*, and is called its *bulb*, from its figure. Its external membrane is thin, and divided lengthwiſe by a *ſeptum*. The middle part of this *corpus* is nearly cylindrical; but the paſſage for the urine is not along the centre, but inclines to its upper part, next the body of the *penis*; its lower extremity, dilating itſelf, forms the *glans*.

Cavernosa *Corpora of the Clitoris*, are two nervous or ſpongy bodies, like thoſe of the *penis*; they have their origin from the lower part of the *os pubis*, on each ſide; and uniting together, conſtitute the body of the clitoris, as the others do that of the *penis*.

Indeed, they have no perforation analogous to that of the *penis*; but they have a *ſeptum*, or membranous partition, running all along between them, and dividing them from the *glans*, to its divarication at the *os pubis*, where they are called *crura clitoridis*.

Cavernosum *Corpus of the Pudendum*. See Reticulare *Corpus*.

CAVERS, in the *Language of Miners*, are any poor people that go about the mines to beg or ſteal ore from the miners.

CAVESON, in the *Manege*, a kind of muſroll, put on a horſe's noſe, which binds or locks him in, and ſerves in breaking, managing, and tutoring him.

The word comes from the Spaniſh *caveça*, or *cabeça*, head.

The *caveſons* for breaking young horſes are uſually of iron, made ſemicircularly, of two or three pieces turning on joints; others are twiſted, others are flat, others hollow in the middle, and indented like ſaws, called *mordants*: though theſe laſt are now baniſhed the academies.—The rope and leathern *caveſons* ſerve for paſſing the horſe between two pillars.

An iron *caveſon* ſpares a young horſe's mouth in the breaking, ſince by means hereof he is accuſtomed to obey the hand, and bend the neck and ſhoulders, without injuring his mouth. All iron *caveſons* are mounted with a head-ſtall, and a throat-band, and two ſtraps, or reins, with three rings: through the middle ring, one rein is paſſed to make a horſe work round a pillar, and through the two ſide rings the other two reins are paſſed, which the rider holds in his hand, or faſtens to his ſaddle to keep the horſe's head in ſubjection.

CAVETTO, in *Architecture*, a hollow member, or moulding, containing a quadrant of a circle, and having an effect juſt contrary to that of a quarter-round: it is uſed as an ornament in cornices.—See *Tab. Archit. fig.* 6.

The word is Italian, and is no more than a diminutive of *cavus*, hollow.

M. Felibien obſerves, that the workmen confound the *cavetto* with a ſcotia, but improperly; the *cavetto* being in effect only half a scotia: yet he himſelf is chargeable with the ſame overſight.

When in its natural ſituation, the workmen frequently call it *gula*, or *gueule*; and when inverted *gorge*.

Cavetto is the ſame with what is otherwiſe denominated a caſement. Moxon ſhews how to deſcribe the *cavetto*, both from the oxygon, and the ſemicircle.

CAUHQ-ROY, in *Natural Hiſtory*, a name given by the natives of the Eaſt Indies to a ſort of foſſil which they calcine, and afterwards give in large doſes in the hiccough, and many other complaints. It is alſo uſed in dying. The Indians boil it in water, and dye or ſtain their cloths with it, to make them appear different from others: it is a kind of ochre, or clayey iron ore, and is found in great abundance in the hills, and iron is ſometimes extracted from it.

CAVIA. See Cavear.

Cavia *cobaya*, in *Zoology*, the name by which the Braſilians, and from them many writers, call the creature commonly known among us by the name of the Guinea-pig.

CAVIDOS, or Cabidos, a Portugueſe long meaſure, uſed in the menſuration of cloth, linen, and the like, equivalent to two foot eleven lines Paris meaſure.

CAVIL, *cavillatio*, is defined by ſome a fallacious kind of reaſon, carrying ſome reſemblance of truth, which a perſon knowing its falſhood, advances in diſpute for the ſake of victory.

The art of framing ſophiſms or fallacies is called by Boethius, *cavillatoria*.

CAVIN, in the *Military Art*, a natural hollow fit to cover a body of troops, and thereby facilitate their approach to a place.

A *cavin* near a place beſieged is of great advantage to the beſiegers; as by help hereof they can open trenches, make places of arms, keep guards of horſe, and the like, without being expoſed to the enemies ſhot.

CAVING. See Cavazion.

CAVITY, among *Anatomiſts* and *Phyſicians*, makes a ſpecies of organical conformation, either *natural*, or *morbid*.

Cavities *of the bones* are of two kinds; the firſt formed from articulation, called *cotyles* and *glenes*; the ſecond for other purpoſes, called *cells*, *caverns*, *foramina*, *foſſæ*, and *ſulci*. Heiſt. Comp. Anat. § 56.

CAUC, Cauk, or Cawk, is uſed by *Miners in the Peak*, to denote a coarſe ſort of ſpar; being a ponderous white ſtone generally found near leadmines, which will draw a white line like chalk, or the galactites. Phil. Tranſ. N° 110. p. 226. Ibid. N° 39. p. 770. It is unſoluble in acids, and fuſible by fire.

The word is formed probably of the German *kaalq*, ſpar.

It is properly no other than a ſparry matter, rendered very coarſe, by being mixed with a large portion of earth. In ſome places it is found more clear and tranſparent than in others: it approaches in this ſtate to the nature of cryſtal, and is called baſtard cauk, and bright cauk. Philoſ. Tranſ. N° 407.

There is a ſingular proceſs mentioned by Dr. Liſter, which is that of vitriſying antimony by its means. This is done with great readineſs and ſpeed by it, and the glaſs, thus made, will produce ſome effect on other metals, which no other glaſs will, nor indeed any other preparation of antimony. The method of preparing it is this: take a pound of antimony, flux it clear; have in readineſs an ounce or two of *cauk* in a lamp red hot; put it into the crucible to the melted antimony, and continue it in fuſion; then caſt it into a clean mortar not greaſed, decanting the clear liquor from the lump of *cauk*. This proceſs gives more than fifteen ounces of glaſs of antimony, like poliſhed ſteel, and bright as the moſt refined quickſilver. The *cauk*, in the mean time, is found to be diminiſhed, not increaſed in its weight, and will never flux with the antimony, though ever ſo ſtrong fire be given it. This is a very odd mineral, and this learned author ſuppoſes it to be allied to thoſe white, milky, and mineral juices which are found in mines. The effect of both is evidently the ſame; for the milky juice of lead mines vitrifies the whole body of antimony, in the ſame manner that the *cauk* does in this experiment. Phil. Tranſ. N° 110.

That there is ſomewhat very peculiar in the *cauk* is plain from this effect on antimony, which no other thing of this kind is poſſeſſed of; for lapis calaminaris, ſulphur vivum, galactites, mundicta, alum ore, ſpar, and many other things have been tried with antimony in the ſame manner, but not one of them has this effect.

CAUKING, in *Architecture*, ſignifies dove-tailing down.

Cauking *time*, in *Falconry*, a hawk's treading time.

Cauking, or Calking *of a ſhip*, implies the driving in oakum, or ſomewhat of that kind, into the ſeams, or commiſſures of the planks, to prevent the ſhip's leaking. It is afterwards covered over with hot melted pitch, or roſin, to prevent its rotting.

Kennet derives the word from the barbarous Latin *Calciatura*, *ſhoeing*.

Cauking-*irons*, denote iron chiſſels for the purpoſe of *cauking* veſſels.

CAUL, in *Anatomy*, a membrane in the abdomen, covering the greateſt part of the guts; called, from its ſtructure, *reticulum*, but moſt frequently omentum.

Caul is likewiſe a little membrane, found on ſome children, encompaſſing the head, when born.

Drelincourt takes this *caul* to be only a fragment of the membranes of the *fœtus*; which ordinarily break at the birth of the child.

Caul, or Caule, among *Mineraliſts*, a reddiſh pink-coloured ſtone, found in the ſtrata of the tin-mines. See Tin.

CAULEDON, from καυλος, *a ſtem*, in *Surgery*, is applied to fractures which happen tranſverſely, wherein the parts of the broken bone ſtart aſunder, ſo as not to lye directly againſt each other.

CAULIAS, an appellation given to the juice drawn from the ſtalk of the *ſilphium*, contradiſtinguiſhed from that drawn from the root of the ſame plant, which is called *rhizias*.

Schroder makes the *caulias* the ſame with our Assa-*fœtida*.

CAULICOLES, Cauliculi, in *Architecture*, denote thoſe eight leſſer branches, or ſtalks, in the Corinthian capital, which ſpring out from the four greater, or principal caules, or ſtalks.—See *Tab. Archit. fig.* 27.

The word comes from the Latin *caulis*, the ſtalk, or ſtem, of a plant.

The volutes of this order are ſuſtained by four caules, or primary branches of leaves; from which ariſe theſe *caulicoles*, or leſſer foliages.

Some authors confound the *caulicoles* with the volutes themſelves; ſome with the helices in the middle, and ſome with the principal ſtalks whence they ariſe.

CAULIFEROUS *herbs*, are ſuch as have a true *caulis*, ſtalk, or trunk, which a great many have not; as the capillaries, &c.

They are ſometimes divided into *cauliferous*, and ACAULOSE.

The former are either perfectly *cauliferous*, as cabbage, or imperfectly, as moſſes.

CAULIFLOWERS, a ſpecies of *braſſica*, are the produce of a kind of cabbage, and have of late years been ſo far improved in England, as to exceed in ſize and goodneſs any that are raiſed in the reſt of Europe. They are in ſeaſon in the months of May, June, and July, but the ſkill of the gardener can continue them much longer. The manner of propagating them is this:

Having procured ſome good ſeed, you muſt ſow it before the middle of Auguſt, upon an old cucumber or melon bed, ſifting earth over the ſeeds to a quarter of an inch thickneſs: if the weather prove very hot and dry, the beds muſt be ſhaded with mats, and be lightly watered at times. In about a week's time the plants will appear above ground, and they muſt be uncovered by degrees, but not expoſed to too much ſun at firſt. In about a month after ſowing, they ſhould be pricked out on another old bed, at two inches diſtance, and ſhaded and watered when firſt tranſplanted; but after this they muſt not be much watered, nor be ſuffered to have too much rain, which will make them black-ſhanked, or rotten in the ſtalks. In this bed they are to remain till the end of October, when they are to be planted out for the winter ſeaſon: they are then to be planted out in rich beds, and thoſe which are to be early ripe are to be ſhaded with bell-glaſſes, two under each glaſs, and toward the latter end of February to be planted out again: the reſt are to be at firſt ſet at a greater diſtance, and to ſtand.

When the *cauliflowers* begin to fruit, they muſt be carefully watched, and ſome of the inner leaves muſt be bent down over the flower, to ſhade it from the ſun, which would otherwiſe turn it yellow. The very fineſt of the *cauliflowers*, which are not looſe and frothy about the edges, and very firm, ſhould be ſaved for ſeed; and the flower ſtems, as they ſhoot out, ſupported with ſticks till the ſeeds are ripened, which muſt then be carefully gathered, and dried for uſe. Mill. Gard. Dict.

CAULINE *leaf*, among *Botaniſts*. See LEAF.

CAULINE *peduncle*, among *Botaniſts*. See PEDUNCLE.

CAULIS, among *Botaniſts*, the ſtalk or ſtem of an herbaceous PLANT; or that part which riſes ſingle above the earth, from which the branches and leaves ſhoot upward.

In trees and ſhrubs this is properly called *caudex*, or trunk; in herbs *caulis*, or ſtalk; in corn and the graſſes, *culmus*, or ſtem.

CAUNGA, in *Botany*, a name given by ſome authors to the *areca*, the tree of whoſe fruit the *terra Japonica* of the ſhops is made.

CAURIS, in *Natural Hiſtory*, a name given by ſome to the genus of ſhells called, by the generality of writers, *porcellana*, and *concha venerea*. It is from a falſe pronounciation of this word *cauris*, that we call theſe ſhells *gowries*. See PORCELAIN *ſhell*.

AURSINES, *Caurſini*, in *Engliſh Hiſtory*, denote Italian bankers or money-changers, who flocked into England, France, and the Netherlands, about the year 1235, calling themſelves the pope's merchants, but driving no other trade than uſury. They were ſeveral times baniſhed the kingdom for their extortions, and re-admitted by the intereſt and intrigues of the popes. Mat. Paris. Hiſt. Angl. p. 403. Du-Cange.

They are alſo called *caorcini*, *caorſini*, *catarcini*, *cawarſini*, and *corſini*. Some will have the name formed from *Cahors*, a city of France, where they flouriſhed more than ordinarily. Others derive it from the *Corſini*, a family of wealthy merchants at Florence.

AUSA *Matrimonii prælocuti*, in *Law*, a writ that lies when a woman gives land to a man in fee, to the intent he ſhall marry her, and he refuſes to do it in a reaſonable time: and in ſuch caſe, for not performing the condition, the entry of the woman into the lands again has been adjudged lawful. The huſband and wife may ſue this writ againſt another, who ought to have married her.

USA *Nobis ſignifices*, in *Law*, a writ directed to the mayor of a town, &c. who, being by the king's writ commanded to make ſeiſin of lands to the king's grantee, delays doing it. The writ requires him to ſhew *cauſe* of the delay.

CAUSALTY, in *Metallurgy*, the lighter part of ſulphureous and earthy ores of metals carried off in the water uſed in waſhing them, and ſubſiding afterwards from it. Boerhaave, Chem. p. 100. n.

In the TIN-*works* the *cauſalty* is thrown in heaps upon banks, which in ſix or ſeven years they work over again, and receive a new ſupply of metal from it. Phil. Tranſ. N° 138. p. 952.

CAUSALITY, in *Metaphyſics*, the power, or action of a CAUSE in producing its effect.

It is a diſpute, among the ſchool-philoſophers, whether, and how the *cauſality* is diſtinguiſhed from the cauſe and effect? Some held it a mode, or modal entity, ſuperadded to the cauſe, &c. others contend for its being the cauſe itſelf, only conſidered *principiative* and *terminative*, &c.

CAUSE, CAUSA, that which contributes to the production of an effect; or that by virtue whereof a thing is done, or from which it proceeds.—In which ſenſe, *cauſe* ſtands eſſentially related to effect.

CAUSE, *Firſt*, is that which acts of itſelf, and from its own proper power, or virtue.—In this ſenſe, God is the only *Firſt Cauſe*.

CAUSES, *Second*, are thoſe which derive the power and faculty of acting, from a firſt *cauſe*.

It is certain the philoſophers are ſtrangely puzzled, and divided about the manner of their agency: ſome maintain them to act by their matter, figure, and motion; others by a ſubſtantial form; many by accidents, or qualities; ſome by matter and form; and others by certain faculties different from all theſe.

CAUSES, in the *School of Philoſophy*, are diſtinguiſhed into,

CAUSES, *Efficient*, which are the agents that produce any effects.

CAUSES, *Material*, the ſubjects whereon the agent works, or whereof the thing is formed: thus, marble is the matter, or *material cauſe* of the ſtatue.

CAUSES, *Final*, are the motives which induce a man to act; or the end for which the thing is done: thus, victory and peace are the *final cauſes* of war. Some add the,

CAUSE, *Exemplary*, which is the model the agent forms, or propoſes, and by which he conducts himſelf in the action: but this is not properly any *cauſe* at all.

CAUSE, *Formal*, the change reſulting from the action; or that which determines a thing to be this, and diſtinguiſhes it from every thing elſe: thus, the ſoul is held the form, or *formal cauſe*, of man, &c.

CAUSES, again, are diſtinguiſhed into *Phyſical*, or *Natural*, and *Moral*.

CAUSE, *Phyſical*, is that which produces a ſenſible corporeal effect: thus, the ſun is the *phyſical cauſe* of heat.

CAUSE, *Moral*, is that which produces a real effect, but in things immaterial: thus, repentance is the *cauſe* of forgiveneſs.

Others define a *phyſical cauſe* to be that which produces its effect by a phyſical virtue; and a *moral cauſe*, that which determines the *phyſical cauſe*, though not neceſſarily, to produce the effect: in which ſenſe, it is alſo called a *diſpoſitive*, *excitative*, and *imputative cauſe*.

Thus, the ſun is the *phyſical cauſe* of light; a ſtone, that breaks the ſkull, is a *phyſical cauſe* of death: and thus the advice, intreaty, commands, or menaces, which determine us, though not neceſſarily, to do, or not to do, any thing, are *moral cauſes*.

In this ſenſe, a *moral cauſe* is only applicable to a free intelligent agent: and it is this notion of a *moral* and *phyſical cauſe* that is the moſt juſt, clear, and diſtinct.

CAUSES, again, are conſidered, either as *univerſal*, or *particular*; *principal*, or *inſtrumental*; *total*, or *partial*; *univocal*, *equivocal*, &c.

CAUSE, *Equivocal*, is that which is of a different kind and denomination from its effect: thus, the ſun is ſaid to be the *cauſe* of the animals it produces.

CAUSE, *Inſtrumental*, is that uſed by the principal to produce its effect; or which is excited to produce an effect, beyond the meaſure of its own perfection.

CAUSE, *Partial*, that which occurs with ſome other in producing the effect.

CAUSE, *Particular*, is that which can only produce a ſingle effect, or a certain kind of effects.

CAUSE, *Principal*, is that which gives motion to the inſtrument, or which does not operate beyond its own natural efficacy.

CAUSE, *Total*, is that which produces the whole effect.

CAUSE, *Univocal*, is that which is of the ſame kind and denomination with its effect: as, a man is the *cauſe* of a man.

Cauſe, *Univerſal*, is that which, by the extent of its power, may produce all effects.

The Carteſians reſolve all phyſical *cauſes* into occaſional ones.

Causes, *Occaſional*, are only the *occaſions*, not the direct *cauſes* of their effects. See Occasion.

The ſoul, ſay thoſe philoſophers, is not able to act on the body; nor the body reciprocally on the ſoul: to keep up an intercourſe between them, God, on occaſion of a motion of the body, impreſſes a ſenſation on the ſoul; and, on occaſion of a ſentiment of the ſoul, impreſſes a motion on the body: the motions, therefore, of the ſoul and body, are only *occaſional cauſes* of what paſſes in the one, or the other. Thus, ſay they, the ſtroke, or percuſſion, is only the *occaſional cauſe* of the motion produced in the body ſtruck; it is God is the direct efficient *cauſe*. And thus the action of objects on our organs is not the efficient *cauſe* of our ideas and perceptions, but merely the *occaſional cauſe*, which determines God to act on the mind, according to the laws of the union of ſoul and body.

Cause, in a *Medical Senſe:* whatever produces a diſeaſe, is called the *cauſe* thereof. This operates, either by inducing a new ſtate of the ſolids and fluids, or by taking away ſomething which is abſolutely requiſite to the exerciſe of ſome function. If a *cauſe* pre-exiſted in ſome meaſure in the body before the effect produced, it is called an internal *cauſe*; but if it exiſted out of the body, and by its application to it produced the diſeaſe, it is called external.

Internal *cauſes* generally injure, firſt the humours, and then the ſolid parts; whereas the external *cauſes* affect the ſolids, and, in conſequence of that, the humours: and this holds univerſally, unleſs perhaps in ſome few diſeaſes produced by poiſon or contagion.

The immediate or proximate *cauſe* is that which taken altogether immediately conſtitutes the preſent diſeaſe; this is always adequate, and ſufficient to the formation of the diſeaſe, whether ſimple or complicated. The preſence of this conſtitutes and continues the diſeaſe; and the abſence of it removes the diſorder, being very little different from the diſeaſe itſelf. The inveſtigation therefore of this is extremely uſeful and very neceſſary.

The remote *cauſe* is that which changes the body in ſuch a manner, as to diſpoſe it for the reception of a diſeaſe upon the acceſſion of another *cauſe*; but it is never adequate or ſufficient to produce a diſeaſe alone: nor would that other *cauſe* the acceſſion of which is neceſſary, be of itſelf ſufficient for the production of the diſeaſe; but both muſt concur. The buſineſs of phyſic therefore, is to eradicate both together, which in conjunction conſtitute the proximate or immediate *cauſe*.

The remote *cauſe* inherent in the body, is called prediſponent, antecedent, and by the Greeks προηγουμένη, and conſiſts principally in temperaments, plethora, and cacochymy. The *cauſe* whoſe acceſſion to the remote *cauſe* excites, and in conjunction with it forms the diſeaſe, is called the procatarctic *cauſe*, or the πρόφασις or occaſion of the diſeaſe. It is ſometimes internal, ſometimes external. Theſe Boerhave reduces to four claſſes.

Firſt, the *ingeſta*, or things entering the body; ſuch as the air, aliments, drink, medicines, poiſons, ſuch things as enter by the pores of the ſkin and noſtrils; by the ſeveral paſſages of the mouth, lungs, œſophagus, ſtomach, inteſtines, and pudenda of women, while in a viſible or inviſible manner; whether by ſteam, draught, deglutition, clyſter, or injection. Secondly, the *geſta*, or things acted, as motion of the whole, or any part of the body, affections of the mind, reſt, both of the body and mind, ſleeping and watching. Thirdly, things retained, or excreted, whether ſalubrious, recrementitious, or morbid. Fourthly, things applied to the body; as air, vapours, fomentations, cloaths, liniments, ointments, plaſters, together with whatever wounds, contuſes, or corrodes.

This diviſion of the non-naturals, as they are called, is different from that of all other writers of inſtitutes.

Causes *and Effects*, in *Law*. In moſt caſes the law hath reſpect to the *cauſe* or beginning of a thing as the principal part, on which all other things are founded: and herein the next, and not the remote cauſe is moſt looked upon, except it be in covinous and criminal things: and therefore that which is not good at firſt, will not be ſo afterward; for ſuch as is the cauſe, ſuch is the effect: e. g. if an infant or feme-covert make a will, and publiſh it, and afterwards die of full age, or ſole, this will is of no force, on account of the original *cauſe* of infancy and coverture, &c.

CAUSEWAY, or **Causey**, a maſſive conſtruction of ſtone, ſtakes, and faſcines; or an elevation of fat, viſcous earth, well beaten; ſerving either as a road, in wet marſhy places; or as a mole, to retain the waters of a pond, or prevent a river from overflowing the lower ground.

The word comes from the French *chauſſee*, anciently wrote *chaulſee*; and that from the Latin *calceata*, or *calcata*; according to Somner, and Spelman, *à calcando*. Bergier rather takes the word to have had its riſe *à peditum calceis, quibus teruntur*.

Causeway, *calcetum*, or *calcea*, more uſually denotes a common hard raiſed way, maintained and repaired with ſtones and rubbiſh.

Causeway, *Devils*, a famous work of this kind which ranges through the county of Northumberland, commonly ſuppoſed to be Roman, though Mr. Horſley ſuſpects it to be of later times. Horſley, Brit. Rom. lib. v. cap. 2. p. 449.

Causeway, *Giants*, is a denomination given to a huge pile of ſtony columns, in the diſtrict of Coleraine in Ireland. See Giant's *Cauſeway*.

CAUSSIDICUS. See Advocate.

CAUSTIA, in *Antiquity*, a kind of woollen cap uſed by the Macedonians; which was ſo ſtrong as ſometimes to ſerve inſtead of a helmet. Mem. Acad. Inſcript. vol. ii. p. 394.

CAUSTICS, from καιω, *I burn*, in *Phyſic*, thoſe medicines, which by their violent activity, and the heat thence occaſioned, deſtroy the texture of the parts to which they are applied.

Cauſtics amount to the ſame with what are otherwiſe denominated *Pyrotics*, and *Eſcharotics*. They are alſo uſually confounded with cauteries, though ſome diſtinguiſh them; reſtraining *cauſtics* to thoſe medicines which do not burn through the part, nor leave an eſchar; and cauteries to thoſe which do.

Cauſtics are uſed to eat off proud fungous fleſh; they alſo penetrate within hard callous bodies, and liquify the humours; and are particularly applied in abſceſſes and impoſthumations, to eat through to the ſuppurated matter, and give it vent: ſometimes, alſo, to make iſſues in parts where cutting is difficult, or inconvenient.

The principal medicines of this claſs are, burnt alum, ſponge, cantharides, and other veſicatories; as alſo orpiment, calx viva, vitriol, aſhes of the fig-tree, the aſh, and wine-lees; the ſalt of the lixivium whereof ſoap is made; ſublimate mercury, red precipitate, &c. See each deſcribed under its proper article.

Cryſtals of *luna*, and *lapis infernalis* made of ſilver and ſpirit of nitre, become *cauſtics* by that mixture.

The ſtrong *cauſtic*, now generally uſed by our ſurgeons, is prepared in this manner: boil ſoap lees to a fourth part of their quantity, then ſprinkle in, while they are boiling, lime that has been kept in a veſſel pretty cloſe ſtopped for ſeveral months; continue to add this lime till all the liquor is abſorbed, and the whole is reduced to a paſte, which is to be kept in a veſſel cloſe ſtopped. The deſign of thus keeping the lime is, that its acrimony may be a little abated.

The common *cauſtic* of quick lime and ſoap-lees, deſerves the preference to any of thoſe compoſed of acid ſpirits. It does not give near ſo much pain, and is not ſo apt to occaſion convulſions, when applied to carious bones. It penetrates better than the dry forms of eroded metals, and does not run ſo much when it melts, as the more liquid acids do. It either is not abſorbed, or its effects are not obſerved in the blood; whereas mercurial preparations frequently raiſe an unexpected ſalivation. Monro, in Med. Eſſ. Edinb. vol. v. art 24.

Heiſter ſays, that the ſhorteſt and moſt approved method of making this is as follows: take pot-aſhes and ſtrong quick-lime, of each ſix ounces; powder them ſeparately, and afterwards mix them together in a large glaſs or earthen veſſel, and diſſolve them in a large quantity of river-water, letting them ſtand an hour or two, that they may diſſolve perfectly; the liquor is then to be filtrated through a linen cloth from its groſs ſediment, and evaporated over the fire in an iron pan; the hard maſs left from this evaporation is to be put into a crucible, and melted over a ſtrong fire till it flows like oil; it is then to be caſt into a mortar or broad pan, and either cut or beat into ſmall pieces before it is quite cold: theſe are the *cauſtic* ſtones. They are to be put into a clean glaſs, and ſtopped very cloſe, and kept in a warm place.

Caustic, *arſenical*. See Magnet.

Caustic, *lunar*, called alſo *lapis cauſticus*, is a preparation of ſilver, ſometimes of copper, uſually made by diſſolving the metal with ſpirit of nitre, evaporating two thirds of the fluid, and boiling the reſt to an oily conſiſtence, which when cold grows hard. See Air *fixed*.

Caustic *curve*. See Curve.

Caustic *fluid*. Some imagine a *cauſtic* fluid, by which the blood is detained in a fluid ſtate, and by which the red globules are formed.

Caustic *glaſſes*. See Burning *glaſſes*.

Caustic, *by reflection*. See *Cauſtic by* Reflection.

Caustic, *by refraction*. See *Cauſtic by* Refraction.

CAUSTICITY, in *Chemiſtry*, denotes a quality belonging to ſeveral ſubſtances, by the acrimony of which the parts of living animals may be corroded and deſtroyed. Bodies which have this quality, taken internally, are true poiſons; and the *cauſticity* of ſome of them is ſo deadly, as, for example, of arſenic, that even their external uſe is proſcribed by prudent phyſicians.

CAUSTICUM *antimoniale*, the name given in the late London Diſpenſatory to what was before called *butter of* ANTIMONY.

CAUSUS, in *Medicine*, denotes a burning FEVER, or a kind of acute continual fever, attended with a vehement heat, and other indications of an uncommon inflammation.

CAUSWAY. See Causeway.

CAUTERY, *Cauterium*, a medicine wherewith to burn, ſear, eat through, or corrode, ſome ſolid part of the body.

The word is originally Greek, καυτηρ, or καυτηριον; formed from καιω, *I burn*.

Cauteries are of two kinds; *actual*, and *potential*.

Cauteries, *actual*, are thoſe which produce an inſtantaneous effect; as fire, or a red-hot iron: theſe are applied in the *fiſtula lochrymalis*, after extirpations of cancers, amputations of legs, or arms, &c. in order to ſtop the hæmorrhages, and produce a laudable ſuppuration. They are ſometimes, alſo, applied to carious bones, abſceſſes, and malignant ulcers; in order to open a paſſage for the diſcharge of the peccant humours. The irons uſed, on theſe occaſions, are ſometimes crooked at the extremity, and that variouſly, according to the various occaſions: whence ſome are called *cultellary*, others *punctual*, others *olivary*, &c.—M. Homberg aſſures us, that a great part of the medicine of the people of Java, and other parts of the Eaſt Indies, conſiſts in burning, or the application of *actual cauteries*; and that there is ſcarce any diſeaſe but they will happily cure thereby.

The *actual cautery*, or hot iron, is frequently applied for the making of iſſues, in parts where cutting is difficult, or inconvenient. It makes a little round hole, which is to be filled up with a pea, or an ivy berry, to keep it open for the humours to paſs through. Pareus deſcribes a method of making *velvet*, or *ſilken cauteries (cauteria ſerica vel holoſerica)*; ſo called, either becauſe they give no pain, or becauſe he purchaſed the ſecret at a dear rate from a certain chemiſt.

In ſome places they *cauteriſe* with burning tow, in others with cotton or MOXA, in others with live coals; others uſe Spaniſh wax; others pyramidal pieces of linen; others gold, or ſilver. Severinus recommends a flame blown through a pipe: but what is uſually preferred among us is a hot iron.

Cauteriſing irons are of various figures, ſome flat, others round, ſome curved, &c. of all which we find draughts in Albucaſis, Scultetus, Ferrara, and others. Sometimes a *cautery* is applied through a capſula, to prevent any terror from the ſight of it. This method was invented by Placentinus, and is deſcribed by Scultetus. In the uſe of all *cauteries*, care is to be taken to defend the neighbouring parts, either by a lamina, defenſive plaſter, or lint moiſtened in oxycrate. Sometimes the hot iron is tranſmitted through a copper cannula, for the greater ſafety of the adjoining parts.

The degrees and manners of *cauteriſing* are varied, according to the nature of the diſeaſe, and the part affected. In a mortification they *cauteriſe* more freely than in any other caſe; in the ſoft parts more ſparingly: in a hæmorrhage, or a caries, they repeat the operation, till an eſchar is induced on the veſſel, or the humidity of the bone is diſcharged.

For the right application of the *actual cautery*, various obſervations are neceſſary. In the firſt place, the ſurgeon ſhould ſee that the ſize and figure of the *cautery* correſpond to that of the diſordered part, and while the patient is preparing for the operation, to let the *cautery* be heating in the fire, and to ſecure the ſound parts, that it may give no more pain than what is abſolutely neceſſary. In caſes of a carious bone, the fleſhy parts are to be drawn aſide, and held out of the way of the iron; and in theſe caſes, as alſo in large hæmorrhages, it is neceſſary to have three or four *cauteries* kept hot together, that if one does not finiſh the operation, there may be no waiting for another.

It has been found that *cauteries* have ſucceeded in apoplexies, when all other means have failed. In this caſe, ſome apply the *cautery* to the *occiput*; but others between the firſt and ſecond *vertebræ* of the neck: others are for *cauteriſing* the meeting of the coronal and ſagital ſutures; and others think it may be beſt done in the ſoles of the feet. Which of all theſe places it ſucceeds beſt in, ſeems yet left to experience to determine. Heiſter's Surgery, p. 318.

Cauteries, *potential*, are compoſitions of CAUSTIC medicines, uſually of quick-lime, ſoap, and the like.

CAUTING *iron*, among *Farriers*, an iron inſtrument, wherewith they cauteriſe and ſear the parts of a horſe which require burning.

CAUTIO, in the *Civil Law*, denotes an aſſurance or ſecurity given or taken for any thing truſted.

CAUTIONE *admittenda*, in *Common Law*, a writ which lies againſt a biſhop, who holds an excommunicated perſon in priſon, notwithſtanding he offers ſufficient ſecurity for obeying the commands of the church for the future.

CAUTIONARY *towns*, places of ſtrength, which one prince or power puts in the poſſeſſion of another, as a ſecurity either for the payment of a debt, or performance of ſome other matter ſtipulated between them.

CAUTO, in *Botany*, a name given by the people of Guinea to a ſhrub common in that part of the world; a decoction of which they uſe as a cure for the running of the reins, or a clap. Phil. Tranſ. Nº 232.

CAUTURIER, in *Anatomy*, a name given by the French writers to a muſcle of the leg; called by the old writers *primus flectentium tibiam*; and by the later writers, Cowper, Albinus, &c. *ſartorius*; by Roſlan, *ſutorius*.

CAXA, a little COIN made of lead, mixed with ſcoria of copper; ſtruck in China, but current chiefly at Bantam, in the reſt of the iſland of Java, and in ſome of the neighbouring iſlands.

It is ſomewhat ſmaller than the French double, and has a ſquare hole through the middle; by means whereof, ſeveral of them are hung on the ſame ſtring: this ſtring, which they call *ſanta*, uſually contains two hundred *caxas*, equivalent to nine French deniers, or ſomewhat leſs than three farthings ſterling. Five ſantas tied together, i. e. a thouſand *caxas*, make a *ſapacou*.—Nothing can exceed the brittleneſs of the *caxa*; a ſtring never falls to the ground without breaking at leaſt ten or twelve pieces. Leaving them a night ſteeped in ſalt-water, they cling ſo firm to one another, that they are not to be ſeparated without breaking one half of them. The Malays call them *cas*; and the Javeſe, *pitis*.

The *caxas* are of two kinds; *great*, and *ſmall*: the *ſmall* are thoſe we have been ſpeaking of; three hundred thouſand whereof are equal to fifty-ſix livres five ſols, French money. The *large*, are *old caxas*; ſix thouſand whereof are equal to the piece of eight, or four ſhillings ſix pence ſterling. Theſe are nearly the ſame with the *caches* of China, and the *caſſies* of Japan.

CAXOU, in *Metallurgy*, a word uſed to expreſs a cheſt of ores of ſilver, or any other metal, that has been burnt, ground, and waſhed, and is ready to be refined.

CAY, in *Zoology*, the name of a ſmall monkey of the Braſils, an extremely ſmall kind, and of a coal black. It lives only in the thick woods, and is uſually found ſitting on the boughs of ſome of the trees which bear pods, the fruit of which it feeds upon. Ray.

CAYANG, in *Botany*, a leguminous plant, cultivated in the Mogul dominions for food. It is a kind of coarſe pulſe; of which the Europeans uſe great quantities on ſhip-board in the Eaſt Indies. It is a ſpecies of the *cytiſus*, called by the Indians there *kiſſery*. Poſtl. Dict. Com.

CAYELAC, a ſweet-ſcented wood, which grows in Siam; the Siameſe and Chineſe burn it in their temples. It is one of the commodities exported from Siam for China.

CAYLUS's *method of painting*. See Encaustic *painting*.

CAYMAN, in *Zoology*, the name of a ſpecies of crocodile found in the ſouthern parts of America, and on the coaſt of Guinea, and more uſually called by authors by its Braſilian name JACARE.

CAYMANUM *lapis*, in *Natural Hiſtory*, the name of a ſtone found in the beds of rivers in many parts of America, and of a yellowiſh colour, veined with red and white.

The Indians have an idle tradition, that it is originally found in the ſtomach of a crocodile, which in their language they call *caymenes*; and thence authors have named it *lapis caymanum*. The natives of America pretend that it has great virtues in medicine, and particularly that it cures quartans by being applied to the wriſt; and, to enhance its value, they pretend to take it from the crocodile.

CAYNTANA, in the *Materia Medica*, a name given by ſome authors to the fruit called FAGARA by other writers.

CAZEMATE, in *Fortification*, a kind of vault, or arch, of ſtone-work, in that part of the flank of a BASTION next the curtain; ſomewhat retired, or drawn back, towards the capital of the baſtion; ſerving as a battery, to defend the face of the oppoſite baſtion, and the moat, or ditch.

The name comes from a vault, formerly made to ſeparate the platforms of the upper and lower batteries; each of which was called, in Italian, *caſa armata*; and, in the Spaniſh, *caſamata:* though others derive the word from *caſa à matti*, *houſe of fools*; Covarruvias, from *caſa* and *mata*, *low houſe*.

The *cazemate*, ſometimes, conſiſts of three platforms, one above another; the higheſt being on the rampart: but they commonly content themſelves to withdraw the laſt within the baſtion.

The *cazemate* is alſo called the *low place*, and *low flank*; as being at the bottom of the wall, next the ditch: ſometimes the *retired flank*; as being that part of the flank neareſt the curtain, and the center of the baſtion. It was formerly covered with an epaulement, or a maſſive body, either round or ſquare, which prevented thoſe without from ſeeing within the batteries; whence it was alſo called *covered flank*.

It is now rarely uſed, becauſe the batteries of the enemy are apt to bury the artillery of the *cazemate* in the ruins of the vault: beſides, the terrible ſmoke, made by the diſcharge of the cannon, renders it intolerable to the men.—Hence, inſtead of the ancient *covered cazemates*, later engineers have contrived open ones, only guarded by a parapet, &c.

CAZEMATE is alſo uſed for a well with ſeveral ſubterraneous branches, dug in the paſſage of the baſtion, till the miner is heard at work, and air given to the mine.

CAZERNS, in *Fortification*. See CASERNS.

CAZIC, or CAZIQUE, a general title given by the Spaniards to the petty kings, princes, and chiefs of the ſeveral countries of America, excepting thoſe of Peru, who are ſtiled *curatas*.

The French call them *caſiques*, a denomination which they alſo give to the chiefs of the Tartarian hords.

The *cazics* in ſome places do the office of phyſicians, and in others of prieſts, as well as captains. The dignity of *cazic* among the Chiites, a people of South America, does not deſcend to children, but muſt be acquired by valour and merit. One of the prerogatives annexed to it is, that the *cazic* may have three wives, while the other people are only allowed one.

Mexico comprehended a great number of provinces and iſlands, which were governed by lords called *caziques*, dependent on, and tributary to the emperor of Mexico: thirty of theſe *caziques* or vaſſals are ſaid to have been ſo powerful, that they could each of them bring an army of an hundred thouſand men into the field.

CAZIMI, among the *Arabian Aſtronomers*, denotes the center or middle of the ſun. A planet is ſaid to be in *cazimi*, when it is not diſtant from the ſun either in longitude or latitude above 17′, or the aggregate of the ſemi-diameter of the ſun's diſk and that of the planet.

This amounts to the ſame with what is otherwiſe called in *corde ſolis*, or in the ſun's heart, which paſſes for a dignity and fortitude of a planet, equal to that of being in its own houſe; whereas in other caſes, a planet's conjunction with the ſun is held detrimental, or a diminution to it; as the ſun, by his ſuperior power, is ſuppoſed to abſorb the virtue of the planet, and even ſcorch or burn it up.

CEANIDES, or CEANTIDES, in *Natural Hiſtory*, a name given by many of the ancients to the ſtone more generally known under the name of *enchymonites*. It was the ſame with our ſparry incruſtations on the walls and roofs of ſubterranean caverns; and, from the opinion of the times, that theſe ſtones brought forth young ones, which was founded on their finding little ones daily produced among them, it became a cuſtom to give this internally to women in labour, as a thing that would, by a ſort of ſympathy, haſten the time.

CEANOTHUS, in *Botany*, a genus of the *pentandria monogynia* claſs; *Euvonymus*, Com. Hort. New Jerſey tea. Its characters are theſe: the flower hath five roundiſh equal petals, which ſpread open, and are leſs than the empalement. It hath five erect ſtamina, placed oppoſite to the petals; and a three-cornered germen, which afterward becomes a dry capſule with three cells, in which are lodged three oval ſeeds. There are three ſpecies.

CEBELL, in *Muſic*, an ancient Engliſh air in duple time of four bars or meaſures repeated at the will of the compoſer; the ſtrains being alternately in the grave and the acute ſeries of notes in the muſical ſcale.

CECROPIA, in *Botany*, a genus of the *diœcia monandria* claſs.

CEDAR *of Lebanon*, in *Botany*. For the characters, ſee LARIX.—Linnæus makes this a ſpecies of the PINE.

The *cedar of Lebanon* is a tree celebrated in antiquity; and what is remarkable, this tree is not found as a native in any other part of the world, ſo far as hath come to knowlege.

This tree is of great beauty, and bears the openeſt expoſures ſo well, that it is a wonder it is not more cultivated in England. The cones of this tree are brought us from the Levant, and, if preſerved entire, will keep their ſeeds many years: theſe cones are to be ſplit open, and the ſeeds picked out: theſe are to be ſown and propagated in the ſame manner as the FIR; only that when the plants begin to ſhoot ſtrong, the leading ſhoot generally inclines to one ſide, and muſt therefore be ſupported by tying it to a ſtake driven upright by its ſide. Theſe trees ſpread greatly, and the ends of their branches bending down, they ſhew very beautifully their upper ſurface, which looks like a green carpet, and as it plays in the wind makes a very elegant appearance; and is therefore a fine tree for planting on an eminence to terminate a viſta.

They thrive beſt of all in a poor ſoil, and are of very quick growth, as appears very plainly by thoſe fine ones in the Phyſic garden at Chelſea, which were planted in the year 1683, and were then not above three feet high; and in the year 1762 meaſured near twelve feet in the girth, at two feet above ground.

Cedar wood is reputed almoſt immortal and incorruptible, a prerogative which it owes chiefly to its bitter taſte, which the worms cannot endure. For this reaſon it was, the ancients made uſe of *cedar* tables to write on, eſpecially for things of importance; as appears from that expreſſion of Perſius, *Et cedro digna locutus.* Sat. i. ver. 42.

A juice was alſo drawn from *cedar*, with which they ſmeared their books and writings, or other matters, to preſerve them from rotting; which is alluded to by Horace: by means of which it was that Numa's books, written on papyrus, were preſerved entire to the year 535, as we are informed by Pliny. Hor. Ars. Poet. ver. 331. Plin. Nat. Hiſt. lib. xii. cap. 13. See CEDRIA.

Solomon's temple, as well as his palace, were both of this wood. That prince gave king Hiram ſeveral cities for the *cedars* he furniſhed him on thoſe occaſions. Cortes is ſaid to have erected a palace at Mexico, in which were 7000 beams of *cedar*, moſt of them 120 feet long, and 12 in circumference, as we are informed by Herrera. Some tell us of a *cedar* felled in Cyprus 130 feet long, and 18 in diameter. It was uſed for the main-maſt in the galley of king Demetrius.

Le Bruyn aſſures us, that the two biggeſt he ſaw on mount Lebanon meaſured one of them 57 palms, and the other 47 in circumference.

In the temple of Apollo at Utica, there were *cedar* timbers of near 2000 years old; which yet were nothing to that beam in an oratory of Diana, at Saguntum in Spain, ſaid to have been brought thither 200 years before the deſtruction of Troy.

Cedar is of ſo dry a nature, that it will not endure to be faſtened with iron nails, from which it uſually ſhrinks, ſo that they commonly faſten it with pins of the ſame wood.

The *cedar* brought from Barbadoes and Jamaica is a ſpurious ſort, of ſo porous a nature, that the wine will leak through it.

That produced in New England is a lofty grower, and makes excellent planks, and flooring that is everlaſting. They ſhingle their houſes with it, and uſe it in all their buildings. This is the *oxycedrus* of Lycia, which Vitruvius deſcribes as having its leaves reſembling thoſe of cypreſs.

The *cedar* of Greece and Aſia was no other than a ſmaller kind of juniper, which, having prickly leaves, was by ſome called *oxycedrus*; and the common juniper was at that time called alſo by the name of *cedar*. The Lycian *cedar* of the Greeks was this juniper kind; but the *cedrium* and *cedrelæum*, which were a kind of pitch and an oil ſeparated from it by melting, were not prepared from this *cedar*, but from the Syrian *cedar*, which was a larger ſhrub, and reſembled the cypreſs; and therefore was confounded with that tree, being called by ſome the wild cypreſs. The *cedrium* was always made from this ſpecies; but the *oleum de cada*, or cade oil, was made from the fruit of the *oxycedrus*, or prickly-leaved juniper, called *cedar* by the Greeks, and growing in their own country.

The *ſhittim* and the *almug* mentioned in Scripture, are uſually ſuppoſed to have been kinds of *cedar*.

Johnſton, in his Dendrographia, is of opinion, that pitch was anciently made of *cedar*, as well as of the pine and fir, grown old and oily. Berkeley's Siris, ſect. 18.

CEDAR, *baſtard*, *of Jamaica*, *Theobroma*, in *Botany*, a genus of the *polyadelphia pentandria* claſs. Its characters are theſe: the empalement of the flower is compoſed of three oval concave leaves, which are reflexed: the flower has five oval petals which ſpread open, and are hollowed like a ſpoon; and from the top of each petal comes out a bifid briſtly ligula, divided like two horns. It has a great number of ſhort ſtamina, joined in five bodies, which are terminated by roundiſh ſummits; and a roundiſh germen ſupporting a ſingle ſtyle the length of the petals, crowned by a ſingle ſtigma. The germen turns to a roundiſh fruit with five angles, opening in five cells, each containing ſeveral ſeeds. We have but one ſpecies, which grows naturally in moſt of the iſlands in the Weſt Indies.

The wood of this tree is white and ductile, and is therefore frequently cut into ſtaves for caſks; the fruit and leaves are good fodder for cattle.

CEDAR *of Barbadoes*, and *Mahogany*, *Cedrus*, in *Botany*. This is properly a genus of the *pentandria monogynia* claſs in the Linnæan ſyſtem. Its characters are theſe: the flower is of one leaf, divided at the top into five parts; with five ſhort ſtamina, which adhere at bottom to the germen. In the center is ſituated the roundiſh germen, which afterward becomes an oval pod having five cells, opening from the bottom upward with five valves, having a double cover, the outer being thick and woody, the inner very thin, which immediately ſurrounds the ſeeds: theſe are thick at the baſe, but upward are flat and thin, like the wings adhering to the ſeeds of firs and pines.

As the *cedar of Libanus* is by Tournefort very properly referred to the genus of *larix*, and all the berry-bearing *cedars* are joined to the junipers; ſo the little *cedrus* is given to this genus, as the plants were mentioned by imperfect titles by moſt of the authors who have treated of them: and as the firſt ſort has been generally known by the appellation of *cedar* in the countries where it naturally grows, ſo the applying the ſame name to thoſe plants which agree in their eſſential characters with it, will connect them properly together.

There are three ſpecies. The firſt is commonly known under the appellation of *cedar*, in the Britiſh iſlands of America, where this tree grows naturally, and is one of the largeſt trees in the country. The trunks of theſe trees are ſo large, that the inhabitants hollow them into boats and periaguas, for which purpoſe they are extremely well adapted: the wood being ſoft, is cut with great facility; and being light, will carry a great weight in the water. It has a fragrant odour, from which the name of *cedar* has been given to it. It is often uſed for wainſcotting of rooms, and to make cheſts, becauſe vermin do not ſo frequently breed in it, as in many other ſorts of wood, it having a bitter taſte. This taſte is communicated to whatever is put into the cheſts, eſpecially when the wood is freſh; for which reaſon it is never made into caſks, becauſe ſpirituous liquors will diſſolve part of the reſin, and thereby acquire a very bitter taſte.

The ſecond ſort is the *mahogany*, the wood of which is now well known in England. This tree is a native of the warmeſt parts of America, growing plentifully in the iſlands of Cuba, Jamaica, and Hiſpaniola: there are alſo many of them on the Bahama iſlands. In Cuba and Jamaica there are trees of a very large ſize, ſo as to cut into planks of ſix feet in breadth; and riſe to a great height, notwithſtanding they are ſometimes found growing on rocks, where there is ſcarcely any earth for their nouriſhment.

The excellency of this wood for all domeſtic uſes, is now ſufficiently known; and it is matter of ſurprize, that the tree ſhould not have been taken notice of, by any hiſtorian or traveller, to this time. The only author who has mentioned this tree is Mr. Cateſby, in his Natural Hiſtory of Carolina and the Bahama Iſlands; although the wood has for many years been brought to England in great quantities.

If the plants are properly managed, they will make conſiderable progreſs in England; ſome are now in Chelſea garden eight or ten feet high, which are but of a few years growth from ſeeds.

CEDAR *of Bermudas*. See JUNIPER.

CEDAR, *white*. See CYPRESS.

CEDAR-*cups*, a ſort of wooden ware brought from the Weſt Indies. They are made out of the wood of the baſtard *cedar*, and appear of a very cloſe and firm grain; but they are really ſo porous, that when any liquor is poured into them, it runs out at the bottom.

CEDILLA, in the Spaniſh and French languages, denotes a ſort of ſmall *c*, to the bottom of which is affixed a kind of virgula, as *ç*, to denote that it is to be pronounced like *s*.

The *cedilla* is called by ſome of our printers a *ceceril*. It is uſed before the vowels *a*, *o*, and *u*; as in *braços*, *choça*, *commença*, *leçon*, *deça*, &c. In the Spaniſh, it is ſometimes uſed at the beginning of a word; as in *çamarra*, *çurzar*, &c.

CEDRA. See CITRON.

CEDRELA, in *Botany*, a genus of the *pentandria monogynia* claſs, including only one ſpecies.

CEDRELATON, in *Botany*, a name given by Pliny to an imaginary tree, and faithfully copied by many authors. The word ſeems evidently formed of *cedrus*, the *cedar*; and *elate*, the *fir-tree*; and hence the original author of the blunder has deſcribed it as a large and high cedar, with few branches: and thoſe who have copied from him, have deſcribed it as being of a middle nature, between the cedar and fir.

CEDRIA, a reſinous liquor iſſuing from the great cedar-tree, or cedar of Lebanon. The word is alſo written *cedrium*, κεδριον, and *cedrinum*, κεδρινον.

Cedria, when good, yields a ſtrong ſmell, is tranſparent, of a thick fatty conſiſtence, ſo that in pouring it out, it does not fall too faſt or freely, but equally drop by drop. It is poſſeſſed of two oppoſite qualities, viz. to preſerve dead bodies, by its drying and conſuming ſuperfluous moiſture without damaging the ſolid parts; and to putrify the ſoft and tender parts of living bodies without exciting any pain.

The *cedria* is properly the tear of the cedar. Some call it the gum, others the pitch of the cedar. The ſame denomination is alſo given to the *cedrelæon*, or oil of the cedars, which differs little from the reſin, except that it is of a thinner conſiſtence.

Pliny, ſpeaking of the cedar, ſays, that the tar of it uſed in embalming was forced out of it by fire, and called in Syria *cedrium*. His words are: *Cujus tanta vis eſt, ut in Ægypto corpora hominum defunctorum eo per fuſa ſerventur.* Dioſcorides calls it the life of the dead, νεκρȣ ζωη. See Phil. Tranſ. vol. liv. p. 12.

CEDRINUM *(Vinum)*, cedar wine; of which there are ſeveral ſorts, whoſe qualities are to be heating, diuretic, and gently aſtringent: but the *laurinum*, or bay-tree wine, is remarkably heating.

CEGINUS, in *Aſtronomy*, a fixed ſtar of the third magnitude, in the left ſhoulder of Bootes. See γ under BOOTES.

CEGOLITES, in *Natural Hiſtory*, a name by which ſome authors have called the *lapis* JUDAICUS, or TECOLITHOS of the ancients.

CEIBA. See COTTON-*tree*.

CEILANESE GODS. See BUDUN and SAKRADEWENDRA.

CEILING, in *Architecture*, the top, or roof, of a lower room; or a covering of plaſter, over laths nailed on the bottom of the joiſts that bear the floor of the upper room; or where there is no upper room, on joiſts for the purpoſe; hence called *ceiling joiſts*.

The word *ceiling* anſwers pretty accurately to the Latin *lacunar*, *every thing over head*.

Plaiſtered *ceilings* are much uſed in England, more than in any other country: nor are they without their advantages, as they make the room lightſome; are good in caſe of fire; ſtop the paſſage of the duſt; leſſen the noiſe over head; and, in ſummer, make the air cooler.

CEILING, in *Sea-Language*, denotes the inſide planks of a ſhip.

CEIMELIA, from κειμαι, *to be laid up*, in *Antiquity*, denotes choice or precious pieces of furniture or ornaments, reſerved or laid up for extraordinary occaſions and uſes.

In which ſenſe, ſacred garments, veſſels, and the like, are reputed of the *ceimelia* of a church. Medals, antique ſtones, figures, manuſcripts, records, &c. are the *ceimelia* of men of letters.

CEIMELIARCHIUM, the repoſitory or place where *ceimelia* are preſerved.

CEIMELIOPHYLAX, from κειμηλιον and φυλαττω, *I keep*, the keeper or curator of a collection of *ceimelia*; ſometimes alſo denominated *ceimeliarcha*.

The *ceimeliarcha*, or *ceimeliophylax*, was an officer in the ancient churches or monaſteries, anſwering to what was otherwiſe denominated *chartophylax*, and *cuſtos archivorum*.

CEIXUPEIRA, in *Zoology*, the name of a fiſh caught in the American ſeas, and eſteemed a very fine and delicate one, though of an enormous ſize. It grows to nine or ten feet long, and to the thickneſs of a man's body; but is chiefly eaten while young. Its body is oblong, and its head flatted. Its mouth is but ſmall for the ſize of the fiſh, and it has no teeth in the jaws; but the whole mouth is thick ſet with ſmall tubercles. Its back and ſides are black, and its belly of a fine bright white. Its fins are all black, except the belly ones, which are white, with a rim of black at their edge. Margrave.

CELANDINE, in *Botany*, *Chelidonium*, a genus of the *polyandria monogynia* claſs. Its characters are theſe: the flower hath four large roundiſh petals: in the center is ſituated a cylindrical germen, attended by a great number of ſtamina. The germen afterward becomes a cylindrical pod, with one or two cells, opening with two valves, and filled with many ſmall ſeeds. There are ſeveral ſpecies.

The firſt ſort is the common *celandine*, which is uſed in medicine, and is eſteemed aperitive and cleanſing, opening obſtructions of the ſpleen and liver; and is of great uſe in curing the jaundice and ſcurvy. This grows naturally on the ſides of banks, and in ſhady places, in many parts of England, ſo is ſeldom cultivated in gardens. Miller's Gard. Dict.

Boccone has very ſtrongly recommended this plant as a ſpecific in the cure of conſumptions: he propoſes the taking it in infuſion, or drinking its juice; and ſays enough in its praiſe to recommend it at leaſt to a fair trial, which would be eaſily made in a country where conſumptions are ſo common. Boccon. de Plant.

Celandine, *leſſer*. See Ranunculus.

Celandine-*tree*, *greater*. See Bocconia.

CELANTES, in *Logic*, a denomination given by the Peripatetics to the Galenical ſyllogiſm; otherwiſe called CALENTES.

CELARENT, among *Logicians*, a mode of ſyllogiſm, wherein the major and concluſion are univerſal negative propoſitions, and the minor an univerſal affirmative. E. gr.

CE *None whoſe underſtanding is limited can be omniſcient.*
LA *Every man's underſtanding is limited.*
RENT *Therefore no man is omniſcient.*

CELASTRUS, in *Botany*. See Staff-*tree*.

CELE, in a general ſenſe, denotes any TUMOUR, but more particularly that proceeding from a RUPTURE or HERNIA.

CELEBATE, or Celibacy, the ſtate of a perſon who lives out of MARRIAGE.

Scaliger derives the word from the Greek κοιτη, *bed*, and λειπω, *linquo*, *I leave*: others ſay, it is formed from *cœli beatitudo*, q. d. *the bleſſedneſs of heaven*.

The ancient Romans uſed all means imaginable to diſcourage *celibacy*. Nothing was more uſual than for the cenſors to impoſe a fine on old bachelors. Dionyſius Halicarnaſſeus mentions an ancient conſtitution, whereby all perſons of full age were obliged to marry. But the firſt law of that kind, of which we have any certainty, is that enacted under Auguſtus, called *Lex Julia de maritandis ordinibus*. It was afterwards denominated *Papia*, *Poppæa*, and more uſually *Julia Papia*, becauſe of ſome new ſanction and amendments made to it under the conſuls Papius and Poppæus. By this law, divers prerogatives were given to perſons who had many children; penalties impoſed on thoſe who lived a ſingle life, as that they ſhould be incapable of receiving legacies, except from their neareſt relations, and not exceeding a certain proportion, &c.

The *celebate* of the clergy, which is ſtill rigorouſly kept up among the Romaniſts, is of a pretty ancient ſtanding. It was firſt propoſed by the council of Nice, but without paſſing; it was, however, in ſome meaſure, admitted by the weſtern councils of Elvira, Arles, Tours, &c. and enjoined by the thirty-third canon of the council of Elvira, though it does not appear that it was either generally or rigorouſly obſerved. Such among the prieſts as piqued themſelves on the faculty of continence, took the hint; inſomuch as, towards the cloſe of the fourth century, there were few but made a profeſſion of a voluntary *celebate*. Syricius iſſued a decree in 385, obliging all prieſts and deacons to obſerve *celibacy*: and it was ſoon after enjoined by the ſynods of each particular nation, and obſerved in moſt of the weſtern churches. In 441, the council of Orange ordered thoſe to be depoſed who did not abſtain from their wives; and Leo the Great, in a letter written about the year 442, extended the law of *celibacy*, which was confined by the decree of this council to deacons, and by the letter of Syricius to deacons and preſbyters, to ſub-deacons likewiſe: but it was Gregory the Great, in 591, who firſt brought eccleſiaſtics to admit the *celebate* as a law. In the council of Trent, it was propoſed to ſet the clergy at liberty again from the yoke of *celebate*; and this was even made an article of the Interim of Charles V. but the pope could not be brought into it.

The obligation of *celibacy* was firſt impoſed on the clergy in England by Henry I. under the influence of pope Calixtus II. and the archbiſhop Anſelm.

CELERES, in *Antiquity*, a body, or regiment, of guards of the ancient Roman kings, eſtabliſhed by Romulus; conſiſting of three hundred youths, choſen from the beſt families of Rome, and approved by the ſuffrages of the *curiæ* of the people, each of which furniſhed ten.

The name comes from *celer*, *quick*, *ready*; and was given them, becauſe of their promptneſs to obey the king.

The *celeres* always attended near the king's perſon, to guard him, to be ready to carry his orders, and to execute them. In war, they made the van-guard in the engagement, which they always began firſt; in retreats, they made the rear-guard. Though the *celeres* were a body of horſe, yet they uſually diſmounted, and fought on foot; their commander was called *tribune*, or *prefect of the celeres*. They were divided into three troops, of one hundred each, commanded by a captain called *centurio*: their TRIBUNE was the ſecond perſon in the kingdom. See Cavalry, &c.

Plutarch ſays, Numa broke the *celeres*: if this be true, they were ſoon re-eſtabliſhed; for we find them under moſt of the ſucceeding kings: witneſs the great Brutus, who expelled the Tarquins, and who was the tribune of the *celeres*.

CELERINUS, in *Ichthyology*, a name by which ſome authors have called the PILCHARD; called by others the *apua membras*, and CHALCIS.

Celerinus is alſo uſed by Bellonius, and ſome other authors, for the common herring. See Clupea.

CELERITY, in *Mechanics*, is the VELOCITY of a moving body; or that affection of a body in MOTION, whereby it is enabled to paſs over a certain ſpace, in a certain time.

CELERY, in *Botany*. For the characters, ſee Apium.

The ſeed of *celery* ſhould be ſown at two or three different times, the better to continue it for uſe through the whole ſeaſon without running up to ſeed. The firſt ſowing ſhould be in the beginning of March, upon a gentle hot-bed; the ſecond may be at the end of the ſame month, which ought to be in an open ſpot of light earth, where it may enjoy the benefit of the ſun; the third time of ſowing ſhould be in the latter end of April, or beginning of May, on a moiſt ſoil; and if expoſed to the morning-ſun only, it will be ſo much the better, but it ſhould not be under the drip of trees. The middle of May, ſome of the plants of the firſt ſowing will be fit to tranſplant for blanching.

The manner of tranſplanting it is as follows: after having cleared the ground of weeds, you muſt dig a trench by a line about ten inches wide, and eight or nine inches deep, looſening the earth in the bottom, and laying it level; and the earth that comes out of the trench ſhould be equally laid on each ſide the trench, to be ready to draw in again to earth the *celery* as it advances in height. Theſe trenches ſhould be made at three feet diſtance from each other; then plant your plants in the middle of the trench, at about four or five inches diſtance, in one ſtrait row, having before trimmed the plants, and cut off the tops of the long leaves: and as they are planted, you muſt obſerve to cloſe the earth well to their roots with your feet, and to water them plentifully until they have taken new root. As theſe plants advance in height, you muſt obſerve to draw the earth on each ſide cloſe to them, being careful not to bury their hearts, nor ever to do it but in dry weather; otherwiſe the plants will rot. When your plants have advanced a conſiderable height above the trenches, and all the earth, which was laid on the ſides thereof, hath been employed in earthing them up; you muſt then make uſe of a ſpade to dig up the earth between the trenches, which muſt alſo be made uſe of for the ſame purpoſe, continuing from time to time to earth it up, until it is fit for uſe. The laſt crop ſhould be planted in a drier ſoil, to prevent its being rotted with too much wet in the winter. You will do well to cover your ridges of *celery* with ſome peaſe-haulm, or ſome ſuch light covering, when the froſt is very hard, which will admit the air to the plants; for if they are covered too cloſe, they will be very ſubject to rot: by this means you will preſerve your *celery* till ſpring; but you muſt remember to take off the covering whenever the weather will permit, otherwiſe it will be apt to cauſe the *celery* to pipe, and run to ſeed. The *celery*, when full blanched, will not continue good above three weeks or a month before it will rot or pipe; therefore, in order to continue it good, you ſhould have, at leaſt, ſix or ſeven different ſeaſons of planting, proportioned to the conſumption.

The other ſort of *celery*, which is commonly called *celeriac*, is to be managed in the ſame manner; excepting that this ſhould be planted on the level ground, or in very ſhallow drills: for this plant ſeldom grows above eight or ten inches high, ſo requires but little earthing up; the great excellency of this being in the ſize of the root, which is often as large as ordinary turnips.

The beſt method to ſave the ſeed of *celery*, is to make choice of ſome long good roots of the upright *celery*, which have not been too much blanched, and plant them out, at about a foot aſunder, in a moiſt ſoil, early in the ſpring; and when they run up to ſeed, keep them ſupported with ſtakes, to prevent their being broken down with the wind: and in July, when the ſeed begins to be formed, if the ſeaſon ſhould prove very dry, it will be proper to give ſome water to the plants, which will greatly help its producing good ſeeds. In Auguſt theſe ſeeds will be ripe, at which time it ſhould be cut up, in a dry time, and ſpread upon cloths in the ſun to dry; then beat out the ſeeds, and preſerve it in bags for uſe.

The qualities of *celery* agree with thoſe of SMALLAGE and PARSLEY, which ſee.

Celery, *wild*, *Apium antarcticum*, was found in conſiderable quantities by Mr. Banks and Dr. Solander, on the coaſt of Terra del Fuego. It is like the garden *celery* in the colour and diſpoſition of the flowers, but the leaves are of a deeper green. The taſte is between that of *celery* and parſley. It is a very uſeful ingredient in the ſoup for ſeamen, becauſe of its antiſcorbutic quality. Hawkeſworth's Voyages, vol. ii. p. 60, &c.

CELESTINS, an order of religious, called alſo the *Congregation of St. Damian*, reformed from the Bernardines, in 1224, by pope Celeſtin V. then only Peter D' Murroni, of Iſernia in Naples; and eſtabliſhed in 1264, by pope Urban IV. and confirmed by Gregory X. in 1274. They were introduced into France by Philip the Fair, who requeſted a dozen of them from the general of their order, by his embaſſador at Naples, in 1300. This order ſtill ſubſiſts in France and Italy.—It is a kind of proverb with them, *Voila un plaiſant Celeſtin.*

CELETES, or **Celetæ**, from κελης, *a race-horſe*, in *Antiquity*, denote ſingle or ſaddle-horſes; by way of contradiſtinction from thoſe yoked or harneſſed together, called *bigarii*, *quadrigarii*, &c.

The ſame denomination is alſo given to the cavaliers, or riders on horſeback; and hence ſome deduce *celeres*, the name of Romulus's guard.

CELEUSMA, or **Celeuma**, in *Antiquity*, the ſhout or cry of the ſeamen, whereby they animated each other in their work of rowing.

The word is formed from κελευειν, *to call*, *to give the ſignal.*

Celeusma was alſo a kind of ſong or formula, rehearſed or played by the maſter, or others, to direct the ſtrokes and movements of the mariners, as well as to encourage them to labour. See Celeustes.

Aquinus, without much foundation, extends the *celeuſma* to the military ſhouts in land armies.

When Chriſtianity got footing, hymns and pſalms were ſung in veſſels, by way of *celeuſma*, in which the words *amen* and *halleluja* were frequently repeated.

CELEUSTES, in *Ancient Navigation*, the boatſwain or officer appointed to give the rowers the ſignal, when they were to pull, and when to ſtop. See Celeusma.

He was alſo denominated *epopeus*, and by the Romans *portiſculus*; ſometimes ſimply *hortator*.

CELIAC *paſſion*. See Coeliac.

CELIBATE. See Celebate.

CELIDOGRAPHIA, the deſcription of the SPOTS which appear on the faces of the ſun and planets.

The word is formed from κηλις, *macula*, *ſpot*, and γραφω, *I deſcribe.*

Signor Bianchini has publiſhed a *celidographia*, or deſcription of the ſpots of the ſun.

CELIMIA, in the *Materia Medica*, a name given by the modern Greeks to the calamine, or *lapis* CALAMINARIS. The Arabians called this ſubſtance *climia*, and ſometimes *calimia*; and *celimia* was but a very ſmall change from this.

CELL, *Cella*, in *Ancient Writers*, denotes a place or apartment uſually under ground, and vaulted; in which were ſtored up ſome ſort of neceſſaries, as wine, honey, wheat, and the like; according to which it was peculiarly denominated *cella vinaria*, *oleria*, *mellaria*, *penaria*, &c.

The word is formed from *celare*, *to conceal.* See Cells.

Cella was alſo uſed for the lodge, or habitation of a common woman or proſtitute, as being under ground; hence alſo denominated *fornix.*

Intravit calidum veteri centone lupanar,
Et cellam vacuam. Juv. Sat. vi. ver. 121.

On which place an ancient ſcholiaſt remarks, that the names of the whores were written on the doors of their ſeveral *cells*; by which we learn the meaning of *inſcripta cella*, in Martial, lib. xi. ep. 46.

Cella was alſo applied to the bed-chambers of domeſtics, and ſervants; probably as being low and narrow.

Cicero, inveighing againſt the luxury of Antony, ſays, the beds in the very *cellæ* of his ſervants were ſpread with pompous purple coverlets.

Cella is alſo applied to the members or apartments of BATHS.

Of theſe there were three principal, called *frigidaria*, *tepidaria*, and *caldaria*. To which may be added a fourth, called *cella aſſa*, and ſometimes *ſudatoria*.

Cella was alſo applied to the *adyta*, or inmoſt and moſt retired parts of the temples, wherein the images of the gods, to whom the edifices were conſecrated, were preſerved. In this ſenſe, we meet with *cella Jovis*, *cella Concordiæ*, &c. Pub. Victor calls them *delubra*; and Pliny by a more comprehenſive name, *ædes*. Hiſt. Nat. lib. xxxv. cap. 10.

The Roman capitol, we are told by Dionyſius, had three ſuch *cellæ*, or chapels; the middlemoſt of which was ſacred to Jupiter, that on the right hand to Minerva, and that on the left to Juno.

Cell is alſo uſed for a leſſer or ſubordinate ſort of monaſtery, dependent on a great one, by which it was erected, and continues ſtill to be governed. The great abbies in England had moſt of them *cells* in places diſtant from the mother-abbey, to which they were accountable, and from which they received their ſuperiors.

The alien priories in England were *cells* to abbies in Normandy, France, Italy, &c.

The name *cell* was ſometimes alſo given to rich and conſiderable monaſteries not dependent on any other. Such was that called *cella vetus*, erected by Otho, ſurnamed the Rich, marquis of Miſnia, in the middle of the twelfth century, the moſt ſplendid abbey in that country.

CELLAR, *Celarium*, in *Ancient Writers*, denotes the ſame with CELLA, viz. a conſervatory of eatables, or drinkables.

Cellar differs from VAULT, as the latter is ſuppoſed to be deeper, the former being frequently little below the ſurface of the ground.

In which ſenſe, *cellarium* only differed from *penus*, as the former was only a ſtore-houſe for ſeveral days, the latter for a long time. Thus it is, the BACTROPERATÆ, a ſort of ancient Cynics, are ſaid by St. Jerome to carry their *cellar* about with them. Hieron. in Matth. cap. 10.

Cellarium alſo denoted an allowance of bread, wine, oil, or other proviſion, furniſhed out of the *cella*, to the uſe of the governor of the province, and his officers, &c. In which ſenſe, the word amounts to much the ſame with ANNONA.

Cellars, in *Modern Building*, are the loweſt rooms in a houſe, the ceilings of which uſually lie level with the ſurface of the ground on which the houſe is built.

Cellars, and other places vaulted under ground, were called by the Greeks *hypogæa*: the Italians ſtill call them *fundi delle caſe.*

As to the ſituation of *cellars*, Sir Henry Wotton ſays they ought, unleſs the whole houſe be cellared, to be ſituated on the north ſide of the houſe, as requiring a cool freſh air.

CELLARER, or **Cellerer**, *Cellelarius*, or *Cellarius*, an officer in monaſteries, to whom belong the care and procurement of proviſions for the convent.

The denomination is ſaid to be borrowed from the Roman law, where *cellarius* denotes an examiner of accounts and expences. Ulpian defines it thus: *Cellerarius, id eſt, ideo præpoſitus ut rationes ſalvæ ſint.*

The *cellerarius* was one of the four *obedientiarii*, or great officers of monaſteries: under his ordering was the *piſtrinum* or bakehouſe, and the *bracinum*, or brewhouſe. In the richer houſes there were particular lands ſet apart for the maintenance of his office, called in ancient writings, *ad cibum monachorum.* The *cellerarius* was a great man in the convent. His whole office in ancient times had a reſpect to that origin: he was to ſee his lord's corn got in, and laid up in granaries; and his appointment conſiſted in a certain proportion thereof, uſually fixed at a thirteenth part of the whole; together with a furred gown. The office of *cellarer* then only differed in name from thoſe of bailiff and minſtrel; excepting that the *cellarer* had the receipt of his lord's rents through the whole extent of his juriſdiction.

Cellarer was alſo an officer in chapters, to whom belonged the care of the temporals, and particularly the diſtributing of bread, wine, and money to canons, on account of their attendance in the choir. In ſome places he was called *cellarer*, in others *burſer*, and in others *currier.*

CELLEPORÆ, in *Botany*, the name of a genus of marine plants, or rather animals; and claſs of worms in the Linnæan ſyſtem. They are of the genus of the *lithophyta*, and have oblong creeping hollows in ſeveral parts. See Coral.

CELLITES, **Cellitæ**, an order of religious, founded at Antwerp in the beginning of the fourteenth century, whoſe patron was Alexius, a Roman; and therefore, in Italy they are called *Alexians*; but in Germany, and the Low Countries, where they have monaſteries, *Cellites*, i. e. people inhabiting in cells. See Lollards.

CELLS, *Cellæ*, *Cellulæ*, are little houſes, apartments, or chambers; particularly thoſe wherein the ancient monks, ſolitaries, and hermits, lived in retirement.

Some derive the word from the Hebrew כלא, i. e. *a priſon*, or *place where any thing is ſhut up.*

The ſame name is ſtill retained in divers monaſteries.

The dormitory is frequently divided into ſo many *cells*, or lodges.

The Carthuſians have each a ſeparate houſe, which ſerves them as a *cell*.

The hall wherein the Roman conclave is held, is divided, by partitions, into divers *cells*, for the ſeveral cardinals to lodge in.

Cells, in *Anatomy*, are little bags, or bladders, where fluids, or other matters, are lodged; called alſo *loculi*, *cellulæ*, &c.

Cells are alſo the little diviſions, or apartments, in honey-combs, where the honey, young bees, &c. are diſtributed: theſe are always regular hexagons.

Cells *of plants*, in *Botany*, are thoſe partitions or hollow parts in the huſks or pods of plants, wherein the ſeed is lodged.

CELLULÆ *Adipoſæ*, in *Anatomy*, the loculi, or little *cells*, wherein the fat of bodies in good habit is contained. See Adeps, and Adiposus.

Theſe are co-extended with the ſkin itſelf, except on the forehead, the eye-lids, *penis*, and *ſcrotum*. In emaciated bodies, theſe *cells*, being unfurniſhed of their fat, appear like a kind of flaccid, tranſparent membrane.

The *cellular membrane* is reticular and adipoſe. The ſubſtance of the reticular part is merely a net-work of ſlender fibres and ſmall membranes, whence it derives its ductility and looſeneſs; ſuch as it is found under the ſkin of the *penis* and *ſcrotum*: in other parts, as under the ſkin of the nates and under the ſoles of the feet, it is loaded with oil, and leſs porous in its ſubſtance. The former part is diſperſed through the whole body, except in the ſubſtance of the bones, brain, and humours of the eye, covering the ſolids of the body, the muſcles, tendons, ligaments, and nerves, and uniting them to one another; and it is even intermixed with the ſubſtance of the ſkin. About the joints, the *cellular membrane* is chiefly reticular, for the ſake of eaſy motion; under the ſkin in general it is adipoſe, between which ſtratum and the ſurface of the muſcular maſs it is looſe, and chiefly reticular. In the *fœtus*, that part only of this membrane is adipoſe, which is upon the outſide of the body: as we grow up, the fat is more equally diſperſed through the body, and its greater quantity in proportion about the *viſcera*. Dr. Hunter is of opinion, that the fat in the body is lodged in a glandular apparatus ſuperadded to the reticular membrane, conſiſting of veſicles or bags for this purpoſe, and of veſſels fitted for ſecretion. See Med. Obſ. vol. i. p. 26, &c.

Cellulæ, in the Colon, a ſort of ſpaces wherein the Excrements continue ſome time before they are voided.

CELLULANUS, a monk inhabitant, or reſident in a cell, or Cella.

He is alſo denominated *concellaneus* and *ſyncelliſta*, by which are imported the relation of fellow-monks, or thoſe who live in the ſame cell or convent.

CELLULAR, or **Cellulose**, an appellation given by Ruyſch, to the ſecond coat of the inteſtines; in which fat is often found. Heiſt. Comp. Anat. § 211. p. 104. Wharton alſo takes notice of a *celluloſe* coat in the Mesentery, wherein fat is contained.

Heiſter thinks that a *celluloſe* coat may alſo be added to the three coats in the human Bladder, by reaſon fat is often found between the outermoſt and muſcular coat, where it is ſecreted, collected, and preſerved in little adipoſe cells.

CELOSIA, in *Botany*, a genus of the *pentandria monogynia* claſs; Amaranth. Its characters are theſe: the flower hath five erect ſharp-pointed petals, which are permanent, ſtiff, and ſhaped like a flower-cup. It hath a ſmall nectarium joined to the border of the germen, to which adhere the five ſtamina, which are terminated by turning ſummits. The empalement afterward becomes a globular capſule with one cell opening horizontally, containing roundiſh ſeeds. There are three ſpecies.

Linnæus has ſeparated the plants of this genus from the amaranths, which have been generally joined with them; becauſe thoſe have male and female flowers on the ſame plants, whereas theſe have only hermaphrodite flowers.

CELSIA, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Linnæus gave it this name in honour of Dr. Celſus, profeſſor at Upſal. We have no Engliſh name for this plant. Its characters are theſe: the flower is of one leaf, with a very ſhort tube, ſpread open above, and cut into five unequal parts; the two upper being ſmall, and the under larger. It hath four hairy ſtamina, which incline toward the upper ſegment of the petal. In the center is ſituated a roundiſh germen, which afterward becomes a roundiſh capſule compreſſed at the top, fitting upon the empalement; and hath two cells, which are filled with ſmall angular ſeeds. We know but one ſpecies of this plant, which is a native of Armenia.

CELTES, in *Ancient Hiſtory*; under this name muſt be underſtood not only the Gallic philoſophers, but all thoſe which anciently flouriſhed in other parts of Europe. The hiſtory of the *Celtic* philoſophy affords nothing certain; nor is the obſcurity in which it is involved to be wondered at, conſidering the remoteneſs of the times. We diſcover nothing either in our own uſages, or from the teſtimony of Latin authors, by which to reſolve our doubts concerning this people; all monuments of thoſe times being deſtroyed, and their dogmas not being committed to writing; as it was their cuſtom to tranſmit them by tradition.

Some of their hymns, however, are reported to be preſerved among thoſe northern nations which have not been ſubject to the revolutions which have ſo often ſubverted the ſouthern parts of Europe. Extracts from the *Edda*, a courſe of poetry for the inſtruction of the Iceland youth, and ſaid to contain the *Celtic* mythology, have been lately publiſhed; though from whence obtained, does not appear. See Druids.

CELTIS, in *Botany*. See Nettle-*tree*.

CEMENT, or Cæment. See Cæment.

CEMENTATION, or Cæmentation. See Cæmentation, and Gold.

CEMETERY, *Cæmeterium*, a dormitory, or ſacred place ſet apart for the burial of the dead.

Chorier obſerves, that under *cæmeterium*, κοιμητηριον, from κοιμαω, *I ſleep*, anciently was comprehended, not only the ſtrict dormitory, or place where the dead were diſpoſed; but all the lands which encompaſſed the pariſh churches, and were contiguous to the real churches. —Perhaps it might be added, that all the church domains were compriſed under *cæmeterium*. This will beſt account for that confiſcation of the *cemeteries*, charged on Valerian.

In the early ages, the Chriſtians held their aſſemblies in the *cemeteries*, as we learn from Euſebius and Tertullian; the latter of whom calls thoſe *cemeteries* where they met to pray, *areæ*. Valerian ſeems to have confiſcated the *cemeteries*, and places deſtined for divine worſhip, which were reſtored again to the Chriſtians by Gallian. In the reſcript of that emperor, which is preſerved by Euſebius, *cemeteries* and places of worſhip are uſed as ſynonymous terms. It being here the martyrs were buried, the Chriſtians choſe thoſe places to have churches in, when leave was given them by Conſtantine to build. And hence ſome derive that rule which ſtill obtains in the church of Rome, never to conſecrate an altar, without putting under it the relics of ſome ſaint. See Burial.

The heathen writers frequently upbraid the primitive Chriſtians for their meetings in *cemeteries*; as if they ſerved other purpoſes beſides thoſe of religion. The council of Elvira prohibits the keeping of tapers lighted in *cæmeteria*, during the day-time; and by another canon, the women from paſſing the night watching in *cæmeteria*.

The practice of conſecrating *cemeteries* is of ſome antiquity: the biſhop walked round it in proceſſion, with the crozier, or paſtoral ſtaff, in his hand, the holy water-pot being carried before, out of which aſperſions were made.

CENCHRAMIDEA, in *Botany*, a name given by Plukenet to a genus of plants afterwards called, by Plumier and Linnæus, Clusia.

CENCHRAMUS, in *Zoology*, a name by which ſome authors have called the Emberiza *alba*; called in Engliſh, the Bunting.

CENCHRIS, in *Zoology*, the name given by many authors to the keſtrel, or windhover, a ſpecies of hawk, of the long-winged kind, called the Tinnunculus, and by ſome in Engliſh, the *ſtannel*.

Cenchris is alſo the name of a ſpecies of ſerpent; ſo called becauſe of its ſmall ſpots, which reſembled the ſeeds of millet. It grows to five feet, or more, in length, and is conſiderably thick and large, and grows very taper at the tail. It is of a greeniſh yellow colour, and is yellowiſh toward the belly. It is found in the iſlands of the Archipelago, particularly in Lemnos and Samos. Ray.

CENCHRUS, in *Botany*, the name given by Linnæus to a genus of plants, of the *polygamia monoecia* claſs; called by Micheli, *panicaſtella*; the characters of which are theſe: the cup conſiſts of a number of involucra, collected into a ſort of head. Theſe are jagged and echinated, and each of them contains three calyces: the perianthia are bivalve glumes of a hollowed and pointed figure, each containing two flowers, and are ſhorter than thoſe flowers. The flowers are ſome male, and others of the hermaphrodite kind. Each flower is bivalve, the valves being pointed, hollow, and without awns, and the inner one ſmaller than the outer. The ſtamina are three in each flower, and are long pointed filaments, each ſuſtaining a ſagittated apex. The piſtil in the hermaphrodite flowers is formed of a roundiſh germen, a ſlender ſtyle of the ſame length with the ſtamina, and two oblong hairy ſtigmata: this is ſucceeded by a ſingle ſeed to every flower, which is of a roundiſh ſhape.

CENEGILD, in the *Saxon Antiquities*, an expiatory mulct, paid by one who had killed a man, to the kindred of the deceaſed. The word is compounded of the Saxon *cinne*, i. e. *cognatio*, *relation*, and *gild*, *ſolutio*, *payment*.

CENEONTLATOTI, in *Zoology*, the name of an American bird deſcribed by Nieremberg, and called by that author, *avis* POLYGLOTTA. It is famous for the different modulations of its voice, and excels even the nightingale in melody.

CENNING, *Cenninga*, or *Kenninga*, in our *Ancient Books*, denotes notice given by the buyer to him of whom he had bought, that the thing purchaſed was claimed by another, that he might appear and avow, or warrant his bargain.

The word is formed of the Saxon *cennan*, *auctorem advocare*, *to call an author*. Du-Cange.

CENOBITE, or COENOBITE. See COENOBITE.

CENOTAPH, an empty tomb, or a monument without a body under it; erected only by way of honour to the deceaſed.

The word is compounded of κενος, *empty*, and τοφος, *tomb*.

It ſtands diſtinguiſhed from *ſepulchre*, in which a corpſe is actually depoſited.

Cenotaphs are honorary tombs, erected either to perſons buried in another place, or to thoſe who have received no BURIAL, and whoſe relics cannot be found, as being killed in battle, loſt at ſea, or the like. Among the ancients, the ſame privileges and religious regard were allowed to theſe *tumuli inanes & honorarii*, as to real tombs. Card. Norris has a treatiſe expreſs on the *cenotaphs* of the Cæſars, Caius and Lucius, which are ſtill ſeen at Piſa. Lamprid. in Alex. cap. 63.

CENOTZQUI, in *Ornithology*, the name of an American bird deſcribed by Nieremberg, and called *avis evocatrix nivis*, becauſe it always is very clamorous before ſnow falls, and afterwards becomes ſilent. It is a very beautiful variegated bird, and lives as well in the colder as hotter climates, but is principally ſeen among the mountains. It has a very remarkable way of twiſting its head about; ſo that, without moving its body, it eaſily ſees every way round it. There is another ſpecies of it a little differing in the diſpoſition of the colours, which ſome call liceto.

CENSAL, in the Mediterranean parts, denotes a regular or eſtabliſhed broker, authoriſed to negotiate between merchant and merchant.

CENSER, in *Antiquity*, a kind of veſſel wherein incenſe was burnt to the gods.

Cenſer is chiefly uſed in ſpeaking of the Jewiſh worſhip. Among the Greeks and Romans, it is more frequently called *thuribulum*, λιβανωτις, and ACERRA.

The Jewiſh *cenſer* was a ſmall ſort of chaffing-diſh, covered with a dome, and ſuſpended by a chain. Joſephus tells us, that Solomon made twenty thouſand gold *cenſers* for the temple of Jeruſalem, to offer perfumes in, and fifty thouſand others to carry fire in.

CENSER, the ſame with ARA.

CENSIO, in *Antiquity*, the act or office of the CENSOR. See CENSUS.

Cenſio included both the rating, or valuing a man's eſtate, and the impoſing mulcts and penalties.

CENSIO *haſtaria*, a puniſhment inflicted on a Roman ſoldier for ſome offence, as lazineſs or luxury, whereby his *haſta* or ſpear was taken from him, and conſequently his wages, and hopes of preferment ſtopped.

CENSITUS, a perſon cenſed, or entered in the cenſual tables. See CENSUS.

In an ancient monument found at Ancyra, containing the actions of the emperor Octavius, we read,

Quo luſtro civium Romanorum
Cenſita ſunt capita quadragies
Centum millia & ſexaginta tria.

CENSITUS is alſo uſed in the *Civil Law* for a ſervile ſort of tenant, who pays capitation to his lord for the land he holds of him, and is entered as ſuch in the lords rent-roll. In which ſenſe, the word amounts to the ſame with *capite cenſus*, or *capite cenſitus*. See CAPITE *Cenſi*.

CENSOR, in *Antiquity*, one of the prime magiſtrates in ancient Rome; whoſe buſineſs was to ſurvey and rate the people, and to inſpect and correct their manners.

The word is derived from *cenſere*; becauſe he aſſeſſed and valued every man's eſtate; regiſtering their names, and placing them in a proper century, that the Romans might know their own ſtrength; though others ſay, the *cenſors* were ſo called on account of their other office; viz. as being comptrollers, or correctors of manners and policy.

There were two *cenſors* firſt created in the year of Rome 311, upon the ſenate's obſerving, that the conſuls were too much taken up with matters of war, to be left at leiſure for looking near enough into private affairs. The two firſt were Papirius and Sempronius: their authority extended over every perſon; and they had a right to reprehend the higheſt. At firſt they were taken out of the ſenate; but after the plebeians had got the conſulate open to them, they ſoon arrived at the *cenſorſhip*. M. Rutilius was the firſt; who, having been twice conſul and dictator, in the year 402 demanded the office of *cenſor*.—The cuſtom was to elect two; the one of a patrician family, the other a plebeian: and upon the death of either, the other was diſcharged from his office, and two new ones elected; but not till the next luſtrum.—In the year 414, a law was made, appointing one of the *cenſors* to be always elected out of the plebeians; which held in force till the year 622, when both *cenſors* were choſen from among the people; after which time, it was ſhared between the ſenate and people.

This office was ſo conſiderable, that none aſpired to it till they had paſſed all the reſt: ſo that it was looked on as ſurpriſing, that Craſſus ſhould be admitted *cenſor*, without having been either conſul, or prætor.—The term of this office was at firſt eſtabliſhed for five years; but that inſtitution only laſted nine: Mamertinus the dictator, in the year 420, made a law, reſtraining the *cenſure* to a year and a half; which was afterwards obſerved very ſtrictly.

The buſineſs of the *cenſors* was, to regiſter and value the effects, &c. of the Roman citizens; and to impoſe taxes, in proportion to what each perſon poſſeſſed. Cicero reduces their functions to the numbering of the people; the correction and reformation of manners; the eſtimating the effects of each citizen; the proportioning of taxes; the ſuperintendence of tribute; the excluſion from the temples, and the care of the public places. They had alſo a right, *ſenatu ejicere*, to expel from the ſenate ſuch of the members as they judged unworthy of the dignity; as well as to break and caſhier the knights who failed in their duty, by taking from them the public horſe, *equum adimere*.

There are many examples of ſenators expelled by the *cenſors*, generally for good reaſons, yet ſometimes through mere peeviſhneſs, envy, or revenge: but in ſuch caſes, there was always the liberty of an appeal to the final judgment of the people. So that the cenſorian power, properly ſpeaking, was not that of making or unmaking ſenators, but of enrolling only thoſe whom the people had made; and of inſpecting their manners, and animadverting upon their vices; over which they had a ſpecial juriſdiction delegated by the people. Their rule of cenſuring ſeems to have been grounded on an old maxim of the Roman policy, enjoining, *that the ſenate ſhould be pure from all blemiſh, and an example of manners to all the other orders of the city*: as we find it laid down by Cicero in his Book of Laws, which were drawn, as he tells us, from the plan of the Roman conſtitution.

Beſides the taſk of enrolling the ſenators, and inſpecting their manners, it was a part likewiſe of the cenſorian juriſdiction to let out to farm all the lands, revenues, and cuſtoms of the republic; and to contract with artificers for the charge of building and repairing all the public works and edifices, both in Rome, and the colonies of Italy. Now in this branch of their office it is certain that they acted merely under the authority of the people, and were prohibited by law to let out any of the revenues, except in the roſtra, under the immediate inſpection, and in the very preſence of the people.

In the general cenſus and review of the city, held by them every five years, though every ſingle citizen was particularly ſummoned and enrolled by name in his proper tribe, as a freeman of Rome, yet that ſolemn enrollment, as Cicero tells us, did not confirm any man's right to a citizenſhip, but ſignified only that he had paſſed for a citizen at that time; becauſe the proper power of determining that right reſided always in the people. Cicer. pro Arch. 5. Liv. x. 52. Middleton of Rom. Sen. p. 59, 68, 70, 83, &c.

The office continued to the time of the emperors, who aſſumed the authority of it to themſelves, but without the name, calling themſelves, inſtead of *cenſors*, *morum præfecti*; though Veſpaſian and his ſons took a pride to be called *cenſors*, and put this among their other titles on their coins. Decius attempted to reſtore the dignity to a particular magiſtrate. After this we hear no more of it till Conſtantine's time, who made his brother *cenſor*; the laſt who ſeems to have enjoyed the office.

The republic of Venice has at this day a *cenſor* of the manners of their people, whoſe office laſts ſix months.

Censors *of books* are a body of doctors, or other officers, eſtabliſhed, in divers countries, to examine and give their judgment of all books, before they go to the preſs; and to ſee they contain nothing contrary to the faith, and good manners.—In England we had formerly an officer of this kind, under the title of *licenſer of the preſs*; but ſince the Revolution the preſs has been open.

At Paris, the *faculty of theology* claim the privilege of *cenſors*, as granted to them by the pope; and it is certain they had been in poſſeſſion of it for many ages: but in the year 1624, a new commiſſion of four doctors were created, by letters patent, the ſole public, or royal *cenſors*, and examiners of all books; and anſwerable for every thing contained therein. The faculty, however, ſtill maintain their claim, by taking occaſion, now and then, to give their approbation to books.

CENSORIAL, *cenſorius*, ſomething that relates to the office of CENSOR.

In which ſenſe we meet with *cenſoria nota*, or *animadverſio*, *cenſoria virgula*, &c.

Censorial *law*, *cenſoria lex*, denotes a law paſſed or enacted by the CENSORS.

Censorial *man*, *homo cenſorius*, a perſon who has borne the dignity, and ſerved the office of CENSOR.

Censorial *note*, *virgula cenſoria*, among the ancient *Grammarians* and *Critics*, denoted a note or mark of reprobation, affixed to thoſe paſſages of a book or writing, which the critic diſapproved or condemned.

CENSUAL *books*, *libri cenſuales*, thoſe wherein the cenſus was taken down.

Censuales, in a ſubſtantive ſenſe, denoted the clerks or public ſcribes who wrote the *cenſual* books.

CENSURE, **Censura**, is popularly uſed for a judgment, whereby ſome book, perſon, or action, is blamed, or condemned; more particularly for a reprimand made by a ſuperior, or perſon in authority.

Censures, *eccleſiaſtical*, are the public menaces which the church makes, or pains and penalties incurred by diſobeying what ſhe enjoins; or rather the pains and puniſhments themſelves: as interdiction, excommunication, &c.

Till the time of the Reformation, the kings of England were ſubject to the *cenſures* of the church of Rome; but the kings of France have always maintained themſelves exempt from them.

The canoniſts diſtinguiſh two kinds of *cenſures*; the one *de jure*, and the other *de facto*, or by ſentence.

Censure is alſo a cuſtom, in ſeveral manors in Cornwall and Devon, whereby all the reſiants above the age of ſixteen are called to ſwear fealty to the lord, to pay two pence *per* poll, and a penny *per annum*, ever after, as CERT-*money*, or common fine.

CENSUS, among the Romans, was an authentic declaration made by the ſeveral ſubjects of the empire, of their reſpective names, and places of abode, before proper magiſtrates, in the city of Rome, called *cenſors*; and in the provinces *cenſitors*, by whom the ſame were regiſtered.

This declaration was accompanied with a catalogue, or enumeration, in writing, of all the eſtates, lands, and inheritances, they poſſeſſed; their quantity, quality, place, wives, children, tenants, domeſtics, ſlaves, &c.

The *cenſus* was inſtituted by king Servius Tullius; to be held every five years. It went through all the ranks of people, though under different names; that of the common people was called *cenſus*, or *luſtrum*; that of the knights, *cenſus*, *recenſio*, *recognitio*; that of the ſenators, *lectio*, *relectio*.

Hence, alſo, *cenſus* came to ſignify a perſon who had made ſuch a declaration: in which ſenſe it was oppoſed to *incenſus*, a perſon who had not given in his eſtate, or name, to be regiſtered.

The *cenſus* among the old Romans was held, as is commonly thought, every five years; but this muſt not be taken to be preciſely true: on the contrary, Dr. Middleton has ſhewn, that both the *cenſus* and luſtrum were for the moſt-part held irregularly and uncertainly, at very different and various intervals of time. See LUSTRUM.

The *cenſus* was an excellent expedient for diſcovering the ſtrength of the ſtate: by it they learnt the number of the citizens, how many were fit for war, and who for offices of other kinds; how much each was able to pay of taxes towards the charge of the war.

The *cenſus*, according to Salmaſius, was peculiar to the city of Rome. That in the provinces was properly called *profeſſio* and απογραφη. But this diſtinction is not every where obſerved by the ancients themſelves.

In the provinces, the *cenſus* not only ſerved to diſcover the ſubſtance of each perſon, but where, and in what manner and proportion, tributes might be beſt impoſed.

Census was alſo uſed for the book or regiſter wherein the profeſſions of the people were entered.

In which ſenſe, the *cenſus* was frequently cited and appealed to, as evidence in the courts of juſtice.

Census is alſo uſed to denote a man's whole ſubſtance or eſtate.

Census *ſenatorius*, the patrimony of a ſenator, which was limited to a certain value; being at firſt rated at eight hundred thouſand ſeſterces, but afterwards, under Auguſtus, enlarged to twelve hundred thouſand. Sueton. in Cæſ. cap. 41.

Census *equeſter*, the eſtate or patrimony of a knight, rated at four hundred thouſand ſeſterces, which was required to qualify a perſon for that order, and without which no virtue or merit was available. Suet. in Cæſ. cap. 33. Hor. lib. i. ep. i. ver. 57, 58, 59.

Census was alſo uſed for a perſon worth an hundred thouſand ſeſterces, or who was entered as ſuch in the cenſual tables, on his own declaration.

In which ſenſe, *cenſus* amounts to the ſame with *claſſicus*, or a man of the firſt claſs; though Gellius limits the eſtate of thoſe of this claſs to an hundred and twenty-five thouſand aſſes. By the Voconian law, no *cenſus* was allowed to give by his will above a fourth part of what he was worth to a woman. Aul. Gell. Noct. Att. lib. vii. cap. 13. Cic. in Verr. 3.

Census was alſo uſed to denote a tax or tribute impoſed on perſons, and called alſo capitation. See CAPITE *cenſi*.

Census *dominicatus*, in *Writers of the Lower Age*, denotes a rent due to the lord.

Census *duplicatus*, a double rent or tax, paid by vaſſals to their lord, on extraordinary or urgent occaſions; as expeditions to the Holy Land, &c.

Census *eccleſiæ Romanæ*, was an annual contribution, voluntarily paid to the ſee of Rome by the ſeveral princes of Europe.

Census *ſiccus*, that paid in money.

CENT, in *Commerce*, an abbreviation of the Latin *centum*, which properly ſignifies a hundred. It is applied when expreſſing the profit or loſs upon any commodity.

Cent is alſo uſed in the trade of money, and ſignifies the benefit, profit, or intereſt of any ſum of money which is laid out for improvement. Thus we ſay money is worth 4 or 5 *per cent.* upon exchange; that is, it brings four or five pounds profit for every 100*l.* laid or lent out.

Cent is alſo uſed with regard to the draughts or remittances of money, made from one place to another. Thus we ſay it will coſt 2½ *per cent.* to remit money to ſuch a city.

CENTAURIUM *minerale*, among *Chemiſts*, a name given by ſome to the PANACEA of antimony, called alſo by Glauber, *purgans univerſale*; the preparation of which is given by Juncken.

CENTAUROIDES, in *Medicine* and *Pharmacy*, the ſame with GRATIOLA.

Others give the denomination to the greater CENTAURY.

CENTAURS, in *Mythology*, a kind of fabulous monſters, half men, half horſes. The poets feign that the *centaurs* were the ſons of Ixion and a *cloud*. The reaſon of which fancy was, that the caſtle to which they retired was called Νεφελη, which ſignifies a *cloud*. Pind. Pyth. Od. 2. This fable is differently interpreted.

The *centaurs*, in reality, were a tribe of Lapithæ, who inhabited the city Pelethronum, adjoining to mount Pelion, and firſt invented the art of breaking horſes: as is intimated by Virgil. Georg. lib. iii. ver. 115.

CENTAURUS, **Centaur**, in *Aſtronomy*, a part or moiety of a ſouthern conſtellation, in form, half man, half horſe; uſually joined with the wolf. See LUPUS.

The word comes from κενταυρος, formed of κεντεω, *pungo*; and ταυρος, *bull*; q. d. *bull-pricker*.

The ſtars of this conſtellation, in Ptolemy's Catalogue, are 37; in Tycho's 4; and in the Britannic Catalogue, with Sharp's Appendix, 35: the order, names, longitudes, latitudes, magnitudes, &c. of which, are as follow.

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude S.			Magnitude

CENTAURY, *the greater*, KNAPWEED, *blue* BOTTLE, &c. in *Botany*, a genus of the *ſyngeneſia polygamia fruſtanea* claſs. Its characters are theſe: it hath a compound flower, whoſe diſk is compoſed of many hermaphrodite florets, and the border, or rays, of female florets, which are larger and looſer: theſe are included in a common ſcaly empalement. The germen is ſituated under the petal, which afterward becomes a ſingle ſeed, ſhut up in the empalement; the female florets have a ſlender tube, which expands above, where it is enlarged, and cut into five unequal parts: theſe are barren. Miller ſpecifies twenty ſorts of it.

The root and leaves of the plant are eſteemed vulnerary and aſtringent: they are given in infuſion, in dyſenteries, profluvia of the menſes, and hæmorrhages of all kinds. The common people alſo are very fond of the root in France, as a remedy for bruiſes, and for diſſolving coagulated blood. Schroder alſo gives it great praiſes as a deobſtruent: he tells us it is of excellent uſe in diſtemperatures of the liver, and in obſtructions of the meſeraic glands. He preſcribes the root in powder.

CENTAURY *the leſſer*, CENTAURIUM *minus*, is a ſmall and low plant, with leaves growing by pairs, and a flower conſiſting of a purple petal, cut into five ſegments, and a tubulous calyx divided in like manner.—Its leaves are eſteemed a good bitter, and very ſerviceable to the ſtomach, either in the compoſitions of that kind, or *per ſe*, in decoction or infuſion, which is beſt made in wine. It diſcuſſes and abſterges viſcid humours; is good againſt worms, and by ſome alſo is extolled as an alexipharmic febrifuge, &c. The bitter ſubſtance of the leaves is ſoluble by water, or by ſpirit of wine. The green colour reſides in the reſinous part, being extracted by ſpirit of wine, but not by water. See GENTIAN, of which this plant is a ſpecies.

CENTELLA, in *Botany*, a genus of the *monoecia tetrandria* claſs, having male and female flowers. The *involucrum* of the male ſort conſiſts of four leaves, and five flowers; and that of the female ſort is compoſed of two leaves, and a ſingle flower; the latter hath two ſtyles, and a double-celled *pericarpium*; and both have four petals.

CENTENARIUS, or CENTENARIO, in the *Middle Age*, was an officer who had the government or command, with the adminiſtration of juſtice, in a village, or diviſion, containing an hundred freemen. The *centenarii* were under the juriſdiction and command of a ſuperior officer, called the count or *comes*. We find them both among the Franks, Germans, Goths, Lombards, &c.

CENTENARIUS is alſo uſed for an officer who had the command of an hundred men; more frequently called CENTURION.

CENTENARIUS, in *Monaſteries*, was an officer who had the ſuperintendance of an hundred monks.

CENTENARIUS was alſo uſed for a perſon worth an hundred thouſand ſeſterces; otherwiſe called CENSUS.

CENTENINUM *ovum*. See EGG.

CENTER, or CENTRE, in a general ſenſe, denotes a point equally remote from the extremes of a line, figure, or body; or the middle of a line, or plane, by which a figure or body is divided into two equal parts.

The word is κεντρον, which primarily ſignifies a *point*; being formed from the verb κεντειν; *pungere, to prick*.

CENTER *of a baſtion*, is a point in the middle of the gorge of the BASTION; whence the capital line commences; and which is ordinarily at the angle of the inner polygon of the figure. Or it is the point within which the two adjacent curtains produced interſect each other.

CENTER *of a battalion*, the middle of a battalion; where is uſually left a large ſquare ſpace, for lodging the cloaths and baggage.

CENTER *of a circle* is a point in the middle of a circle, or circular figure, from which all lines drawn to the circumference are equal.

Euclid demonſtrates, that the angle at the *center* is double to that at the circumference; i. e. the angle made by two lines drawn from the extremes of an arch to the *center*, is double that made by two lines drawn from thoſe extremes to a point in the circumference.

CENTER *of a conic ſection* is the point wherein all the diameters concur.

This point, in the ellipſis, is within the figure; and, in the hyperbola, without.

CENTER *of converſion*, in *Mechanics*, a term firſt uſed by M. Parent. Its ſignification is thus conceived: if a ſtick be laid on a ſtagnant water, and drawn by a thread faſtened to it, ſo that the thread always makes the ſame angle with the ſtick; always, v. g. a right angle; the ſtick will be found to turn on one of its points, which will be immoveable; which point is termed the *center of converſion*. For the greater eaſe, the thread may be conceived faſtened to one end of the ſtick.

This effect ariſes from the reſiſtance of the fluid, and the manner wherein it divides: for, imagine the firſt moment of traction, it is certain, here, the reſiſtance of the parts of the fluid to be diſplaced, tends to turn the ſtick around the point to which the thread is faſtened, as on a *center*: ſo that in the preſent inſtance, the ſtaff would deſcribe preciſely the quadrant of a circle: after which, the fluid would no longer bear the ſtick lengthwiſe; but in a particular motion, in ſuch manner, as that the free end of the ſtick, and the parts neareſt it, would deſcribe larger arches of circles than the reſt, and have a greater velocity. The reſiſtance therefore of the fluid, which tends to impreſs a circular motion on the ſtick, around the point to which the thread is faſtened, tends to impreſs a greater velocity on the parts next to the other extremity; or, which is the ſame thing, thoſe parts require a greater velocity to ſurmount the reſiſtance of the fluid: ſo that the ſtick will not have that circular motion around the point to which the thread is faſtened; or, the reſiſtance of the fluid is greater towards the free extreme of the ſtick, and ſtill leſſens towards the other extreme. Now, all the columns, or threads of water, which reſiſt the ſtick, muſt be ſuppoſed of the ſame length, or the ſame maſs. One may therefore find on the ſtick ſuch a point, as that taking a great number of thoſe threads on that ſide which reſiſts the leaſt, and a leſs number on that ſide where they reſiſt the moſt, there will be an exact compenſation, and the forces be equal on each ſide: this point is the *center of converſion*. And as the ſame reaſoning has place in all motions of traction made in the ſame manner, this *center* is always the ſame point.

The grand queſtion here ariſing is, to know preciſely in what point the *center* of converſion is found: this M. Parent has determined by much laborious calculation. If the ſtick drawn by one extremity be a ſtrait line divided into twenty parts, reckoning from the thread, the *center* of converſion, he finds, will be nearly on the 13th. If it be not a line, but a ſurface, or a ſolid, there will be ſome change in the ſituation of the *center* of converſion, according to the ſurface, or the ſolid. See Mem. of the Acad. of Sciences, abridged, vol. i. p. 191.

If in lieu of a body ſwimming in a fluid, we ſuppoſe it laid on a rough uneven plane; the reſiſtance of this plane to the motion of the body will always be divided in the ſame manner, and determine the ſame *center* of converſion. This reſiſtance is, preciſely, what we call *friction*, ſo prejudicial to the effects of machines.

CENTER *of a curve*, of the higher kind, is the point where two diameters concur.

When all the diameters concur in the ſame point, Sir Iſaac Newton calls it the *general center*.

CENTER *of a dial*, is that point where its gnomon or ſtile, which is placed parallel to the axis of the earth, interſects the plane of the dial; and from thence, in thoſe dials which have *centers*, all the hour-lines are drawn. If the plane of the dial be parallel to the axis of the earth, it can have no *center* at all; but all the hour-lines will be parallel to the ſtile, and to one another.

Center *of an ellipſis*, is that point where the two diameters, the tranſverſe and the conjugate, interſect each other.

Center *of the equant*, in the *Old Aſtronomy*, a point in the line of the aphelion; being ſo far diſtant from the *center* of the excentric, towards the aphelion, as the ſun is from the *center* of the excentric towards the perihelion.

Center *of gravitation*, or *attraction*, in *Phyſics*, is that point to which a revolving planet, or comet, is impelled, or attracted, by the force or impetus of gravity.

Center, in *Maſonry*, denotes a wooden mould by which to turn an arch.

Center *of gravity*, in *Mechanics*, is a point within a body, through which if a plane paſs, the ſegments on each ſide will equiponderate, i. e. neither of them can move the other.

Hence, if the deſcent of the *center* of gravity be prevented, or if the body be ſuſpended by its *center* of gravity, it will continue at reſt in *equilibrio*, in any poſition. The whole gravity of a body may be conceived united in its *center*; and therefore, in demonſtrations, it is uſual for the body to ſubſtitute the *center*.

Through the *center* of gravity paſſes a right line, called *the diameter of gravity*: the interſection, therefore, of two ſuch diameters determines the *center*.

The plane whereon the *center* of gravity is placed, is called *the plane of gravity*: ſo that the common interſection of two ſuch planes determines the diameter of gravity.

In homogeneal bodies, which may be divided lengthwiſe into ſimilar and equal parts, the *center* of gravity is the ſame with the *center* of magnitude. If, therefore, a line be biſected, the point of ſection will be the *center* of gravity.

Common **Center** *of gravity of two bodies*, is a point ſo ſituated, in the right line joining the *centers* of the two bodies, as that, if the point be ſuſpended, the two bodies will equiponderate, and reſt in any ſituation.—Thus, the point of ſuſpenſion in a common balance, or in a Roman ſteelyard, where the two weights equiponderate, is the common *center* of gravity of the two weights.

When any number of bodies move in right lines with uniform motions, their common *center* of gravity moves likewiſe in a right line with an uniform motion; and the ſum of their motions eſtimated in any given direction, is preciſely the ſame as if all the bodies, in one maſs, were carried on with the direction and motion of their common *center* of gravity. Nor is the *center* of gravity of any number of bodies affected by their colliſions or actions on each other.

Laws of the **Center** *of gravity.*—1. *If the* centers *of gravity of two bodies* A *and* B (Tab. Mechan. fig. 13. N° 2.) *be joined by the right line* AB, *the diſtances* BC *and* CA *of the common* center *of gravity* C, *from the particular* centers *of gravity* B *and* A, *are reciprocally as the weights* B *and* A. See this demonſtrated under Balance.

Hence, if the gravities of the bodies A and B be equal, the common *center* of gravity C will be in the middle of the right line AB Again, ſince A : B :: BC : AC; it follows that A × AC = B × BC; whence it appears, that the powers of equiponderating bodies are to be eſtimated by the product of the maſs, multiplied into the diſtance from the *center* of gravity; which product is uſually called the *momentum* of the weights.

Further, ſince A : B :: BC : AC, A + B : A :: BC + AC : BC. Therefore the common *center* of gravity C, of two bodies, will be found, if the product of one weight A, into the diſtance of the ſeparate *centers* of gravity AB, be divided by the ſum of the weights A and B. Suppoſe, e. g. A = 12, B = 4, AB = 24; therefore BC = 24 × 12 ÷ 16 = 18. If the weight A be given, and the diſtance of the particular *centers* of gravity AB, together with the common *center* of gravity C; the weight of B will be found = to A × AC ÷ BC; that is, dividing the moment of the given weight, by the diſtance of the weight required from the common *center* of gravity. Suppoſe, A = 12, BC = 18, AC = 6; then B = 6 × 12 ÷ 18 = 4.

2. *To determine the common* center *of gravity of ſeveral given points*, *a*, *b*, *c*, *d* (*fig.* 13.) in the right line AB. Find the common *center* of gravity of the two bodies *a* and *b*, which ſuppoſe in F; conceive a weight $a+b$, applied in F; and in the line FE, find the common *center* of the weights $a+b$ and *c*; which ſuppoſe in G. Laſtly, in BG, ſuppoſe a weight $a+b+c$ applied, equal to the two $a+b$ and *c*; and find the common *center* of gravity between this and the weight *d*, which ſuppoſe in H; this H will be the common *center* of gravity of the bodies *a*, *b*, *c*, *d*. And in the ſame manner might the common *center* of gravity of any greater number of bodies be found.

3. *Two weights* D *and* E (*fig.* 14.) *being ſuſpended without their common* center *of gravity in* C, *to determine which of them preponderates and how much.* Multiply each into its diſtance from the *center* of ſuſpenſion; that ſide on which the product is greateſt, will preponderate; and the difference between the two will be the quantity wherewith it preponderates.

Hence, the momenta of the weights D and E, ſuſpended without the *center* of gravity, are in a ratio compounded of the weights D and E, and the diſtances from the point of ſuſpenſion. Hence alſo the momentum of a weight ſuſpended in the very point C, will have no effect at all in reſpect of the reſt D, E.

4. *To determine the preponderation where ſeveral bodies a*, *b*, *c*, *d* (fig. 15.) *are ſuſpended without the common* center *of gravity in* C. Multiply the weights *c* and *d* into their diſtances from the point of ſuſpenſion CE and CB; the ſum will be the momentum of their weights, or the ponderation towards the right: then multiply the weights *a* and *b* into their diſtances AC and CD, the ſum will be the ponderation towards the left: ſubtracting, therefore, the one from the other, the remainder will be the preponderation required.

5. *Any number of weights*, *a*, *b*, *c*, *d*, *being ſuſpended without the common* center *of gravity in* C, *and preponderating towards the right*; *to determine the point* F, *from whence the ſum of all the weights being ſuſpended, the ponderation ſhall continue the ſame as in their former ſituation.*

Find the momentum wherewith the weights *c* and *d* preponderate towards the right; ſince the momentum of the ſum of the weights to be ſuſpended in F is to be equal to it, the momentum now found will be the product of CF into the ſum of the weights: this, therefore, being divided by the ſum of the weights, the quotient will be the diſtance CF, at which the ſum of the weights is to be ſuſpended, that the preponderation may continue the ſame as before.

6. *To find the* center *of gravity in a parallelogram and parallelepiped.* Draw the diagonals AD and EG (*fig.* 16.) likewiſe CB and HF; ſince each diagonal, AD and CB, divides the parallelogram ACDB into two equal parts, each paſſes through the *center* of gravity; conſequently, the point of interſection I muſt be the *center* of gravity of the parallelogram. In like manner, ſince both the plane CBFH, and ADGE, divide the parallelepiped into two equal parts, each paſſes through its *center* of gravity; ſo that the common interſection IK is the diameter of gravity, the middle whereof is the *center*.

After the ſame manner may the *center* of gravity be found in priſms and cylinders; it being the middle point of the right line that joins the *center* of gravity of their oppoſite baſes.

7. In regular polygons, the *center* of gravity is the ſame with the *center* of the circumſcribed parallelogram.

8. *To find the* center *of gravity of a cone, and a pyramid.* The *center* of gravity of a cone is in its axis AC (*fig.* 17.) If then AP = *x*, AC = *a*, CD = *r*, the periphery of the baſe = *p*, and PN = *y*, we ſhall have, by the well-known property of circles, $r : p :: y : \frac{py}{r}$ = the periphery of the circle, whoſe diameter is MN, which being multiplied by $\frac{y}{2}$ will give $\frac{py^2}{2r}$ = the area of the ſame circle. But, by ſimilar triangles, $y : x :: r : a$, therefore $y = \frac{rx}{a}$, and $y^2 = \frac{r^2x^2}{a^2}$; conſequently the area of the circle, whoſe radius is PN, becomes equal to $\frac{prx^2}{2a^2}$; and therefore $\frac{prx^2\dot{x}}{2a^2}$ will be the fluxion of the maſs, or of the content of the cone at the term MN, and $\frac{prx^3\dot{x}}{2a^2}$ will be the fluxion of the momentum, whoſe fluent is $\frac{prx^4}{8a^2}$, which being divided by $\frac{prx^3}{6a^2}$, the fluent of $\frac{prx^2\dot{x}}{2a^2}$, the fluxion of the maſs, will give $\frac{3}{4}x = \frac{3}{4}$ AP, for the diſtance of the *center* of gravity of the portion AMN from the vertex A; and when AP becomes equal to AC, *x* will be equal to *a*; and therefore the *center* of gravity of the whole cone is diſtant from the vertex $\frac{3}{4}$ of AC. And in the ſame manner is found the diſtance of the *center* of gravity from the vertex of the pyramid $\frac{3}{4}$ AC.

9. *To determine the* center *of gravity in an iſoſceles triangle* BAC (*fig.* 18.) Draw the right line AD, biſecting the baſe BC in D which will be alſo perpendicular to it; ſince △ BAD = △ DAC, each may be divided into the ſame number of little weights, applied in the ſame manner on each ſide to the common axis AD; ſo that the *center* of gravity of the △ BAC, will be in AD. To determine the preciſe point in that, let AD = *a*, BC = *b*, AP = *x*, MN = *y*; then will AP : MN :: AD : BC; or, $x : y :: a : b$.

Hence, $y=\frac{bx}{a}$. Conſequently $yx\dot{x}$, which repreſents the fluxion of the maſs at the term MN divided by $y\dot{x}$, expreſſing the fluxion of the area AMN, will be equal to $\frac{bx^2\dot{x}}{a} \div \frac{bx\dot{x}}{a} = \frac{x^2\dot{x}}{x\dot{x}}$; the fluent of which quantity will be $\frac{\frac{1}{3}x^3}{\frac{1}{2}x^2} = \frac{2x}{3} =$, at the term BC, when $x = AD$, $\frac{2}{3}$ AD; and therefore the diſtance of the *center* of gravity of the △ from the vertex, will be found $\frac{2}{3}a$.

In the very ſame manner the *center* of gravity of any other plain triangle will appear to be at $\frac{2}{3}$ of the altitude from the vertex.

10. *For the* center *of gravity in a parabola* (*fig.* 19). Let $AE=a$, $SH=b$, $AP=x$, $PN=y$. Then will $2y\dot{x}$ be the fluxion of the whole weight; but from the nature of the parabola, and the parameter being a conſtant quantity, $1x=y^2$; whence $x^{\frac{1}{2}}=y$, and $2x^{\frac{1}{2}}=2y$: ſubſtituting $2x^{\frac{1}{2}}$ inſtead of $2y$ in the above expreſſion, we ſhall have $2x^{\frac{1}{2}}\dot{x}$ for the fluxion of the maſs, whoſe fluent $\frac{4x^{\frac{3}{2}}}{3}$ will be the maſs itſelf. Then, multiplying $2x^{\frac{1}{2}}\dot{x}$ by x, we ſhall have $2x^{\frac{1}{2}}x\dot{x}$ or $2x^{\frac{3}{2}}\dot{x}$ for the fluxion of the momentum, whoſe fluent $\frac{4x^{\frac{5}{2}}}{5}$ will be the momentum itſelf. Divide this by the whole weight, and the quotient $\frac{12}{20}x^{\frac{5}{2}-\frac{3}{2}}=\frac{3}{5}x$, will be the diſtance of the *center* of gravity of the ſpace NAzP from the vertex A; and when AP becomes equal to AE, or $x=a$, $\frac{3}{5}a$, or $\frac{3}{5}$AE, will be the diſtance of the *center* of gravity of the whole parabolic ſpace from the vertex A. Now $y^m=1x$, being a general equation for all kinds of parabolas, we ſhall have $y=x^{\frac{1}{m}}$, and therefore $x^{\frac{1}{m}}\dot{x}$ will be the fluxion of the whole maſs, and $x^{\frac{1}{m}}+1\dot{x}$, the fluxion of the momentum: the fluent of this laſt expreſſion, viz. $\frac{m}{2m+1}x^{\frac{1}{m}+2}$, being divided by the fluent of $x^{\frac{1}{m}}$, $\dot{x}$ or $\frac{m}{m+1}x^{\frac{1}{m}+1}$, will give $\frac{m+1}{2m+1}x$, for the diſtance of the *center* of gravity of the ſpace ZAN from the vertex A, and $\frac{m+1}{2m+1}a$ will be the diſtance of the *center* of gravity of the whole parabolic ſpace from A. When $m=2$, as in the common parabola, this expreſſion will be $\frac{3}{5}a$. If $m=3$, as in the cubical parabola, then the expreſſion will be $\frac{4}{7}a$; when $m=4$, as in a biquadratic parabola, we ſhall have $\frac{5}{9}$ of the axis for the diſtance; and in a ſurſolid parabola, when $m=5$, the expreſſion will give $\frac{6}{11}a$ for the required diſtance. If $m=\frac{1}{2}$, which is the property of the concave or ſupplemental ſpace, then the axis becomes a tangent to the vertical point, and $\frac{3}{4}a$ will be the diſtance required. In the exterior parabola AST, as may be eaſily found, by reaſoning on ſimilar principles, the *center* of gravity is at the diſtance AL, equal to $\frac{3}{4}$ AQ. In the cubical parabola, $\frac{4}{5}$ AQ. In a biquadratic parabola, $\frac{5}{6}$ AQ. In a ſurſolidal parabola, $\frac{6}{7}$ AQ.

11. *The center of gravity of the arch of a circle*, as EHF (*fig.* 19. N° 2.) is ſomewhere in the radius AH that biſects it in H. Let DI, a diameter parallel to the chord of the arch EF, be conſidered as the axis of ſuſpenſion, and be equal to $2r$; let $EF=2a$, $EHF=2c$, the perpendicular $BC=y$, the arch $CH=z$, and $AB=x$. When the point C arrives at H, y becomes equal to r, and z and x in their evaneſcent ſtate are equal; therefore $y:r::\dot{x}:\dot{z}$; and conſequently $y\dot{z}$, which is the fluxion of the momentum, is equal to $r\dot{x}$; and rx will be the momentum itſelf. Divide this by z the whole maſs, and $\frac{rx}{z}$ will be the diſtance of the *center* of gravity of the arch from the point of ſuſpenſion A: but when the point C arrives at E, $\frac{rx}{z}$ will be equal to $\frac{ar}{c}$: and therefore the required diſtance will be to the radius as the chord of the arch to the arch itſelf; and if the arch be the ſemiperiphery, as the diameter to the ſemiperiphery. In the ſector of a circle, as CACH (*fig.* 19. N° 2.) the *center* of gravity is in the biſecting line AGH. On the center A, with a radius at pleaſure, deſcribe the arc NN, and draw the chords NN and CC. Let $AC=r$, the chord $CC=2a$, $CAC=2c$, and $AN=x$. The momentum of an arch, with reſpect to the axis of ſuſpenſion, being equal to the chord of that arch multiplied by the radius, the momenta of different arches are in the compound ratio of the chords and radii, or in the duplicate of the radii; therefore we ſhall have $rr:xx$, as the momentum of the arch $CHC=2ar$, to the momentum of the arch $NPN=\frac{2axx}{r}$, which, multiplied by $\dot{x}$, gives $\frac{2axx\dot{x}}{r}$ equal to the fluxion of the ſector NANP, whoſe fluent $\frac{2ax^3}{3r}$ will be the momentum of the ſame ſector. Divide this by cr, the value of the maſs, and $\frac{2ax^3}{3cr^2}$ will be the diſtance of the *center* of gravity of the ſector NAN; but when x becomes equal to r, $\frac{2ax^3}{3cr^2}$ will be $\frac{2ar}{3c}$ for the diſtance of the *center* of gravity of the ſector CACH, from the point of ſuſpenſion A: therefore this diſtance is to $\frac{2}{3}$ of the radius, as the chord of the arch to the arch itſelf. And if the ſector be a ſemicircle, it will be as the diameter to the ſemiperiphery. To find the value of any ſurface or ſolid by means of the *center* of gravity, ſee CENTROBARYC *method.*

For the center *of gravity of ſegments*, *lines*, *parabolic conoids*, *ſpheroids*, *truncated cones*, &c. as being caſes more operoſe, and at the ſame time more uncommon; we refer to Wolfius, Hodgſon, Simpſon, and others.

12. *To determine the* center *of gravity in any body mechanically.* Lay the given body HI (*fig.* 20.) on an extended rope, or on the edge of a triangular priſm FG, bringing it this and that way, till the parts on either ſide are in equilibrio; the plane, whoſe ſide is KL, paſſes through the *center* of gravity. Balance it again on the ſame, only changing its ſituation: then will the chord or the ſide MN, paſs through the *center* of gravity; ſo that the interſection of the two lines MN and KL determines the point O in the ſurface of the body required.

The ſame may be done by laying the body on an horizontal table (as near the edge as is poſſible, without its falling) in two poſitions, lengthwiſe and breadthwiſe: the common interſection of the two lines contiguous to the edge, will be its *center* of gravity. Or it may be done by placing the body on the point of a ſtyle, &c. till it reſt in equilibrio. It was by this method, Borelli found the *center* of gravity in a human body, to be between the nates and pubis; ſo that the whole gravity of the body is there collected, where nature has placed the genitals: an inſtance of the wiſdom of the Creator, in placing the membrum virile in that place, which of all others is the moſt convenient for copulation.

CENTER *of an hyperbola*, is a point in the middle of the determinate or tranſverſe *axis.*

CENTER *of magnitude*, is that point which is equally diſtant from all the external parts of a body.

CENTER *of motion*, is a point round which one or more heavy bodies, that have one common *center* of gravity, revolve; v. gr. If the weights P and Q (*Tab. Mechanics*, *fig.* 21.) revolve about the point N, ſo that when P deſcends, Q aſcends, N is ſaid to be the *center of motion.*

It is demonſtrated in mechanics, that the diſtance IN, of the *center* of gravity of any particular weight, from the common *center* of gravity, or the *center* of motion N, is perpendicular to the line of direction IP.

CENTER *of oſcillation*, is that point, in the axis or line of ſuſpenſion of a vibrating body, into which, if the whole was contracted, the angular velocity, and the time of vibration, would remain unaltered. Hence, in a compound pendulum, its diſtance from the point of ſuſpenſion is equal to the length of a ſimple *pendulum*, whoſe oſcillations are iſochronal with thoſe of the compound one.

Laws of the CENTER *of oſcillation.* 1. *If ſeveral weights* D, F, H, B (*Tab. Mechanics*, *fig.* 22.) *whoſe gravity is ſuppoſed collected in the points* D, F, H, B, *conſtantly retain the ſame diſtance between themſelves and the point of ſuſpenſion* A; *and the pendulum thus compounded, performs its oſcillations about* A; OA *the diſtance of the* center *of oſcillation* O *from the point of ſuſpenſion will be had by multiplying the ſeveral weights into the ſquares of the diſtances, and dividing the aggregate by the ſum of the momenta of their weight.* See Simpſon's Fluxions, vol. i. p. 212, &c.

2. *To determine the* center *of oſcillation in a right line* AB (*fig.* 23.) Let $AB=a$, $AD=x$, then will $x\dot{x}$ be the fluxion of the momentum, which being multiplied by x, becauſe the velocity of every point is proportional to its diſtance from the *center* of motion A, will give $x^2\dot{x}$ for the fluxion of the force, whoſe fluent $\frac{x^3}{3}$, being divided by $\frac{x^2}{2}$, the fluent of $x\dot{x}$, will give $\frac{2}{3}x$ for the diſtance of the *center* of oſcillation in the part AD from the point of ſuſpenſion A. If then for x be ſubſtituted a,

the diſtance of the *center* of oſcillation in the right line $AB = \frac{2}{3} a$. In this manner is found the *center* of oſcillation of a wire, oſcillating about one of its extremities.

3. *To determine the* center *of oſcillation of the rectangle* RIHS (*fig.* 19.) *ſuſpended in the middle point* A *of the ſide* RI, *and oſcillating about its axis* RI. Let $RI = SH = a$, $AP = x$; then will $a\dot{x}$ be the fluxion of the maſs, or whole weight. This, multiplied by x, the velocity will give $a x \dot{x}$ for the fluxion of the momentum; and multiplying this quantity again by x, the acquired velocity, we ſhall have $a x^2 \dot{x}$ for the fluxion of the force; whoſe fluent $\frac{a x^3}{3}$, being divided by $\frac{a x^2}{2}$, the fluent of $a x \dot{x}$, will give $\frac{2}{3} x$, which indefinitely expreſſes the diſtance of the *center* of oſcillation, from the axis of oſcillation in the ſegment RCDI. If then for x be ſubſtituted the altitude of the whole rectangle $RS = b$, we ſhall have the diſtance of the *center* of oſcillation from the axis $= \frac{2}{3} b$.

For the center *of oſcillation in an iſoſceles triangle*, ASH, oſcillating about its axis RI, parallel to its baſe SH; its diſtance from the vertex A is found $= \frac{3}{4}$ of AE the altitude of the triangle.

Of an iſoſceles triangle SAH oſcillating about its baſe SH, its diſtance from the vertex A is found $= \frac{1}{2}$ AE the altitude of the triangle.

For the center *of oſcillation in an iſoſceles triangle* SAH, *ſuſpended by an inflexible thread* void of gravity, A*h*, and oſcillating about its axis parallel to its baſe SH; its diſtance from the vertex is found $= \frac{1}{2}$ the altitude of the triangle.

For the centers *of oſcillation of parabolas, and curves of the like kind*, oſcillating about their axes, parallel to their baſes, they are found as follows.

Let $AE = a$, $AP = x$, and $PN = y$, (*fig.* 19.) then univerſally, $y = x^{\frac{1}{m}}$, and therefore $x^{\frac{1}{m}} \dot{x}$ will denote the fluxion of the whole maſs. This being multiplied by x^2 will give $x^{\frac{1}{m}+2} \dot{x}$ for the fluxion of the force, whoſe fluent $\frac{m}{3m+1} x^{\frac{1}{m}+3}$, being divided by $\frac{m}{2m+1} x^{\frac{1}{m}+2}$, the fluent of $x^{\frac{1}{m}+1} \dot{x}$, the fluxion of the momentum, will give $\frac{2m+1}{3m+1} x$ for the diſtance of the *center* of oſcillation of the ſpace ZANP from the vertex A; and when x becomes equal to a, $\frac{2m+1}{3m+1}$, a will denote the diſtance of the *center* of oſcillation of the whole parabolic ſpace SAH, from the point of ſuſpenſion A, in the axis of rotation RAI.

In the Apollonian parabola, $m = 2$, therefore the diſtance of the *center* from the axis, $= \frac{5}{7}$ AE.

In a cubical parabole, $m = 3$, and the diſtance of the *center* of oſcillation from the axis $= \frac{7}{10}$ AE.

In a biquadratic parabole, $m = 4$, and therefore the diſtance of the *center* from the axis, $= \frac{9}{13}$ AE.

For the method of determining the diſtance of the *center* of oſcillation from the baſe, ſuppoſed to be the axis about which the parabola revolves, ſee Hodgſon's Fluxions, p. 431, &c.

In ſolid and plane figures agitated laterally, i. e. about the axis of oſcillation, perpendicular to the plane of the figure, the inveſtigation of the *center* of oſcillation is ſomewhat difficult; becauſe all the parts of the weight, on account of their unequal diſtances from the point of ſuſpenſion, do not move with the ſame velocity; as is ſhewn by Huygens, in his Horol. Oſcill. He found, in this caſe, the diſtance of the *center* of oſcillation, from the axis in a circle, to be $\frac{3}{4}$ of the diameter: in a rectangle, ſuſpended by one of its angles, $\frac{2}{3}$ of the diagonal: in a parabola, ſuſpended by its vertex, $\frac{5}{7}$ of its axis, and $\frac{1}{3}$ of the parameter; ſuſpended from a point in the middle of the baſis, $\frac{4}{7}$ of the axis, and $\frac{1}{2}$ the parameter; in the ſector of a circle, $\frac{3}{4}$ of a right line which is to the radius as the arch to the ſubtenſe: in a cone, $\frac{4}{5}$ of the axis, and $\frac{1}{5}$ of the third proportional to the axis, and a ſemidiameter of the baſe: in a ſphere (as is uſually the caſe in pendulums) $\frac{2}{5}$ of a third proportional to two quantities compoſed of the ſemidiameter and length of the thread, and the ſemidiameter itſelf: in a cylinder, $\frac{2}{3}$ of the altitude, and $\frac{1}{2}$ a right line, which is to the ſemidiameter of the baſe, as that is to the altitude.

CENTER *of percuſſion*, in a moving body, is that point wherein the PERCUSSION is the greateſt, wherein the whole percutient force of the body is ſuppoſed to be collected: or about which the impetus of the parts is balanced on every ſide: ſo that it may be ſtopt, by an immoveable obſtacle, at this point, and reſt on it, without acting on the *center* of ſuſpenſion.

Laws of the CENTER *of percuſſion.*—1. *The* center *of percuſſion is the ſame with the* center *of oſcillation*, where the percutient body revolves round a fixed point; and is determined in the ſame manner, viz. by conſidering the impetus of the parts, as ſo many weights applied to an inflexible right line, void of gravity; i. e. by dividing the ſum of the products of the forces of the parts, multiplied by their diſtances from the point of ſuſpenſion, by the ſum of the forces. What, therefore, has been above ſhewn of the *center of oſcillation*, will hold of the *center of percuſſion*, where the percutient body moves round a fixed point.

2. *The* center *of percuſſion is the ſame with the* center *of gravity*, if all the parts of the percutient body be carried with a parallel motion, or with the ſame celerity: for the momenta are the products of the weights into the celerities. Wherefore, to multiply equiponderating bodies by the ſame velocity, is the ſame thing as to take equimultiples; but the equimultiples of equiponderating bodies, themſelves equiponderate; therefore, equivalent momenta are diſpoſed about the *center* of gravity: conſequently the *center* of percuſſion in this caſe coincides with that of gravity; and what is ſhewn of the one, will hold of the other.

CENTER *of a parallelogram*, or *polygon*, the point wherein its diagonals interſect.

CENTER *of a ſphere* is a point from which all the lines drawn to the ſurface, are equal.

The *center of the ſemicircle*, by whoſe revolution the ſphere is generated, is alſo that of the ſphere.

Hermes Triſmegiſtus defines God an intellectual ſphere, whoſe *center* is every-where, and circumference no-where.

CENTER-*wheel of a watch*. See WATCH-*work*.

CENTER *of a ſquadron*, or *of a fleet*, is the middle of a LINE, which is always the ſtation of the admiral, or commander in chief, and ought to be proportionably the ſtrongeſt, becauſe it reaches from the van and rear.

CENTERING *of an optic glaſs*, the grinding it ſo as that the thickeſt part is exactly in the middle.

One of the greateſt difficulties in grinding large optic glaſſes is, that in figures ſo little convex, the leaſt difference will put the center two or three inches out of the middle. Dr. Hook notes, that though it were better the thickeſt part of a long object glaſs were exactly in the middle, yet it may be a very good one when it is an inch or two out of it. Phil. Tranſ. N° 4. p. 57. Id. ibid. p. 64, ſeq.

M. Caſſini the younger has a diſcourſe expreſs on the neceſſity of *well centering the object glaſs* of a large teleſcope, that is, of grinding them ſo, that the center may fall exactly in the axis of the teleſcope. Mem. Acad. Sc. an. 1710, p. 299, ſeq.

CENTESIMA *uſura*, that wherein the intereſt in an hundred months became equal to the principal; i. e. where the money is laid out at one *per cent.* per month, anſwering to what in our ſtile would be called 12 *per cent.* for the Romans reckoned their intereſt not by the year, but by the month.

CENTESIMATION, *Centeſimatio*, the puniſhing every hundredth man.

Macrinus ſometimes decimated, and ſometimes *centeſimated* the ſoldiers. The latter term ſeems to have been introduced by himſelf, to the honour of his clemency, as being contented to *centeſimate* thoſe who deſerved decimation, or viceſimation.

CENTGRAVIUS, in *Middle Age Writers*, the ſame with CENTENARIUS.

CENTILOQUIUM, from *centum*, *a hundred*, and *loquor*, *I ſpeak*, denotes a collection of an hundred ſentences, opinions, or ſayings.

CENTINODIUM, an officinal plant, popularly called KNOT-*graſs*; by the botaniſts *polygonum*; reputed an aſtringent and vulnerary.

CENTIPES. See SCOLOPENDRA.

CENTNER, or *Docimaſtic* HUNDRED, in *Metallurgy* and *Aſſaying*, is a weight diviſible, firſt into an *hundred*, and thence into a greater number of other ſmaller parts; but though the word is the ſame, both with the aſſayers and metallurgiſts, yet it is to be underſtood as expreſſing a very different quantity in their different acceptation of it. The weights of the metallurgiſts are eaſily underſtood, as being of the common proportion, but thoſe of the aſſayers are a thouſand times ſmaller than theſe, as the portions of metals or ores examined by the aſſayers are uſually very ſmall.

The metallurgiſts, who extract metals out of their ores, uſe a weight divided into an *hundred* equal parts, each part a pound; the whole they call a *centner* or *hundred* weight; the pound is divided into thirty-two parts, or half ounces; and the half ounce into two quarters of ounces, and theſe each into two drams.

Theſe diviſions and denominations of the metallurgiſts are eaſily underſtood; but the ſame words, though they are equally uſed by aſſayers, with them expreſs very different quantities; for as the *centner* of the metallurgiſts contains an *hundred* pounds, the *centner* of the aſſayers is really no more than one dram, to which the other parts are proportioned.

As the aſſayers weights are divided into ſuch an extreme degree of minuteneſs, and are ſo very different from all the common weights, the aſſayers uſually make them themſelves in the following manner, out of ſmall ſilver, or fine ſolder plates, of ſuch a ſize, that the mark of their weight, according to the diviſion of the dram, which is the *docimaſtic*, or aſſaying *centner*, may be put upon them. They firſt take for a baſis one weight, being about two-thirds of a common dram: this they mark (64*lb.*) Then having at hand ſome granulated lead, waſhed clean, well dried, and ſifted very fine, they put as much of it in one of the ſmall diſhes of a fine balance, as will equipoiſe the (64*lb.*) as it is called, juſt mentioned: then dividing this granulated lead into very nice halves, in the two ſcales, after taking out the firſt ſilver weight, they obtain a perfect equilibrium between the two ſcales; they then pour the granulated lead out of one diſh of the ſcales, and inſtead of it put in another ſilver weight, which they make exactly equiponderant with the lead in the other ſcale, and mark it (32*lb.*) If this ſecond weight, when firſt put into the ſcale, exceed by much the weight of the lead, they take a little from it by a very fine file; but when it comes very near, they uſe only a whetſtone to wear off an extremely ſmall portion at a time. When it is brought to be perfectly even and equal to the lead, they change the ſcales to ſee that no error has been committed, and then go on in the ſame manner till they have made all the diviſions, and all the ſmall weights. Then to have an entire *centner* or *hundred* weight, they add to the (64*lb.*) as they call it, a 32*lb.* and a 4*lb.* and weighing againſt them one ſmall weight, they make it equal to them, and mark it (100*lb.*) This is the *docimaſtical*, or aſſaying *centner*, and is really one dram. Cramer, Art. Aſſ. p. 108.

CENTO, in *Poetry*, a work wholly compoſed of verſes, or paſſages promiſcuouſly taken from other authors; only diſpoſed in a new form, or order: ſo as to compoſe a new work, and make a new meaning.

The word is Latin, *cento*, which primarily ſignifies a cloak made of patches; and that from *κεντρον*.

Auſonius has laid down the rules to be obſerved in compoſing *centos*. The pieces, he ſays, may be taken either from the ſame poet, or from ſeveral; and the verſes may be either entire, or divided into two; one half to be connected with another half taken elſewhere; but two verſes are never to be taken running, nor is much leſs than half a verſe to be taken. Agreeably to theſe rules, he has made a pleaſant nuptial *cento* from Virgil.

Proba Falconia has written the life of Jeſus Chriſt, in *centos* taken from Virgil: the like is done by Alex. Roſs, in his Chriſtiados; and by Stephen de Pleurre, canon regular of St. Victor at Paris.

CENTONARII, in *Antiquity*, a ſort of officers or operators, whoſe buſineſs was to make *centones*, or coats patched of leather and cloth, wherewith to cover the *vineæ*, under which the beſiegers made their approaches, as well as the towers and machines uſed to batter the place, and prevent their being ſet on fire by the enemy. In the Theodoſian code we have a title, *De centonariis & dendrophoris*. And in ancient inſcriptions, the *centonarii* are joined with the *tignarii*, or carpenters, *ferrarii* or ſmiths, &c. who made but one company, under the denomination of *collegium fabrorum & centonariorum*.

CENTRAL, ſomething relating to a CENTER.

Thus we ſay *central eclipſe*, *central fire*, *central forces*, *central rule*, &c.

CENTRAL *forces*, are the *vires*, or powers, whereby a moving body either tends towards the center of motion, or recedes from it.

Central forces are divided into two kinds, with regard to their different relations to the center, viz. the *centripetal*, and the *centrifugal*.

The doctrine of *central*, or *centripetal*, and *centrifugal forces*, has been much cultivated by mathematicians, as being of extenſive uſe in the theory of gravity and other phyſico-mathematical ſciences.

In this doctrine it is ſuppoſed, that a body at reſt never moves itſelf; and that a body in motion never changes the velocity or direction of its motion of itſelf; but that every motion would continue uniform, and its direction rectilinear, unleſs ſome external *force* or reſiſtance affected it. Hence, when a body at reſt always tends to move, or when the velocity of any rectilinear motion is accelerated continually, or when the direction of a motion is continually varied, and a curve line deſcribed, theſe are ſuppoſed to proceed equally from the influence of ſome power that acts inceſſantly; which may be meaſured either by the preſſure of the quieſcent body againſt the obſtacle that hinders it to move, in the firſt caſe; or by the acceleration of the motion, in the ſecond; or by the flexure of the curve deſcribed, in the third caſe; due regard being had to the time in which theſe effects are produced, and other circumſtances, according to the principles of mechanics. Effects of the power of gravity of each kind fall under our conſtant obſervation near the ſurface of the earth; for the ſame power which renders bodies heavy while they are at reſt, accelerates them when they deſcend perpendicularly, and bends their motion into a curve line when they are projected in any other direction than that of their gravity. But we can judge of the powers that act on the celeſtial bodies by effects of the laſt kind only. And hence it is that the doctrine of *central forces* is of ſo much uſe in the theory of the planetary motions.

Sir Iſaac Newton has treated of *central forces* in book I. § 2. of his Principles. M. De Moivre has given elegant general theorems relating to the ſame ſubject, in the Phil. Tranſ. and in his Miſcel. Analyt. p. 231.

Let MPQ (*Tab.* II. *Analyſis*, *fig.* 57.) be any given curve in the perimeter of which a body moves: let P be the place of the body in the curve, S the center of *forces*, PG the radius of concavity or curvature, ST the perpendicular drawn from the center of *forces* to the tangent of the curve in P; then will the *centripetal force* be every where proportional to the quantity $\frac{SP}{PG \times ST \text{ cub.}}$ See Miſcel. Analyt. p. 231.

What is there called the *center of force*, is the point to which the *central force* is always directed.

Monſ. Varignon has alſo given two general theorems on this ſubject in the Memoirs of the Acad. Scienc. an. 1700, 1701, and has ſhewn their application to the motions of the planets. See alſo the ſame Memoirs, an. 1706, 1710.

Mr. Mac-Laurin has alſo treated the ſubject of *central forces* very fully in his Fluxions, from art. 416 to 493, where he gives a great variety of expreſſions for theſe *forces*, and ſeveral elegant methods of inveſtigating them.

Sir Iſaac Newton has demonſtrated this fundamental theorem of *central forces*, that the areas which revolving bodies deſcribe by radii drawn to an immoveable center, lie in the ſame immoveable planes, and are proportional to the times in which they are deſcribed. Princip. lib. i. prop. 1.

A late eminent mathematician obſerves, that this law, which is originally Kepler's, is the only general principle in the doctrine of *centripetal forces*; but ſince this law, as Sir Iſaac Newton himſelf has proved, cannot hold whenever a body has a gravity or *force* to any other than one and the ſame point, there ſeems to be wanting ſome law that may ſerve to explain the motions of the moon and ſatellites which have a gravity towards two different centers: the law he lays down for this purpoſe is,

That where a body is deflected by two *forces* tending conſtantly to two fixed points, it will deſcribe by lines drawn from the two fixed points, equal ſolids in equal times, about the line joining thoſe fixed points. See Machin, of the Laws of the Moon's Motion, in the poſtſcript. This ſhort treatiſe is publiſhed at the end of the Engliſh tranſlation of Sir Iſaac Newton's Principles. See a demonſtration of this law by Mr. W. Jones, in the Phil. Tranſ. vol. lix. art. 12. p. 74, &c.

CENTRAL *forces, laws of*. 1. The following rule, for which we are obliged to the marquis de l'Hôpital, opens at once all the myſteries of *central forces*. Suppoſe a body of any determinate weight to move uniformly round a center with any certain velocity; find from what height it muſt have fallen to acquire that velocity: then, as the radius of the circle it deſcribes is to double that height, ſo is its weight to its centrifugal force.

2. The *central force* of a body moving in the periphery of a circle, is as the ſquare of the indefinitely ſmall arch AE, divided by the diameter AB. *Tab. Mechanics*, *fig.* 25. N° I. Let this arch be the diſtance which the body deſcribes in a given particle of time; then, from the nature of the circle, $AE^2 = AB \times AM$, and therefore $AM = \frac{AE^2}{AB}$. Now AM is the ſpace through which the body is drawn from the tangent in the given time; and though 2 AM is the proper meaſure of the *ceutral* force, yet when the forces compared are all computed in the ſame manner, from the naſcent, or indefinitely ſmall ſubtenſes of contemporaneous arches, it is of no conſequence whether we conſider thoſe ſubtenſes, or their doubles, as the meaſures of the forces, ſince the ratio is in both caſes the ſame. Since then a body, by an equable motion, in equal times deſcribes

equal arches AE; the *central force* wherewith the body is impelled in the periphery of the circle, is conſtantly the ſame.

3. If two bodies deſcribe different peripheries by an equable motion, their *central forces* are in a ratio, compounded of the duplicate ratio of their celerities; and the reciprocal one of their diameters: becauſe the ratio of the celerities is in this caſe the ſame with that of the arches or ſpaces deſcribed in the ſame time; and the celerities are evidently in the ſubduplicate of the products of the diameters multiplied by the forces. Hence, if the celerities be equal, the *central forces* will be reciprocally as their diameters; and if the diameters AB and HL be equal, i. e. if each moveable proceed in the ſame periphery, but with unequal celerities, the *central forces* will be in a duplicate ratio of the velocities.

If the *central forces* of the two bodies moving in different peripheries be equal, the diameters of the circles AB and HL will be in a duplicate ratio of the celerities.

4. The *central forces* are in a ratio compounded of the direct ratio of the diameters, and the reciprocal one of the ſquares of the times. For the diameters are as the peripheries, which are the ſpaces run in the periodic times; and theſe are in the compound ratio of their times and celerities directly: therefore, repreſenting the times by T, t, the celerities by C, c, and the diameters by D, d; $D : d :: C \times T : c \times t$; conſequently, $\frac{C^2 \times T^2}{D^2} = \frac{c^2 \times t^2}{d^2}$, and $\frac{t^2}{d} : \frac{T^2}{D} :: \frac{C^2}{D} : \frac{c^2}{d}$; and therefore by art. 3. the *central forces* are in the proportion required. And when the circles are equal, the *central forces* are reciprocally as the ſquares of the times.

5. If two bodies, equal in weight, deſcribe peripheries of unequal circles in equal times, their *central forces* are as their diameters AB, and HL (*Tab. Mechanics*, *fig*. 25). And hence, if the *central forces* of two bodies, deſcribing peripheries of two unequal circles, be as their diameters, they paſs over the ſame in equal times.

6. If two bodies, moving in unequal peripheries, be acted on by the ſame *central force*, the time in the larger is to that in the ſmaller, in a ſubduplicate ratio of the greater diameter AB, to the leſs HL; wherefore, $T^2 : t^2 :: D : d$, that is, the diameters of the circles in whoſe peripheries thoſe bodies are acted on by the ſame *central force*, are in a duplicate ratio of the times. Hence alſo the times wherein ſimilar peripheries or arches are run over by bodies impelled by the ſame *central force*, are in proportion to their velocities.

7. If the times wherein the bodies are carried through the ſame entire peripheries, or ſimilar arches, be as the diameters of the circles, the *central forces* are reciprocally as the ſame diameters.

8. If a body move uniformly in the periphery of a circle, with the velocity it acquires by falling the height AF; the *central force* will be to the gravity, as double the altitude AF to the radius CA.—If therefore the gravity of the body be called G, the centrifugal force will be $2\,AF \times G \div CA$.

9. If a heavy body move equably in the periphery of a circle, and with the velocity which it acquires by falling through a height equal to half the radius; the *central force* will be equal to the gravity.—And again, if the *central force* be equal to the gravity, it moves in the periphery of the circle, with the ſame gravity which it acquires in falling a height equal to half the radius.

10. If the *central force* be equal to the gravity, the time it takes up in the entire periphery, is to the time of its fall through half the radius, as the periphery to the radius.

11. If two bodies move in unequal peripheries, and with an unequal velocity, which is reciprocally in a ſubduplicate ratio of the diameters; the *central forces* are in a duplicate ratio of the diſtances from the center of the forces, taken reciprocally.

12. If two bodies move in unequal peripheries, with celerities which are reciprocally as the diameters; their *central forces* will be reciprocally as the cubes of their diſtances from the center of their forces.

13. If the velocities of two bodies moving in unequal peripheries, be reciprocally in a ſubduplicate ratio of the diameters; the ſquares of the times wherein they paſs the whole periphery, or ſimilar arches, are in a triplicate ratio of the diſtances from the center of the forces; wherefore, if the *central forces* be reciprocally in a duplicate ratio of the diſtances from the center, the ſquares of the times wherein the entire peripheries, or ſimilar arches, are paſſed over, are alſo in a triplicate ratio of the diſtances.

From this, and ſome of the foregoing theorems, we may deduce the velocity and periodic time of a body revolving in a circle, by means of its own gravity, at any given diſtance from the earth's center. Let d be the ſpace through which a heavy body deſcends at the ſurface of the earth, in the firſt ſecond of time, then $2d$ will be the meaſure of the force of gravity at the ſurface: and r being aſſumed for the earth's radius, the velocity in a circle at its ſurface, in one ſecond, will be $\sqrt{2rd}$, by art. 2. And the time of revolution will be $= \frac{3,14159, \&c. \times 2r}{\sqrt{2rd}} = 3,14159, \&c. \times \sqrt{\frac{2r}{d}}$ (ſeconds); becauſe the ſpace, deſcribed in a given time, which is the true meaſure of the celerity, is to the whole periphery, viz. $3.14159 \times 2r$, as the ſaid time is to the true meaſure of the periodic time: the two foregoing expreſſions, ſubſtituting for r, 21000000 feet, and for d, $16\frac{1}{2}$, will be nearly equal to 26000 feet, and 5075 ſeconds, reſpectively. Let R repreſent the radius of another circle deſcribed by a projectile about the earth's center; ſince the force of gravitation varies inverſly as the ſquare of the diſtance, we ſhall have $r-\frac{1}{2} : R-\frac{1}{2} :: 26000$ feet, the velocity in a ſecond at the ſurface, to $26000 \times \sqrt{\frac{r}{R}}$, the velocity in the circle whoſe radius is R: and by art. 13. $r\frac{3}{2} : R\frac{3}{2} :: 5075$ ſeconds, the periodic time at the ſurface: $5075 \times \sqrt{\frac{R^3}{r^3}}$, the time of revolution in the circle R. Let $R = 60r$, or the diſtance of the moon from the earth, and the above expreſſion will give 2360000 ſeconds, or 27,3 days nearly for the periodic time at that diſtance. Thus alſo the ratio of the forces of gravitation of the moon towards the ſun and earth may be eſtimated. For, 1 year being the periodic time of the earth and moon about the ſun, and $\frac{1}{178}$ the ſquare of the proportional periodic time of the moon about the earth, we have, by art. 4. $\frac{94000000}{1} : 240000 \times 178 :: 2,2, \&c. : 1$; or this is the proportion of the gravitation of the moon towards the ſun to her gravitation towards the earth. Again, we may hence compute the centrifugal force of a body at the equator, ariſing from the earth's rotation. The time of revolution, when the centrifugal force would become equal to that of gravity, as has been ſhewn above, is 5075 ſeconds; and, by art. 4. $\overline{86160}|^2$, which is the ſquare of the number of ſeconds in 23 hours, 56 minutes, the time of the earth's entire rotation, is to $\overline{5075}|^2$, as the force of gravity, which may be denoted by unit, to $\frac{1}{289}$, the centrifugal force required. Simpſon's Fluxions, vol. i. p. 240, &c.

14. If a body move in a curve line, in ſuch manner as that the radius CB, *fig*. 25. Nº 2. drawn from it to the fixed point C, placed in the ſame plane, deſcribes areas BAC, BCE, &c. proportional to the times, or equal in any given time, it is ſolicited towards the point C, by a centripetal force.

15. If a body proceed according to the direction of the right line AD, and be ſolicited by a centripetal force towards a fixed point C, placed in the ſame plane; it deſcribes a curve, whoſe cavity is towards C, and whoſe ſeveral areæ, comprehended between two radii AC and CB, are proportional to the times.

16. However the *central forces* differ from one another, they may be compared together; for they are always in a ratio compounded of the ratio of the quantities of matter in the revolving bodies, and the ratio of the diſtances from the center; and alſo in an inverſe ratio of the ſquares of the periodical times. If then you multiply the quantity of matter in each body by its diſtance from the center, and divide the product by the ſquare of the periodical time, the quotients of the diviſion will be to one another in the ſaid compound ratio, that is, as the *central forces*.

17. When the quantities of matter are equal, the diſtances themſelves muſt be divided by the ſquare of the periodical times, to determine the proportion of the *central forces*: in that caſe, if the ſquares of the periodical times be to one another as the cubes of the diſtances, the quotients of the diviſions, as well as the *central forces*, will be in an inverſe ratio of the ſquares of the diſtances.

18. When the force by which a body ſolicited towards a point is not every where the ſame, but is either increaſed or diminiſhed, in proportion to the diſtance from the center; ſeveral curves will thence ariſe in a certain proportion. If the force decreaſes in an inverſe ratio of the ſquares of the diſtances from that point, the body will deſcribe an ellipſis, which is an oval curve, in which there are two points called *foci*, and the point towards which the force is directed falls upon one of them; ſo

that in every revolution the body once approaches to, and once recedes from it. The circle alſo belongs to that ſort of curves, and ſo in that caſe the body may alſo deſcribe a circle. The body may alſo (by ſuppoſing a greater celerity in it) deſcribe the two remaining conic ſections, viz. the parabola and hyperbola-curves, which do not rerurn into themſelves: on the contrary, if the force increaſes with the diſtance, and that in a ratio of the diſtance itſelf, the body will again deſcribe an ellipſis; but the point to which the force is directed is the center of the ellipſe; and the body, in each revolution, will twice approach to, and again twice recede from that point. In this caſe alſo a body may move in a circle, for the reaſon above mentioned.

CENTRAL *Rule*, is a rule or method diſcovered by our countryman Thomas Baker, rector of Nympton in Devon, whereby to find the center of a circle deſigned to cut the parabola in as many points, as an equation to be conſtructed hath real roots.

Its principal uſe is in the conſtruction of equations; and he has applied it with good ſucceſs as far as biquadratics.

The *central rule* is chiefly founded on this property of the parabola: that if a line be inſcribed in that curve perpendicular to any diameter, a rectangle formed of the ſegments of this inſcript is equal to a rectangle made of the intercepted diameter and parameter of the axis.

The *central rule* has the advantage over Cartes's and De Latteres's methods of conſtructing equations, in that both theſe are ſubject to the trouble of preparing the equation by taking away the ſecond term. This we are freed from in Baker's method, which ſhews us how to conſtruct all equations not exceeding the fourth power, by the interſection of a circle and parabola, without the omiſſion or change of any terms. See Phil. Tranſ. N° 157.

CENTRATION, *centratio*. See CONCENTRATION.

Paracelſus uſes the word *centratio*, for the change or converſion of a ſaline principle into a corroſive and ulcerating quality. According to him, a *centrum ſalis* is the beginning of ulcers.

CENTRIFUGAL *force* is that whereby a body revolving round a center, endeavours to recede from it.

It is one of the eſtabliſhed laws of nature, that all motion is of itſelf rectilinear; and that the moving body never recedes from its firſt right line, till ſome new impulſe be ſuperadded in a different direction: after that new impulſe, the motion becomes compounded, but it continues ſtill rectilinear, though the direction of the line be altered. To move in a curve, it muſt receive a new impulſe, and that in a different direction every moment; a curve not being reducible to right lines, unleſs infinitely ſmall ones. If then a body continually drawn towards a center, be projected in a line that does not go through that center, it will deſcribe a curve; in each point whereof, A (*Tab. Mechanics*, *fig.* 25. N° I.) it will endeavour to recede from the curve, and proceed in the tangent AD; and, if nothing hindered, it would actually proceed; ſo as in the ſame time wherein it deſcribes the arch AE, it would recede the length of the line DE, perpendicular to AD, by its *centrifugal force*. The *centrifugal force*, therefore, is as the right line DE, perpendicular to AD; ſuppoſing the arch AE infinitely ſmall.

The effect of the *centrifugal force* is ſuch, that a body, obliged to deſcribe a circle, always deſcribes the largeſt it poſſibly can; a greater circle being, as it were, leſs circular, and leſs diſtant from a right line, than a ſmall one. A body therefore ſuffers more violence, and exerts its *centrifugol force* more, when it deſcribes a little circle, than when a large one: that is, the *centrifugal force* is always proportional, other circumſtances being alike, to the circumference of the curve in which the revolving body is carried round.

It is the ſame in other curves as in circles; for a curve, whatever it be, may be eſteemed as compoſed of an infinity of arches of infinitely ſmall circles, all deſcribed on different radii; ſo that it is at thoſe places where the curve has the greateſt curvity, that the little arches are moſt circular: thus, in the ſame curve, the *centrifugal force* of the body that deſcribes it, varies according to the ſeveral points wherein it is found.

CENTRIFUGAL *wheel*. See WHEEL.

CENTRINE, in *Zoology*, the name by which moſt authors call the *porcus piſcis*. It is properly of the *galeus* kind, but much thicker and ſhorter than any other of that genus, and from head to tail is ſomewhat of a triangular figure; its broad and flat belly making one ſide of the triangle, and its two ſides, which meet at the back, the other two. Aldrov. de Piſc. lib. iii. cap. 141.

It has its name of *porcus piſcis* either from the ſhape of its back, which, riſing into a ridge, reſembles that of a hog, or from his loving like the hog to wallow in mud.

CENTRINES, in *Phyſiology*, a ſpecies of inſects hatched in the wild fig-tree, and uſed in CAPRIFICATION.

CENTRIPETAL *force* is that power whereby a moveable body, impelled in the right line AG (*Tab. Mechanics*, *fig.* 25. N° I.) is perpetually drawn out of its rectilinear motion, and ſolicited to proceed in a curve. The *centripetal force*, therefore, is as the right line DE; ſuppoſing the arch AE infinitely ſmall. Hence, in circles, the *centripetal* and *centrifugal forces* are equal.

CENTRISCUS, in *Zoology*, a genus of the order of *nantes*, in the claſs of *amphibia*: the characters of which are, that the head is lengthened out into a very narrow beak, the aperture is recurved, the abdomen carinated, and the belly-fins united.

CENTRO-BARYC *method*, from κεντρὸν and βαρυς, *heavy*, in *Mechanics*, is a method of meaſuring or determining the quantity of a ſurface, or a ſolid, by conſidering it as formed by motion, and multiplying it into the way of its center of gravity.

The doctrine is compriſed in the following theorem, with its corollaries.

Every figure, whether ſuperficial or ſolid, generated by the motion of a line or figure, is equal to the factum of the generating magnitude into the way of its center of gravity, or the line which its center of gravity deſcribes.

Demonſt. For ſuppoſe the weight of the whole generating magnitude collected in the center of gravity; the whole weight produced by its motion will be equal to the factum of the weight moved into the center of gravity. But when lines and figures are conſidered like homogeneous heavy bodies, their weights are as their bulks; and therefore the weight moved is the generating magnitude; and the weight produced, that generated. The figure generated, therefore, is equal to the factum of the magnitude into the way of its center of gravity. Q. E. D.

Corol. 1. Since a parallelogram ABCD (*Tab. Mechanics*, *fig.* 26.) is deſcribed, if the right line AB proceed according to the direction of another AC, with a motion ſtill parallel to itſelf; and the way of the center of gravity E is equal to the right line EF, perpendicular to CD, that is, to the altitude of the parallelogram: its area is equal to the factum of the baſe CD, or the deſcribent line into the altitude EF.

Corol. 2. In the ſame manner it appears, that the ſolidity of all bodies, deſcribed by a plane deſcending according to the direction of any right line AC, is had by multiplying the deſcribing plane by the altitude.

Corol. 3. Since a circle is deſcribed, if the radius CL (*fig.* 27.) revolve round a center C, and the center of gravity of the radius CL be in the middle F, the way of the center of gravity is a periphery of a circle X, deſcribed by a ſubduple radius: conſequently the area of the circle is equal to the factum of the radius CL, into the periphery deſcribed by the ſubduple radius CF.

Corol. 4. If a rectangle ABCD (*Tab. Mechanics*, *fig.* 28.) revolve about its axis AD; the rectangle will deſcribe a cylinder, and the ſide BC the ſuperficies of a cylinder. But the center of gravity of the right line BC is in the middle F; and the center of gravity of the generating plane in the middle G of the right line EF. The way of this latter, therefore, is the periphery of a circle deſcribed by the radius EF. Wherefore, the ſuperficies of the cylinder is the factum of the altitude BC into the periphery of a circle deſcribed by the radius EF, or the baſe. And the ſolidity of the cylinder is the factum of the generating rectangle ABCD into the periphery of a circle deſcribed by the radius EG, which is ſubduple of EF, or of the ſemidiameter of the cylinder.

Suppoſe, v. gr. the altitude of the deſcribing plane, and therefore of the cylinder $BC=a$; the ſemidiameter of the baſe $DC=r$; then will $EG=\frac{1}{2}r$: and ſuppoſing the ratio of the ſemidiameter to the periphery $=1:m$, the periphery deſcribed by the radius $\frac{1}{2}r=\frac{1}{2}mr$. Therefore, multiplying $\frac{1}{2}mr$ by the area of the rectangle $AC=ar$; the ſolidity of the cylinder will be $=\frac{1}{2}mar^2$. But $\frac{1}{2}mar^2 =\frac{1}{2}r\times mr\times a$; and $\frac{1}{2}mr^2$ is the area of the circle deſcribed by the radius EG. It is evident, therefore, the cylinder is equal to the factum of the baſe into the altitude.

Corol. 5. In like manner, ſince the center of gravity of the right line AB (*Tab. Mechanics*, *fig.* 17.) is in the middle M, and the ſurface of a cone is deſcribed, if the triangle ABC revolves about its axis; if $PM=\frac{1}{2}BC$; the ſuperficies of the cone will be equal to the factum of its ſide AB, into the periphery deſcribed by the radius PM, or the ſubduple diameter of the baſe BC.

Suppoſe, v. gr. $BC=r$, $AB=a$, the ratio of the radius to the periphery $1:m$; then will $PM=\frac{1}{2}r$, and the periphery deſcribed by this radius $=\frac{1}{2}mr$. Therefore, multiplying $\frac{1}{2}mr$ into the ſide of the cone AB, the product is the ſuperficies or $\frac{1}{2}amr$. But $\frac{1}{2}amr$ is alſo the factum of $\frac{1}{2}a$ and mr: therefore, the ſurface of the cone is the product of the periphery into half the ſide.

Corol. 6. If the triangle ACB (*Tab. Mechanics*, *fig.* 29.) revolve about its axis, it deſcribes a cone; but if CB be biſected in D, and the right line AD be drawn, and

$AO = \frac{2}{3} AD$; the center of gravity will be in O. The ſolidity of the cone, therefore, is equal to the factum of the triangle CAB into the periphery deſcribed by the radius PO; but $AD : AO :: BD : OP$; and $AO = \frac{2}{3} AD$, and $DB = \frac{1}{2} CB$. Therefore, $OP = \frac{2}{3} BD = \frac{1}{3} CB$.

Suppoſe, v. gr. $BC = r$, $AB = a$; the ratio of the radius to the periphery $= 1 : m$. Then will $OP = \frac{1}{3} r$, the periphery deſcribed by this radius $\frac{1}{3} mr$; the triangle $ACB = \frac{1}{2} ar$; and therefore, the ſolidity of the cone $\frac{1}{3} mr \; \frac{1}{2} ar = \frac{1}{6} amr^2$. But $\frac{1}{6} amr^2 = \frac{1}{2} r \times mr \times \frac{1}{3} a$: Or, the factum of the baſe of the cone into the third part of the altitude. See TRIANGLE.

This elegant theorem, which may be ranked among the chief inventions in geometry of the laſt age, was taken notice of long ago by Pappus; but the jeſuit Guldinus was the firſt who ſet it in its full light, and exhibited its uſe in a variety of examples. Several other geometers, after Guldinus and Pappus, have alſo uſed it in meaſuring ſolids, and ſurfaces generated by a rotation round a fixed axis; eſpecially before the late invention of the integral calculus: and it may ſtill take place in ſome caſes, where the integral calculus would be more difficult. M. Leibnitz has obſerved, that the method will hold, though the axis or center be continually changed during the generative motion.

CENTRONIA, in *Ichthyology*, the name by which the *echini marini* have been lately diſtinguiſhed. Dr. Hill makes them a diſtinct ſeries of animals, living under the defence of ſhelly coverings, formed of one piece, and furniſhed with a vaſt number of ſpines, moveable at the creature's pleaſure.

The ſpecies of *centronia* are very numerous, but may be all comprehended under the following diviſions. 1. The roundiſh, or ſubgloboſe kind; called by Klein, CIDARIS. See TURBAN-*ſhell*.

2. The cordated kinds; called by Klein, SPATANGI and SPATAGOIDES.

3. The flat kinds; called by Klein, PLACENTÆ.

Klein, who has been at much pains to arrange theſe bodies, has divided them into a number of other genera; but they may be all ranked under one or other of theſe diviſions. But beſide the known recent ſpecies, we meet with ſeveral others, foſſile, of a very ſingular figure; for which ſee ECHINITES, and ECHINI *foſſiles*.

CENTRUM, in *Geometry*, *Mechanics*, *&c.* See CENTER.

CENTRUM *phonicum*, in *Acouſtics*, is the place where the ſpeaker ſtands in poloſyllabical and articulate echoes.

CENTRUM *phonocampticum*, is the place, or object, that returns the voice in an echo.

CENTRUM *tendinoſum*, in *Anatomy*, a point, or center, wherein the tails of the muſcles of the diaphragm meet. This center is perforated towards the right ſide, for the *vena cava*; towards the left, backward: its fleſhy part gives way to the *gula*. The deſcending trunk of the great artery, thoracic duct, and *vena azygos*, paſs between its two inferior proceſſes. See DIAPHRAGM.

CENTRY *Box*, a wooden cell, or lodge, made to ſhelter the centinel, or centry, from the injuries of the weather. In a fortification, ſuch lodges are uſually placed on the flanked angles of the baſtions, on thoſe of the ſhoulder, and ſometimes in the middle of the curtain.

CENTUM-MORBIA, in *Botany*, a name uſed by ſome authors for the common moneywort or nummularia, from its ſuppoſed virtues.

CENTUMVIRATE, among the Romans, a court compoſed of one hundred magiſtrates, or judges, appointed to decide private differences between the people.

The *centumviri* were a body of men choſen, three out of each tribe; ſo that their number amounted to five more than their name imports: their buſineſs was to judge of matters relating to teſtaments, tutorage, inheritances, and ſuch other matters of leſſer weight and moment, as the prætors committed to them. Their body was afterwards increaſed to an hundred and eighty.

The *centumviri* were called together by ſetting up a ſpear; at firſt, by thoſe who had diſcharged the office of quæſtor; afterwards, by the decemviri.

CENTUNCULUS, in *Botany*, a name uſed by ſome authors for the gnaphalium, or cudweed.

CENTUNCULUS, in the Linnæan ſyſtem of *Botany*. This makes a diſtinct genus of plants, of the *tetrandria monogynia* claſs; the characters of which are theſe: the cup is a wide perianthium, divided into four oval and pointed ſegments, and remaining after the flower is fallen; theſe alſo are larger than the ſegments of the flower. The flower is compoſed of a ſingle petal, in form of a roundiſh tube, with a rim divided into four ſegments of an oval figure: the ſtamina are four filaments nearly of the length of the flower: the antheræ are ſimple: the germen of the piſtil is roundiſh, and ſituated in the tube of the flower: the ſtyle is ſlender, of the length of the flower, and remains when the petal is fallen: the ſtigma is ſimple: the fruit is a globoſe capſule, containing only one cell, which ſplits open horizontally: the ſeeds are ſmall, numerous, and roundiſh.

CENTURIAL *Inſcriptions*, a denomination given by ſome to thoſe inſcriptions inſerted in the face of Severus's wall, which make mention of the centuries and cohorts by whom ſuch parts of the wall are ſuppoſed to have been erected. In which ſenſe, *centurial inſcriptions* ſtand contradiſtinguiſhed from *legionary*.

CENTURIATA *Comitia*, in *Antiquity*, thoſe aſſemblies of the Romans, wherein the people gave their votes by centuries.

CENTURIATOR, an appellation given to certain learned Germans of the city of Magdeburg, who in the early days of the Reformation compoſed a body of church hiſtory, divided into CENTURIES of years.

Baronius is ſaid to have written his Annals by way of oppoſition to the *centuriators* of Magdeburg.

CENTURION, *Centurio*, among the Romans, an officer in the infantry, who commanded a century, or an hundred men.

The firſt *centurion* of the firſt cohort of each legion, was called *primipilus*, *primopilus*, or *primipili centurio*, ſometimes *primus centurio*: he was not under the command of any tribune, as all the reſt were; and had four centuries under his direction. He guarded the ſtandard, and the eagle of the legion.

CENTURY, a thing divided, or ranged into an hundred parts. At the time when the Roman people were aſſembled for creating of magiſtrates, eſtabliſhing of laws, or deliberating of public affairs, they were divided into *centuries*; and to the end their ſuffrages might be more eaſily collected, they voted by *centuries*: this was done in the Campus Martius; and theſe aſſemblies were hence called *comitia centuriata*.

The denomination CENTURY, *centuria*, was given to the horſemen or *equites* belonging to each tribe, which at firſt were only a hundred; but the ſame name, *centuria equitum*, was retained when the number was afterwards doubled, and even tripled: juſt as it was with the word tribe, which at firſt denoted a third part of the people; but was ſtill retained, after the people were divided into ſix parts. Mem. Acad. Inſcript. tom. ii. p. 101.

The Roman cohorts were diſtributed into decuries, commanded by decurions; and *centuries* by centurions. Each COHORT conſiſted of ſix *centuries*, and a LEGION of ſixty.

CENTURY, in *Chronology*, is the ſpace of one hundred years. Church-hiſtory is computed chiefly by *centuries*, commencing from our Saviour's incarnation.

In this ſenſe, we ſay, the firſt *century*; the fathers of the ſecond *century*; the councils of the third *century*, &c.

CENTUSSIS, a Roman coin, containing a hundred *aſſes*. See AS.

CEOAN, in *Zoology*, the name of a bird, common in the Spaniſh Weſt Indies, and deſcribed by Nieremberg, who alſo calls it *avis nivea*. It is a little larger than our largeſt thruſh, and very remarkable for the facility with which it learns to imitate the human ſpeech.

CEORLE. See CHURLE.

CEPA, the *onion*, in *Botany*, &c. See ONION.

CEPÆA, in *Botany*, a name given by ſome authors to the common *anagallis aquatica*, or water-brook lime.

CEPHALALGIA, from κεφαλη, *head*, and αλγος, *pain*, in *Medicine*, is underſtood, in the general, of any HEAD-*ach*; but properly ſignifies only a freſh one.—When it becomes inveterate, it is called *cephalæa*; and, when it only poſſeſſes half the head, *hemicrania*.

CEPHALALGIA *biaco-hæmatitica*, a name given by ſome medical writers to that ſpecies of HEAD-*ach*, called by others the *clavus hyſtericus*.

CEPHALANTHUS, in *Botany*. See BUTTON-*tree*.

CEPHALIC, in *Medicine*, is applied to any thing belonging to the HEAD, or its parts.

The word is formed of κεφαλη, *head*.

CEPHALICS, or CEPHALIC *Medicines*, are ſuch as are proper for diſorders of the head.

Theſe are generally of a volatile, ſpirituous, or aromatic nature, or at leaſt they are joined with ſuch; and are ſuppoſed to be of ſervice, by the volatility of their particles inſinuating into the nerves, and mixing with the animal ſpirits directly, as well as by the common circulation. Fixed bodies can only become *cephalic* by accident. Thus, ſpirit of lavender is ſuppoſed directly to act upon the nerves of the palate, &c. upon which account, it is frequently taken dropped on ſugar, or bread: and ſal volatile, by ſmelling to, is ſuppoſed to be aſſiſtant to the head, by its volatile particles entering the olfactory nerves. As to aromatic *cephalics*, as the ſpecies of diambra, powder de gutteta, nutmeg, &c. they act chiefly by their aromatic parts warming the nervous ſyſtem, and increaſing their vibrations, by which the nervous fluid circulates more freely.

Cephalics are different, according to the diverſity of cauſes, which may happen to obſtruct the circulation of the humours of the brain. If the cauſe is of a cold and mucous kind, the *cephalics* to be preſcribed, muſt be of a heating, ſtimulating, fragrant, and aromatic quality: if, on the contrary, the diſorder ariſes from an exceſs of heat in the body, the *cephalics* to be exhibited muſt be of a cooling and refrigerating nature.

Cephalics are either *internal*, when for inſtance they are exhibited by the mouth, in order to produce their effects by the general circulation of the fluids; or by way of clyſters, which often produce the moſt happy conſequences, by making a revulſion from the ſuperior and more noble parts: or they are ſuch as are *external*; to which claſs belong errhines, proper liquors for waſhing the head, medicated cups, and other remedies commonly called topics, the materials of which are alſo uſed againſt diſorders of other parts of the body.

With reſpect to *cephalic* topics in general, we muſt obſerve, that the head is leſs capable of bearing moiſt than dry applications; becauſe the former, by diſtending or relaxing the veſſels, produce congeſtions of humours, which prove hurtful to the brain. Nor do moiſt preparations applied to the head ever anſwer any valuable purpoſe, except in thoſe caſes alone where the diſorder ariſes from an exceſs of heat and dryneſs; or from an inflammatory diſpoſition in the head.

CEPHALIC *Vein*, in *Anatomy*, is a vein of the arm between the ſkin and the muſcles, divided into two branches, *external* and *internal*. The external goes down to the wriſt, where it joins the *baſilica*, and turns up to the back of the hand: the internal branch, together with a ſprig of the *baſilica*, makes the *mediana*.—See *Tab. Anat.* (*Angeiol.*) *fig.* 6. *lit. n.*

It is thus called, becauſe the ancients uſed to open it in diſorders of the head; from a miſtaken notion, that it had a nearer concern with the head than any other of the veins.

CEPHALOIDES, a denomination given by ſome writers, who diſcover virtues in plants from their ſignatures, to thoſe which bear any reſemblance to a human head; ſuch are the poppy, piony, and the like.

CEPHALOMANTIA, from κεφαλη and μαντεια, *divination*, an ancient ſpecies of divination, or method of foretelling futurity, by a dead man's ſkull.

CEPHALONOMANTIA, a method of divination, or revealing ſecrets, by means of an aſs's head broiled on the coals.

The word is compounded of κεφαλη, *head*, ονος, *aſs*, and μαντεια, *divination*.

After muttering a few prayers, the names of ſeveral perſons ſuſpected of a theft, or the like, were repeated over: he at whoſe name the aſs's jaws made any motion, or the teeth began to chatter, was held for convicted.

CEPHALOPHARYNGÆI, in *Anatomy*, two muſcles of the orifice of the *æſophagus*, called the *pharynx*.

They have their origin in the articulation of the head with the firſt *vertebra*, and are inſerted into the upper part of the *pharynx*: they ſerve to draw it upwards and backwards.

CEPHALOPONIA, from κεφαλη and πονος, *pain*, a denomination given by ſome to the *cephalalgia*, or HEAD-*ach*.

CEPHALUS, in *Ichthyology*, a name given by Ariſtotle, Ælian, Appian, and others, to the *mugil* or *mullet*, called alſo by ſome *capito*.

CEPHALUS is alſo a name given by ſome naturaliſts to the *ſargus*, called alſo *gardo*, and *gardon*; a fiſh very little, if at all, differing from our roach.

CEPHEUS, in *Aſtronomy*, a conſtellation of the northern hemiſphere; whoſe ſtars, in Ptolemy's Catalogue, are thirteen; in Tycho's, eleven; in Hevelius's, fifty-one; in the Britannic Catalogue, thirty-five. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude.			Magnitude.

CEPI *Corpus*, in *Law*, a return made by the ſheriff, upon a capias, or other proceſs to the like purpoſe; ſignifying, that he hath taken the body of the party.

CEPION, in *Antiquity*, the name of a particular air, invented by a diſciple of Terpander, and deſigned to be played on the CITHARA.

CEPIONITES, in *Natural Hiſtory*, a name given by Pliny, and other ancient writers, to a ſpecies of ſtone, ſeeming to approach to the nature of the JASPER. Pliny tells us, that there were many kinds of it, ſome more pellucid than others, and ſome colourleſs; others variegated with green, and the other colours of the jaſpers and agates: they were all uſed in the ornamenting houſes; and the leaſt beautiful ſerved, when well poliſhed, to make ſpeculums of.

CEPITES, in *Natural Hiſtory*, a name uſed by the ancients to expreſs a gem which gave the repreſentation of the ſeveral cluſters of plants and flowers in the beds of a garden, with naked veins, expreſſing the walks between. The common text of Pliny is unintelligible, where he gives the deſcription of this ſtone; but Salmaſius has reſtored it from ſome old copies, ſo as to make it ſenſe, and expreſſive of this meaning. The ſtone was probably no other than a peculiar kind of that agate which the ancients called *dendrites*, and we the MOCOA *ſtones*.

CEPOLA, in *Ichthyology*, a genus of the *thoracici* in the claſs of fiſhes; the characters of which are, that the head is roundiſh and compreſſed, the mouth flat, the teeth crooked, the branchioſtege membrane conſiſts of ſix ſmall bones, the body uniform and naked, and the abdomen ſcarce as long as the head.

CEPOLAPITES, in *Natural Hiſtory*, a name given by ſome to the ſtone properly called CEPITES, a kind of MOCOA *agate*.

CEPPHUS, in *Zoology*, the name of a bird of the *larus* or gull kind; but, except in its feet and beak, very much reſembling the common duck. It is a moderately large bird, but is ſo thick feathered, that it appears much more ſo than it really is. It is of a variegated colour, of a mixture of white, brown, and yellow; but the long wing and tail feathers are black: its legs are greeniſh; but the membrane which connects the toes is brown. See Phil. Tranſ. vol. lii. part i. N° 24.

CEPULA, a name by which Geſner and ſome other authors have called the common *tænia*. It is derived from the Italian *cepole*; the common name of the ſame fiſh in the markets of Rome. It is a ſpecies of the CEPOLA.

CEPUS, in *Zoology*, a name given by ſome to thoſe monkeys of the ſmaller kind, which have more or leſs green among their other colours.

CERACHATES, in the *Natural Hiſtory of the Ancients*, the name of a ſpecies of agate of a plain yellow colour, and very much reſembling yellow wax. We have it from the Eaſt Indies, as alſo from New Spain, and ſome other parts of America; and our jewellers ſometimes work it into toys of ſmall value.

CERAMBYX, in *Zoology*. See *Capricorn* BEETLE.

CERAMIUM, an ancient MEASURE, anſwering to what was otherwiſe called AMPHORA and CADUS.

CERASTES, the *horned ſnake*, in *Zoology*, the name of a ſpecies of ſerpent, which has on its forehead two protuberances, that look like ſhells, but of a more ſolid texture, and from their reſemblance of horns have given it this name: theſe are often no larger than grains of barley: its teeth are like thoſe of the viper, and are placed in the ſame order: it is of the number of viviparous ſerpents, and is remarkable among the ſerpent claſs for its long enduring thirſt. It is found in Lybia and Arabia, particularly about the town of Suez.

Cerastes was alſo a name given by the ancient Greeks to a ſtag when at its full growth, or at the end of its fourth year.

CERASTIUM, in *Botany*. See Mouse-*ear*.

CERASUS, in *Botany*. See Cherry-*tree*.

CERATE. See Ceratum.

CERATIAS, among *Ancient Naturaliſts*, denotes a horned comet.

The word is formed from κερας, *a horn*. Such is that ſaid to have appeared when Xerxes paſſed his army into Greece.

CERATION, *Ceratio*, in *Chemiſtry*, the operation of waxing.

CERATITES, a name given by many authors to the ſubſtance more uſually called by authors unicornu *foſſile*, and found in great plenty in the caverns of Hart's foreſt in Germany.

CERATIUM, or Ceration, a name given by the *Ancient Phyſicians* to a ſmall weight. The *ceration* is properly the name of a tree called the carob, or *ſiliqua dulcis*, the ſweet pipe-tree: this tree bears a long pod, in which are contained ſeveral ſeeds among the pulp: theſe ſeeds are alſo called *ceration* and *jembut* by the Arabians; and being dried, they were uſed as a weight to proportion the doſes of medicines. Thus the ſmall weight, which took its origin from them, was called *ceration*; as that ſmall weight, which took its origin from a grain of barley, was called *granum*.

Ceratium was alſo a ſmall ſilver coin, the third part of an *obolus*, and the ſame with what the Romans called *folis*.

CERATOCARPUS, in *Botany*, a name given by Buxbaum to a new genus of plants, belonging to the claſs of *monoecia monandria* in the Linnæan ſyſtem; the characters of which are, that the leaves are ſlender and graſſy, the flowers apetalous, and having no cup, but ſtanding upon the embryo fruit: the fruit, when ripe, is of a triangular figure, reſembling that of the ſhepherd's purſe, but running out into horns, and compoſed of two valves. Each of theſe fruits contains only one ſeed, and that of a very ſingular figure: it is long and ſlender, and not flat, but rounded, and each of its extremities is bent round in the manner of an arch, which are held together in their approach to one another by a membrane; the root is fibroſe and annual, the ſtalk woody and branched, the leaves rigid and hollowed along the middle, and the flowers are yellow. It grows in marſhy places near the Caſpian ſea, and in the neighbourhood of Aſtracan; and toward autumn the ſtalks are uſually torn up by the winds, and blown about the marſhes in great abundance. Act. Petrop. vol. i. p. 244.

The author named it *ceratocarpus*, *horned fruit*, from the ſeed veſſels running out into two horns: he obſerves, that the deſcription of the ceratoides of Tournefort's corollary approaches to this plant in many points; but differs ſo much in others, that either Tournefort muſt mean another plant, or elſe he muſt have informed himſelf but very imperfectly as to this.

CERATOGLOSSUM, in *Anatomy*, a pair of muſcles of the tongue, thus deſcribed by Mr. Cowper: "The *ceratogloſſum* has a broad fleſhy origination, at the ſuperior "part of the *os hyoides*, laterally; whence it aſcends to "its inſertion, at the root of the tongue. This, with its "partner, acting, draws the tongue into the mouth directly: if only one of them act, it moves the tongue "on one ſide."

The word is derived from κερας, *horn*, and γλωσσα, *tongue*; its form bearing ſome reſemblance to a horn.

CERATOIDES, in *Anatomy*, the cornea *tunica*. See Cornea.

Ceratoides is alſo a denomination given to the *os hyoides*, or *bicorne*. See Hyoides.

CERATOMALAGMA, a cerate or cerecloth.

CERATONIA, in *Botany*. See Carob.

CERATOPHYLLUM, in *Botany*, the name by which Linnæus calls a genus of plants, of the *monoecia polyandria* claſs; called by others *dichotophyllum*, and *hydroceratophyllum*. The characters are theſe: the flowers are ſome male, others female, on the ſame plant: in the male flowers the cup is divided into many ſegments, which are pointed, and equal in ſize. There are no petals: the ſtamina are ſlender filaments, double in number to the ſegments of the cup, being uſually ſixteen or twenty, and are ſcarce conſpicuous: the antheræ are oblong, erect, and longer than the cup. In the female flowers the cup and corolla are the ſame as in the male: the germen of the piſtil is compreſſed, and of an oval figure: there is no ſtyle, but the ſtigma is obtuſe and oblique: the fruit is an oval nut, of a pointed figure, and having only one cell. Vaillant deſcribes one ſpecies of this genus, the ſeeds of which have three ſpines, one ſtanding forward, and the other two behind.

CERATUM, Cerate, in *Medicine*, a kind of ſtiff unguent, or liniment, made of oil and wax, with other ingredients; uſed externally in ſeveral diſeaſes, eſpecially thoſe of the ſkin.

It takes its name from its capital ingredient, wax, called in Latin *cera*.

Its conſiſtence is thicker than that of a liniment; the laſt having uſually two ounces of wax to two of oil; but the *cerate*, four of wax to two of oil: yet it is thinner than a plaſter.

There are *cerates* of various kinds, *refrigerative*, *ſtomachic*, &c. *cerate of ſulphur*, *of ſaunders*, *reſtringent cerate of bricks*, *divine cerate*, &c.

There is a particular one, called the *refrigerative cerate of Galen*, made of white wax and *oleum roſat. omphacin*.

Ceratum *epuloticum*, a name given in the late London Diſpenſatory to the compoſition commonly called Turner's *cerate*, and there ordered to be made in this manner: take oil olive, a pound; yellow wax and prepared calamy, of each half a pound; melt the wax in the oil, and when the mixture begins to congeal again, ſprinkle in the powder, and continue ſtirring it till the whole is cold.

Ceratum *mercuriale*, a form of medicine preſcribed in the late London Pharmacopœia, and ordered to be made in the following manner: take yellow wax and tried hog's lard, of each half a pound; quickſilver, three ounces; ſimple balſam of ſulphur, a dram: melt the wax and lard, and then add to them gradually the quickſilver, firſt well divided by the balſam of ſulphur.

CERAULA, in *Antiquity*, a kind of muſician, who blows or plays on the horn.

In which ſenſe, the word amounts to the ſame with the Latin *cornicem*.

CERAUNIA, Ceraunias, or Ceraunius *lapis*, in *Natural Hiſtory*, a ſort of flinty figured ſtone, of no certain colour, but of a pyramidal or wedge-like figure; popularly ſuppoſed to fall from the clouds in thunder-ſtorms, and to be poſſeſſed of divers notable virtues; as of promoting ſleep, preſerving from lightning, &c.

The word is formed from κεραυνος, *a thunder-bolt*.

The *ceraunia* is the ſame with what is otherwiſe called the thunder-ſtone or thunder-bolt; and ſometimes alſo *ſagitta*, or arrow's head, on account of its ſhape.

The *ceraunia* are frequently confounded with the ombria and brontia, as being all ſuppoſed to have the ſame origin.

The generality of naturaliſts take the *ceraunia* for a native ſtone, formed among pyrites, of a ſaline, concrete, mineral juice. Mercatus and Dr. Woodward aſſert it to be artificial, and to have been faſhioned thus by tools.

The *ceraunia*, according to theſe authors, are *ſilices*, or heads of the ancient weapons of war, in uſe before the invention of iron; which, upon the introduction of that metal, growing into diſuſe, were diſperſed in the fields through this and that neighbouring country.

Ceraunia, in *Botany*, is uſed by ſome authors for orpin.

Ceraunias *albus*, in *Natural Hiſtory*, a name given by Pliny to a gem or precious ſtone, of the nature of the aſteria, but ſomewhat inferior to it in beauty. Pliny tells us, that it was a very bright gem, of a cryſtalline appearance, but with a caſt of bluiſh; and that it was found in Caramania. Solinus gives us much the ſame account, but makes Germany the place of its origin. It is indeed written Germania in ſeveral of the old copies in Pliny, but the moſt correct have it as it is printed, Caramania; and Caramania was a country from which the Romans had many gems.

CERAUNITES, in *Natural Hiſtory*, a name given by ſeveral writers to the belemnites.

CERBERA, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower is of one leaf, funnel-ſhaped, ſpread open at the top, where it is divided into five large ſegments; with five large ſtamina in the middle of the tube. In the center is ſituated a roundiſh germen, which afterward becomes a large, fleſhy, roundiſh berry, divided into two cells, each containing a ſingle large compreſſed nut. There are two ſpecies, natives of the Weſt Indies, and the Braſils.

CERBERUS, in *Aſtronomy*, a ſmall northern conſtellation near Hercules, conſiſting, in Hevelius's Catalogue, of four ſtars, which are enumerated under Hercules in the Britannic Catalogue.

Cerberus, among *Chemiſts*, denotes MERCURY.

The name CERBERUS is alſo given by ſome to a famous purging powder, more uſually called *pulvis cornachinus*, and *pulvis comitis Warwicenſis*.

Cerberus *chemicus*, in *Chemiſtry*, a phraſe uſed by Hoffman and others to expreſs the common nitre or ſalt-petre, which they have called alſo *ſal infernalis*.

Cerberus, in *Mythology*, a name which the ancient poets have given to a dog with three heads and mouths, born of Tiphon and Echidna, and ſtationed at the gate of hell. Some have ſuppoſed that *Cerberus* is the ſymbol of the earth, or of all-devouring time; and that its three mouths repreſent the preſent, paſt, and future. The victory obtained by Hercules over this monſter, denotes the conqueſt which this hero acquired over his paſſions. Dr. Bryant ſuppoſes, that *Cerberus* was the name of a place, and that it ſignified the temple of the Sun; deriving it from *Kir-Abor, the place of light*. This temple was alſo called *Tor-Caph-El*, which was changed to τρικηφαλος; and hence *Cerberus* was ſuppoſed to have had three heads. It was likewiſe called *Tor-Keren, Turris Regia*; whence τρι καρηνος, from τρεις, *three*, and καρηνον, *head*. Anal. of Mythology, vol. i. p. 409, &c.

CERCASI, in the *Eaſtern Military Orders*, are a body of horſe in the ſervice of the grand ſignior.

CERCELE, in *Heraldry*. A *Croſs* Cercele, is a CROSS, which, opening at the ends, turns round both ways, like a ram's horn.

The croſs *cercele* differs from the croſs ANCHORED, as the latter turns but a little rounding, whereas the former turns quite round.

CERCIS, in *Botany*, the name given by Linnæus to the genus of plants called *ſiliquaſtrum* by Tournefort, Rivinus, and others. See Judas-*tree*.

CERCOPITHECUS, in *Natural Hiſtory*, the name of a ſpecies of long-tailed monkeys.

The word is derived from κέρκος, *a tail*, and πίθηκος, *a monkey*.

Aldrovandus, Marcgrave, and others, have given the figures and hiſtories of many of the *cercopitheci*. The former of theſe authors ſpeaks of ſome as large as maſtiff dogs, having tails five cubits long. In Braſil there is a yellowiſh kind, which ſmells of muſk. As theſe monkeys climb trees, if in danger of falling, they ſave themſelves not only by their feet, but by their tails, wrapping them round the boughs of trees. The Zygantes in Africa eſteem their fleſh good meat.

CERCOSIS, in *Medicine*, a preternatural extenſion and tumidity of the female CLITORIS, ſo as to project beyond the *labia pudendi*.

CERDONIANS, a ſect who maintained moſt of the errors of Simon Magus, Saturninus, and the Manichees.

They took their name from their leader *Cerdo*, a Syrian, who came to Rome in the time of pope Hyginus; and there abjured his errors: but he did this in appearance only; for he was afterwards convicted of perſiſting in them, and accordingly was caſt out of the church again. *Cerdo* aſſerted two principles, the one good, and the other evil: between theſe, he imagined an intermediate kind of deity, of a mixed nature: this laſt, according to him, was Creator of the world, and the God that appeared under the old law. To his juriſdiction the Jews were ſubject; and idolatrous nations were under the empire of the evil principle. The good Being, whom he called *unknown*, was the father of Jeſus Chriſt; who, he taught, was only incarnate in appearance, and was not born of a virgin; nor did he ſuffer death, but in appearance. Marcion, his diſciple, ſucceeded him in his errors: whence the Marcionites.

CEREALES *ædiles*, two officers of ancient Rome, erected under Julius Cæſar, appointed to have the ſuperintendency of the corn and grain for the proviſion of the city. They alſo preſided in the *cerealia*. See Ædile.

Cereales *ludi*, ſolemn ſports held in honour of Ceres, wherein the matrons repreſented the grief and lamentation of Ceres for the loſs of her daughter Proſerpine, and her travels to find her again.

CEREALIA, in *Antiquity*, feaſts of Ceres, inſtituted by Triptolemus, ſon of Celeus, king of Eleuſine in Attica, in gratitude for his having been inſtructed by Ceres, who was ſuppoſed to have been his nurſe, in the art of cultivating corn, and making bread.

There were two feaſts of this kind at Athens; the one called *Eleuſinia*, the other *Theſmophoria*.

What both agreed in, and was common to all the *cerealia* was, that they were celebrated with a great deal of religion and purity; ſo that it was eſteemed a great pollution to meddle, on thoſe days, in conjugal matters.

It was not Ceres alone that was honoured here, but alſo Bacchus. The victims offered were hogs, becauſe of the waſte they make in the products of the earth: whether there was any wine offered, or not, is matter of much debate among the critics. Plautus and Macrobius ſeem to countenance the negative ſide; Cato and Virgil, the poſitive.

The *Cerealia* paſſed from the Greeks to the Romans, who held them for eight days ſucceſſively; commencing, as generally held, on the fifth of the ides of April. It was the women alone who were concerned in the celebration, all dreſſed in white: the men, likewiſe in white, were only ſpectators. They eat nothing till after ſun-ſet; in memory of Ceres, who in ſearch after her daughter took no repaſt but in the evening.

After the battle of Cannæ, the deſolation was ſo great at Rome, that there were no women to celebrate this feaſt, becauſe they were all in mourning; ſo that it was omitted that year.

Cerealia *ſemina*, an appellation given by ſome to what we call *legumina* or pulſe.

CEREBELLUM, or Cerebe[illegible] in *Anatomy*, the hinder part of the brain.—See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. cc.*

The *cerebellum* is eſteemed a kind of little brain by itſelf, as the word imports, which is a diminutive of *cerebrum*. It is placed in the hinder and lower part of the ſkull, underneath the hind part of the brain, or *cerebrum*: it lies open to the *cerebrum* at bottom; but at top it is ſeparated from it by a duplicature of the *dura mater*. Its figure ſomewhat reſembles a flat bowl, broader than it is long. Its ſubſtance is harder, drier, and more ſolid, than that of the brain, but of the ſame nature and kind; being compoſed, like it, of a cortical, or glandulous, and a medullary part: the branches of which laſt, when opened, reſemble thoſe of a tree, meeting in the middle, and forming a kind of ſtem, which runs quite through it. Its colour is yellowiſh, that of the brain being whiter.

Its ſurface is unequal, and furrowed, but not ſo much as that of the *cerebrum*; appearing rather as if laminated, like ſome ſhell; the middle circles being the largeſt and deepeſt: between the *laminæ* are duplicatures of the *pia mater*. The fore and hind parts of the *cerebellum* are terminated by apophyſes, called *vermiformes*, from the reſemblance they bear to worms: it is joined to the *medulla oblongata* by two proceſſes, called by Willis, *pedunculi*.

Beſides theſe, there are two or three other medullary proceſſes, which paſſing along the *medulla oblongata*, form an arch; from the diſcoverer called *pons Varoli*.

The blood-veſſels of the *cerebellum* are the ſame with thoſe of the *cerebrum*; and the uſe the ſame; viz. to ſeparate the nervous juice from the blood, and convey it through the ſeveral parts of the body.

Dr. Willis, however, diſtinguiſhes between the functions of the *cerebrum*, and *cerebellum*; making the firſt the principle of voluntary motions, and actions; and the laſt the principle of involuntary ones, viz. that of reſpiration, the motion of the heart, &c.

It is commonly aſſerted, that a wound either in the cortex, or medulla of the *cerebellum*, is mortal; though it is not in the brain, from which there have been entire parts taken away without harm. The truth is, we have inſtances of people living ſome time, not only without any *cerebrum*, but alſo without any *cerebellum*.

Willis and Boerhaave ſuppoſe the *cerebellum* to be the ſeat of the vital principle: but this opinion is liable to difficulties. The obſervations of M. de la Peyronie ſhew, that wounds in the *cerebellum* of dogs are not immediately mortal; and we have more than one account of perſons living with a ſchirrhous *cerebellum*. See Phil. Tranſ. N° 474. ſect. 3. and Mem. de l' Acad. Royale des Scienc. 1705.

CEREBRUM, in *Anatomy*, the BRAIN, properly ſo called; in contradiſtinction from the *cerebellum*.

Cerebrum *jovis*, in *Ichthyology*, a name given by Ennius the poet to a peculiar fiſh of the *labrus* kind, called by the generality of authors *ſcarus*: it is diſtinguiſhed by Artedi from the other ſpecies of the ſame genus, by the name of the LABRUS, *qui ſcarus auctorum eſt*.

CEREFOLIUM. See Chervil.

CEREIS, in *Botany*, a name uſed by ſome authors, and ſuppoſed to have been uſed by the ancients for the *ſiliquaſtrum*, or Judas's *tree*.

CERELÆUM, a compoſition of WAX and OIL. See Wax.

Some alſo give the ſame denomination to the *oleum ceræ*, otherwiſe called *butter of* WAX.

CEREMONIAL is uſed for the ſet or ſyſtem of rules and ceremonies which cuſtom has introduced for regulating our behaviour; and which perſons practiſe towards each other, either out of duty, decency, or civility.

Ceremonial, in a more particular ſenſe, denotes the manner wherein princes and their embaſſadors uſe to receive, and treat one another. The *ceremonial* is a kind of law introduced by compact, cuſtom, preſcription, &c.

which ſovereigns and their embaſſadors are to obſerve at their interviews, that none of them may either receive more or leſs marks of reſpect than they are entitled to. Some diſtinguiſh three occaſions on which the *ceremonial* is to take place: viz. when princes meet in perſon; when they write to each other; and when they ſend embaſſadors.

There are endleſs diſputes among ſovereigns about the *ceremonial:* ſome endeavouring to be on a level, and ſome to be ſuperior, to others. Numerous ſchemes have been propoſed for fixing the place and rank of each prince; but they have not been accepted of by any, except ſome alternate princes, as they are called in Germany. See PRECEDENCY.

CEREMONIAL is more particularly uſed in ſpeaking of the laws and regulations given by Moſes, relating to the worſhip of God among the ancient Jews.

In which ſenſe, it amounts to much the ſame with what we otherwiſe call *levitical* law; and ſtands contradiſtinguiſhed from the *moral*, as well as the *judicial* law.

It is diſputed whether the obſervation of the SABBATH be a *ceremonial*, or a moral law.

The *ceremonial* law preſcribed the forms, uſages, rites, &c. relating to ſacred places, utenſils, prieſts, levites, prophets, congregations, garments, feaſts, ſacrifices, ſabbaths, &c.

Moſt of the *ceremonial* laws of the Jews had ſome relation to thoſe idolatrous cuſtoms which had been eſtabliſhed among them before the publication of the levitical law.

CEREMONIALE, a book in which is preſcribed the order of the ceremonies to be obſerved in certain actions and occaſions of ſolemnity and pomp.

The *ceremonial* of the Roman church is called *Ordo Romanus.*

The Roman *ceremonial* was firſt publiſhed by the biſhop of Corcyra, in 1516; at which the college of cardinals were ſo ſcandaliſed, that ſome of them voted to have the author as well as book burnt, for his temerity in expoſing the ſacred ceremonies to the eyes of the profane people.

CEREMONY, an aſſemblage of ſeveral actions, forms, and circumſtances, ſerving to render a thing more magnificent and ſolemn.

The word comes from the Latin *ceremonia*, quaſi *Cereris munia*, on account of the great number of ceremonies uſed in making the offerings to Ceres; or becauſe the firſt religious ceremonies were thoſe of Ceres. Hence Cicero calls *Cererem antiquiſſimam, religioſiſſimam principem omnium ſacrorum, quæ apud omnes gentes fiunt.*

We have an ample and magnificent account of the religious *ceremonies* and cuſtoms of all the nations in the world, repreſented in figures deſigned by Picart, with hiſtorical explications, and divers curious diſſertations, &c. Ceremonies & Coutumes Religeuſes de tous les Peuples du Monde, 6 tom. fol. Amſt. 1723.

M. Porree, in 1646, publiſhed a hiſtory of ancient *ceremonies*; tracing the riſe, growth, and introduction of each rite into the church, and its gradual advancement to ſuperſtition therein. Traité des Anciennes Ceremonies. Amſt. 1646. 12°.

Many of them were borrowed from Judaiſm; but more, as it ſhould ſeem, from Paganiſm.

Dr. Middleton has given a fine diſcourſe on the conformity between the popiſh and pagan *ceremonies*; which he exemplifies in the uſe of incenſe, holy water, lamps and candles before the ſhrines of the ſaints, votive gifts or offerings round the ſhrines of the deceaſed, &c. In effect, the altars, images, croſſes, proceſſions, miracles, and legends; nay, even the very hierarchy, pontificate, religious orders, &c. of the preſent Romans, he ſhews are all copied from their heathen anceſtors. Who then can doubt of the idolatry of popery, when we ſee the preſent people of Rome worſhipping at this day in the ſame temples, at the ſame altars, ſometimes the ſame images, and always with the ſame *ceremonies*, as the old Romans?

CEREMONY is alſo applied to thoſe reſpects and honours which people pay to each other, out of mere civility and good breeding. China is the land of *ceremonies.* The Chineſe have annexed ſuch an idea of reſpect and gravity to certain garments, that the miſſionaries dare not ſay maſs without their boots on.

CEREMONY, *habit of*, denotes the ornaments and external badges of a profeſſion, dignity, or office.

CEREMONY, *officers of*, thoſe whoſe buſineſs is to ſee the cuſtomary *ceremonies* duly obſerved in actions of pomp and ſolemnity. Such are marſhals, ſerjeants at arms, &c.

In our court is a maſter and aſſiſtant of the *ceremonies:* the French have a grand maſter of the *ceremonies*, as well as a maſter and aſſiſtant. In churches of the Romiſh communion there are alſo maſters of the *ceremonies*, to ſee that every thing be performed as preſcribed in the ritual.

CEREPOLIUM, in *Botany*, a name uſed by Pliny to expreſs the gingidium, an umbelliferous plant of the nature of the chervil or cereſolium; and it is very probable that this name is only a falſe ſpelling of that word. Columella makes the *cerepolium* and gingidium different; but it may only be that in different ages they applied theſe names to different ſpecies of the ſame genus of umbelliferous plants. Neophytus tells us, that the gingidium of the ancients was called by the later writers biſacutum; a name very well expreſſing its ſeeds, which are long and ſlender, and are pointed at both ends.

CERES, in *Mythology*, the daughter of Saturn and Ops, the goddeſs of corn and tillage. Sometimes *Ceres* is taken for the Moon; as Liber, Bacchus, is for the Sun. By metonymy, the word is uſed to ſignify *bread*, and all manner of food.

CEREUS, in *Botany*. See TORCH-*thiſtle.*

CERIGO, in *Natural Hiſtory*, a name by which many authors have called that remarkable American animal called the OPOSSUM.

The Americans in ſome places call this animal in their language *carigueya*; and it is probable that this name *cerigo* is only a corruption of that word, though it be received generally in the world as a proper name, and uſed as ſuch by Maffei, Barlæus, Nieremberg, and many others.

CERINTHE, among the *Ancients*, was uſed by ſome to expreſs that ſubſtance called by others *ambroſia* and *ſandarach*, and by ſome *erithace.* See WAX.

CERINTHE, in *Botany*. See HONEY-*wort.*

CERINTHIANS, a ſect that took their name from *Cerinthus*, cotemporary with St. John; who formed a ſingular ſyſtem of doctrine and diſcipline, by combining the doctrines of Chriſt with the opinions and errors of the Jews and Gnoſtics.

Cerinthus aſcribed the creation of the world, and the legiſlature of the Jews, to a created being, who derived from the Supreme God extraordinary virtues and powers, but afterwards became apoſtate and degraded. He ſuppoſed that *Jeſus* was a mere man, born of Joſeph and Mary; but that, in his baptiſm, *Chriſt*, who was one of the *Æons*, deſcended upon him in the form of a dove; and that he was commiſſioned to oppoſe the degenerate God of the Jews, and to deſtroy his empire. In conſequence of which, by his inſtigation, the man *Jeſus* was ſeized and crucified; but *Chriſt* aſcended up on high, without ſuffering at all. He recommended to his followers the worſhip of the Supreme God in conjunction with his Son; he required them to abandon the lawgiver of the Jews; and, though they were permitted to retain a part of the Moſaic law, yet they were to make the precepts of *Chriſt* the rule of their conduct. For their encouragement, he promiſed them the reſurrection of the body; after which the millennium was to commence, under the government of *Chriſt* united to the man *Jeſus:* and this he repreſented as conſiſting in eating and drinking, nuptial entertainments, and other feſtivities.

Some authors aſcribe the book of the Apocalypſe to *Cerinthus*; adding, that he put it off under the name of St. John, the better to authoriſe his reveries touching Chriſt's reign in the fleſh: but it is juſtly obſerved by the Biſhop of London, in his third Paſtoral Letter, p. 58, that his millenary ſtate was not the life of ſaints, as the Apocalypſe repreſents it, but the life of libertines: and it is even certain he publiſhed ſome works of this kind, under the title of Apocalypſes.

St. Epiphanius obſerves, that when a *Cerinthian* died without baptiſm, another perſon was baptiſed in his ſtead.

They received the Goſpel of St. Matthew, to countenance their doctrine of circumciſion, from Chriſt's being circumciſed; but they omitted the genealogy. And they diſcarded the Epiſtles of St. Paul, becauſe that apoſtle held circumciſion aboliſhed.

CERITES, the *wax-ſtone*, a name uſed by ſome old authors for that yellow agate uſually called CERACHATES.

CERNUA, in *Ichthyography*, the name of a ſmall freſh-water fiſh; called by others the *aurata*, *aſpredo*, and *perca minor*, or *ſmall pearch*; and in Engliſh, the RUFFE. It is very much of the ſhape and figure of the common pearch; ſeldom, at its utmoſt growth, being known to exceed ſix inches: and it differs in this alſo, that it has none of thoſe black tranſverſe lines with which the back and ſides of the common pearch are variegated It is caught in many of our rivers; as the Yare at Norwich, &c. See alſo ORPHEUS.

CEROCHYTOS, in *Antiquity*, a method of painting in wax, melted and coloured with pigments for the purpoſe, and applied with pencils.

The word is compounded of *κηρος*, *cero*, *wax*, and *χύω*, *fundo*, *I melt down.* Plin. Hiſt. Nat. lib. xxxv. cap. 11. and lib. xxi. cap. 14.

CEROMA, originally denoted a mixture of oil and wax, with which the ancient wreſtlers rubbed themſelves, not only to make their limbs more ſleek, and leſs capable of being laid hold of, but more pliable, and fit for exerciſe.

The name *ceroma* is ſometimes applied by ancient phyſicians to a cerate or cerecloth.

The champions ready to engage in the *palæſtra* having ſtripped themſelves naked, were firſt anointed with oil, then ſtrewed over with duſt, to which was laſtly added wax. From the laſt ingredient, this compoſition was denominated *ceroma*; from *cera*, *wax*.

CEROMANTIA, an ancient method of DIVINATION, by means of wax melted over a veſſel of water, and let drop in three diſtinct ſpaces; obſerving the figure, ſituation, diſtance, and concretion of the drops.

CEROPEGIA, in *Botany*, a genus of the *pentandria monogynia* claſs. The flower conſiſts of a ſingle petal; it has two ſmall erect leaves, plumoſe ſeeds, and the limb of the corolla is connivent.

CEROSTROTUM, in *Ancient Writers*, denotes a ſort of picture compoſed of pieces of horn; anſwering to what among us is called MOSAIC *work*.

Some write the word *ceroſtratum*, and ſuppoſe it primarily to denote a ſort of pavement compoſed of pieces of wood, inlaid and joined with ſlips of horns, variouſly coloured and figured.

Salmaſius will have *ceroſtrata* to denote a method of painting, or enamelling with wax, otherwiſe called CEROCHYTOS.

CERPASUS, in *Natural Hiſtory*, a name given by Uranius to a poiſonous drug of the Abyſſines; probably the ſame with the *carpaſus* of the Greeks.

CERRUS, in *Botany*, a name given by many authors to the *ægilops*, or bitter oak; or oak that has large acorns, and a prickly cup.

CERRUS, in *Ichthyology*, a name given by ſome of the old writers, Pliny, Martial, and others, to the fiſh called by the generality of writers *ſmaris*, by ſome *mæna candida*. It is of the SPARUS kind, according to the Artedian ſyſtem, and is diſtinguiſhed from the other fiſhes of that genus by its having a black ſpot in the middle of each ſide, and the pectoral and tail fins red.

CERTHIA, in *Zoology*. See CREEPER.

CERTIFICANDO *de recognitione ſtapulæ*, is a writ commanding the mayor of the ſtaple to certify to the lord chancellor a ſtatute ſtaple taken before him, where the party himſelf detains it, and refuſeth to bring in the ſame. Reg. Orig. 152. There is the like writ to certify a ſtatute merchant; and in divers other caſes. Ib. 148. 151, &c.

CERTIFICATE, a teſtimony given in writing, to aſſure and notify the truth of any thing to a court of juſtice, or the like. See TESTIMONIAL.

CERTIFICATE *of coſts*, in *Law*, relates to the caſe of a plaintiff, who, in an action of treſpaſs, is allowed no more coſts than damages, when the jury give leſs damages than 40*s.* unleſs the judge certify under his hand that the freehold or title of the land came chiefly in queſtion. To this rule there are two exceptions: the one is grounded on ſtat. 8 and 9 W. III. c. 11. whereby the plaintiff obtains full coſts, if the judge certify that the treſpaſs was wilful and malicious. The other exception is by ſtat. 4 and 5 W. and M. c. 23. which gives full coſts againſt any inferior tradeſman, apprentice, or other diſſolute perſon, who is convicted of a treſpaſs in hawking, hunting, fiſhing, or fowling upon another's land. Blackſt. Com. vol. iii. p. 214.

CERTIFICATE *into Chancery*. See CASE *ſtated*, &c.

CERTIFICATE *of Bankrupt*, is a declaration in his favour, written and ſigned by four parts in five of his creditors (thoſe under 20*l.* excepted), and authenticated under the hands and ſeals of the commiſſioners, and by them tranſmitted to the lord chancellor. The *certificate* is allowed of courſe, if no cauſe be ſhewn to the contrary; in conſequence of which, the bankrupt is entitled to a decent allowance out of his effects for his future maintenance. If they do not amount to 10*s.* in the pound, he is left to the diſcretion of the commiſſioners, who are to allow him any ſum not exceeding *three per cent*; if they pay 10*s.* in the pound, he is to be allowed *five per cent*; if 12*s.* 6*d.* *ſeven and a half per cent.* if 15*s.* *ten per cent.* provided the allowance does not in the firſt caſe exceed 200*l.* in the ſecond, 250*l.* and in the third, 300*l.*

He is likewiſe diſcharged hereby from all debts owing at the time of his bankruptcy. However, he has no title to theſe advantages, if he conceals a fictitious debt produced by any creditor; if he has given above 100*l.* for a marriage portion to any of his children, unleſs at that time he had ſufficient to pay his debts; if he has loſt at any one time 5*l.* or in the whole 100*l.* within a twelvemonth before by gaming, or loſt to the value of 100*l.* by ſtock-jobbing. Perſons who are thus cleared, and become bankrupts again, unleſs they pay 15*s.* in the pound, are indemnified hereby only from bodily confinement; any future eſtate remaining liable to their creditors.

CERTIFICATE *of the Poor*, is an acknowledgment from the pariſh to which they belong of their being pariſhioners; which prevents their removal till they become actually chargeable. Such *certificated* perſons can obtain a ſettlement, only by renting a tenement of 10*l.* per annum, or by ſerving an annual office in the pariſh in conſequence of a legal appointment; but no apprentice or ſervant of ſuch perſons can gain a ſettlement.

CERTIFICATE, *trial by*, is a mode of trial allowed in ſuch caſes, where the evidence of the perſon certifying is the only proper criterion of the point in diſpute. Blackſt. Com. vol. iii. p. 333, &c.

CERTIFICATION *of aſſiſe of novel diſſeiſin*, is a writ granted for re-examining a matter paſſed by aſſiſe before juſtices. It is uſed where a perſon appears by his bailiff to an aſſiſe, brought by another, and has loſt the cauſe.

CERTIORARI, or CERTIORARI FACIAS, in *Law*, a writ iſſuing out of the chancery to an inferior court, to call up the records of a cauſe there depending, that juſtice may be done therein, upon complaint that the party who ſeeks the ſaid writ, hath received hard uſage, or is not like to have an impartial trial in the ſaid court. Fitz. N. B. fol. 242. This writ is either returnable in the king's bench, and then hath theſe words, *nobis mittatis*; or in the common bench, and then hath *juſticiariis noſtris de banco*; or in the chancery, and then it has *in cancellaria noſtra*; or into the court of parliament, or into that of the lord high ſteward of Great Britain, in caſe of indictments againſt a peer.

Indictments from inferior courts, and proceedings of the quarter ſeſſions of the peace, &c. may be removed into B. R. by *certiorari*: and it is ſaid a *certiorari* to remove an indictment is good, although it bear date before the taking thereof.

CERTITUDE, is properly a quality of the judgment, importing an adheſion of the mind to the propoſition we affirm, or the ſtrength wherewith we adhere to it.

Certitude is of the ſame nature with the evidence that produces it: the evidence is in the things that the mind ſees and conſiders, i. e. in the ideas: *certitude* is in the judgment the mind makes of thoſe ideas.

The ſchoolmen diſtinguiſh two kinds of *certitude*: the one of *ſpeculation*, ariſing from the evidence of the thing; the other of *adheſion*, which ariſes from the importance thereof: this laſt they apply to matters of faith.

Further, the ſchools diſtinguiſh three other kinds of *certitude*, with regard to the three different kinds of evidence whence they ariſe.

CERTITUDE, *metaphyſical*, is that ariſing from a metaphyſical evidence: ſuch is that a geometrician has of the truth of this propoſition, "That the three angles of a triangle "are equal to two right ones."

CERTITUDE, *phyſical*, is that ariſing from phyſical evidence: ſuch is that a man has, that there is fire on his hand, when he ſees it blaze, and feels it burn.

CERTITUDE, *moral*, is that founded on moral evidence: ſuch is that a perſon has, that he has got, or loſt a cauſe, when his attorney and friends ſend him an expreſs notice of it, or a copy of the judgment, &c.

Moral certitude is frequently equivalent to metaphyſical *certitude*. Thus a criminal who hears the ſentence read, frequently makes no doubt either of his condemnation or execution; and yet has nothing, here, beyond a moral *certitude*; for metaphyſical *certitude* he has none: neither has he any phyſical *certitude*, except as to what relates to the reading of the ſentence, and the action of the executioner, when he takes him into his poſſeſſion.

In the Philoſophical Tranſactions, we have an algebraic calculation of the degrees of moral *certitude*, ariſing from human teſtimony in all its caſes; whether immediate, mediate, concurring, oral, or written.

The author thereof ſhews, that if the report paſs through ſeveral reporters hands before it arrive, each conveying $\frac{5}{6}$ of *certitude*; after twelve tranſmiſſions, it will only be an equal lay, whether it be true or not: if the proportion of *certitude* be fixed at $\frac{100}{101}$, it will come to half from the 70th hand; if at $\frac{1000}{1001}$, from the 695th hand.

For concurring evidences, if two reporters have each $\frac{5}{6}$ of certainty, they will both give an aſſurance of $\frac{35}{36}$, or of 35 to 1; if three, of $\frac{215}{216}$: and the co-atteſtation of ten would give $\frac{1023}{1024}$, of certainty. He ſhews, farther, that if there be ſix particulars in a narrative, all equally remarkable; and that he to whom the report is given has $\frac{5}{6}$ of *certitude* for the whole; there is 35 to 1 againſt the failure in any one certain particular.

He proceeds to compute the certainty of tradition, both oral and written, in whole and part; ſucceſſively tranſſmitted, and alſo co-atteſted by ſeveral ſucceſſors of tranſmittents.

See alſo an ingenious argument, deduced from the doctrine of chances, and applied to enforce the practice of virtue, in the Concluſion to Dr. Price's Review of the principal Queſtions in Morals.

CERT-MONEY, *Head-money*, a common fine, paid yearly by the reſiants of ſeveral manors to the lords thereof; and ſometimes to the hundred, *pro certo letæ*, for the certain keeping of the leet.—This, in ancient records, is called *certum letæ*.

CERVI *Cornu*. See *Hart's* Horn.

CERVICAL *Nerves*, are ſeven pair of nerves, ſo called, as having their origin in the *cervix*, or neck.—See *Tab. Anat.* (*Oſteol.*) *fig.* 6. *lit. dd*.

They are thus called from *cervix*, *neck*.

The firſt pair ariſes between the firſt and ſecond *vertebræ* of the neck; and, contrary to the reſt, comes out before and behind: whereas the other ſix pair come out laterally from the junctures of the *vertebræ*, through particular perforations: this firſt pair goes to the muſcles of the head and ear. The ſecond pair, according to Dr. Willis, contributes the main branch towards the formation of the diaphragmatic nerves; which, according to Vieuſſens, ſpring only from the fourth and ſixth pair. The three laſt pair, joining with the two firſt of the dorſum, or thorax, make the brachial nerves. All the *cervical nerves* ſend innumerable branches to the muſcles, and other parts of the head, neck, and ſhoulders.

Cervical *Veſſels*, among *Anatomiſts*, denote the arteries, veins, &c. which paſs through the *vertebræ* and muſcles of the neck, up to the ſkull.

CERVICALES *Deſcendentes*, a pair of muſcles, antagoniſts to the *ſacro lumbares*; coming from the third, fourth, fifth, and ſixth *vertebræ* of the neck.

Moſt authors reckon theſe, though improperly, a production and part of the *ſacro lumbus*.

CERVICARIA, in *Botany*, a term uſed by ſome authors to expreſs the *thapſia* of the ſhops, or leſſer *libanotis* of Theophraſtus.

Cervicaria is alſo a name given by ſome to the *trachelium*.

CERVICEM *flectentium primus*, in *Anatomy*, a name given by Spigelius, and ſome others, to a muſcle of the neck, called by Cowper, Winſlow. and Albinus, by a much ſhorter name, the *longus colli*.

CERVICIS *tertius*, in *Anatomy*, a name given by Fallopius and others, to a muſcle called by Albinus *tranſverſalis cervicis*; and by Winſlow, *tranſverſalis magnus*.

CERVIX, in *Anatomy*, properly denotes the hind part of the neck; as contradiſtinguiſhed from the fore part, which is called *jugulum*, or the throat.

Cervix *of the* SCAPULA, denotes the head of the ſhoulder-blade, or that upper proceſs whoſe *ſinus* receives the head of the *humerus*.

Cervix *of the Uterus*, the neck of the UTERUS, or that oblong canal, or paſſage between the internal and external orifices, which receives and incloſes the *penis* like a ſheath; whence it is alſo called VAGINA.

The *cervix uteri*, in maids, is very narrow, except in the time of the *menſes*; ſcarce wide enough to admit a gooſe's quill: its inner extremity is called *oſculum internum*, which is kept ſealed up with a kind of glutinous matter, iſſuing from the glands about it.

CERUMEN, a thick, viſcous, bitter, excrementitious humour, ſeparated from the blood by proper glands placed in the *meatus auditorius*, or outer paſſage of the EAR.

This is alſo called *cerumen aurium*; in Engliſh, EAR-*wax*. See an account of experiments on *cerumen*, to diſcover the beſt method of diſſolving it; with the cauſe of deafneſs. Lond. Medic. Obſerv. &c. vol. iv. p. 198.

It is by ſome ranked in the claſs of medicines; eſpecially that ſpecies of it obtained from the human ears, and which is uſed both internally and externally.

CERUSSE, **Ceruse**, a white calx of LEAD, uſed in painting, and coſmetics; made by calcining that metal, in the vapour of vinegar.

Ceruſſe is made of thin laminæ, or plates of lead, made up into rolls, and ſo placed as to receive and imbibe the fumes of vinegar, contained in a veſſel ſet over a moderate fire.

The laminæ are thus converted into a white ruſt; which is gathered together, and ground up with water, and formed into little cakes. Cardan ſhews how to make a ſort of *ceruſſe* of tin and urine.

Ceruſſe makes a beautiful white colour, and is much uſed by the painters, both in oil and water colours. It makes the principal ingredient in the fucus uſed by the ladies for the complexion. Taken inwardly, it is a dangerous poiſon; it ſoon ſhews its malignity, ſpoiling the breath and teeth, and haſtening wrinkles, and all the ſymptoms of old age. Even the external uſe of it as a paint or enamel, for it is ſaid that it has been ſo uſed, is attended with very diſagreeable, and, in the end, with fatal conſequences. Its effects in nervous diſorders are terrible; witneſs the caſe of Mr. Butler at Moſcow. See a curious account of it, in the Phil. Tranſ. vol. l. part i. N° 2. and vol. liv. N° 2. an. 1764.

Ceruſſe is the only white hitherto found fit for painting in oil; the diſcovery of ſome other white for this purpoſe is deſirable, not only from the faults of *ceruſſe* as a paint, but alſo from its injuring the health of its manufacturers, and producing a dreadful diſeaſe, which lead and all its preparations frequently occaſion, called the COLIC *of minerals*, or the COLIC *of painters*.

Ceruſſe, like the other preparations of lead, is drying, ſedative, and lenient; as ſuch it is employed, but only externally; it is an ingredient in many ointments, plaſters, and other pharmaceutical preparations deſigned for external maladies.

The beſt *ceruſſe* is that of Venice; but this is rare: that chiefly uſed, is either Engliſh or Dutch, both of which have more chalk in them than WHITE-*lead*; the latter, however, is the better of the two.

The manner of preparing *ceruſſe* in quantities at Venice, is deſcribed by Sir Phil. Vernatti. The plates for this purpoſe are large, and about the thickneſs of a knife's back; and rolled up, but ſo as that the ſurfaces no where touch. Each roll is put in a ſeparate pot, wherein it is upheld by a little bar from the bottom, that it may not touch the vinegar, which is alſo put into the pot, to effect the converſion. The pots are then covered with a plate of lead as cloſe as may be, and over this with a board; after which they are let down into a bed of horſe-dung, big enough to contain four hundred pots. After three weeks continuance the pots are taken up, the plates unrolled, laid on a board, and beaten with battledores till all the flakes come off; which, when they prove good, are hard, thick, and weighty; but when otherwiſe, porous and light, and ſometimes black or burned, if the dung proves not well ordered: ſometimes alſo there will be no flakes, or *ceruſſe* at all. From the beating-table it is carried to the mill, ground with water between two ſtones to an almoſt impalpable fineneſs: laſtly, it is moulded into ſmall parcels, and expoſed to the ſun to dry, and harden for uſe. Vernatti, in Phil. Tranſ. N° 138. p. 935, ſeq.

The Chineſe make an uſe of this preparation of lead, which it is eaſier to ſee the advantages of, than to comprehend the manner in which they are brought about. The China veſſels, when they have been baked and finiſhed as to the matter, and even covered with their varniſh, will yet receive into their very ſubſtance, the colours which thoſe people mix up with an addition of *ceruſſe*, and, as ſome of the old accounts ſay, of copperas and ſalt-petre; but though theſe latter ingredients had uſed to be added, the *ceruſſe* alone ſupplies their place at this time, at leaſt in very many things. It would be worth while to try an admixture of *ceruſſe* with the colours uſed in painting on glaſs; and this, after a ſecond baking, might perhaps be found to incorporate itſelf in the ſame manner that it does into China ware, and recover the long ſecret of letting in the ſtrongeſt colours, without hurting the tranſparence.

Cerusse *of antimony*. See Antimony.

CERVULA, or **Cervulus**, in *Middle Age Writers*, a kind of ſport, celebrated by pagans, and after their example by the Chriſtians, on New-Year's Day; when they run about in maſquerade, dreſſed in imitation of deer, and other beaſts. We find divers cenſures of the fathers, and decrees of councils againſt the obſervance of this ceremony. Even litanies were compoſed, and faſting preſcribed, for that day, *ad calcandum gentilium conſuetudinem*. Du-Cange.

CERVUS. See Stag.

Cervus *volans*, in *Natural Hiſtory*, a name given by authors to the ſtag-fly, or ſtag-horned beetle, a very large ſpecies of beetle with horns ſloped, and ſomewhat like thoſe of a ſtag. It is of a blackiſh colour, and its horns are uſually of the ſame colour; though in ſome of a purpliſh caſt, and in ſome few they have been found of the colour of red coral. They are an inch and half, or more, in length, when full grown.

This is the kind of ſtag-beetle uſually found in Eſſex, and ſome other counties; but beſide this we have another ſpecies, which is produced of a hexapode worm, frequently found in old wood. This ſpecies is of a deeper black than the former, and its horns ſend out only one branch.

CERYX, in *Natural Hiſtory*, a name by which Pliny, and other old authors, have called the three genera of ſhell-fiſh, ſince diſtinguiſhed under the names of BUCCINUM, PURPURA, and MUREX. Hiſt. Nat. Eclair. p. 281.

Ceryx, in *Antiquity*. The *ceryces* were a ſort of public miniſters, appointed to proclaim, or publiſh things aloud in aſſemblies.

The *ceryx* among the Greeks, anſwered to the PRÆCO among the Romans.

Our cryers have only a ſmall part of their office and authority.

There were two kinds of *ceryces*; *civil*, and *ſacred.*

CERYCES, *civil*, thoſe appointed to call aſſemblies, and make ſilence therein; alſo to go on meſſages, and do the office of our heralds, &c.

CERYCES, *ſacred*, were a ſort of prieſts, whoſe office was to proclaim ſilence in the public games, and ſacrifices, publiſh the names of the conquerors, proclaim feaſts, and the like.

The prieſthood of the *ceryces* was annexed to a particular family, the deſcendants of Ceryx, ſon of Eumolphus. To them it alſo belonged to lead ſolemn victims to ſlaughter.

Before the ceremonies began, they called ſilence in the aſſembly, by the formula, Ευφημειτε σιγη πας εςω λεως; anſwering to the *favete linguis* of the Romans. When the ſervice was over, they diſmiſſed the people with this formula, Λαων αφεσις, *Ite miſſa eſt.*

CESAR. See CÆSAR.

CESARE, in *Logic*, a mode of ſyllogiſms in the ſecond figure, wherein the major propoſition and concluſion are univerſal negatives, and the minor an univerſal affirmative. Such is,

CE *No man who betrays his country deſerves praiſe.*
SA *Every virtuous man merits praiſe.*
RE *Therefore no man who betrays his country is virtuous.*

CESARIAN *ſection.* See CÆSARIAN *ſection.*

CESIS, in *Botany*, a name by which ſome authors expreſs the common *daucus ſylveſtris*, wild carrot, or bird's neſt.

CESPITOSE *plants*, in *Botany*, thoſe which produce many ſtems from one root.

CESSAMPELUS, in *Botany*, a name given to a hoary ſpecies of *convolvulus*. See CONVOLVULUS.

CESSATION, the act of intermitting, diſcontinuing, or interrupting the courſe of any thing, work, action, or the like.

CESSATION *of arms*, an armiſtice, or occaſional TRUCE.

When the commander of a place finds things reduced to an extremity, ſo that he muſt either ſurrender, or ſacrifice the garriſon and inhabitants to the mercy of the enemy, he plants a white flag on the breach, or beats the chamade; on which a *ceſſation* of arms, and hoſtilities, takes place, to give opportunity for CAPITULATION.

CESSATION, *Ceſſatio à divinis*, in the *Romiſh Church*, is a penalty inflicted for any notorious injury to the church, by putting a ſtop to all divine offices, and the adminiſtration of the ſacraments, and by depriving Chriſtians of church-burial.

CESSAVIT, a writ which lies in divers caſes; upon this general ground, that he againſt whom it is brought, has for two years ceaſed or neglected to perform ſuch ſervice, or pay ſuch rent, as he is obliged to by his tenure; and has not upon his lands or tenements ſufficient goods or chattels to be diſtrained.

A *ceſſavit* only lies for annual ſervice, rent, and ſuch like; not for homage or fealty.—The forms and ſpecies of *ceſſavit* are various; as, *ceſſavit de cantaria*, *ceſſavit de feodifirma*, *ceſſavit per biennium.*

CESSION, in a *Legal Senſe*, an act whereby a perſon ſurrenders up, and tranſmits to another perſon, a right which belonged to himſelf.

Ceſſion is a general term; the ſpecies whereof are, a *ſurrender*, *relinquiſhment*, *transfer*, and *ſubrogation*; which ſee.

CESSION is particularly uſed in the *Civil Law*, for a voluntary and legal ſurrender of a perſon's effects to his creditors, to avoid impriſonment.

This practice ſtill obtains in France, and other countries; and is done by virtue of letters patent granted in favour of the poor and honeſt. The *ceſſion* originally carried with it a mark of infamy, and obliged the perſon to wear a green cap, or bonnet; at Lucca, an orange one: to neglect this, was to forfeit the privileges of the *ceſſion.* This was originally intended to ſignify, that the ceſſionary was become poor through his own folly.

The Italian lawyers deſcribe the ceremony of *ceſſion* to conſiſt in ſtriking the bare breech three times againſt a ſtone, called *lapis vituperii*, in the preſence of the judge. Formerly it conſiſted in giving up the girdles and keys in court; the ancients uſing to carry at their girdles the chief utenſils wherewith they got their living; as the ſcrivener his eſcritoire, the merchant his bag, &c.

The form of *ceſſion* among the ancient Romans and Gauls was as follows. The *ceſſionary* gathered up duſt in his left hand, from the four corners of the houſe; and, ſtanding on the threſhold, holding the door-poſt in his right hand, threw the duſt back over his ſhoulders; then ſtripping to his ſhirt, and quitting his girdle and bags, he jumped with a pole over a hedge; hereby letting the world know, that he had nothing left, and that when he jumped, all he was worth was in the air with him.

The judicial *ceſſion* is that which is made by a merchant or trader, who is actually kept in priſon by his creditors, and who being abſolutely incapable to ſatisfy them, petitions a court of juſtice for leave to make *ceſſion.* This judicial *ceſſion* is certainly compulſive on the part of the creditors; ſince the debtor is commonly allowed the benefit of a *ceſſion*, by an order from the judges, notwithſtanding the oppoſition made by the creditors to prevent it; which renders this *ceſſion* more infamous than that which is voluntary.

CESSION, in the *Eccleſiaſtical Law*, is one manner of vacating or voiding an eccleſiaſtical benefice.

Ceſſion is an implicit kind of reſignation, underſtood where a perſon does ſome act, or takes on himſelf ſome charge, which is inconſiſtent with his holding the benefice he was before poſſeſſed of.

By the ſtatute, if a clerk have one benefice of 8*l.* per annum value in the king's books, and takes another, of what value ſoever, with cure of ſouls, and without diſpenſation; the former living is, *ipſo facto*, void: and this kind of voidance of a living is called *ceſſion.*

What is called *ceſſion* in other benefices, is called *conſecration* in relation to a biſhoprick; for if an incumbent be made a biſhop, his benefice is ſaid to be *void by conſecration.*

CESSIONARY, a BANKRUPT. Sometimes it denotes an ASSIGNEE.

CESSOR, in *Law*, one dilatory, and delinquent in his duty, or ſervice; and who thereby incurs the danger of the law, and is liable to have the writ *ceſſavit* brought againſt him.

When it is ſaid, *the tenant ceſſeth*, it is meant, he ceaſeth to do his duty, or ſervice, to which he is bound.

CESTRATUM, a work enamelled, or painted with a ceſtron. The word is alſo written CEROSTROTUM and *ceroſtratum.*

CESTREUS, in *Zoology*, the name of a fiſh of the mullet kind, but having a much ſmaller and narrower head, and its ſides variegated with much ſhorter longitudinal lines. It is eaten in many places, but is accounted much inferior to the mullet. See MULLET.

CESTRON, in *Antiquity*, the inſtrument wherewith they painted, or enamelled, in horn, or ivory.

CESTROPHENDONA, in the *Ancient Military Art*, a compound kind of dart, or miſſive weapon, balanced with feathers like an arrow, and caſt by a large ſling; uſed chiefly by the Macedonians, in their wars under Perſeus, with the Romans.

The word is compoſed of κεςρος, a ſort of dart called by the Latins *tragula*, and σφενδονη, *funda, a ſling.* Liv. lib. xl. p. 65.

CESTRUM, in *Botany.* See *Baſtard* JASMINE.

CESTRUM, in the *Materia Medica of the Ancients*, a name given to a plant often mentioned, but very ill explained to us by the generality of writers.

CESTUI, a French term, literally ſignifying *he*, or *him*; frequently uſed in our law writings. Thus,

CESTUI *qui truſt*, is he who has lands in truſt, &c. committed to another for his benefit.

CESTUI *qui vie*, one for whoſe life any lands or tenements are granted.

CESTUI *qui uſe*, he to whoſe uſe another man is infeoffed in land or tenements.

CESTUS, among *Ancient Poets*, a fine embroidered girdle worn by Venus, endowed with a faculty of charming, and conciliating love.

The word is alſo written *ceſtum*, and *ceſton*: it comes from κεςος, *a girdle*, or other thing embroidered, or wrought with a needle; derived, according to Servius, from κεντειν, *pungere*: whence alſo *inceſtus*; a term uſed at firſt for any indecency by undoing the girdle, &c. but now reſtrained to that between perſons near akin. See INCEST.

CESTUS, in *Antiquity.* See CÆSTUS.

CESURE, or CÆSURA, in *Poetry.* See CÆSURA.

CETACEOUS, in *Natural Hiſtory*, a term applied to all large ſea-fiſhes, and beaſts, which bear a reſemblance to the WHALE.

The word is formed of *cetus*, *a whale.*

Cetaceous, in a proper ſenſe, denotes only thoſe large fiſh which are viviparous, or breed their young within their own bodies; and have no gills, but lungs, with which they breathe like quadrupeds; having but one pair of fins, and giving ſuck to their young. Hought. Collect. N° 531. tom. iii. p. 272, & ſeq.

Theſe ſcarce differ in any thing from quadrupeds, except the want of feet. They have no AIR-*bladder*; but are enabled by the air they receive into the lungs in reſpiration, to render their bodies equiponderant to water. *Cetaceous*, in the ordinary uſe, is extended to all larger fiſh, called by the Latins *belluæ marinæ*, or ſea-beaſts.

In which view, *cetaceous* fiſhes are divided into *greater*, including the whale kind, properly ſo called; and *leſſer*, to which belong the porpoiſe, ſhark, dog-fiſh, &c. Theſe latter are more properly called *cartilaginous* fiſhes.

The ſea-fox is ranked by authors in the claſs of *cetaceous cartilaginous* fiſhes, not flat, called alſo GALEOLÆ; whoſe ſpecific difference conſiſts in this, that they have two livers, five gills, or *branchiæ*, on each ſide, and tufts hanging from the fins, which in the males are under the belly on each ſide the navel.

Of the *cetaceous* kind, properly ſo called, there are divers ſpecies: ſome without teeth, or tube to caſt up water; others with teeth and a water-tube; and others with a large long horn.

The horn uſually called the *unicorn's horn*, is found to be the tooth of a *cetaceous* fiſh in the icy ſea, called *narval*.

CETERACH, in *Botany*, an officinal, agglutinant plant; the ſame with what is otherwiſe denominated *aſplenium* and *ſcolopendrium*.

This plant ſtands recommended as an excellent diuretic, and a promoter of the *menſes*. The whole plant is to be uſed, and ſhould be gathered in the month of September. It is given by ſome in jaundices, in quartan agues, and in obſtructions of the ſpleen; but it is much neglected in the preſent practice. In ſome parts of Eſſex, where it is common on the walls of their churches, and on the tombs in the church-yards, the common people tell us wonders of its effects in the ſtone.

CETERIS *paribus*. See CÆTERIS *paribus*.

CETRA, in *Antiquity*, a ſmall leathern ſhield, uſed by the ancient Spaniards, Moors, and even Britons.

The African *cetræ* are ſaid by Pliny to have been impenetrable, and made of elephants ſkins.

The *cetra* was much the ſame with the PELTA. Whence Livy calls the Macedonians *peltaſtæ*, *cetrati*.

CETUS, in *Aſtronomy*, the *Whale*; a large conſtellation of the ſouthern hemiſphere, under Piſces, and next the water of Aquarius.

The ſtars in the conſtellation *Cetus*, in Ptolemy's Catalogue, are twenty-two; in Tycho's, twenty-one; in Hevelius's, forty-five; in the Britannic Catalogue, ninety-ſeven. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

In the mandible of *Cetus* is a variable ſtar, which appears and diſappears periodically, paſſing through the ſeveral degrees of magnitude, both increaſing and diminiſhing, in about 333 days. Hevel. in Phil. Tranſ. N° 66. p. 2028. Marald. in Mem. Acad. Scienc. an. 1719. p. 122, ſeq.

CETUS, in *Zoology*. See WHALE.

CEVADILLA, in *Botany*, a name uſed by ſome authors for the *hordeum cauſticum Indicum*, or Indian cauſtic barley.

CEURAWATH, the name of a particular ſect of Banians in the Eaſt Indies, who hold the metempſychoſis with ſo much ſuperſtition, that they will not kill the leaſt inſect: their prieſts carry a piece of linen over their mouth, that no flies may enter. All the other ſects of Banians have an averſion for this; and continually exhort their auditors to ſhun all diſcourſe and converſation with them. See Banians.

CHA, in *Commerce*, a ſilk ſtuff very thin and light, made in China, which moſt commonly ſerves the inhabitants for a ſummer dreſs; it is ſomewhat like our taffeties or luſtrings.

CHAA, in *Botany*, a name given by ſome authors to the tea-tree.

CHABNAM, or Rosee, in *Commerce*, a kind of muſlin or cotton linen, very clear and fine: it comes from the Eaſt Indies, particularly from Bengal.

CHACE. See Chase.

CHACING. See Chasing.

CHACK, in the *Manege*, is taken in the ſame ſenſe, as *beat upon the hand*; it is applied to a horſe when his head is not ſteady, but he toſſes up his noſe, and ſhakes it all of a ſudden, to avoid the ſubjection of the bridle. Turkiſh horſes have this fault frequently. We ſay, they beat upon the hand; and neither the beſt bits, nor the beſt hand, can ever fix their heads. Croats, or Croatian horſes, are alſo ſubject to *chack* upon the hand; which proceeds from this, that their bars are too ſharp and ridged, or edged, ſo that they cannot bear the preſſure of a bit, though ever ſo gentle. If a horſe had not too ſenſible, or too tender a mouth, he would not beat upon the hand: but in order to fix and ſecure his head, you need only to put under his noſe-band a ſmall flat band of iron, bent archwiſe, which anſwers to a martingale. This will hinder him to beat upon the hand, but will not break him of the habit; for as ſoon as the martingale is taken off, he will fall into the ſame vice again.

CHACOON, or Chacone, a kind of dance, in manner of a ſaraband borrowed from the Spaniards, and by them from the Moors. The baſs always conſiſts of four notes, with three crotchets in a bar, which proceed in conjunct degrees: and whereon they make divers concords and couplets, with the ſame burden.

The word is formed of the Spaniſh *chacona*, which may probably be derived from the Perſian *ſhack*, *a king*, thus intimating that this might have been a royal dance; not, as others pretend, from the Italian *Gecone*, a blind man, the inventor.

CHADCHOD, in *Jewiſh Antiquity*. Ezekiel mentions *chadchod* among the ſeveral merchandizes which were brought to Tyre. The old interpreters not very well knowing the meaning of this term, continued it in their tranſlation. St. Jerom acknowleges that he could not diſcover the ſignification of it. The Chaldee interprets it pearls; others think that the onyx, ruby, carbuncle, cryſtal, or diamond is meant by it. Ezek. chap. xxvii. ver. 16. Calmet. Dict. Bibl. in voc.

CHÆLÆ *cancrorum*. See Crabs *claws*.

CHÆROPHYLLUM, in *Botany*. See Chervil.

CHÆRUS, in *Ichthyology*, a name given by Strabo, and ſome other of the old Greek writers, to the fiſh we now call the *capriſcus*. Rondeletius and Salvian were the firſt who properly deſcribed this fiſh. See Goat-*fiſh*.

CHÆTIA, in *Zoology*, the name of a ſpecies of inſects of the *apteria* kind, without any viſible limbs.

The *chætia* reſembles a hair, or a piece of fine thread; its ſurface is ſmooth, its body rounded, and very ſlender. It is called in Engliſh the hair-worm. Hill's Hiſt. Anim. p. 14.

CHÆTODON, in *Ichthyology*, the name of a genus of the *acanthopterygious* or *thoracic* fiſhes; the characters of which are theſe: the branchioſtege membrane on each ſide contains five or ſix ſmall bones: the body is compreſſed, broad, thin, and ſhort: the back has but one fin, which reaches all along it: the tail is large, and there are in all ſix fins beſide it: the mouth is ſmall, the lips may be opened and extended, but naturally they cover a part of the teeth: the teeth in the jaws are oblong, contiguous to each other, and flexile: the ſcales are rough; and the eyes are not covered with the ſkin of the head. There are ſeveral ſpecies.

The name is derived from χαιτα, *a thin filament*, and οδους, *a tooth*; and expreſſes that the teeth may be divided into thin and fine filaments, reſembling briſtles.

CHAFE, or Chafing *of a rope*, in *Sea-Language*, is ſaid of a rope that is galled or fretted, or when the rope runs againſt any thing.

The cable is chafed in the hawſe, ſignifies that it is fretted or begun to be worn out there.

Chafe-*Wax*, or Chaufee-*Wax*, an officer in chancery, whoſe buſineſs is to fit the wax for the ſealing of writs, patents, and other inſtruments iſſued thence.

CHAFF, in *Huſbandry*, the huſks of the corn, ſeparated by ſcreening or winnowing it. It ſignifies alſo the rind of corn; and ſtraw cut ſmall for the uſe of cattle.

CHAFFER, in *Zoology*, a ſpecies of beetle. See Scarabæus.

CHAFFERCONNERS, in *Commerce*, printed linens manufactured in the Great Mogul's dominions. They are imported by the way of Surat; and are of the number of thoſe linens prohibited in France.

CHAFFERS, in our *Statutes*, ſeem to ſignify wares or merchandize. 3 Edw. IV. c. 4.

The original French of the ſtatute is *chaffares*.

CHAFFERY, or Chafery, in the *Iron-Works*, the name of one of the two principal forges. The other is called the *finery*. When the iron has been wrought at the finery into what is called an *ancony* or ſquare maſs, hammered into a bar in its middle, but with its two ends rough, the buſineſs to be done at the *chaffery* is the reducing the whole to the ſame ſhape, by hammering down theſe rough ends to the ſhape of the middle part.

CHAFFINCH, in *Ornithology*, a ſpecies of the fringilla, with a ferruginous breaſt; the wings black, ſpotted with white.

CHAGREEN, or Chagrin, in *Commerce*. See Shagreen.

CHAIN, *Catena*, a ſeries of ſeveral rings, or links; fitted into one another.

There are *chains* of divers matters, ſizes, and forms, and for divers uſes.—Ports, rivers, ſtreets, &c. are cloſed with iron *chains*: rebellious cities are puniſhed by taking away their *chains*, and barriers.

The arms of the kingdom of Navarre are, *Chains or*, *in a field gules*. The occaſion hereof is referred to the kings of Spain leagued againſt the Moors; who having gained a celebrated victory againſt them in 1212, in the diſtribution of the ſpoils, the magnificent tent of Miralmumin fell to the king of Navarre; as being the firſt that broke and forced the *chains* thereof.

Chain, *a gold*, is one of the ornaments or badges of the dignity of a lord mayor of London; and remains to the perſon, after his being diveſted of that magiſtrature, as a mark that he has paſſed the chair.

Something like this, Chorier obſerves, obtained among the ancient Gauls: the principal ornament of their people in power and authority was a gold *chain*, which they wore on all occaſions; and even in battle, to diſtinguiſh them from the common ſoldiers. Hiſt. de Dauph. lib. iii. p. 130.

Chain alſo denotes a kind of ſtring, of twiſted wire; ſerving to hang watches, tweezer-caſes, and other valuable toys upon. The invention of this piece of curious work was owing to the Engliſh; whence, in foreign countries, it is denominated the *Engliſh chain*. It was ſome time before foreigners undertook to imitate them, and at laſt with no extraordinary ſucceſs: thoſe of Paris have come neareſt. Theſe *chains* were at firſt uſually either of ſilver or gold, ſome of gilt copper; the thread or wire of each kind muſt be very fine.

For the fabric, or making of theſe Chains; a part of the wire is folded into little links of an oval form; the longeſt diameter about three lines; the ſhorteſt, one. Theſe, after they have been exactly ſoldered, are again folded into two; and then bound together, or interwoven, by means of ſeveral other little threads of the ſame thickneſs; ſome whereof, which paſs from one end to the other, imitate the warp of a ſtuff; and the others, which paſs tranſverſe, the woof. There are at leaſt four thouſand little links in a chain of four pendants; which are, by this means, bound ſo equally, and withal ſo firmly together, that the eye is deceived, and takes the whole to conſiſt of one entire piece.

Chain is alſo a kind of meaſure in France, applied to fewel-wood, ſheaves of corn in eſtimating the tythes, hay, and horſes. Theſe meaſures are divided variouſly, according to the uſes for which they are intended.

Chain-*pump*. See Pump, and *Bur*-Pump.

Chain-*ſhot*, in *War*, two bullets, or rather half-bullets, linked together by a chain. Their uſe at ſea is to ſhoot down yards, or maſts; or to cut the rigging of a ſhip.

Chain, in *Surveying*, is a measure, conſiſting of a certain number of links of iron wire, uſually a hundred; ſerving to take the dimenſions of fields, &c.

This is what Merſenne takes to be the *arvipendium* of the ancients.

The *chain* is of various dimenſions, as the length or number of links varies: that commonly uſed in meaſuring land, called *Gunter's chain*, is in length four poles or perches; or ſixty-ſix feet, or a hundred links; each link being ſeven inches $\frac{92}{100}$. Whence it is eaſy to reduce any number of thoſe links to feet, or any number of feet to links.

This *chain* is entirely adapted to Engliſh meaſures; and its chief convenience is in finding readily the numbers contained in a given field. Where the proportions of ſquare feet and acres differ, the *chain* to have the ſame advantages as Gunter's *chain*, muſt alſo be varied. Thus in Scotland, the *chain* ought to be of 74 feet, or 24 Scotch ells, if no regard be had to the difference between the Scotch and Engliſh foot; but if regard be had to this difference, the Scotch *chain* ought to conſiſt of $74\frac{2}{3}$ Engliſh feet, or 74 feet 4 inches, and $\frac{4}{5}$ of an inch. This *chain* being divided into a hundred links, each of theſe will be $8\frac{928}{1000}$ inches. See Foot and Acre.

That ordinarily uſed for large diſtances, is in length a hundred feet; each link one foot.

For ſmall parcels, as gardens, &c. is ſometimes uſed a ſmall *chain* of one pole, or ſixteen feet and a half length; each link one inch $\frac{98}{100}$.

Some in lieu of *chains* uſe ropes; but theſe are liable to ſeveral irregularities; both from the different degrees of moiſture, and of the force which ſtretches them. Schwenterus, in his Practical Geometry, tells us, he has obſerved a rope ſixteen feet long, reduced to fifteen in an hour's time, by the mere falling of a hoar froſt. To obviate theſe inconveniences, Wolfius directs, that the little ſtrands whereof the rope conſiſts be twiſted contrary ways, and the rope dipped in boiling hot oil; and when dry, drawn through melted wax. A rope thus prepared, will not get or loſe any thing in length, even though kept under water all day.

Uſe of the Chain *in Surveying.*—The manner of applying the *chain* in meaſuring lengths, is too popular to need deſcription. In entering down the dimenſions taken by the *chain*, the *chains* and links are ſeparated by a dot; the former being integers, and the latter decimals: thus a line ſixty-three *chains* fifty-five links long, is written 63.55. If the links be ſhort of ten, a cypher is prefixed, thus 10 *chains*, 8 links, are written 10.08.

To find the area of a field, &c. the dimenſions whereof are given in Chains *and links.* 1ſt, Multiply the lines by one another, according to the rules referred to under Area; and from the product cut off five figures towards the right; which is nothing more than dividing by 100000, the number of ſquare links in an acre: thoſe remaining on the left will be acres. 2dly, Multiply the five figures cut off by four, the number of roods in an acre; and cutting off five again from the product on the right, thoſe remaining on the left will be roods. Laſtly, Multiply the five thus cut off by forty, the fourth part of the ſquare perches in an acre; and cutting off five, as before, on the right, thoſe remaining on the left are ſquare perches.

To take an angle DAE *(Tab. Surveying, fig. 1.) by the* Chain. Meaſure a ſmall diſtance from the vertex A along each leg, v. g. to *d* and *c*; then meaſure the diſtance *dc*: to lay this down, draw AE at pleaſure, and from your ſcale ſet off the diſtance meaſured on it. See Scale.

Then, taking in your compaſſes the length meaſured on the other ſide, on the vertex A, as a center, deſcribe an arch *dc*; and on the point *c*, as a center, with the meaſured diſtance of *cd*, deſcribe another arch *ab*. Through the point where this interſects the former arch, draw a line AD. So is the angle plotted; and its quantity, if required, may be meaſured on a line of chords. See Chord.

To take the plan or plot of any place, as ABCDE *(fig. 2.) by the* Chain. Draw a rough ſketch of the place by the eye; and meaſuring the ſeveral ſides AB, BC, CD, DE, enter down the lengths on the reſpective lines: then if the plan be to be taken within-ſide of the place, inſtead of meaſuring the angles, as before, meaſure the diagonals AD, BD. Thus will the figure be reduced into three triangles, whoſe ſides are all known, as in the former caſe; and may be laid down on paper, according to the method above.

If the plan be to be taken without-ſide the place, the angles muſt be taken thus; v. g. for the angle BCD, produce the lines BC and CD to any certain equal diſtance, v. g. to *a* and *b*, five *chains*: and meaſure the diſtance of *ab*. Thus have you an iſoſceles triangle C*ab*, wherein the angle $aCb = BCD$ its oppoſite one is had: thus is the quantity of BCD found, and the angle laid down as before.

By the Chain *to find the diſtance between two objects inacceſſible in reſpect of each other.* From ſome place, as C *(fig. 3.)*, whence the common diſtance to each object A and B, is acceſſible in a right line; meaſure the diſtance CA, which ſuppoſe fifty *chains*; and continue the line to D, viz. fifty more: meaſure alſo BC, which ſuppoſe thirty *chains*; and produce the line to E, viz. thirty more. Thus will be formed the triangle CDE, equal and ſimilar to the triangle ABC; conſequently the diſtance DE, being meaſured, will give the inacceſſible diſtance required.

By the Chain *to find the diſtance of an inacceſſible object, v. g. the breadth of a river.* On one ſide place a pole, four or five feet high, perpendicularly, having a ſlit a-top, with a ſtrait piece of wire, or the like, two or three inches long, put through the ſame. This is to be ſlipped up or down, till, looking along it, you find it point full on the other ſide of the river; then turning the pole with the wire in the ſame direction, obſerve the point on the dry land, to which it points when looked along as before: meaſure the diſtance from the pole to this laſt point; it is the ſame with that of the firſt required.

Chains, *Catenæ*, in *Eccleſiaſtical Hiſtory*, denote collections of ſuch theological opinions and ſcriptural interpretations, as had been received by the ancient doctors of the church. See Catena.

Chains, *hanging in*, a kind of puniſhment inflicted on murderers. By ſtat. 25 Geo. II. c. 37. the judge ſhall direct ſuch to be executed on the next day but one, unleſs Sunday intervene; and their bodies to be delivered to the ſurgeons to be diſſected and anatomized: and he may direct them afterwards to be hung in *chains*. During the interval between ſentence and execution, the priſoner ſhall be kept alone, and ſuſtained only with bread and water. The judge, however, hath power to reſpite the execution, and relax the other reſtraints of the act. Blackſt. Com. vol. iv. p. 20.

Chains, in *Ship-building*, are thoſe irons by which the ſhrouds of the maſts are made faſt to the *chain-wales*.

Chain-wales, in a ſhip, are the broad timbers which are made projecting horizontally from her ſides, to which, with *chains*, the ſhrouds are faſtened, and by them ſpread out, the better to ſecure the maſts.

CHAIR, *Cathedra*, was anciently uſed for the pulpit, or ſuggeſtum, whence the prieſt ſpoke to the people.

It is ſtill applied to the place whence profeſſors and regents in univerſities deliver their lectures, and teach the ſciences to their pupils: thus, we ſay, the profeſſor's *chair*, the doctor's *chair*, &c.

Chair, *curule*, was an ivory ſeat placed on a car, wherein were ſeated the prime magiſtrates of Rome, and thoſe to whom the honour of a triumph had been granted.

Chair, *ſedan*, a vehicle ſupported by poles, wherein perſons are carried; borne by two men. There are two hundred *chairs* allowed by act of parliament; and no perſon is obliged to pay for a hackney-*chair*, more than the rate allowed by the act for a hackney-coach driven two third parts of the ſaid diſtance. 9 Ann. c. 23. § 8. Their number is ſince increaſed, by 10 Ann. c. 19. and 12 Geo. I. c. 12. to four hundred. See *Hackney*-Coaches.

Chair is alſo applied by the Romaniſts to certain feaſts, held anciently in commemoration of the tranſlation of the ſee, or ſeat of the vicarage of Chriſt, by St. Peter.

The *perforated chair*, wherein the new-elected pope is placed, F. Mabillon obſerves, is to be ſeen at Rome: but the origin thereof he does not attribute, as is commonly done, to the adventure of pope Joan; but ſays there is a myſtery in it; and it is intended, forſooth, to explain to the pope thoſe words of Scripture, that *God draws the poor from out of the duſt and mire.*

CHAIRMAN, the President, or ſpeaker of an aſſembly, company, &c.

We ſay, the *chairman* of a committee, &c.

CHAISE, a ſort of light open chariot, or calaſh.

Aurelius Victor relates, that Trajan firſt introduced the uſe of poſt-*chaiſes*: but the invention is generally aſcribed to Auguſtus; and was probably only improved by Trajan, and ſucceeding emperors. Goth. in Cod. Theodoſ. tom. ii. p. 506, &c.

CHALAPA, in *Botany* and the *Materia Medica*, is a name given to Jalap.

CHALASTIC *Medicines*, are ſuch as have the faculty of relaxing the parts; when, on account of their extraordinary tenſion, or ſwelling, they occaſion pain.

The word comes from χαλαω, *I relax*.

Of this kind are butter, and many oils, &c.

CHALASTICUM *ſal*, in the *Materia Medica*, a name given by ſome writers to the ſal gem.

CHALAZA, among *Naturaliſts*, a white knotty kind of ſtring at each end of an Egg, formed of a plexus of the fibres of the membranes whereby the yolk and white are connected together.

Its uſe, according to Harvey, is to be as it were the poles of this microcoſm, and the connexion of all the membranes twiſted and knit together; whereby the liquors are not only conſerved, each in its place, but alſo in its due poſition to the reſt.

Mr. Derham adds, that they alſo ſerve to keep one and the ſame part of the yolk uppermoſt, let the egg be turned which way it will; which is done by the following mechaniſm: the *chalazæ* are ſpecifically heavier than the whites wherein they ſwim; and being braced to the membrane of the yolk, a little out of the axis, they cauſe one ſide of the yolk to be heavier than the other. The yolk being thus by the *chalazæ* made buoyant, and kept ſwimming in the midſt of two whites, is by its own heavy ſide kept with the ſame ſide always uppermoſt: which uppermoſt ſide he imagines to be that whereon the cicatricula lies.

CHALAZIAS, in *Natural Hiſtory*, the name of a ſmall ſtone, deſcribed by Pliny and other ancient writers, and ſaid to have been of the ſize and colour of a common hail-ſtone, and of the hardneſs of the diamond. It was probably no other than the ſmall pebble-cryſtals of the Indies, which are at this time frequent on the ſhores of rivers there, from the bigneſs of a large pin's head to that of a pea; and as they lie in great cluſters together, without any other ſtones among them, they make a ſort of coarſe ſand, which much reſembles a cluſter of hail-ſtones.

CHALAZITES, in *Natural Hiſtory*, a name given by ſome to the *chalazias*.

CHALCANTHUM, in *Natural Hiſtory*, a name uſed by many authors to ſignify the ſubſtance called by others CHALCITIS.

Chalcanthum has been uſed as the generical name of a ſet of foſſils; the characters of which are, that they are compound or metallic ſalts, of a coarſe and irregular ſtructure, conſiderably hard, and naturally impure and opake; in which they differ from the native vitriols, which are fine, of a regular ſtructure, and naturally pure and pellucid.

CHALCANTHUM, in *Medicine*, the ſame with VITRIOL.

Some have alſo uſed *chalcanthum* corruptly for COLCOTHAR, or VITRIOL *rubified*.

CHALCANTHUM *chlorum*, in the *Materia Medica*, a name given by ſome of the old Greek writers to the *melanteria*, a yellowiſh vitriolic mineral, which turned black on being wetted with common water.

CHALCAS, in *Botany*, a genus of the *decandria monogynia* claſs: the calyx of which is ſeparated into five ſegments, and the corolla bell-ſhaped, with unguiculated petals.

CHALCEDONIUS, the name of a medicine deſcribed by Galen; and directed by him to be infuſed into the ears, in inveterate diſorders of that part.

CHALCEDONY. See CALCEDONY.

CHALCEDONY, in the *Glaſs Trade*. See GLASS-*chalcedony*.

CHALCEMBOLON, in *Antiquity*, a ſhip, the roſtrum of which was of braſs.

The word is compounded of χαλκος, *braſs*, and εμβολον, *roſtrum*.

CHALCHUS, in *Ichthyology*, a name given by the ancient Greeks to the fiſh which we call the DOREE. It ſeems to have obtained both theſe names from its colour; the one from the word *chalcos*, *braſs*; and the other from *doree*, *gilded*.

CHALCIDIC, CHALCIDICUM, or CHALCEDONIUM, in the *Ancient Architecture*, a large magnificent hall belonging to a tribunal, or court of juſtice.

Feſtus ſays, it took its name from the city Chalcis; but he does not give the reaſon. Philander will have it to be the court, or tribunal, where affairs of money and coinage were regulated; ſo called from χαλκος, *braſs*, and δικη, *juſtice*. Others ſay, the money was ſtruck in it; and derive the word from χαλκος, and οικος, *houſe*.

In Vitruvius, it is uſed for the auditory of a BASILICA: in other of the ancient writers, for a hall, or apartment, where the heathens imagined their gods to eat.

CHALCIDICA *lacerta*, in *Zoology*, a ſort of ſerpent, ſo called from its reſemblance in colour to the calcedony. Its bite is ſucceeded by a pellucid tumour, which has a kind of ſhining blackneſs at the margin. Drank in wine, it cures its own bite, according to Paulus Ægineta. It is alſo called *ſeps*.

CHALCIDICUM, in *Antiquity*, ſometimes denoted a dining-room. See CHALCIDIC.

CHALCIS, in *Ichthyology*, a name by which ſome have called the pilchard; called by others *celerinus*, and *apua membras*. See PILCHARD.

CHALCIS was alſo the name given by Ariſtotle, Ælian, Appian, and the other Greek writers, to the common herring. See CLUPEA.

CHALCITARIUM, in the *Materia Medica of the Ancients*, a name given by the Greeks of the middle ages to the *colcothar*, or *calcanthum*. Some have applied it to the CHALCITIS alone, but others make it expreſs the vitriols in general. It is derived from the Arabian word *colcothar*.

CHALCITIS, a kind of vitriolic mineral, reddiſh like copper, friable, and having yellow ſhining veins within. It has the taſte of the blue vitriol of copper, and diſſolves very eaſily in aqueous liquors. There are two other minerals, called *miſy* and *ſory*, very much like the *chalcitis*. In effect, the ancients confounded them together; and not only the miſy and ſory, but alſo the MELANTERIA; or rather, they imagined a ſucceſſive tranſmutation of the four minerals, which began with *chalcitis*, then became miſy, then melanteria, and laſtly, ſory, where it fixed.

The generality have eſteemed it one of the loſt foſſils of the ancients, though its name ſtill ſtands in the preſcription for the Venice treacle. This is, however, as erroneous an opinion as the other; the true *chalcitis* of the ancients being yet exiſtent, and in the Turkiſh dominions commonly known, and in frequent uſe as a medicine. The Turks calcine it in a ſtrong fire, and afterwards give it internally as a powerful aſtringent; and, it is ſaid, with great ſucceſs.

There is no doubt but that this is the very ſubſtance deſcribed by the ancient Greeks, under the name *chalcitis*; the deſcription of Dioſcorides perfectly agreeing with, and very well expreſſing it. He accounts it one of the more ſlightly corroſive medicines, and recommends the external uſe of it in collyriums, and in hæmorrhages, in an eryſipelas, and in the herpes. But the ancients ſeem not to have known the uſe of it internally ſo early as in theſe times; though among the Romans it was well known alſo in internal preſcription, and made an ingredient in the famous *theriaca Andromachi*.

The moderns make theſe four diſtinct matters; though the chief difference between them is ſuppoſed to lie in the different tenuity or groſſneſs of their ſubſtance.

Some ſay, the MISY is formed on the *chalcitis*, as verdegris on copper, being properly its ruſt; and that *chalcitis* is formed in the ſame manner on the SORY.

This is certain, they are all found in copper mines: but the modern druggiſts know little of any of them.

The *chalcitis* is brought from Germany: it is very cauſtic and eſcharotic. Its chief uſe is in the compoſition of Venice treacle: in lieu of it is frequently ſubſtituted chalcanthum rubified, or copperas.

Chalcitis and *colcothar* were of the ſame ſignification; they expreſſed a vitriolic mineral, which Avicenna tells us was yellow. It was a kind of what he calls *alzagiat*, or *zagi*, a word expreſſing all the vitriolic minerals in general: the other ſorts of which were, the *calcadis*, which was white; the *calcanthum*, which was green; and the SORY, which was red.

CHALCOGRAPHY, the art of ENGRAVING on copper and braſs.

CHALCOLIBANON, a word mentioned in the Apocalypſe of St. John, and very much miſunderſtood by the interpreters, who generally render it *braſs*; but the word will bear no ſuch ſignification. When the name of a metal is prefixed to ſome other word, it only denotes the thing mentioned after the metal to be of the colour of that metal. This word is formed of χαλκος, *braſs*, and *olibanum*, *frankincenſe*. We have many parallel compounds, and all underſtood in the ſame way, the name of the metal only expreſſing the thing to be of its colour: thus *chryſomela* are apples of the colour of gold; &c. This, therefore, can only ſignify frankincenſe of the colour of braſs, that is, yellow.

CHALCOMUIA, the *braſs fly*, in *Natural Hiſtory*, the name of a fly, whoſe wings are of the colour of poliſhed braſs. It is of the carnivorous kind, feeding on other flies, beetles, and on the bodies of ſerpents, when dead; whence it has been alſo called by ſome *ophioborus*; others have called it *heſycius*.

CHALCOPHTHONGUS, in *Natural Hiſtory*, a word uſed by Pliny, and other writers, as the name of a peculiar ſpecies of marble, which was very hard, and of a deep black colour, and when ſtruck upon, ſounded like braſs.

CHALCOSMARAGDUS, in *Natural Hiſtory*, a name given by the ancients to what they called a ſpecies of the emerald, found about the copper mines of the iſland of Cyprus, and of a duſky appearance, and veined with yellow.

The ancients were very indeterminate in the characters of the gems, and one or other of them have called almoſt every green ſtone in the world an emerald. This was probably only a dirty green ſpar or cryſtal tinged with copper, and ſuch as we daily find about our own copper mines.

CHALCUS, among the *Ancient Greek Phyſicians*, a weight of about two grains, the ſame as *æreolus* or *æreolum*.

CHALDEE, or CHALDAIC *Language*, that ſpoken by the Chaldeans, or people of Chaldea.

The *Chaldee* is a dialect of the Hebrew.

CHALDEE *Paraphraſe*, in the Rabbinical ſtyle, is called TARGUM.

There are three *Chaldee* paraphraſes in Walton's Polyglot; viz. that of Onkelos, that of Jonathan ſon of Uziel, and that of Jeruſalem.

CHALDRON, CHALDER, or CHAUDRON *of coals*, a dry Engliſh meaſure, conſiſting of thirty-ſix buſhels heaped up, according to the ſealed buſhel kept at Guildhall, London.

The *chaldron* ſhould weigh two thouſand pounds.—On ſhip-board, twenty-one *chaldrons* of coals are allowed to the ſcore. See Coal.

CHALEF, in the botanical writings of the ancient Arabs, the name of a tree often occurring, and ſeldom explained. The beſt account we have of the *chalef* or *chalaf*, is in the writings of Proſper Alpinus on the Egyptian plants, who tells us, that it is a kind of willow, growing in Egypt and in Meſopotamia.

CHALICE, the cup, or veſſel, uſed to adminiſter the wine in, in the euchariſt; and, by the Romaniſts, in the maſs.

Chalice, or **Cup-*ſhell***. See Shell.

CHALINOS, in *Antiquity*, the bit, or that part of a bridle which is put into the mouth of a horſe. But it was, among the ancient phyſicians, alſo uſed to expreſs that part of the cheeks, which, on each ſide, is contiguous to the angles of the mouth.

CHALIZA, in the *Jewiſh Cuſtoms*, the ceremony whereby a woman who is left a widow, pulls off her brother-in-law's ſhoes, who ſhould eſpouſe her, and by this means is allowed to be at liberty to marry whom ſhe pleaſes. The word ſignifies *extractio* vel *exuviæ*.

CHALK, a white foſſil ſubſtance, uſually reckoned a ſtone, but of the friable kind, which cannot therefore be poliſhed as marble, &c. It is found alſo in powder, and has all the properties which characterize calcareous earths: but, Dr. Slare obſerves, that, when examined by the hydroſtatical balance, it is found to want much of the weight and conſiſtence of a real ſtone: ſo that he thinks it more juſtly ranked among the earths.

This he obſerves to be the caſe, not only in *chalk*, but in various other bodies, taken for granted to be ſtones; ſome whereof are nearer to earth than ſtone; others nothing but earth, ſulphur, metal, &c.

Chalk, *alcaline* or *vulgar*, called *Creta*, from the iſland of Crete, now Candia, where the beſt was formerly found, is of two ſorts; the firſt, a hard, dry, ſtrong *chalk*, uſed for making lime: the other, a ſoft, unctuous *chalk*, uſed to manure lands.

This ſort of *chalk* uſed inſtead of marle by way of a manure, is a very fine improvement for ſome ſorts of land, eſpecially the firſt time it is laid on. It changes the very nature of the ſoil, and makes it rich for a time; but it ſoon exhauſts itſelf, and requires dunging to keep it in heart afterwards. A ſecond *chalking* will prove of very little benefit to thoſe lands which ſucceeded ever ſo well with the firſt, unleſs they have lain a long time to recover themſelves after it. It is from hence that the farmers have their trite ſaying, that *chalk* makes a rich tenant, but a poor landlord.

The beſt method therefore of uſing *chalk*, is to mix one load of it with two loads of dung or mud; this will make it not only a temporary, but a laſting advantage to the ground. It is the beſt improvement for ſour and cold lands, and is obſerved always to do moſt good to thoſe lands that lie fartheſt off from any natural beds of it; the ground near *chalk*-beds partaking of their nature, though there is no *chalk* diſtinguiſhable in them by the eye. The common method of *chalking* lands, is to lay twelve or fourteen load of *chalk* upon every acre, and this will ſometimes make the land bring very rich crops for fourteen or fifteen years together.

It is beſt to *carry the chalk upon a lay* a year or two before it is plowed up; by this means it will ſweeten the ſurface of the earth, and will not work ſo much downwards, as it will if plowed up at firſt. It makes corn yield well; and when laid upon graſs ground, it makes the graſs ſweet and rich; and cattle that feed upon it grow fat ſoon. The cows alſo that feed in theſe paſtures, are obſerved to give better milk than ordinary.

Chalk is found in large ſtrata, chiefly in the ſouth-eaſt part of Britain: ſo that if a ſtrait line was drawn on a map from Dorcheſter to the coaſt of Norfolk, it would nearly include the *chalky* ſtrata of this iſland; for no conſiderable quantity is dug beyond that line.

They have a very eaſy way of digging *chalk* in Kent. It lies on the ſides of hills, and the workman undermines it as far as he thinks proper; then digging a trench at the top, as far diſtant from the edge as the undermining goes at bottom, they fill this with water, and that ſoaks through in the ſpace of one night, and the whole flake falls down at once.

In other parts of the kingdom, *chalk* generally lies deeper, and they are often forced to dig for it in conſiderable depths, and draw it up in buckets; yet in theſe places, it ſells cheap enough at the mouth of the pit to be worth buying, even to carry a great way, for manure. See Soil.

Chalk raiſes an efferveſcence with acid liquors, and is therefore deſervedly looked upon as an alcaline or abſorbent earth. It is uſed with ſucceſs to allay the too great acidity of the juices of the ſtomach, particularly in the diſeaſe commonly called the heart-burn; as alſo in coughs ariſing from a ſharp phlegm, hæmorrhages, and is ſaid to kill worms. In a word, the property of all alcaline earths is not only to abſorb acids, but to allay the acrimony of the fluids, and eſpecially to reſtrain the violent motion of the bile, by detaining the ſalts and ſulphur thereof, in their fixed parts. Powdered *chalk* is given with milk, to prevent its growing acid on the ſtomach; and externally it is commended for drying wounds, ulcers, and fiſſures in the nipples. It is likewiſe uſed by ſugar-bakers, and in the manufacture of laſs, and other mechanical operations.

There are various kinds of *chalk*, uſually diſtinguiſhed by their different colours.

Chalk, *aſh* and *grey*. See Melia.

Chalk, *black*, a light earthy ſubſtance, of a fine black colour, compact and laminated texture, and ſmooth ſurface. It is eaſily reduced into an impalpable ſoft powder, without hurting its colour: it becomes white with a reddiſh caſt in the fire, and very friable; and it is neither diſſolved, nor loſes its colour, in acids. It ſeems to be of the ſlaty bituminous kind. This ſubſtance is uſed for drawing black lines on paper; and is in various ways very convenient for painters, both in oil and water colours. This uſeful earth is ſaid to come from Italy and Germany; but many parts of England and Wales furniſh ſubſtances nearly, if not entirely of the ſame quality, and equally ſerviceable both for marking, and as black paints. Such is the chalky ſubſtance called killow. See Lewis's Commercium Phil. Techn. p. 324.

Wallerius ſays, that in Sweden, near Huneberg, a black earth is found as diffuſible in water as Indian ink.

Chalk, *brown*. See Tripoli.

Chalk, *fungous*. See Agaric *mineral*, and Lac *lunæ*.

Chalk, *red*, an earth much uſed by painters and artificers, and common in the colour-ſhops of London, and elſewhere. It is properly an indurated clayey ochre, and is dug in Germany, Italy, Spain, and France, but in the greateſt quantity in Flanders. Its characters, by which it is diſtinguiſhed from other red earths, are theſe: it is of a fine, even, and firm texture; very heavy, and very hard; of a pale red on the outſide; but when broken, of a deep duſky chocolate colour within. It adheres firmly to the tongue, is perfectly inſipid to the taſte, and makes no efferveſcence with acids. It makes excellent crayons, but does not mix with oil. It is uſed in Germany medicinally, in hæmorrhages, dyſenteries, and other fluxes.

Chalk, *ſilver*, the Engliſh name of a kind of earth not properly a *chalk*. See Argentaria *Creta*.

Chalk, *yellow*. See Tripoli.

Chalk-*ſtones*, in *Medicine*, a term uſed for the concretions of calcareous matter in the hands and feet of people violently afflicted with the gout. Lewenhoek has been at the pains of examining theſe by the microſcope. He divides them into three parts. The firſt part is compoſed of various ſmall parcels of matter, looking like grains of white ſand: this is harder and drier, and alſo whiter than the reſt. When examined with large magnifiers, theſe are found to be compoſed of oblong particles, laid cloſely and evenly together: though the whole ſmall ſtones are opake, theſe component parts of them are pellucid, and reſemble pieces of horſe-hair cut ſhort, only that they are ſomewhat pointed at both ends. Theſe are ſo extremely thin, that Mr. Lewenhoek computes that a thouſand of them placed together would not amount to the ſize of one hair of our heads. The whole ſtones in this harder part of the *chalk*, are not compoſed of theſe particles, but there are confuſedly thrown among them ſome broken parts of other ſubſtances, and in a few places ſome globules of blood, and ſmall remains of other juices.

The ſecond kind of *chalky* matter is leſs hard and leſs white than the former, and is compoſed of fragments or irregular parts of thoſe oblong bodies which compoſe the firſt or hardeſt kind; and theſe are mixed among tough and clear matter, interſperſed with the ſmall and broken globules of blood diſcoverable in the former, but in much greater quantity.

And the third kind appears red to the naked eye, and when examined with glaſſes, is found to be a mere tough and clammy white matter, in which a great number of globules of blood are interſperſed; theſe give it the red appearance it has. Phil. Tranſ. Nº 168. p. 906. See an account of a great quantity of *chalky* matter paſſed by a gouty perſon with his urine; and obſervations on the *chalk* of the joints of ſome gouty people; in the Mem. of the A. D. S. an. 1747. H. 56. and in the Coll. Acad. P. Etr. tom. vii. p. 84.

CHALKING, in our *Old Laws*, ſeems to be ſome duty laid on merchandize; what it was particularly we do not find: but in the rolls of parliament it is ſaid, the merchants of the ſtaple require to be eaſed of divers new impoſitions, as *chalking*, ironage, wharfage, &c.

CHALLENGE, a cartel, or invitation to a DUEL, or other combat.

The word *challenge* was anciently tranſlated *calumnia*.

Challenges to fight either by word or letter, or bearing ſuch *challenges*, are puniſhable by fine and impriſonment; and if they ariſe from gaming, the offender ſhall forfeit all his goods to the crown, and be impriſoned two years. 9 Ann. cap. 14.

CHALLENGE, in *Law*, is an exception made to jurors who are returned to paſs on a trial.

Challenge to the jurors, is either made to the array, or to the poll: to the array, as when the whole number is excepted againſt, as partially impanelled. If the ſheriff be of affinity to either of the parties; or if any one or more of the jurors are returned at the nomination of either party, or for any other partiality, the array ſhall be quaſhed. To the poll, as when particulars are excepted againſt, as not indifferent.

Theſe may be *challenged*, 1. *Propter honoris reſpectum*, as when a lord of parliament is impanelled. 2. *Propter defectum*, as in the caſe of an alien born, which is defect of birth; or of a ſlave or bondman, which is defect of liberty; or in caſe of inſufficient eſtate. This latter exception has undergone ſeveral alterations by different ſtatutes; but by 4 and 5 W. and M. cap. 24. the qualification is 10*l.* *per annum* in England, and 6*l.* in Wales, either of freehold or copyhold lands; and by 3 Geo. II. cap. 25. the holder of a leaſe on life or lives, or for the term of five hundred years abſolute, of the clear yearly value of 20*l.* *per annum*, is qualified to ſerve on juries. 3. *Propter affectum*, or on ſuſpicion of partiality; and this kind of *challenge* is *principal*, or *to the favour*; in the former caſe the cauſe of ſuſpicion is obvious; and in the latter, when only ſome probable circumſtances of ſuſpicion are pleaded, which are to be determined by TRIORS. 4. *Propter delictum*, or on account of ſome crime, which diſqualifies the juror by affecting his credit, as conviction of treaſon, felony, perjury, or conſpiracy; judgment of the pillory; branding or whipping; outlawry or excommunication; attaint of falſe verdict, or forgery, &c.

Challenge to the jurors, is alſo divided into *challenge principal*, and *challenge per cauſe*; i. e. upon cauſe or reaſon alleged.

Challenge principal, otherwiſe called *challenge peremptory*, is what the law allows without cauſe alleged, or further examination: thus, a priſoner at the bar, arraigned on felony, may peremptorily *challenge* twenty, one after another, alleging no cauſe but his own diſlike; and they will be ſet aſide, and new ones choſen in their room. 22 Hen. VIII. cap. 14. and 1 and 2 Ph. and Mar. cap. 10. In caſe of high-treaſon, no *challenge peremptory* was formerly allowed; but by ſtat. 7. W. III. liberty is given *peremptorily* to *challenge* thirty-five.

Yet there ſeems to be a difference between *challenge principal* and *challenge peremptory*; the latter being only in matters criminal, and without any cauſe alleged; the former moſtly in civil caſes, and with aſſigning ſome ſuch cauſe, as being found true, the law allows; v. g. if either party allege, that one of the jurors is the ſon, brother, couſin, or tenant, of the other, the exception is good. Alſo in the plea of the death of a man, or in any action real or perſonal, where the debt or damages amount to forty ſhillings, it is a good *challenge* to a juror, that he cannot diſpend forty ſhillings *per annum* of freehold.

Challenge upon reaſon or cauſe, is when the party does allege ſome ſuch exception as is ſufficient upon acknowlegement of the truth of it; v. g. if the ſon of the juror have married the daughter of the other party, or the like.

CHALLENGE, in *Hunting*. When hounds, at firſt finding the ſcent of their game, preſently open, and cry, the huntſmen ſay, *they challenge*.

CHALYBEAT, in *Medicine*, ſomething that partakes of the nature of ſteel, or iron; or that is impregnated with particles of thoſe metals. See MINERAL *waters*, and WINE.

Chalybeats act chiefly as abſorbents, and deobſtruents. Iron, M. Lemery obſerves, is a mixture of an oily ſubſtance with a metallic matter; but the oil is predominant in the mixture; and between the parts mixed are large pores. Hence, iron becomes eaſily diſſolvable; and its oil eaſily diſengages itſelf; but when once decompounded, i. e. when once the oil is ſeparated from the pure, ferruginous, or metallic part, no diſſolvent has any effect on the *caput mortuum*.

Hence appears the abſurdity of that common practice, of calcining iron to ſuch a degree, as to convert it into what the chemiſts call a *crocus*, or ſaffron. This operation muſt of neceſſity take away all, or moſt of the oily ſubſtance, and leave nothing but the indiſſoluble *caput mortuum*. The oil here ſeparated ſhould properly have been ſeparated by the heat of the ſtomach; whence, according to Mr. Lemery, it would have carried into the blood a new ſpirituous, ſalutary juice: he obſerves alſo, that iron acts as an abſorbent, from the largeneſs of its pores, and the eaſe wherewith all kinds of ſalts, even groſs ones, inſinuate themſelves into them: even ſcorbutic acids are abſorbed thereby. Further, it is not all, that peccant acids enter iron; but in entering they alſo expel and expreſs that ſalutary juice, which is alſo put in motion, and diſpoſed to be evacuated by the natural heat. Thus is iron doubly advantageous, both by the oil it furniſhes the blood withal, and by the ſalts it frees it from. The action of the particles of a *chalybeat*, by their elaſticity, together with the *momentum* they give the blood by their ponderoſity, make it not only preferable to moſt other deobſtruents, but alſo proper in other caſes; eſpecially where there is a viſcidity of the juices; the blood depauperated, and where the circulation is languid; as in moſt hectic and hypochondriac caſes.

CHAM, or KHAN, the title given to the ſovereign princes of Tartary.

The word, in the Perſian, ſignifies *mighty lord*; in the Sclavonic, *emperor*. Sperlingius, in his Diſſertation on the Daniſh term of majeſty, *koning*, *king*, thinks the Tartarian *cham* may be well derived from it; adding, that in the North they ſay *kan*, *konnen*, *konge*, *konning*, &c. The term *cham* is alſo applied, among the Perſians, to the great lords of the court, and the governors of provinces.

CHAMA, in *Natural Hiſtory*, the name of a large genus of bivalve ſhells, the characters of which are theſe: they are uſually ſmooth, though in ſome places a little rugoſe, and have in ſome few a number of ſpines. The valves of the ſhell are equal, elate, and convex, and the mouth gaping, not cloſing faſt, and even in all parts, as in the oyſter.

The fiſh contained in this genus of ſhells, have all a hot taſte like that of pepper, and inflame the mouth in a troubleſome manner. The French have hence called them flames and *flammets*, and in ſome parts of the ſame nation they are called *lavignons* and *pelourdes*.

The ancients uſed the ſeveral ſpecies of this ſhell to engrave figures on; and as they thought proper, could give the ſeveral parts of the engraved figure the colours of the ſeveral coats of the ſhell, by cutting deeper or leſs deep into it. Thus they could give the fleſh of a man its natural white, and his garments a blue or a yellow, according to the nature of the ſpecies of *chama* they worked on. We find ſeveral of theſe antique works; and it is thought by ſome, that this was the firſt invention of that ſort of engraved gem, which we call *camea*.

The ſpecies of the *chama* are very numerous. *Tab. of Shells*, N° 18.

CHAMADE, in *War*, a certain beat of a drum, or ſound of a trumpet, which is given the enemy as a ſignal, to inform them of ſome propoſition to be made to the commander, either to capitulate, to have leave to bury their dead, make a truce, or the like.

Menage derives the word from the Italian *chiamata*, of *clamare*, *to cry*.

CHAMÆBALANUS, in *Botany*, a name given by many of the Greek authors to the apios, from its having numerous tubera among its roots, buried under the ground. Some have explained the ſame word as a name of the bulbocaſtanum, or earth-nut, but it is wrong to confound two roots of ſuch very different characters together; and it does not appear that the Greek authors of note ever uſed it in any other ſenſe but as the name of the apios. The name pſeudo-apios has indeed been given by ſome to the bulbocaſtanum roots, but it was a name founded on ignorance, and likely to produce great errors.

CHAMÆBATOS, in the *Materia Medica*, the name given by ſome to the common dewberry-buſh, or RUBUS.

CHAMÆCERASUS, in *Botany*. See HONEYSUCKLE.

CHAMÆCERASUS is alſo uſed by Dioſcorides, and ſome of the old botaniſts, for the *alkekengi*, or, as we call it, the winter-cherry. It had this name from its fruit greatly reſembling a cherry, and the plant not growing up to a tree, but riſing only a little way from the ground. Care muſt be taken in the reading the botanical writers, to diſtinguiſh when this plant is meant by the name *chamæceraſus*, and when the ſhrub.

CHAMÆCLEMA, in *Botany*, a name by which ſome authors have called the GROUND-*ivy*.

CHAMÆCRISTA, in *Botany*. See CASSIA.

CHAMÆDAPHNE, in *Botany*, a name by which Pliny, and ſome other authors, call the *vinca pervinca*, or periwinkle, and others the ſpurge-laurel.

It is alſo uſed by Columna, and ſome other authors, for the broad-leaved *ruſcus*, commonly called the Alexandrian bay, LAURUS *Alexandrina*. See BUTCHER'S BROOM.

CHAMÆDAPHNE is alſo the name given by Buxbaum to a new genus of plants, not obſerved by former botaniſts, and found frequently in boggy places, in the northern parts of the world. The flowers conſiſt of one leaf each, and are of the globoſe campaniform kind; the fruit is divided into five cells, and contains very numerous, and very ſmall ſeeds, of a roundiſh ſhape; and the whole plant, in its manner of growth, much reſembles our Solomon's ſeal. One thing very ſingular is obſerved in this plant, which is, that it retains its leaves all the winter, but ſheds them in the middle of ſummer. In the latter end of May, and beginning of June, the flowers are ſeen to wither, and at this time there ariſe a number of new ſhoots from the alæ of the lower leaves; theſe all riſe up to bear leaves, and by the middle of July are well covered with them. In the mean time the old leaves fall off, and the ſtalks of the former year are left naked, except that they have the fruit on them. The new ſhoots have, beſides leaves, the buds of the next year's flowers, and thoſe ſo perfect, that on opening them the minute parts of the ſtamina may be perceived. In Auguſt and September, when the cold comes on, the leaves become blackiſh, and the whole plant ſeems to be decaying; but in the ſucceeding ſpring, as ſoon as the ſun has appeared bright for a few days, the leaves re-aſſume their former green, the whole plant ſeems to revive, and is ſoon ſeen covered with flowers, and exhibiting a beautiful appearance. The ſtalks of the former year die down to the origin of theſe new ones; ſo that though the plant annually grows ſeveral inches in height, yet it is never the taller for its great age, as much dying of the height of a former year as is added anew for the ſucceeding one. Act. Petrop. vol. i. p. 243.

Buxbaum, who firſt deſcribed this plant, called it *chamædaphne*, the dwarf-bay, from its low ſtature, and its reſemblance to the common bay-tree in the ſhape of its leaves, which are oval and pointed. See ANDROMEDA.

CHAMÆDROPE, in *Botany*, a name given by ſome of the ancient writers to the common GERMANDER.

CHAMÆDRYS. See GERMANDER.

CHAMÆLEA, in *Botany*. See WIDOW-*wail*.

CHAMÆLEON, in *Zoology*. See CAMELEON.

CHAMÆLEON, in *Aſtronomy*. See CAMELEON.

CHAMÆLEON-*thiſtle*, in *Botany*, the name of a kind of thiſtle, of which there are two kinds deſcribed by Dioſcorides, and others of the ancient Greeks, and called the white and the black *chamæleon*-thiſtles. The white *chamæleon* is an innocent plant, its root eſculent, and a gum which exſudates from it in the hot countries, not only innocent but agreeable, the women uſing it to perfume their breath, and chewing it in their mouths as we do maſtic.

It may ſeem ſtrange to ſome to find this plant thus mentioned as a ſafe, eſculent, and uſeful one; whereas Pliny and many other writers have declared it to be a poiſon. The later authors are to be excuſed in this, as having followed Pliny. The error of this author, who has miſled the others, may be eaſily diſcovered by tracing his accounts up to the Greeks, from whom he borrowed the greater part of what we find in him, and whom he often, as in this caſe, has copied careleſsly, and tranſlated badly.

CHAMÆMORUS, in *Botany*, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of five leaves; and the fruit is compoſed of many acini, in form of the mulberry.

There is only one ſpecies of this plant known, which grows on the tops of the higheſt hills in the north part of England, but cannot be cultivated in a garden by any art.

CHAMÆNERIUM, in *Botany*. See WILLOW *Herb*.

CHAMÆPITYS, in *Botany*, *Ground-pine*, a ſpecies of GERMANDER.

CHAMÆRIPHES, in *Botany*, a name given by Pontedera to a genus of plants called by Linnæus CHAMÆROPS.

CHAMÆRODODENDROS, *Dwarf Roſe-bay*, a ſpecies of the KALMIA, according to Miller, and of the RHODODENDRON, in the Linnæan ſyſtem.

CHAMÆROPS. See *Dwarf*-PALM.

CHAMANIM, in the *Jewiſh Antiquities*, is the Hebrew name for that which the Greeks call *pyræïa*, or *pyrateria*; and St. Jerom in Leviticus has tranſlated *ſimulachra*, in Iſaiah, *delubra*. Lev. ch. xxvii. ver. 30. Iſaiah, ch. xxvii. ver. 9.

Theſe *chamanim* were, according to rabbi Solomon, idols expoſed to the ſun upon the tops of houſes. Abenezra ſays, they were portable chapels or temples, made in the form of chariots, in honour of the ſun.

What the Greeks call *pyræïa*, were temples conſecrated to the ſun and fire, wherein a perpetual fire was kept up. They were built upon eminences, and were large encloſures, without covering, where the ſun was worſhipped. Herodotus and Strabo ſpeak of them; and the *guebres* or worſhippers of fire in Perſia and the Indies have ſtill theſe *pyræïa*. Strabo ſays, that in his time there were many of theſe temples to be ſeen in Cappadocia, conſecrated to the goddeſs Anaita, and the god Homanus. Anaita is in all probability the moon, and Homanus, the ſun. Herod. lib. i. p. 87. Strab. lib. 15.

The word *chamanim* is derived from *chaman*, which ſignifies *to warm*. Calmet.

CHAMARIM, a word mentioned in ſeveral places of the Hebrew Bible, and generally tranſlated *the prieſts of the idols*, or *prieſts cloathed in black*, becauſe *chamar* ſignifies *black* or *blackneſs*.

Camar, in Arabic, ſignifies the *moon*; Iſis is the ſame deity. Grotius thinks the Roman prieſts called *camilli*, came from the Hebrew *chamarim*. They, among the heathens, who ſacrificed to the infernal gods, were dreſſed in black.

CHAMÆXYLON, in *Botany*, a name by which ſome authors have called the *gnaphalium*, or CUDWEED.

CHAMBER, in *Building*, a member of a lodging, or piece of an apartment, ordinarily intended for ſleeping in; and called by the Latins *cubiculum*.

The word comes from the Latin *camera*; and that, according to Nicod, from the Greek *καμαρα*, *vault*, or *curve*; the term *chamber* being originally confined to places arched over.

A complete apartment is to conſiſt of a hall, antechamber, *chamber*, and cabinet.

As to the proportions of *chambers*, their length ſhould be to the breadth as 1 ½ to 1, or ſome ſmall matter leſs, but ought never to exceed that proportion; and as for the height, it ſhould be three fourths of the breadth. The height of the *chambers* of the ſecond ſtory, ſhould be a twelfth part leſs than the height of thoſe below: thus, if the height of the firſt ſtory be ſixteen feet, that of the ſecond will be fourteen feet eight inches. As to the height of the third ſtory, it ſhould be only three fourths of the ſecond.

In building bed-*chambers*, regard ſhould be had as well to the ſituation of the bed, as to that of the chimney. For which reaſon, the chimney ought not to be placed juſt in the middle, but diſtant from it about two feet, or two and an half, in order to make room for the bed, which prevents this inequality from being diſcerned. See BED-*Chamber*.

CHAMBER, *privy*.—*Gentlemen of the Privy*-CHAMBER are ſervants of the king, who are to wait and attend on him and the queen at court, and in their diverſions, progreſſes, &c.

Six of theſe are appointed by the lord-chamberlain, together with a peer, and the maſter of the ceremonies, to attend all embaſſadors from crowned heads in their public entries. Their number is fifty.

Their inſtitution is owing to king Henry VII. As a ſingular mark of favour, they are impowered to execute the king's verbal command, and without producing any written order; their perſon and character being deemed ſufficient authority.

CHAMBER *in policy*, is uſed for the place where certain aſſemblies are held; alſo, for the aſſemblies themſelves.

Of theſe there are various kinds; ſome eſtabliſhed for the adminiſtration of juſtice; others for matters of commerce, &c. Of the firſt kind among us was the

Star-CHAMBER. See COURT *of Star-Chamber*.

CHAMBER, *Imperial*, is a court or juriſdiction held anciently at Spires, but ſince transferred to Wertſlar; in which are determined the differences ariſing among the princes and cities of the empire.

It was at firſt ambulatory: in 1473, it was fixed to Augſburg, then removed to Frankfort, and thence to Worms, in 1497; afterwards it was removed to Nuremberg and Ratiſbon; again to Worms and Nuremberg; and from this laſt to Eſlingen; thence, in 1527, to Spires; where Charles V. rendered it ſedentary, in 1530.

At its firſt inſtitution it conſiſted of ſixten aſſeſſors; but the reformation enſuing, occaſioned the number to be increaſed: by the treaty of Oſnabrug, in 1648, there were appointed fifty aſſeſſors; whereof twenty-four were to be proteſtants, and twenty-ſix catholics; beſides five preſidents, two of them proteſtants, the reſt catholics.

As the princes or circles of the empire are not always exact in filling up the vacancies in this *chamber*, the number of aſſeſſors is now reduced to ſixteen.

This *chamber* has a right of judging by appeal, and is the laſt reſort of all civil affairs of the ſtates and ſubjects of the empire, in the ſame manner as the Aulic council reſiding at Vienna. Proceſſes are here almoſt endleſs, on account of the infinite number of ceremonies and formalities wherewith they are embarraſſed.

The *imperial chamber* is frequently afraid to pronounce ſentence, for fear of expoſing its awards to ſome diſgrace; the princes ſometimes not permitting ſuch to be executed as diſpleaſe them.

CHAMBER *of accounts*, is a ſovereign court in France, where accounts are rendered of all the king's revenues; inventories and avowals thereof regiſtered; oaths of fidelity taken, and other things relating to the finances tranſacted. The French have alſo

CHAMBERS, *eccleſiaſtical*, which judge, by appeal, of differences ariſing on the raiſing of tythes: of theſe *eccleſiaſtical chambers* there are nine; viz. at Paris, Bourdeaux, Rouen, Lyons, Tours, Tholouſe, Bourges, Pau, and Aix: they uſually conſiſt of the archbiſhop of the place, as preſident; other archbiſhops and biſhops, a deputy of each of the dioceſes, and three counſellors of parliament. The *chamber* chooſes as many counſellors out of the clergy as it thinks proper; as alſo a promoter.

CHAMBER, *apoſtolical*, at Rome, is that wherein affairs relating to the revenues and domains of the church and the pope are tranſacted.

CHAMBER of *audiences*, or *grand* **CHAMBER**, a juriſdiction in each parliament of France.

At the firſt inſtitution of their parliaments, there were two *chambers*, and two kinds of counſellors; the one the *grand chamber* for audiences, the counſellors whereof were called *jugeurs*, who only judged; the other the *chamber of inqueſts*; the counſellors whereof were called *rapporteurs*; who only reported proceſſes by writing.

CHAMBER, *direction*, is a court inſtituted in Old Spain, for the regulation of divers affairs relating to their commerce to the Spaniſh Weſt Indies.

CHAMBER *of the edict*, or *Mi-party*, was a court eſtabliſhed by virtue of the edicts of pacification, in favour of thoſe of the reformed religion: wherein the number of judges of either religion were the ſame; and to which recourſe was had in all affairs wherein any of the proteſtants were concerned. This *chamber* is now ſuppreſſed.

CHAMBER *of London*. See CHAMBERLAIN.

CHAMBER *of aſſurance*, in France, denotes a ſociety of merchants and others, eſtabliſhed by a decree of the council of ſtate in 1668, for conducting the buſineſs of inſuring: but in Holland, it ſignifies a court of juſtice, where cauſes relating to inſurances are tried.

CHAMBER *of bookſellers*, in Paris, denotes a ſociety conſiſting of a ſyndic and aſſiſtants, elected by four delegates from the printers, and twelve from the bookſellers, whoſe buſineſs is to ſuperintend and regulate the trade of printing, and ſelling books, prints, &c. In the viſitation of books, performed by at leaſt three perſons of the ſociety, all libels againſt the honour of God, and the welfare of the ſtate, and all books printed in violation of their regulations and privileges, are ſuppreſſed.

CHAMBERS *of commerce*, are aſſemblies of merchants and dealers, where they treat about matters relating to commerce. Of theſe there are ſeveral, eſtabliſhed in moſt of the chief cities of France, by virtue of an arret of the 30th of Auguſt, 1701. Indeed there were ſome before this general eſtabliſhment, particularly one at Marſeilles, and another at Dunkirk.

CHAMBERS *of the king*, *regiæ cameræ*, in our old records, are uſed for the havens or ports of the kingdom.

CHAMBER, in *War*, is uſed for the place where the powder of a mine is lodged.

The *chamber of a mine* is a cavity of five or ſix cubic feet, generally made of a cubical form.

CHAMBER *of a mortar*, or *cannon*, is a cell, or cavity, at the bottom of the barrel, or chace, where the charge of powder is lodged.

The different form of the *chamber*, is found by experiment to have an influence on the range of the piece. A cubical *chamber* carries the ball to a leſs diſtance than a circular one; and that leſs than a cylindrical one.

Mr. Robins, apprehending that the charge of powder is inſtantaneouſly fired, concluded, that no particular form of *chambers* can be of any advantage; and this ſeems to be a juſt concluſion from his theory. But profeſſor Euler has advanced many ſtrong objections to this theory; and he obſerves in the reſult, that the ſame quantity of powder will fire ſooner in a globular ſpace, than in a ſpace of any other form: and accordingly recommends to make the cavity behind the ball as nearly globular as poſſible. See the true Principles of Gunnery inveſtigated and explained, &c. 1777. p. 93.

Though *chambers* are now diſuſed, Mr. Muller obſerves, that in large cannons they are an improvement not to be neglected; becauſe pieces, having *chambers*, require a leſs charge than they would otherwiſe do: and he recommends a *chamber* in all pieces of twenty-four pound ball and upwards, whoſe diameter ſhould be two-thirds the diameter of the bore, and length equal to that diameter. See *Tab. Gunnery, fig.* 1. And he adds, that though this *chamber* contains but one ninth part of the ſhot's weight of powder, yet the effect it produces is nearly equal to that of a fourth part, which is ſufficient in large pieces. Muller's Treat. of Artillery, p. 96.

CHAMBERS, *iron*, in a FIRE-*ſhip*, are ten inches long, and 3.5 in diameter. They are breeched againſt a piece of wood fixed acroſs the ports, and let into another a little higher. When loaded, they are almoſt filled with corned powder, and have a wooden tompion well driven into their muzzles. They are primed with a quick-match thruſt through their vents into the powder, with a part of it hanging out. When the ſhip is fired, they blow open the ports; and the port-lids either fall downward, or are carried away, and thus give vent to the fire out of the ſides of the ſhip.

CHAMBERDEKINS, in our *Old Statutes*, a denomination for certain Iriſh beggars, which by ſtatute 1 Hen. V. cap. 7 and 8. were to leave England within a certain time. They were called in the ſtatute *chamberdeakynz*, and ſaid to be clerks mendicants. Blount ſays they are called *chamber deacons* in the parliament roll.

CHAMBERLAIN, an officer who has the management, or direction of a chamber.

The word *chamberlain*, according to Ragueau, originally ſignified a gentleman who was to ſleep in the king's bedchamber, at his bed's feet, in the abſence of the queen.

There are almoſt as many kinds of *chamberlains* as chambers: the principal are as follow.

Lord Great **CHAMBERLAIN** *of England*, an officer of great antiquity and honour; being ranked the ſixth great officer of the crown: a conſiderable part of his function is at the coronation of a king; when he dreſſes him, carries the coif, ſword, and gloves, to be uſed on that occaſion; the gold ſword and ſcabbard to be offered by the king; and the robe royal and crown: he alſo undreſſes him, and waits on him at dinner; having for his fee the king's bed, and all the furniture of his chamber, the night-apparel, and the ſilver baſon wherein the king waſhes, with the towels.

To him likewiſe belongs the proviſion of every thing in the houſe of lords, in the time of parliament; to which end he has an apartment near the lords houſe. He has the government of the palace of Weſtminſter; and iſſues out warrants for preparing, fitting out, and furniſhing Weſtminſter-hall, againſt coronations, trials of peers, &c.

He diſpoſes of the ſword of ſtate, to be carried by whom he pleaſes; and when he goes to parliament, is on the right hand of the ſword, the lord marſhal being on the left. On all ſolemn occaſions, the keys of Weſtminſter-hall, of the Court of Wards, and Court of Requeſts, are delivered to him.

To him belong livery and lodging in the king's court; and he has certain fees from every biſhop at his doing homage to the king, and from every peer at his creation. Under his command are, the gentleman-uſher of the black rod, the yeoman-uſher, and door-keepers.

This honour was long held by the earls of Oxford; viz. from the time of Henry I. by an eſtate-tail, or inheritance; but in later coronations by the marquis Lindſey, afterward duke of Ancaſter, by an eſtate or inheritance from a daughter and heir general, claimed, but controverted.

Lord **CHAMBERLAIN** *of the houſhold*, an officer who has the overſight and direction of all officers belonging to the king's chamber, except the precinct of the BED-*chamber*; which is abſolutely under the groom of the ſtole.

He has the overſight and direction of the officers of the wardrobe, of the removing wardrobes, beds, tents, revels, muſic, comedians, hunting, meſſengers, trumpeters, drummers, handicrafts, and other tradeſmen retained in the king's ſervice: as alſo of all ſerjeants at arms, phyſicians, apothecaries, ſurgeons, barbers, the king's chaplains, &c. and adminiſters the oath to all officers above ſtairs.

There are alſo **CHAMBERLAINS** *of the king's courts, of the Exchequer, of North Wales, of the city of London*, &c. In theſe caſes, this officer is commonly the receiver of all rents and revenues belonging to the place whereof he is *chamberlain*.

When there is no prince of Wales, and earl of Cheſter, the *chamberlain* of Cheſter hath the receipt and return of all writs coming thither out of any of the king's courts.

In the Exchequer, there are two *chamberlains*, who keep a controulment of the pells of receipts, and exitus, and have certain keys of the treaſury and records: they alſo keep the keys of that treaſury where the leagues of the king's predeceſſors, and divers ancient books, as Doomſday Book, and the Black-Book of the Exchequer, remain.

The CHAMBERLAIN *of London* keeps the city-money, which is laid up in the chamber of London, an apartment in Guildhall: he alſo preſides over the affairs of maſters and apprentices; and makes free of the city, &c.

His office laſts but for a year, being choſen annually on Midſummer-day: but the cuſtom uſually obtains to re-chooſe the ſame perſon; unleſs he has been chargeable with any miſdemeanor in his office.

CHAMBERLAIN, *vice.* See VICE-*Chamberlain.*

CHAMBRANLE, in *Architecture* and *Joinery*, the bordet, frame, or ornament of ſtone, or wood, ſurrounding the three ſides of doors, windows, and chimneys.

The *chambranle* is different in the different orders: when it is plain, and without mouldings, it is called ſimply and properly, *band*, *caſe*, or *frame*.

The *chambranle* conſiſts of three parts; the two ſides, called *aſcendants*; and the top, called the *traverſe*, or *ſupercilium*.

The *chambranle* of an ordinary door is frequently called *door-caſe*; of a window, *window-frame*.

CHAMELEIA, in *Natural Hiſtory*, a word uſed by ſome authors as a name for a peculiar ſpecies of CHAMA, but by others as a name for all thoſe *chamæ* that have ſmooth ſurfaces, which are a very great number.

CHAMELOT, in *Commerce*. See CAMBLET.

CHAMFER, or CHAMFERET, in *Architecture*, an ornament conſiſting of half a ſcotia; being a kind of ſmall furrow, or gutter, on a column; called alſo *ſtrix*, and *ſtria*.

CHAMFERING, or CHAMFRAINING, is uſed for cutting the edge, or end of any thing aſlope, or BEVEL.

CHAMOIS, in *Zoology*, is uſed by ſome, particularly the French, for the creature from whoſe ſkin the *chamois* leather is made. See *Tab. of Quadrupeds*, N° 8.

It is known among naturaliſts by the name of RUPICAPRA. It is very common in the mountains of Helvetia, and in many other places. In the figure of its body it ſeems to approach very much to the ſtag kind; its belly, forehead, inner part of its ears and throat, are white; it has a yellow ſtroke on each ſide near the eyes, and the reſt of the body is a deep brown; its tail alſo is of the ſame colour, and that equally on all ſides, not white on that part next the body as is the caſe in the deer.

The male and female both have horns, which are a hand's breadth and an half long, rough toward the bottom, and ſomewhat knotty; a new knot growing every year; they are nearly ſtraight, but at the top bent into the ſhape of a hook, black, and not ſmooth, but longitudinally ſtriated with ſlender ſtreaks, and their inner cavity is filled up with a ſolid bone proceeding from the ſkull.

This creature has two remarkable holes always open behind its ears; theſe, ſome have imagined, ſerved for reſpiration; and Appian, who had the *poetica licentia* for whatever he choſe to ſay, ſeems to have led them into this; but there is no ſort of probability of truth in it, ſince the ſkull is ſeen immediately under theſe holes, and there is no perforation through it, nor any duct diſcoverable from them. The vulgar have alſo ſome remarkable opinions founded on the ſtructure of the horns of the creature; the one, that in depreſſing them to rub his back, he often gets them ſo far within the ſkin that he cannot get them out again; and the other, that he hangs by the horns to the rocks.

CHAMOMILE, *Anthemis*, in *Botany*, a genus of the *ſyngeneſia polygamia ſuper*. claſs. Its characters are theſe: it is a plant with a compound flower, the border or rays of the flower being compoſed of many female flowers, whoſe petals are ſtretched out like tongues on one ſide. The middle or diſk of the flower is compoſed of many hermaphrodite florets, which are funnel-ſhaped, erect, and cut into five parts at the top. The germen is ſituated at the bottom, which afterward becomes an oblong naked ſeed. There are fifteen ſpecies.

The firſt ſort is the common *chamomile*, which grows in plenty upon commons, and other waſte lands: it is a trailing perennial plant, which puts out roots from the branches as they lie on the ground. The flowers of this ſort are ordered for medicinal uſe; but the market people generally ſell the double flowers, which are much larger, but not ſo ſtrong as the ſingle.

The ſecond ſort is a common annual weed, which grows among corn: it flowers in May, ſo is called May-weed; though ſome have applied that title improperly to the *cotula fœtida*, which rarely flowers till late in June; this is the third ſort.

Another ſort is the PELLITORY of Spain, the roots of which are uſed for the tooth-ach; being extremely warm, when they are applied to the part affected, they draw out the cold rheum, and are often ſerviceable.

The common *chamomile* is digeſtive, laxative, and emollient; it mitigates pain, and promotes the menſes and urine; the leaves dried are ſaid to anſwer theſe purpoſes better than any other part of the plant: for all others, the flowers are uſed. Theſe are given in infuſion, as a gentle emetic, very large quantities of the infuſion being drank warm. They are alſo uſed in emollient decoctions, and are a general ingredient in clyſters. It is very remarkable of the flowers of this plant, that like thoſe of the common yarrow, they yield by diſtillation a fine ſky-blue oil.

CHAMOS, or CHEMOSH, the idol or god of the Moabites.

The name of *Chamos* comes from a root, which, in Arabic, ſignifies *to make haſte*; for which reaſon many believe *Chamos* to be the ſun, whoſe precipitate courſe might well procure it the name of ſwift or ſpeedy.

Farther particulars may be ſeen in Calmet's Diſſertation on Baal Peor and *Chamos*, prefixed to his Comment on the book of Numbers.

CHAMPADA, in *Natural Hiſtory*, the name of a tree common in the woods of Malacca, and bearing a fruit much valued by the natives. It is a large tree, very full of branches, and theſe are very knotty, and, when cut, throw forth a thick and acrid juice like that of the tithymal. The fruit grows on the trunk and thick branches of the tree: the firſt appearance toward this is a large button or bud; this by degrees opens into a flower conſiſting of a great number of leaves, among which, when open, are ſeen the rudiments of the fruit; this appears very ſmall at firſt, but it ſoon grows to a very conſiderable bigneſs, being, when ripe, twelve or fourteen inches long, and as much in circumference; it is ſhaped much like a melon. The rind is green, and is all over divided into ſmall pentagons, in the center of each of which is a ſmall black ſpot. The pedicle is thick and woody, and entering into the ſubſtance of the fruit, it divides itſelf into ſeveral branched fibres, which run through the whole ſubſtance of it, and meet in a point at the end. Within this large fruit there are contained a large number of kernels of the ſize of our common cheſnuts, all hanging together in bunches, ſo as to reſemble a cluſter of grapes; theſe are confined in a narrow compaſs, being preſſed firmly upon one another while the fruit is whole, but as ſoon as this is cut or burſt open, they fly farther aſunder, and hang to the ſtalks like grapes that are placed at a diſtance on the bunch, as ſome of our oblong kinds are. The people of Malacca are very fond of this fruit; they ſuck the pulpy matter which ſurrounds the kernels, and which is of a ſweet and luſcious taſte, but of a diſagreeable raw ſmell. The Indians are very fond of this fruit, as well for its qualities as its taſte, for it is very heating, and, when taken in large quantities, will inebriate people in the ſame manner as ſtrong liquors. The kernels are much of the nature of our cheſnuts, but of a leſs agreeable taſte; they are eaten by way of food rather than as a delicacy, and the common way of eating them is boiled in water. Mem. Acad. Scienc. Par. 1699. p. 640.

CHAMPAGNE, in *Heraldry*, a name given by Ferne, and ſome other writers, to the line differing from the common lines, and called alſo URDEE, and by Upton *vert*, from its reſemblance to the ends of the figures of that ſort of fur which is called *vair* by heralds.

CHAMPAIN. See CAMPAIGN, and CHAMPION.

A Point CHAMPAIN, in *Heraldry*, is a mark of diſhonour in the coat of arms of him who kills a priſoner of war after he has cried quarter.

CHAMPART, in our *Old Cuſtoms*, a duty, or tenure, by which the tenant was to pay part of the fruits of the ground of the lord. It is alſo written *chaumpert*, and in the middle-age Latin is called *campipars*, *camparcium*.

CHAMPARTORS, or CHAMPERTORS, are thoſe who move pleas, or ſuits, or cauſe them to be moved, either by their own procurement or others; and ſue them at their proper coſts, to have part of the land, or other matter in variance: againſt whom lies a writ of *champarty*.

CHAMPARTY, or CHAMPERTY, in *Law*, a maintenance of any man in his ſuit, upon condition of having part of the thing in queſtion, be it lands or goods; in caſe it be recovered.

The word comes from the French *champ*, *field*, and *parti*, *divided*; the field, or thing conteſted for, being ſuppoſed to be divided between the *champartor*, or maintainer, and the perſon in whoſe right he ſues.

This ſeems to have been an ancient grievance; for notwithſtanding ſeveral ſtatutes againſt it, and a form of writ accommodated to them, in the time of Edward I. yet in that of Edward III. it was enacted, that whereas redreſs on the former ſtatute was only to be had in the king's bench, which then followed the court: for the future it ſhould likewiſe be cognizable by the juſtices of the common pleas, and judges of aſſize.

CHAMPION, properly ſignifies a perſon who undertakes a COMBAT, in the place or quarrel of another: though the word is alſo ſometimes uſed for him who fights in his own cauſe.

Hottoman defines *champion, certator pro alio datus in duello, à campo dictus, qui circus erat decertantibus definitus:* hence alſo the word *campfight.*

Du-Cange obſerves, that *champions,* in the juſt ſenſe of the word, were perſons who fought in lieu of thoſe who, being obliged by cuſtom to accept the duel, had yet a juſt excuſe for diſpenſing with it, as being too old, or infirm, being eccleſiaſtic, or the like. He adds, that the *champions* were uſually retained or hired for ſums of money, and were held infamous.

There were alſo ſome vaſſals, who, by the faith and homage ſworn to their lords, were obliged to fight for them in caſe of need.

Some authors hold, that any perſon was allowed the benefit of a *champion,* excepting parricides, and thoſe accuſed of very heinous offences.

This cuſtom of deciding differences by combat, was derived from the North; whence it paſſed into Germany, and, with the Saxons, into England, and inſenſibly through the reſt of Europe. See DUEL.

When two *champions* were choſen to maintain the pro and the con. it was always required there ſhould be a decree of the judge to authorize the combat. When the judge had pronounced ſentence, the accuſed threw a gage, or pledge, ordinarily a glove, or gauntlet; which being taken up by the accuſer, they were both taken into ſafe cuſtody till the day of battle appointed by the judge.

If either of them fled after this, he was declared infamous, and deemed to have committed the crime in queſtion. Nor were the accuſer and accuſed now allowed to make up the matter; at leaſt, not without the conſent of the judge; which was never granted, without making the lord ſatisfaction for the right of inheritance to the effects of the vanquiſhed

Before the *champions* took the field, their heads were ſhaved, and they made oath, that "they believed the perſon who retained them was in the right; and that they would defend his cauſe to the utmoſt of their power." The weapons they uſed in the combat were a ſword and buckler; ſome ſay, in England, only a club and buckler: when on horſeback, they were armed at all points. In a civil combat, on a writ of right, the only weapons allowed them were *batons,* or ſtaves, of an ell long, and a four-cornered leather target. Their weapons were bleſſed in the field by the prieſt, with great ceremony; and each took an oath he had no charm upon him.

In the civil combat, a piece of ground was marked out of ſixty feet ſquare, encloſed with liſts, and on one ſide a court erected for the judges of the court of common pleas, who attended in their ſcarlet robes. The court was to ſit by ſun-riſing; and proclamation being made, the *champions* were introduced by two knights, and were dreſſed in a ſuit of armour, with red ſandals, bare-legged from the knee downwards, bare-headed, and with bare arms to the elbows.

The action then began; at the ſound of a trumpet they were to go to blows; after the number of blows or rencounters expreſſed in the cartel, the judges of the combat threw a rod into the air, to advertiſe the *champions* that the combat was ended. If it laſted till night, or ended with equal advantage on either ſide, the accuſed was reputed victor.

The puniſhment of the vanquiſhed was that which the crime merited, whereof he was accuſed: if it were a capital crime, the vanquiſhed was diſarmed, led out of the field, and immediately executed, together with the party whoſe cauſe he maintained. If the conquered *champion* fought in the cauſe of a woman, ſhe was burnt.

In civil combat, the combatants were bound to fight till the ſtars appeared in the evening; and if the *champion* of the tenant was able to defend himſelf till the ſtars appeared, the tenant prevailed in his cauſe; or if victory declared itſelf for either party, by the death of the other, which ſeldom happened, or by his proving *recreant,* and pronouncing the word CRAVEN, judgment was finally given in his favour. Blackſt. Com. book iii. p. 339, &c.

CHAMPION *of the king,* is an officer, whoſe buſineſs is, at the coronation of a king of England, to ride into Weſtminſter-hall, armed cap-a-pe, when the king is at dinner, and throw down his gauntlet by way of challenge; pronouncing, by a herald, "That if any man ſhall deny, or gainſay the king's title to the crown, he is there ready to defend it in ſingle combat, &c." Which done, the king drinks to him, ſending him a gilt cup with a cover, full of wine; which the *champion* drinks, and has the cup for his fee.

This office, ever ſince the coronation of Richard II. has been continued in the family of Dymocke, who held the manor of Scrivelſby in Lincolnſhire, hereditary from the family of the Marmions, who had it before, by grand ſerjeantry; on condition that the lord thereof ſhould be the king's *champion.*

CHAMPION, or rather **CHAMPAIN**-*lands,* are lands not incloſed; or large fields, downs, or places without woods or hedges.

CHANCE, a term we apply to events, to denote that they happen without any neceſſary, or foreknown cauſe: or it is uſed to denote the bare poſſibility of an event, when nothing is known either to produce or hinder it.

Our aim is, to aſcribe thoſe things to *chance,* which are not neceſſarily produced as the natural effects of any proper cauſe, which we can diſcover; but our ignorance and precipitancy lead us to attribute effects to *chance,* which have neceſſary and determinate cauſes.

When we ſay a thing happens by *chance,* we really mean no more, than that its cauſe is unknown to us: not, as ſome vainly imagine, that *chance* itſelf can be the cauſe of any thing. From this conſideration, Dr. Bentley takes occaſion to expoſe the folly of that old tenet, *The world was made by chance.*

The caſe of the painter, who, unable to expreſs the foam at the mouth of a horſe he had painted, threw his ſponge in deſpair at the piece, and, by *chance,* did that which he could not before do by deſign, is an eminent inſtance of the force of *chance:* yet, it is obvious, all we here mean by *chance,* is, that the painter was not aware of the effect; or that he did not throw the ſponge with ſuch a view: not but that he actually did every thing neceſſary to produce the effect; inſomuch that, conſidering the direction wherein he threw the ſponge, together with its form, ſpecific gravity, the colours wherewith it was ſmeared, and the diſtance of the hand from the piece, it was impoſſible, on the preſent ſyſtem of things, that the effect ſhould not follow.

Chance is frequently perſonified, and erected into a chimerical being, whom we conceive as acting arbitrarily, and producing all the effects, whoſe real cauſes do not appear to us: in which ſenſe, the word coincides with the Τυχη, and *Fortuna,* of the ancients.

CHANCE is confounded with *Fate* and *Deſtiny;* and the word is alſo uſed for the manner of deciding things, the conduct or direction of which is left at large, and not reducible to any determinate rules or meaſures; or where there is no ground for preference: as at cards, dice, lotteries, &c.

CHANCE, *for the laws of, or the proportion of hazard in gaming,* ſee GAMING. See alſo EXPECTATION and PROBABILITY.

The ancient *ſors,* or *chance,* M. Placette obſerves, was inſtituted by God himſelf; and in the Old Teſtament we find ſeveral ſtanding laws, and expreſs commands, which preſcribed its uſe on certain occaſions: hence, the Scripture ſays, *the lot, or* chance, *fell on St. Matthias;* when it was in queſtion who ſhould fill Judas's place in the apoſtolate

Hence alſo aroſe the *ſortes ſanctorum,* or method of determining things among the ancient Chriſtians, by opening ſome of the ſacred books, and pitching on the firſt verſe they caſt their eye on, as a ſure prognoſtic of what was to befal them. The *ſortes Homericæ, Virgilianæ, Præneſtinæ,* &c. uſed by the heathens, were with the ſame view, and in the ſame manner. See SORTES.

St Auguſtine ſeems to approve of this method of determining things future, and owns that he had practiſed it himſelf; grounded on this ſuppoſition, that God preſides over *chance,* and on Proverbs xvi. ver. 33.

Many among the modern divines hold *chance* to be conducted in a particular manner by Providence, and eſteem it an extraordinary way which God uſes to declare his will, and a kind of immediate revelation.

CHANCE-*Medley,* in *Law,* the accidental killing of a man, not altogether without the killer's fault, though without any evil intent.

Stamford calls it, *Homicide by miſadventure:* Weſt calls it *homicide mixed;* and ſays, it is when the killer's ignorance or negligence is joined with the *chance:* as ſuppoſing a man lopping trees by the highway, and a bow falling *chance* to kill a paſſenger; the party here offends in not having given warning, whereby the ſlain might have been induced to take more heed: or when a workman in throwing down rubbiſh from a houſe, after warning to take care, kills a perſon; or a ſchool-maſter in correcting his ſcholar, a maſter his ſervant, or an officer in whipping a criminal, in a reaſonable manner, happens to occaſion his death, it is *chance-medley* and miſadventure. 3 Inſt. 56. Dalt. 351. But if a man throws ſtones in a highway where perſons uſually paſs, or ſhoot an arrow, &c. in a market-place, among a great number of people; or if a workman caſt down rubbiſh from a houſe in cities and towns, where people are continually paſſing; or a ſchool-maſter, maſter, &c. correct his ſcholar, ſervant, &c. in a degree exceeding the bounds of moderation, it is manſlaughter; and if with an improper inſtrument of correction, as with a ſword or iron bar, or by kicking, ſtamping, &c. in a cruel manner, it is murder.

CHANCEL, is properly that part of the choir of a church, between the altar, or communion-table, and the baluſtrade, or rail that incloſes it; where the miniſter is placed at the celebration of the communion.

The word comes from the Latin *cancellus*, which in the lower Latin is uſed in the ſame ſenſe, from *cancelli*, *lattices*, or *croſs bars*, wherewith the *chancels* were anciently encompaſſed, as they now are with rails.

The right of a ſeat and a ſepulchre in the *chancel*, is one of the privileges of the founders of a church. The repairs of the *chancel* belong by uſage, in moſt pariſhes, to the rector or vicar, or both.

CHANCELLOR, an officer, ſuppoſed originally to have been a notary, or ſcribe, under the emperors, and named *cancellarius*, becauſe he ſat behind a lattice, called in Latin *cancellus*, to avoid being crouded by the people.

Naude ſays, it was the emperor himſelf who ſat and rendered juſtice within the lattice; the *chancellor* attending at the door thereof, whence he took his title.

Others ſay, he had it from this, that all letters, addreſſes, petitions, &c. to the king, being firſt examined by him, were *cancelled*, where amiſs: others, becauſe all patents, commiſſions, and warrants, coming from the king, were examined and *cancelled* by him. Others, becauſe he *cancelled* and annulled the ſentences of other courts.

Du-Cange, from Joannes de Janua, fetches the original of the word *chancellor* from Paleſtine, where the houſes being flat, and made in form of a terrace, with parapets or paliſadoes, called *cancelli*; thoſe who mounted theſe houſes to rehearſe any harangue, were called *cancellarii*; whence the name paſſed to thoſe who pleaded at the bar, which he calls *cancelli forenſes*, and at length to the judge who preſided; and laſtly to the king's ſecretaries.

This officer is now in great authority in all countries: the perſon who bears it with us, or the

Lord High **CHANCELLOR** *of England*, is the firſt lay perſon of the realm, next after the king, and princes of the blood, in all civil affairs. He is the chief adminiſtrator of juſtice next the ſovereign, being the judge of the court of chancery; and to him belongs the appointments of all the juſtices of peace in the kingdom.

All other juſtices are tied to the ſtrict law; but the *chancellor* has the king's abſolute power to moderate the rigour of the written law, to govern his judgment by the law of nature and conſcience, and to order all things *ſecundum æquum & bonum*. Accordingly, Stamford ſays, the *chancellor* has two powers, the one abſolute, the other ordinary; meaning, that though by his ordinary power he muſt obſerve the ſame form of procedure as other judges, yet in his abſolute power he is not limited by any written law, but by conſcience and equity.

The offices of *lord-chancellor* and lord-keeper are by the ſtatute 5 Eliz. made the ſame thing; till that time they were different, and frequently ſubſiſted at the ſame time in different perſons: ſometimes the *lord-chancellor* had a *vice-chancellor*, who was keeper of the ſeal.

The keeper was created *per traditionem magni ſigilli*, but the *lord-chancellor* by patent, though now that he has the keeper's office, he is created in like manner by giving him the ſeal. The *chancellor* is a privy-counſellor by his office, and likewiſe ſpeaker of the houſe of lords. See PARLIAMENT.

Though he be ſole judge of the court of chancery, yet in matters of much difficulty he ſometimes conſults the other judges; ſo that this office may be diſcharged by one who is no profeſſed lawyer, as anciently it commonly was, by an eccleſiaſtic, who preſided over the king's chapel, and became keeper of the king's conſcience, viſitor in the king's right of all hoſpitals and colleges of royal foundation, patron of all the king's livings under the value of 20*l.* *per ann.* in the king's books, guardian of all infants, idiots, and lunatics; and ſuperintendent of all charitable inſtitutions. He has twelve aſſiſtants, or coadjutors, anciently called *clerici*, as then being in holy orders, now *Maſters in Chancery*, the firſt whereof is the *Maſter of the Rolls*. See MASTER *of the Rolls*, MASTERS *in Chancery*, &c.

CHANCELLOR *of a cathedral.* His office is thus deſcribed in the Monaſticon; viz. to hear the leſſons and lectures read in the church, either by himſelf, or his vicar; to correct and ſet right the reader when he read amiſs; to inſpect ſchools, to hear cauſes, apply the ſeal, write and diſpatch the letters of the chapter, keep the books, take care there be frequent preachings, both in the church, and out of it, and aſſign the office of preaching to whom he liſts.

CHANCELLOR *of a dioceſe*, is a judge of the biſhop's court, held in the cathedral of each dioceſe.

He was anciently called *eccleſiaſticus*, and *eccleſiæ cauſidicus*, the church-lawyer. See *Biſhop's* COURT.

CHANCELLOR *of the duchy of Lancaſter*, is an officer, the head of that court, whoſe buſineſs is to judge and determine all controverſies between the king and his tenants of the dutchy-land; and otherwiſe to direct all the king's affairs relating to that court. See *Dutchy* COURT.

CHANCELLOR *of the exchequer*, is an officer, ſuppoſed by ſome to have been created for moderating extremities in the exchequer.

He ſometimes ſits in that court and the exchequer-chamber, and, with the reſt of the court, orders things to the king's beſt benefit. He is always in commiſſion with the lord-treaſurer for letting lands accruing to the crown by diſſolution of abbeys, and otherwiſe: he has power, with others, to compound for forfeitures on penal ſtatutes, bonds, and recognizances entered into by the king. He has a great authority in managing the royal revenue, and in matters of firſt-fruits.

The court of equity, in the exchequer-chamber, is held before the lord-treaſurer, *chancellor*, and barons, as that of common law before the barons only.

CHANCELLOR *of the order of the* GARTER, and other military orders, is an officer who ſeals the commiſſions and mandates of the chapter, and aſſembly of the knights, keeps the regiſter of their deliberations, and delivers acts thereof under the ſeal of the order.

CHANCELLOR *of an univerſity*, is he who ſeals the diplomas or letters of degrees, proviſion, &c. given in the univerſity.

The *chancellor* of Oxford is their chief magiſtrate, elected by the ſtudents themſelves: his office is *durante vita*, to govern the univerſity, preſerve and defend its rights and privileges, convoke aſſemblies, and do juſtice among the members under his juriſdiction.

Under the *chancellor* is the *vice-chancellor*, who is choſen annually; being nominated by the *chancellor*, and elected by the univerſity in convocation. His buſineſs is to ſupply the *chancellor*'s abſence.

At his entrance upon his office, he chooſes four *pro-vice-chancellors*, out of the heads of colleges, to one of whom he deputes his power in his abſence.

The *chancellor of Cambridge*, is in moſt reſpects the ſame with that of Oxford; only he does not hold his office *durante vita*, but may be elected every three years.

He has under him a commiſſary, who holds a court of record of civil cauſes, for all perſons of the univerſity under the degree of maſter of arts.

The *vice-chancellor* of Cambridge is choſen annually by the ſenate, out of two perſons nominated by the heads of the ſeveral colleges and halls.

CHANCERON, in *Natural Hiſtory*, a name given by the French writers to the ſmall caterpillar that eats the corn, and does vaſt miſchief in their public granaries. The butterfly which produces this creature has white wings with black ſpots in them. The caterpillar, when firſt hatched, is one of the ſmalleſt that we are acquainted with. It ſpins a great number of fine threads, as ſoon as hatched from the egg, and in many of theſe it faſtens itſelf to every thing that lies near it.

Toward the latter end of ſummer theſe caterpillars leave the corn, and mount up the walls of the granary, where they ſearch for a proper place of reſt, and, when they have pitched upon ſuch a one, they eat their way into it, and burying themſelves in a hole, they cover their whole body with a web of ſilk of their own ſpinning, and there change into a ſort of browniſh red chryſaliſes. Theſe remain the whole winter without life or motion; but in the months of April and May the butterflies are hatched out of them, and the males and females couple together, immediately after which the female lays her eggs, and the foundation is laid for a new progeny, who, during the remainder of the ſummer, are to deſtroy and ſpoil the corn, under the form of caterpillars. The female thruſts out a ſort of tube from her tail, by means of which ſhe opens a way into the grain, and lodges her egg, which in fifteen or ſixteen days is hatched into the caterpillar; as ſoon as hatched, it begins to eat, and, devouring greedily, it ſoon marks the place where it lies, by a quantity of the huſks which it leaves there. Deſlandes, Trait. Phyſ.

CHANCERY. See COURT *of Chancery*.

CHANCRE, in *Medicine*, a malignant ulcer, which gnaws and eats the fleſh, uſually occaſioned by ſome venereal diſorder.

Chancres are reputed among the firſt ſymptoms that appear in the venereal diſeaſe; and Antonius Muſa Braſavolus obſerves, that the puſhes on the prepuce, glans, or both, are occaſioned by the ſharpneſs of humours which are ſtirred in the time of coition, and the malignant quality of the venereal taint contained in the vagina, or that flows from the adverſe party. This being premiſed, it is certain the *chancres* on the *frænum* and prepuce differ very much from thoſe on the glans, and other parts.

CHANDELIER, or Chandeleer, in *Fortification*, a wooden frame, made of two pieces, fixed croſs-ways on two other pieces, at about four feet aſunder, and on their interſections are erected two vertical pieces of five feet high, each ſupported by three buttreſſes; the interval of theſe two pieces is filled up with faſcines, or faggots, to cover the workmen inſtead of a parapet. See *Tab. Fortif. fig.* 25.

Chandeliers are ſometimes alſo made to prevent the enemy from ſeeing what paſſes within.

The difference between *chandeliers*, and blinds, conſiſts in this, that the former ſerve to cover the pioneers before, and the latter alſo cover them over head.

Chandelier ſignifies alſo a candleſtick, lamp, &c.

CHANE, in *Ichthyology*, a name given by Ariſtotle, Athenæus, and the other Greek writers, to the fiſh called by other authors *hiatula chauna*, and *chaunus*. It is truly a ſpecies of the *labrus*, and is diſtinguiſhed by Artedi by the name of the forked-tailed Labrus, with the lower-jaw longer than the upper, and with black tranſverſe lines on the ſides.

CHANFRIN, in the *Manege*, is the fore-part of a horſe's head, extending from under the ears, along the interval between the eye-brows, down to his noſe.

CHANGE, in *Commerce*. See Exchange.

Change, in the *Manege*. To *change* a horſe, or *change* hand, is to turn or beat the horſe's head from one hand to the other, from the right to the left, or from the left to the right. You ſhould never *change* your horſe without puſhing him forward upon the turn; and after the turn, puſh him on ſtraight, in order to a ſtop.

Change *of ſpecies*, in *Huſbandry*. See Species.

CHANGER, or Chaunger, an officer belonging to the king's mint, who changes money for gold, or ſilver bullion.

Changer, *money*, is a banker, who deals in the exchange, receipt, and payment of moneys.

CHANGES, in *Arithmetic*, &c. the permutations or variations of any number of quantities; with regard to their poſition, order, &c.

To find all the poſſible changes *of any number of quantities, or how oft their order may be varied.*

Suppoſe two quantities a and b. Since they may be either wrote ab or ba, it is evident their *changes* are $2=2\times1$.

c a b
a c b
a b c
——
c b a
b c a
b a c

Suppoſe three quantities abc: their *changes* will be as in the margin; as is evident by combining c firſt with ab, then with ba; and hence the number of *changes* ariſes $3\times2\times1=6$. If the quantities be 4, each may be combined four ways with each order of the other three; whence the number of *changes* ariſe $6\times4=4\times3\times2\times1=24$. Wherefore, if the number of quantities be ſuppoſed n, the number of *changes* will be $n\times n-1\times n-2\times n-3\times n-4$, &c. to $n-n$. If the ſame quantity occur twice, the *changes* of two will be found bb, of three bab, abb, bbc; of four $cbab$, $bcab$, $babc$. And thus the number of *changes* in the firſt caſe will be $1=(2\times1)\div2\times1$; in the ſecond, $3=(3\times2\times1)\div2\times1$; in the third, $12=(4\times3\times2\times1)\div2\times1$.

If a fifth letter be added, in each ſeries of four quantities, it will beget five *changes*, whence the number of all the *changes* will be $60=(5\times4\times3\times2\times1),\div2\times1$. Hence if the number of quantities be n, the number of *changes* will be $(n\times n-1\times n-2\times n-3\times n-4, \&c.)\div2\times1$. From theſe ſpecial formulæ may be collected a general one; viz. if n be the number of quantities, and m the number which ſhews how oft the ſame quantity occurs; we ſhall have $(n\times n-1\times n-2\times n-3\times n-4\times n-5\times n-6\times n-7, \&c.)\div(m-1\times m-2\times m-3, \&c.)$; the ſeries being to be continued, till the continual ſubtraction of unity from n and m leave 0. After the ſame manner we may proceed further, till putting n for the number of quantities, and l, m, r, &c. for the number that ſhews how oft any of them is repeated, we obtain an univerſal form $(n\times n-1\times n-2\times n-3\times n-4\times n-5, \&c.)\div(l\times l-1\times l-2\times l-3\times l-4, \&c.\ m\times m-1\times m-2\times m-3, \&c.)\ r\times r\times r-1\times r-2\times r-3$, &c.

Suppoſe, for inſtance, $n=6$, $l=3$, $r=3$. The number of *changes* will be $(6\times5\times4\times3\times2\times1)\div3\times2\times1\times3\times2\times1)=6\times5\times4)\div3\times2=2\times5\times2=20$.

Hence, ſuppoſe thirteen perſons at a table, if it be required how oft they may *change* places, we ſhall find the number $13\times12\times11\times10\times9\times8\times7\times6\times5\times4\times3\times2\times1=6227020800$. See Alternation.

In this manner may all the poſſible anagrams of any word be found in all languages, and that without any ſtudy. Suppoſe, v. g. it were required to find the anagrams of the word *Roma*, the number of *changes* will be $4\times3\times2\times1=24$. Thus,

Roma *orma mroa arom*
roam oram mrao armo
rmoa omra mora aorm
rmao omar maor aomr
raom oarm maro amro
ramo oamr maor amor.

The anagrams therefore of the word *Roma*, furniſhing any word of known ſignification in the Latin tongue, are ſeven; viz. *Roma*, *ramo*, *oram*, *mora*, *maro*, *armo*, *amor*. Wallis's Algebra, p. 117.

Whether this new method of anagrammatizing be like to prove of much ſervice to that art, is left to the poets.

Changes *of inſects*. See *Tranſformation of* Insects.

CHANNA, in *Zoology*, the name of a fiſh caught in great plenty in the Mediterranean, and brought to market in Italy, and elſewhere, among the ſea-pearch, which it nearly reſembles.

There is an obſervation, that in all the fiſh of this kind which have been examined by naturaliſts, there have been found none but females. This is as old as Ariſtotle. Whether it be fact, would require many obſervations to determine; if it ſhould be proved ſo, the whole ſeems to end in this; that the *channa* is no diſtinct ſpecies, but only the female of ſome other fiſh.

There is another fiſh, not unlike this, called *cannadella*, or rather *channadella*, which at Marſeilles is known by the name of *channa*.

CHANNADELLA, in *Ichthyology*, a name given by Bellonius, and others, to a ſpecies of the *labrus*, called alſo *ſachettus*, and *hepatus piſcis*. See Chane.

CHANNEL, in *Anatomy*, *Chirurgery*, &c. See Canal.

Channel, or *bed of a river*. See River.

Channel is alſo applied to divers arms of the ſea, where the water runs within the land; or to certain narrow ſeas, confined between two adjacent continents, or between an iſland and continent.

In this ſenſe we ſay, St. George's *Channel*, the Britiſh *Channel*, the *Channel* of the Black Sea, of Conſtantinople, &c.

Channel, in *Building*. See Gutter.

Channel *of the volute*, in the Ionic capital, is the face of its circumvolution, incloſed by a liſtel. See Volute.

Channel *of the larmier*, is the hollow ſoffit of a cornice, which makes the *pendant mouchette*. See Larmier.

Channel, in the *Manege*, is uſed for that concavity in the middle of the lower-jaw of a horſe, where the tongue lies. This hollow being bounded on each ſide by the bars, terminates in the grinders or maxillary teeth. The barbles grow in this *channel*.

CHANNELINGS. See Flutings.

CHANT, Cantus, is uſed for the vocal muſic of churches. In church-hiſtory we meet with divers kinds of *chant*, or *ſong*: the firſt is the Ambrosian *chant*, eſtabliſhed by St Ambroſe.

The ſecond, the *Gregorian chant*, introduced by pope Gregory the Great, who eſtabliſhed ſchools of *chantors*, and corrected the church ſong.

This is ſtill retained in the church under the name of *plain ſong*: at firſt it was called the *Roman ſong*.

The *plain*, or *Gregorian chant*, is where the choir and people ſing in uniſon, or all together in the ſame manner.

Chant *Royal*. See Comedy.

CHANTLATE, in *Building*, a piece of wood faſtened near the ends of the rafters, and projecting beyond the wall, to ſupport two or three rows of tiles, ſo placed to prevent the rain-water from trickling down the ſides of the wall.

CHANTOR, in the *Jewiſh Antiquities*. In the Temple of Jeruſalem there was a great number of Levites, who were employed in ſinging the praiſes of God, and in playing upon inſtruments before his altar. In the reign of David there were four thouſand ſinging men, with their heads and preſident.

The *chantors* and Levites who were employed in ſinging, playing upon inſtruments, and other functions of the Temple, had no habits diſtinct from the reſt of the people. Nevertheleſs, in the ceremony of removing the ark to the Temple of Jeruſalem built by Solomon, the *chantors* appeared dreſſed in tunics of byssus, or fine linen. Joſephus remarks, that in king Agrippa's time they obtained the favour from that prince of wearing a linen robe in the Temple, like the prieſts. Agrippa believed it would be for the honour of his reign, to ſignalize it by ſo conſiderable a change as this. The other Levites, employed in different exerciſes under the command of the prieſts in the Temple, procured likewiſe commiſſion to learn to ſing, to the end that they might enjoy the ſame privileges with their brethren.

Chantor, or Chauntor, a perſon who ſings in the choir of a cathedral.

All great chapters have *chantors* and chaplains to eaſe and aſſiſt the canons, and officiate in their abſence.

St. Gregory firſt inſtituted the office of *chantors*, erecting them into a body, called *ſchola cantorum:* though Anaſtaſius ſeems to attribute their riſe to pope Hilary, who lived an hundred years before Gregory.

But the word grows obſolete in this ſenſe, and inſtead thereof we uſe the word *choriſter*, or ſinging-man.

Chantor is uſed, by way of excellence, for the præcentor, or maſter of the choir; which is one of the dignities of the chapter.

The *chantor* bears the cope and the ſtaff at ſolemn feſtivals; and gives tune to the reſt at the beginning of pſalms and anthems. At St. David's in Wales, where they have no dean, he is next in dignity to the biſhop.

The ancients called the *chantor*, *primicerius cantorum.*

To him formerly belonged the direction of the deacons, and other inferior miniſters.

CHANTRY, or **Chauntry.** See **Chauntry.**

CHAOLOGY, the hiſtory or deſcription of the chaos.

Orpheus, in his *Chaology*, ſets forth the different alterations, ſecretions, and divers forms, which matter went through till it became inhabitable: this amounts to the ſame with what we otherwiſe call *coſmogony*, or the creation of the world.

Dr Burnet likewiſe gives us a *Chaology*, in his Theory of the Earth. He repreſents the *chaos*, as it was at firſt, entire, undivided, and univerſally rude and deformed; or the *tohu bohu:* then ſhews how it came divided into its reſpective regions; how the homogeneous matter gathered itſelf apart from all of a contrary principle; and laſtly, how it hardened, and became a ſolid habitable globe.

CHAOMANTIA, among the *Enthuſiaſtical Chemiſts*, is the art of making preſages from obſervations on the air.

CHAOS, among the *Ancient Philoſophers*, was deſcribed a dark, turbulent kind of atmoſphere; or a diſorderly ſyſtem, or mixture, of all ſorts of particles together, without any form or regularity; out of which the world was formed.

Chaos is every-where repreſented as the firſt principle, ovum, or ſeed of nature, and the world. All the ancient ſophiſts, ſages, naturaliſts, philoſophers, theologues, and poets, hold that *chaos* was the eldeſt and firſt principle, το αρχαιον χαος.

The Barbarians, Phœnicians, Egyptians, Perſians, &c. all refer the origin of the world to a rude, mixed, confuſed maſs of matter. The Greeks, Orpheus, Heſiod, Menander, Ariſtophanes, Euripides, and the writers of the Cyclic Poems, all ſpeak of the firſt *chaos:* the Ionic and Platonic philoſophers build the world out of it. The Stoics hold, that as the world was firſt made of a *chaos*, it ſhall at laſt be reduced to a *chaos*; and that its periods and revolutions in the mean time are only tranſitions from one *chaos* to another. Laſtly, the Latins, as Ennius, Varro, Ovid, Lucretius, Statius, &c. are all of the ſame opinion. Nor is there any ſect or nation whatever, that does not derive their διακοσμησις, *the ſtructure of the world*, from a *chaos*.

The opinion firſt aroſe among the Barbarians, whence it ſpread to the Greeks, and from the Greeks to the Romans, and other nations.

Dr. Burnet obſerves, that beſides Ariſtotle, and a few other pſeudo-Pythagoreans, nobody ever aſſerted, that our world was always, from eternity, of the ſame nature, form, and ſtructure, as at preſent: but that it had been the ſtanding opinion of the wiſe men of all ages, that what we now call the terreſtrial globe, was originally an unformed, indigeſted maſs of heterogeneous matter, called *chaos*; and no more than the rudiments and materials of the preſent world.

It does not appear who firſt broached the notion of a *chaos*. Moſes, the eldeſt of all writers, derives the origin of this world from a confuſion of matter, dark, void, deep, without form, which he calls *tohu bohu*; which is preciſely the *chaos* of the Greek and Barbarian philoſophers. Moſes goes no further than the *chaos*; nor tells us whence it took its origin, or whence its confuſed ſtate; and where Moſes ſtops, there, preciſely, do all the reſt.

Dr. Burnet endeavours to ſhew, that as the ancient philoſophers, &c. who wrote of the coſmogony, acknowleged a *chaos* for the principle of their world; ſo the divines, or writers of the theogony, derive the origin or generation of their fabled gods from the ſame principle.

Mr. Whiſton ſuppoſes the ancient *chaos*, the origin of our earth, to have been the atmoſphere of a comet; which, though new, yet, all things conſidered, is not the moſt improbable aſſertion. He endeavours to make it out by many arguments, drawn from the agreement which appears to be between them.

So that, according to him, every planet is a comet, formed into a regular and laſting conſtitution, and placed at a proper diſtance from the ſun, revolving in a nearly circular orbit; and a comet is a planet either beginning to be deſtroyed, or re-made: that is, a *chaos*, or planet, unformed, or in its primæval ſtate, and placed, as yet, in an orbit very eccentrical.

Chaos, in the phraſe of Paracelſus, imports the air. It has alſo ſome other ſignifications amongſt the alchemiſts.

CHAOASES, an order of horſe in the ſervice of the grand ſignior. Theſe and the *mutéferriker* were originally the guards of the ſultans in Egypt, and their leaders were his two vizirs, that always accompanied him. They now always go out with the baſhaw.

The body of the *chaoaſes* ſeem originally to have been the guard out of which the ſultan uſed to ſend perſons to execute his orders.

CHAP, in *Ornithology*, denotes either of the mandibles of a bird's beak, which are diſtinguiſhed by the epithets *upper* and *lower*.

Chap. See **Chilblain.**

CHAPEAU, in a general ſenſe. See **Hat.**

Chapeau is ſometimes alſo uſed to denote the cap, or coronet, armed with ermin, borne by dukes; and of late frequently met with above an helmet inſtead of a wreath, under gentlemen's or noblemen's creſts. *Tab. Heraldry, fig.* 91.

The creſt is borne on the *chapeau*; and by the *chapeau* the creſt and coat are ſeparated; it being a rule, that no creſt muſt touch the ſhield immediately.

CHAPEL, or **Chappel**, a kind of little church, ſerved by an incumbent, properly under the denomination of a *chaplain*.

The word *chapel*, according to ſome, comes from καπηλεια, *little tents*, or *booths*, ſet up by traders in fairs to ſhelter them from the weather. Papias fetches it both from the Greek and Latin, *quaſi capiens* λαον, or *populum*, vel *laudem:* others derive it from the *chape*, or cope, which ſerved to cover the body: others, *à pellibus caprarum*; becauſe theſe places were anciently covered with goatſkins. Rebuff derives it from *cappa*, St. Martin's cope, which the kings of France carried to war with them as their ſtandard, and preſerved very carefully in particular tents, thence called *chapels*.

There are two kinds of *chapels*, the one conſecrated, and held as benefices: the other ſecular, being of the nature of oratories.

The firſt are built apart, and at a diſtance from the pariſh-church; being neither pariſhes, cathedrals, nor priories, but ſubſiſting of themſelves.

Theſe are called by the canoniſts *ſub dio*, and by us *chapels of eaſe*; as being erected at a diſtance from the mother-church, where the pariſh is large and wide, for the eaſe and conveniency of ſome of the pariſhioners who reſide far off.

Theſe are ſerved by ſome inferior paſtor, provided either by the rector of the pariſh, or by thoſe for whoſe eaſe and benefit they are intended, by prayers or preaching merely. Some of theſe are alſo parochial, having the parochial rights of chriſtening and burying, and differing from a church only in the want of a rectory and endowment.

The ſecond kind are frequently built in, or adjoining to a church, as a part thereof; having only a deſk, &c. to read prayers in; and, in the Romiſh churches, an altar, &c. to celebrate maſs on; but without any baptiſtery, or font. Theſe the canoniſts call *ſub tecto.* They are generally erected by ſome conſiderable perſon, for the uſe of their own families; *ut ibidem familiaria ſepulcra ſibi conſtituant.* The twenty-firſt canon of the council of Agda, held in 506, allows private perſons the uſe of *chapels*; but with prohibition to all clerks to officiate in them without leave from the biſhop.

Chapels, *free*, are thoſe *chapels of eaſe* which have a ſettled revenue for perpetual maintenance of a paſtor, &c. by charitable donatives of lands, or rents beſtowed on them; ſo as not to be any charge either to the rector, or the pariſhioners; and they are thus called, becauſe they are *free* from all ordinary juriſdiction.

There are ſeveral collegiate churches in France, which they call *ſaintes chapelles*, *holy chapels*; as thoſe of Paris, Dijon, Bourges, Bourbon, &c. Theſe are ſo denominated, from being repoſitories of certain relics.

Hence, all thoſe places where relics were preſerved came to be called *chapels*; and the perſons who had the care of them, *chaplains*.

Chapel is alſo a name given to a printer's workhouſe; becauſe, ſay ſome authors, printing was firſt actually performed in *chapels*, or churches; or, according to others, becauſe Caxton, an early printer, exerciſed the art in one of the *chapels* in Weſtminſter Abbey.

In this ſenſe they ſay, the orders, or laws of the *chapel*, the ſecrets of the *chapel*, &c.

CHAPEL, *knights of the,* was an order of knights inſtituted by king Henry VIII. in his teſtament, to the number of thirteen; though theſe have been increaſed to the number of twenty-ſix: they are called alſo *poor knights.*

Theſe are not knights of the order of the garter; but are, as it were, their aſſiſtants or deputies, ſerving to diſcharge all their offices in the funeral ſervices of the kings of England.

They are ſubject to the office of the canons of Windſor, and live on penſions which the order aſſigns them.

They bear the blue or red cloke, with the arms of St. George on the left ſhoulder; but the cloke is only cloth, and they wear no ſort of garter: which diſtinguiſhes them ſufficiently from the knights of the garter.

CHAPELET, in the *Manege,* a couple of ſtirrup-leathers, mounted each of them with a ſtirrup, and joining at top in a ſort of leather buckle, called the head of the *chapelet,* by which they are made faſt to the pummel of the ſaddle, after being adjuſted to the rider's length and bore. They are uſed both to avoid the trouble of taking up or letting down the ſtirrups every time that a gentleman mounts on a different horſe and ſaddle, and to ſupply what is wanting in the academy ſaddles, which have no ſtirrups to them.

CHAPELING *a ſhip,* is the art of turning her round in a light breeze of wind when ſhe is cloſe-hauled, ſo that ſhe will lie the ſame way ſhe did before. This is commonly occaſioned by the negligence of the ſteerſman, or by a ſudden change of the wind.

CHAPELRY, *Capellania,* is uſed for a certain precinct belonging to a chapel, having the ſame relation to it that a pariſh has to a church.

CHAPERON, CHAPERONNE, or CHAPEROON, properly ſignifies a ſort of hood, or covering of the head anciently worn both by men and women, the nobles, and the populace, and afterwards appropriated to the doctors, and licentiates in colleges, &c.

Hence, the name paſſed to certain little ſhields, and other funeral devices, placed on the foreheads of the horſes that drew the hearſes in pompous funerals, and which are ſtill called *chaperoons,* or *ſhafferoons*; becauſe ſuch devices were originally faſtened on the *chaperonnes,* or hoods, worn by thoſe horſes with their other coverings of ſtate.

CHAPERON *of a bit-mouth,* in the *Manege,* is only uſed for ſcatch-mouths, and all others that are not cannon-mouths, ſignifying the end of the bit that joins to the branch juſt by the banquet. In ſcatch-mouths the *chaperon* is round, but in others it is oval: and the ſame part that in ſcatch and other mouths is called *chaperon,* is in cannon-mouths called *fronceau.*

CHAPITERS, in *Architecture,* the crowns or upper parts of a pillar. See CAPITAL.

CHAPITERS *with mouldings,* are thoſe which have no ornaments, as the Tuſcan and Doric.

CHAPITERS *with ſculptures,* are thoſe which are adorned with leaves and carved works, the fineſt of which is of the Corinthian order.

CHAPITERS, in *Law,* were anciently a ſummary of ſuch matters as were to be inquired of, or preſented before juſtices in eyre, juſtices of aſſiſe, or of the peace, in their ſeſſions.

Chapiters are now taken for articles delivered by the mouth of the juſtice, in his charge to the inqueſt: though it appears from Bracton and Briton, they were formerly written exhortations given by the juſtices for the good obſervation of the laws, and the king's peace; firſt read in open court, then delivered in writing to the grand inqueſt: which the grand jury, or inqueſt, were likewiſe to anſwer to upon their oaths, either affirmatively, or negatively.

CHAPLAIN properly ſignifies a perſon provided with a CHAPEL; or who diſcharges the duty thereof.

CHAPLAIN is alſo uſed for an eccleſiaſtical perſon, in the houſe of a prince, or a perſon of quality, who officiates in their chapels, &c.

With us there are forty-eight *chaplains* to the king, who wait four each month, preach in the chapel, read the ſervice to the family, and to the king in his private oratory, and ſay grace in the abſence of the clerk of the cloſet. While in waiting they have a table, and attendance, but no ſalary.

An archbiſhop may retain eight *chaplains*; a duke or a biſhop, ſix; a marquis or earl, five; a viſcount, four; a baron, knight of the garter, or lord chancellor, three; a ducheſs, marchioneſs, counteſs, baroneſs, the treaſurer and comptroller of the king's houſe, the king's ſecretary, dean of the chapel, almoner and maſter of the rolls, two each; the chief juſtice of the king's bench, one: all of whom may purchaſe a licence or diſpenſation, and take two benefices with cure of ſouls. Stat. 22 Hen. VIII. c. 13.

Every judge of the king's bench and common pleas, the chancellor and chief baron of the exchequer, the king's attorney and ſolicitor-general, may each of them have one, entitled to one benefice with cure, and non-reſident. Stat. 25 Hen. VIII. c. 16.

And alſo the groom of the ſtole, treaſurer of the king's chamber, and chancellor of the duchy of Lancaſter, may retain each one *chaplain.* Stat. 33 Hen. VIII. c. 28.

A *chaplain* muſt be retained by letters teſtimonial under hand and ſeal, or he is not a *chaplain* within the ſtatute: and a *chaplain* thus qualified may hold his livings, though diſmiſſed from attendance, during life; nor can a nobleman, though he may retain other *chaplains* in his family, qualify any of them to hold pluralities whilſt the firſt are living. 4 Rep. 90.

The firſt *chaplains* are ſaid to have been thoſe inſtituted by the ancient kings of France, for preſerving the *chape,* or *cape,* with the other relics of St. Martin, which the kings kept in their palace, and carried out with them to the war. The firſt *chaplain* is ſaid to have been Gul. de Meſmes, *chaplain* to St. Louis.

CHAPLAIN *in the order of* MALTA, is uſed for the ſecond rank, or claſs, in that order; otherwiſe called *diaco.*

The knights make the firſt claſs, and the *chaplains* the ſecond.

CHAPLAINS *of the pope,* are the auditors, or judges of cauſes in the ſacred palace; ſo called, becauſe the pope anciently gave audience in his chapel, for the deciſion of caſes ſent from the ſeveral parts of Chriſtendom.

He hither ſummoned as aſſeſſors the moſt learned lawyers of his time; and they hence acquired the appellation of *capellani, chaplains.*

It is from the decrees formerly given by theſe, that the body of decretals is compoſed: their number pope Sixtus IV. reduced to twelve.

Some ſay, the ſhrines of relics were covered with a kind of *tent, cape,* or *capella,* i. e. *little cape*; and that hence the prieſts, who had the care of them, were called *chaplains.* In time theſe relics were repoſited in a little church, either contiguous to a larger, or ſeparate from it; and the ſame name, *capella,* which was given to the cover, was alſo given to the place where it was lodged: and hence the prieſt who ſuperintended it came to be called *chaplain.*

CHAPLET, or CHAPELET, a ſtring of beads, uſed in the Romiſh church, to keep account of the number of Paternoſters, and Ave-Mary's, to be rehearſed in honour of God, and the Holy Virgin.

Chaplets are otherwiſe called *Pater-noſters.* A ROSARY is a *chaplet* of fifteen decads of Ave-Marys.

Menage derives the word from *chapeau, hat*; becauſe of the reſemblance the thing bears to a hatband, or *chaplet* of roſes, *chapeau de roſes.* The modern Latins call it *capellina*; the Italians more frequently *corona.*

Larrey and P. Viret aſcribe the firſt invention of the *chaplet* to Peter the Hermit, well known in the hiſtory of the croiſades.

There is a *chaplet* of our Saviour, conſiſting of thirty-three beads, in honour of his thirty-three years living on earth, inſtituted by father Michael, the Camaldulian.

The Orientals have a kind of *chaplets,* which they call *chains,* and which they uſe in their prayers, rehearſing one of the perfections of God on each link, or head.

The great Mogul is ſaid to have eighteen of theſe chains, all of precious ſtones, ſome diamonds, others rubies, pearls, &c.

The Turks have likewiſe *chaplets,* which they bear in the hand, or hang at the girdle: but father Dandini obſerves, that they differ from thoſe uſed by the Romaniſts, in that they are all of the ſame bigneſs, and have not that diſtinction into decads; though they conſiſt of ſix decads, or ſixty beads. He adds, that the muſſulmen have preſently run over the *chaplet,* the prayers being extremely ſhort, as containing only theſe words, *Praiſe to God*; or theſe, *Glory to God,* for each bead.

Beſides the common *chaplet,* they have likewiſe a larger one, conſiſting of one hundred beads, where there is ſome diſtinction, as being divided by little threads into three parts, on one of which they repeat thirty times *Soubhan Allah,* i. e. *God is worthy to be praiſed*; on another, *Ellamb Allah, Glory be to God*; and on the third, *Alla echer, God is great.* Theſe thrice thirty times making only ninety; to complete the number one hundred, they add other prayers for the beginning of the *chaplet.*

He adds, that the Mahometan *chaplet* appears to have had its riſe from the *mea beracoth,* or *hundred benedictions*; which the Jews are obliged to repeat daily, and which we find in their prayer-books, the Jews and Mahometans having this in common, that they ſeldom do any thing without pronouncing ſome laud, or benediction.

CHAPLET, or CHAPELET, in *Architecture,* a little moulding, cut, or carved into round beads, pearls, olives, or the like.—See *Tab. Archit. fig.* 12.

A *chaplet*, in effect, is little elſe but a BAGUETTE enriched with ſculpture.

CHAPOTENSIS, in *Writers of the Middle Age*, a kind of coin. We do not find any certain account of its value. Du-Cange inclines to think it the ſame as the CHATUS.

CHAPPAR, a COURIER of the king of Perſia, who carries diſpatches from court to the provinces, and from the provinces to the court.

The word, in the original Perſian, ſignifies *courier*.

The poſts, M. Tavernier tells us, are not eſtabliſhed and regulated in Perſia as among us: when the court ſends out a *chappar*, the ſophi's maſter of the horſe furniſhes him with a ſingle horſe, how long ſoever his journey be, and a man to run after him: when his horſe is weary, he takes that of the firſt horſeman he meets with, who dares not make the leaſt refuſal, and ſends his own home by the man who follows him.

As for the maſter of the new horſe he has taken, he muſt run, or at leaſt, ſend after the *chappar*, to retake him, when the *chappar* diſmounts ſome other horſeman to change him.

CHAPPE, in *Heraldry*, the partition of an eſcutcheon, by lines drawn from the center of the upper edge to the three angles below: as repreſented in *Tab. Herald. fig.* 14. which they blazon *chappé* or, and vert.

The ſections of the ſides are to be of a different colour from the reſt. Mackenzie calls it, *A chief party per bend dexter*, or *ſiniſter*, or both.

CHAPPEL, or CHAPEL. See CHAPEL.

CHAPTER, *Capitulum*, a community of eccleſiaſtics belonging to a cathedral, or collegiate church.

The chief, or head of the *chapter*, is the dean; the body conſiſts of canons, or prebendaries, &c.

The *chapter* has now no longer any ſhare in the adminiſtration of the dioceſe, during the life of the biſhop; but ſucceeds to the whole epiſcopal juriſdiction during the vacancy of the ſee.

The origin of *chapters* is derived from hence, that anciently the biſhops had their clergy reſiding with them in their cathedrals, to aſſiſt them in the performance of ſacred offices, and in the government of the church; and even after parochial ſettlements were made, there was ſtill a body of clerks who continued with the biſhop, and were indeed his family, maintained out of his income.

After the monaſtic life grew into requeſt, many biſhops choſe monks rather than ſeculars for their attendants.

Theſe bodies, either of monaſtics or ſeculars, then had the ſame privilege of chuſing the biſhop, and being his council, which the whole clergy of the dioceſe had before; but, by degrees, their dependence on the biſhop grew leſs and leſs; and then they had diſtinct parcels of the biſhop's eſtate aſſigned them for their maintenance; till at laſt, the biſhop had little more left than the power of viſiting them.

On the other hand, theſe capitular bodies by degrees alſo loſt their privileges; particularly that of chuſing the biſhop, for which the kings of England had a long ſtruggle with the pope: but at laſt Henry VIII. got this power veſted in the crown; and now the deans and *chapters* have only the ſhadow of it.

The ſame prince likewiſe expelled the monks from the cathedrals, and placed ſecular canons in their room; thoſe he thus regulated, are called *deans and chapters of the new foundation*; ſuch are Canterbury, Wincheſter, Worceſter, Ely, Carliſle, Durham, Rocheſter, and Norwich: ſuch alſo are the *chapters* of the four new ſees, of Peterborough, Oxford, Glouceſter, and Briſtol.

CHAPTER is alſo applied to the aſſemblies held by religious and military orders, for deliberating on their affairs, and regulating their diſcipline.

Papias ſays they are ſo called, *quòd capitula ibi legantur.*

The eſtabliſhment of general *chapters* of religious orders is owing to the Ciſtercians, who held the firſt in 1116, and were ſoon followed by the other orders.

CHAPTER is alſo uſed for a diviſion of a book; contrived for keeping the matters treated thereon more ſeparate, clear, and diſtinct.

The ancients were unacquainted with the diviſion of books into *chapters* and ſections. Papias ſays, the name *chapter, caput*, aroſe hence, *quòd ſit alterius ſententiæ caput*, or *quòd capiat totam ſummam*. St. Auguſtine compares *chapters* to inns, inaſmuch as theſe refreſh the reader, as thoſe the traveller.

The diviſion of the BIBLE into *chapters* is attributed by ſome to Stephen Langton, archbiſhop of Canterbury, in the reigns of king John and Henry III. But it was really done by Cardinal Hugo, who flouriſhed about the year 1240, the author of the firſt Scripture CONCORDANCE, with a view of rendering this work an uſeful index to the Scripture. The *chapters* were again ſubdivided, not into verſes, but by the letters A, B, C, D, E, F, G, placed in the margin at an equal diſtance from each other, according to the length of the *chapters*. In ſome, all the ſeven letters were uſed; in others fewer, as the length of the *chapters* required. In 1445, Rabbi Nathan, a famous rabbi among the Weſtern Jews, finiſhed a Concordance to the Hebrew Bible, in the manner of Hugo's above mentioned; and introduced the diviſion of the Hebrew Bible into *chapters*: he alſo improved on his plan, by uſing the ancient diviſion into verſes, and by numbering them, fixing the numerical letters in the margin at every fifth verſe. Athias, in his edition of the Bible, 1661 and 1667, introduced the Indian figures, and placed them at every verſe. Vatablus publiſhed a Latin Bible, in which the ſame kind of diviſion was adopted; though ſome ſay this diviſion and diſtinction by numbers was firſt uſed in R. Stephens's Latin Bible, publiſhed at Paris, 1557. R. Stephens made the ſame diviſion of the *chapters* of the New Teſtament into verſes, for the ſake of a Concordance to the Greek Teſtament, which was printed by his ſon H. Stephens.

CHAPTERS, *the three*, is a phraſe famous in *Eccleſiaſtical Hiſtory*, ſignifying a volume publiſhed by Theodoret, an adherent of Neſtorius, againſt St. Cyril; conſiſting of a letter of Ibas prieſt of Nedeſſa, to Maris a biſhop of Perſia; of extracts from the works of Diodorus of Tarſus, and Theodore of Mopſueſtia, wherein the ſame doctrines were taught, that were contended for by Neſtorius; and of two pieces of Theodoret, the one againſt the council of Epheſus, the other againſt the anathemas of St. Cyril.

Theſe make the famous three *chapters*; which were firſt condemned by an edict of Juſtinian, A. D. 544, and ſince by various councils, and many popes.

CHAPTREL. See IMPOST.

CHAR, in *Ichthyology*. See CHARRE.

CHAR *of lead*, denotes the quantity of thirty pigs.

CHARA, in *Botany*, the name given by Linnæus to a genus of plants, of the *monoecia monandria* claſs; reſembling the horſe-tails in general appearance, and called by ſome HIPPURIS. The characters of the genus are theſe: the cup is very ſmall, and conſiſts of two leaves. Vaillant deſcribes a monopetalous flower in this cup; but others ſay there is no flower or corolla at all. There is no appearance of ſtamina, but the ſingle anthera or apex is of a globoſe figure, and is affixed to the cup: the germen of the piſtil is of an oval figure: there is no ſtyle, but the ſtigmas are three in number, and are very broad: the ſeed is ſingle, and of an oval oblong figure.

CHARA, in *Aſtronomy*, the name of one of the CANES *venatici*.

CHARABE, or CARABE, is ſometimes uſed for AMBER; as alſo for the juice of the poplar-tree.

CHARACTER, in a general ſenſe, ſignifies a mark, or figure drawn on paper, metal, ſtone, or other matter, with a pen, graver, chiſſel, or other inſtrument, to ſignify, or denote any thing.

The word is χαρακτηρ; formed from the verb χαρασσειν, *inſculpere, to engrave, impreſs, &c.*

The various kinds of *characters* may be reduced to three heads, viz. *literal characters, numeral characters*, and *abbreviations.*

CHARACTER, *literal*, is a letter of the alphabet, ſerving to indicate ſome articulate ſound, expreſſive of ſome idea, or conception of the mind.

Theſe may be divided, with regard to their nature and uſe, into *nominal, real, and emblematical.*

CHARACTERS, *nominal*, are thoſe we properly call *letters*; which ſerve to expreſs the names of things.

CHARACTERS, *real*, are thoſe that, inſtead of names, expreſs things and ideas.

CHARACTERS, *emblematical*, or *ſymbolical*, have this in common with real ones, that they expreſs the things themſelves; but they alſo have this further, that they in ſome meaſure perſonate them, and exhibit their form: ſuch are the hieroglyphics of the ancient Egyptians.

CHARACTERS, *literal*, may be again divided, with regard to their invention and uſe, into *particular* and *general.*

CHARACTERS, *particular*, are thoſe peculiar to this or that nation; or that have been ſo: ſuch are the Roman, Italic, Greek, Hebrew, Arabic, Gothic, Chineſe, &c. *characters.*

CHARACTERS, *univerſal*, are alſo *real characters*, and make what ſome authors call a *philoſophical language.*

The diverſity of *characters* uſed by the ſeveral nations to expreſs the ſame idea, is found the chief obſtacle to the advancement of learning: to remove this, ſeveral authors have taken occaſion to propoſe plans of *characters* that ſhould be univerſal, and which each people ſhould read in their own language. The *character* here is to be real, not nominal; to expreſs things, and notions; not, as the common ones do, letters, or ſounds: yet, to be mute, like letters, and arbitrary; not emblematical, like hieroglyphics.

Thus, every one ſhould retain their own language, yet every one underſtand that of each other, without learning it; only by ſeeing a real or univerſal *character*, which ſhould ſignify the ſame thing to all people; by what ſounds ſoever each expreſſed it in his particular idiom. For inſtance, by ſeeing the *character* deſtined to ſignify *to drink*, an Engliſhman ſhould read *to drink*; a Frenchman, *boire*; Latin, *bibere*; a Greek, πινειν; a Jew, שתה; a German, *trincken*; and ſo of the reſt: in the ſame manner as ſeeing a horſe, each people expreſſes it after their own manner; but all mean the ſame animal.

This real *character* is no chimera; the Chineſe and Japaneſe have already ſomething like it. They have a common *character* which each of thoſe nations underſtand alike in their ſeveral languages; though they pronounce it with ſuch different ſounds, that they do not underſtand a tittle of one another in ſpeaking.

The firſt, and moſt conſiderable attempts for a real *character*, or philoſophical language, in Europe, are thoſe of biſhop Wilkins, and Dalgarme: but theſe, with how much art ſoever they were contrived, have yet proved ineffectual.

M. Leibnitz had ſome thoughts the ſame way: he thinks thoſe great men did not hit the right method; and adds, it was probable, indeed, that, by this means, people, who do not underſtand one another, might eaſily have a commerce together; but that they have not hit on true, *real characters*.

According to him, the *characters* ſhould reſemble thoſe uſed in algebra: which, in effect, are very ſimple, yet very expreſſive; without any thing ſuperfluous or equivocal; and contain all the varieties required.

The real *character* of biſhop Wilkins has its juſt applauſe: Dr. Hook recommends it on his own knowlege and experience, as a moſt excellent ſcheme; and to engage the world to the ſtudy thereof, publiſhed ſome fine inventions of his own therein.

M. Leibnitz tells us, he had under conſideration *an alphabet of human thoughts*; in order to a new philoſophical language, on his own ſcheme; but his death prevented this from being brought to maturity.

M. Lodwic, in the Philoſophical Tranſactions, gives us a plan of *an univerſal alphabet*, or *character* of another kind: this was to contain an enumeration of all ſuch ſingle ſounds, or letters, as are uſed in any language; by means whereof people ſhould be enabled to pronounce truly and readily any language; to deſcribe the pronunciation of any language that ſhould be pronounced in their hearing; ſo, as others accuſtomed to this language, though they had never heard the language pronounced, ſhould at firſt be able truly to pronounce it: and, laſtly, this *character* to ſerve as a ſtandard to perpetuate the ſounds of any language. Abridgm. vol. iii. p. 373.

In the Journal Litteraire, an. 1720, we have a very ingenious project for an univerſal *character*: the author, after obviating the objections that might be made againſt the feaſibleneſs of ſuch ſchemes in the general, propoſes his own: his *characters* are to be the common Arabic, or numeral figures. The combinations of theſe nine are ſufficient to expreſs diſtinctly an incredible quantity of numbers, much more than we ſhall need terms to ſignify our actions, goods, evils, duties, paſſions, &c. Thus is all the trouble of framing and learning any new *characters* at once ſaved; the Arabic figures having already all the univerſality required.

The advantages are immenſe: for, 1. We have here a ſtable, faithful interpreter; never to be corrupted or changed, as the popular languages continually are. 2. Whereas the difficulty of pronouncing a foreign language, is ſuch as uſually gives the learner the greateſt trouble, and there are even ſome ſounds which foreigners never attain to; in the *character* here propoſed, this difficulty has no place: every nation is to pronounce them according to the particular pronunciation that already obtains among them. All the difficulty is, the accuſtoming the pen and the eye to affix certain notions to *characters* that do not, at firſt ſight, exhibit them. But this trouble is no more than we find in the ſtudy of any language whatever.

The inflexions of words are here to be expreſſed by the common letters: for inſtance, the ſame *character* ſhall expreſs a *filly*, or a *colt*, a *horſe*, or a *mare*, an *old horſe*, or an *old mare*, as accompanied with this or that diſtinctive letter, which ſhall ſhew the ſex, youth, maturity, or old age: a letter is alſo to expreſs the bigneſs or ſize of things; thus, v. g. a man with this or that letter, to ſignify a *great man*, or a *little man*, &c. The uſe of theſe letters belongs to the grammar, which once well underſtood, would abridge the vocabulary exceedingly. An advantage of this grammar is, that it would only have one declenſion, and one conjugation: thoſe numerous anomalies of grammarians are exceeding troubleſome, and ariſe hence, that the common languages are governed by the populace, who never reaſon on what is beſt: but in the *character* here propoſed, men of ſenſe introducing it, would have a new ground, whereon to build regularly.

The difficulty is not in inventing the moſt ſimple, eaſy, and commodious *character*, but in engaging the ſeveral nations to uſe it; there being nothing they agree leſs in, than the underſtanding and purſuing their common intereſt.

Characters, *literal*, again, may be divided, with reſpect to the nations among whom they have been invented, and uſed, into *Greek characters*, *Roman characters*, *Hebrew characters*, &c.

The *character* now ordinarily uſed throughout Europe, is the *Latin character* of the ancients.

The Latin *character* was formed from the Greek, and that from the Phœnician, which Cadmus brought into Greece.

The Phœnician *character* was the ſame with that of the ancient Hebrew, which ſubſiſted to the time of the Babyloniſh captivity; after which they uſed that of the Aſſyrians, which is the ſquare Hebrew, now in uſe; the ancient being only found on ſome Hebrew medals, commonly called *Samaritan medals*.

Poſtellus, and others ſhew, that beſide the Phœnician, the Chaldee, Syriac, and Arabic *characters*, were likewiſe formed from the ancient Hebrew.

The French were the firſt who, with the Latin of St. Gregory, admitted the Latin *characters*. And in a provincial ſynod, held in 1091, at Leon in Spain, the uſe of the Gothic *characters* invented by Ulfilas, was aboliſhed, and the Latin ones eſtabliſhed.

Medalliſts obſerve, that the Greek *character*, conſiſting only of majuſcule letters, has preſerved its uniformity on all medals, as low as the times of Gallienus; there being no alteration found in the turn of the *character*, notwithſtanding the many conſiderable ones both in the uſe and pronunciation. From the time of Gallienus, it appears ſomewhat weaker and rounder: from the time of Conſtantine to Michael, the ſpace of five hundred years, we find only Latin *characters*; and after Michael, the Greek *characters* re-commence; but from that time they began to alter with the language, which was then a mixture of GREEK and LATIN.

The LATIN medals preſerve both their *character* and language, as low as the tranſlation of the ſeat of the empire to Conſtantinople. Towards the time of Decius, the *character* began to alter, and to loſe of its roundneſs and beauty: ſome time after it retrieved itſelf, and ſubſiſted tolerably till the time of Juſtin; when it fell into the laſt barbarity mentioned, under Michael; though it afterwards grew worſe, and degenerated into the Gothic: ſo that the rounder and better formed the *character* is on a medal, the greater pretence it has to antiquity.

Characters, *numeral*, are thoſe uſed to expreſs numbers.

Numeral characters are either *letters*; or *figures*, otherwiſe called digits.—The kinds now chiefly in uſe, are the Common, and the Roman: to which may be added the GREEK, and another called the FRENCH *character*; as alſo the letters of other alphabets which have been made uſe of to expreſs numbers.

COMMON *character* is that ordinarily called the *Arabic*, as ſuppoſed to have been invented by the Arab aſtronomers; though the Arabs themſelves call it the *Indian character*; as if they had borrowed it from the people of India.

The *Arabic characters* are ten, viz. 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; the laſt is called *cipher*.

The *Arabic character* is uſed almoſt throughout Europe, and that on almoſt all occaſions; in commerce, in meaſuring, in aſtronomical calculations, &c.

Roman character conſiſts of the majuſcule letters of the Roman alphabet; whence probably its name: or perhaps, from its being uſed by the ancient Romans on their coins, and in the inſcriptions of their public monuments, erected in honour of their gods, and great men; on their ſepulchres, &c.

The numeral letters that compoſe the Roman *character* are in number ſeven, viz. I, V, X, L, C, D, M.

The I denotes one, V five, X ten, L fifty, C a hundred, D five hundred, and M a thouſand.

The I, repeated twice, makes two, II; thrice, three, III; four is expreſſed thus, IV, I before V or X taking an unit from the number expreſſed by each of thoſe letters.

To expreſs ſix, an I is added to a V, VI; for ſeven, two, VII; and for eight, three, VIII: nine is expreſſed by an I before X, IX; agreeably to the preceding remark.

The like remark may be made of the X before L or C, except that the diminution is by tens, not units: thus, XL ſignifies forty, and XC ninety; an L followed with an X, ſixty, LX, &c. The C before D or M, diminiſhes each by a hundred.

Beſides the letter D, which expreſſes five hundred, that number may alſo be expreſſed by an I before a C inverted, thus, IↃ; and thus, in lieu of the M, which ſignifies a thouſand, is ſometimes uſed an I between two C's, the one direct, the other inverted: agreeable to this, ſix hundred may be expreſſed IↃC; and ſeven hundred, IↃCC, &c.

The addition of C and Ↄ before, or after, raiſes CIↃ by tens thus, CCIↃↃ, 10000; CCCIↃↃↃ, 100,000, &c.

This is the common way of notation, formerly uſed by the Romans; who alſo expreſſed any number of thouſands by a line drawn over any numeral leſs than a thouſand; e. g. $\overline{\mathrm{V}}$, 5000; $\overline{\mathrm{LX}}$, 60,000: ſo likewiſe $\overline{\mathrm{M}}$ is 1,000,000; $\overline{\mathrm{MM}}$ is 2,000,000, &c.

Beſides which, (I.) certain liberties or variations have been admitted, at leaſt by ſome modern writers; e. g. IIX, 8; IICIX, 89. (II.) And certain *characters* have been uſed, which ſeem to have been derived from the letters; e. g. M, by which they expreſs (Mille) 1000, was formed from CXↃ, or CIↃ; half of which, viz. IↃ, ſtood for 500. (III.) And for the eaſier writing of theſe *characters*, 1. IↃ ſeems to have been altered into D; 2. IↃↃ into Ѧ, or V̄; 3. CIↃ into ∞ or ψ: whence ΨΥ, 1000; ΨΨ, 200, V. X.

In Roman inſcriptions, we meet with the *characters* ↀ and ∞, uſed to expreſs a thouſand. The uſual note of a thouſand, is either I between two CC's (direct and reverſed) thus, CIↃ; or elſe X, thus, CXↃ. The former figure, when cloſed at top, exactly reſembles an ancient M, thus, ↀ; and the latter, when ſhut up, the figure of 8, inclined thus ∞.

We alſo find, in ſome inſcriptions, the *character* ⊗, which is X between two CↃ's, but cloſed on all ſides. But the learned Dr. Taylor ſeems to ſuſpect the accuracy of the copy of the inſcription from whence this *character* is taken. See Phil. Tranſ. Nº 482. § 2. D

As to the origin and uſe of the *character* X, ſo often met with on the coins, utenſils, and manuſcripts of the ancients; ſee X.

Characters, *Hebrew*. See **Hebrew**.

Greek numerals. The Greeks had three ways of expreſſing numbers. (I.) The moſt ſimple was, for every ſingle letter, according to its place in the alphabet, to denote a number from α 1 to ω 24; in which manner the books of Homer's Ilias are diſtinguiſhed. (II.) Another way was by dividing the alphabet into, (1.) 8 Units: α 1, β 2, &c. (2.) 8 Tens: ι 10, κ 20, &c. (3.) 8 Hundreds: ρ 100, σ 200, &c. N. B. Thouſands they expreſſed by a point, or accent under a letter, e. g. ͵α 1000, ͵β 2000, &c. (III.) A third way was by ſix capital letters, thus, I [ια for μια] 1, Π [ϖεντε] 5, Δ [δεκα] 10, H [Ηεκατον] 100, X [χιλια] 1000, M [μυρια] 10000: and when the letter Π incloſed any of theſe, except I, it ſhewed the incloſed letter to be five times its own value, as, $|\overline{\Delta}|$ 50, $|\overline{\mathrm{H}}|$ 500, $|\overline{\mathrm{X}}|$ 5000, $|\overline{\mathrm{M}}|$ 50000.

N. B. 6,90,900 are expreſſed by *character* ϛ.

Hebrew numerals. The Hebrew alphabet was divided into 9 Units: א 1, ב 2, &c.—9 Tens: י 10, כ 20, &c.—9 Hundreds: ק 100, ר 200, &c. ך 500, ם 600, ן 700, ף 800, ץ 900.—Thouſands, (1.) were ſometimes expreſſed by the units prefixed, to hundreds, as, אדלר, 1534, &c. and even to tens, as, אע, 1070, &c. (2.) But generally by the word אֶלֶף, 1000; אַלְפַּיִם, 2000; אֲלָפִים, with the other numerals prefixed, to ſignify the number of thouſands: e. g. גאֲלָפִים, 3000, &c.

Character, *French*, ſo called, becauſe invented, and chiefly uſed by the French, is more uſually denoted, *character of account*, or *finance*.

It conſiſts of ſix figures; partly taken from the letters of the uſual current hand, and partly invented by the contriver; the ſix *characters* are *j*, *b*, *x*, L, C, γ. The *j* conſonant ſtanding for one, the *b* for five, the *x* for ten, the L for fifty, the C for an hundred, and the laſt *character* γ for a thouſand.

This *character* is only an imitation of the Roman *character*; and its uſe in moſt reſpects the ſame, particularly in what relates to the combination of certain letters, which placed before or after others, diminiſh or increaſe their value. Indeed it has theſe things peculiar in it, that when ſeveral things occur ſucceſſively, only the laſt is expreſſed. 2dly, That ninety, and the following numbers to one hundred, are expreſſed, thus, $jjjj^{xxx}$, ninety; $jjjj^{xxxj}$, ninety-one; $jjjj^{xxjj}$, &c.

It is principally uſed in the chambers of accounts, in the accounts given in by treaſurers, receivers, farmers, and other perſons concerned in management of the revenue.

Characters, in *Printing*, denote the letters or types, by the various arrangement whereof, are compoſed forms; whence impreſſions are taken, by means of a preſs, on paper.

For the method of caſting theſe Characters, ſee *Letter* **Foundery**.

Character, is alſo uſed in ſeveral of the arts, for a ſymbol, contrived for a more conciſe, immediate, and artful conveyance of the knowledge of things.

In this ſenſe of the word, Paulus Diaconus refers the invention of *characters* to Ennius; who, he ſays, contrived the firſt eleven hundred. To theſe were many more added by Tyro, Cicero's freedman, and by Philagyrus, Fannius, and Aquila, freedmen of Mæcenas.

Laſtly, L. Annæus Seneca made a collection of them, reduced them into order, and increaſed their number to five thouſand. Tyro's notes may be ſeen at the end of Gruter's inſcriptions.

Valerius Probus, a grammarian, in the time of Nero, laboured to good purpoſe in explaining the notes of the ancients. P. Diaconus wrote an ample treatiſe of the explication of the *characters* in law, under the reign of the emperor Conrad I. and Goltzius another for thoſe of medals.

Characters, or ſymbols, are now chiefly affected in the ſeveral parts of mathematics; particularly in algebra, geometry, trigonometry, and aſtronomy: as alſo in medicine, chemiſtry, muſic, &c. The principal of each kind we ſhall here ſubjoin.

Characters *uſed in Arithmetic and Algebra.*

a, *b*, *c*, and *d*, the firſt letters of the alphabet, are the ſigns or *characters* that denote given quantities; and *z*, *y*, *x*, &c. the laſt letters, are the *characters* of quantities ſought. Some for the former, uſe conſonants, or large letters, and vowels, or ſmall ones, for the latter.

Note, Equal quantities are denoted by the ſame *character*.

m, *n*, *r*, *s*, *t*, &c. are *characters* of indeterminate exponents, both of ratios and powers; thus x^m, y^n, z^r, &c. denote indeterminate powers of different kinds; mx, ny, rz, different multiples, or ſubmultiples of the quantities x, y, z, according as m, n, r, are either whole numbers or fractions.

+ Is the ſign of real exiſtence, and is called the *affirmative*, or *poſitive* ſign; importing the quantities to which it is prefixed, to have a real and poſitive nature.

It is alſo the ſign of addition, and is read *plus*, or *more*; thus $9+3$, is read 9 *plus* 3; or 9 more 3: that is, the ſum of 9 and 3, equal to 12.

— Before a ſingle quantity, is the ſign of *negation*, or *negative* exiſtence; ſhewing the quantity to which it is prefixed to be leſs than nothing.

Between quantities, it is alſo the ſign of ſubtraction, and is read *minus*, or *leſs*; thus $14-2$, is read 14 *minus*, or abating 2; that is, the remainder of 14, after 2 has been ſubtracted, viz. 12.

= Is the ſign of *equality*: thus, $9+3=14-2$; ſignifies 9 *plus* 3, to be *equal* to 14, *minus* 2.

This *character* was firſt introduced by Harriot: Des Cartes in lieu of it uſes ∞. Before Harriot there was no ſign of equality at all.

Wolfius, and ſome other authors, uſe the ſame *character*, = for the identity of ratios; or to denote the terms to be in a geometrical proportion; which moſt authors expreſs thus ::

× Is the ſign of *multiplication*, denoting the quantities on either ſide to be multiplied into one another: thus, 4×6, is read 4 multiplied by 6; or the factum, or product of 4 and $6=24$; or the rectangle between 4 and 6.

Ordinarily, however, in algebra, the ſign is omitted, and the two quantities put together: thus bd expreſſes the product of the two numbers denoted by b and d, which ſuppoſe 2 and 4, the product whereof is 8, ſignified by bd.

Wolfius, and others, make the ſign of multiplication a dot (.) between the two factors: thus 6.2 ſignifies the product of 6 and $2=12$.

Where one or both the factors are compounded of ſeveral letters, they are diſtinguiſhed by a line drawn over them: thus, the factum of $a+b-c$ into d, is wrote $d\times\overline{a+b-c}$.

Guido Grandio, and after him Leibnitz, Wolfius, and others, to avoid the perplexity of lines, in lieu thereof diſtinguiſh the compound factors, by including them in a parentheſis, thus $(a+b-c)\,d$.

÷ Is the *character* of *diviſion*: thus, $a \div b$ denotes the quantity a to be divided by b.

Indeed, ordinarily, in algebra, the quotient is expreſſed fraction-wiſe; thus, $\frac{a}{b}$ denotes the quotient of a divided by b.

Wolfius, &c. make the ſign of diviſion (:) thus, $8:4$ denotes the quotient of 8 divided by $4=2$.

If either the diviſor or dividend, or both, be compoſed of ſeveral letters, v. g. $a+b$, divided by c; inſtead of writing the quotient fraction-wiſe, thus, $\frac{a+b}{c}$, Wolfius, &c. include the compound quantities in a parentheſis; thus, $(a+b:c)$, or $(a+b):c$.

@ Is the *character* of *involution*, or of producing the ſquare of any quantity, by multiplying it by itſelf.

ω The *character* of *evolution*, or of extracting the roots out of the ſeveral powers; the reverſe of @.

⌉ Is the ſign of *majority*, or of the exceſs of one quantity beyond another: ſome uſe this ⊏, or this ⊐.

∠ Is the ſign of *minority*. Theſe two *characters* were firſt introduced by Harriot, and have been ſince uſed by Wallis and Lamy. Other authors uſe others; ſome this ⊐.

∽ The ſign of SIMILITUDE commended in the Miſcellanea Berolinenſia, and uſed by Leibnitz, Wolfius, and others; though the generality of authors uſe none. The ſame *character* is uſed by other authors for the difference between two quantities, while it is yet unknown which is the greater.

√ Is the *character* of *radicality*, and ſhews that the root of the quantity, to which it is prefixed, is extracted, or to be extracted: thus, $\sqrt{25}$, or $\sqrt[2]{25}$, denotes the ſquare root of 25, viz. 5; and $\sqrt[3]{25}$, the cube root of 25. See ROOT.

This *character* ſometimes affects ſeveral quantities diſtinguiſhed by a line drawn over them, thus, $\sqrt{b+d}$, denotes the ſquare root of the ſum of b and d.

Wolfius, &c. in lieu hereof, includes the roots compoſed of ſeveral quantities in a parentheſis, adding its index: thus, $(a+b-c)^2$ denotes the ſquare of $a+b-c$, ordinarily written $\overline{a+b-c}^2$.

: Is the *character* of arithmetical proportion disjunct; thus, $7.3:13.9$, intimates 3 to be exceeded by 7, as much as 9 by 13; viz. by 4.

:: This is the *character* of identity of ratio, and geometrical proportion disjunct; thus, $8:4::30:15$, expreſſes the ratio of 30 to 15, to be the ſame with that of 8 to 4; or that the four terms are in geometrical proportion, viz. 8 to 4, as 30 to 15.

Wolfius, in lieu hereof, uſes the *character* of equality =; which he prefers to the former, as being more ſcientifical and expreſſive.

∺ The *character* of geometrical proportion continued, implying the ratio to be carried on without interruption: thus, 2, 4, 8, 16, 32, ∺ are in the ſame uninterrupted proportion.

When one or more terms in an equation are wanting, their places are uſually marked with one or more aſteriſms; as,

$$\left.\begin{array}{r} y^2+py+\frac{1}{4}p^2 \\ -py-\frac{1}{2}p^2 \\ +q \end{array}\right\} = 0.\quad y^2 * -\frac{1}{4}p^2+q=0.$$

Character of *decimals*. See SEPARATRIX.

CHARACTERS *uſed in Aſtronomy*.

♄ *Character* of Saturn.
♃ Jupiter.
♂ Mars.
♀ Venus.
☿ Mercury.
☉ The Sun.
☾ The Moon.
⊕ The Earth, or ♁.
♈ Aries.
♉ Taurus.
♊ *Character* of Gemini.
♋ Cancer.
♌ Leo.
♍ Virgo.
♎ Libra.
♏ Scorpio.
♐ Sagittarius.
♑ Capricornus.
♒ Aquarius.
♓ Piſces.

CHARACTERS *of the Aſpects, Nodes, &c.*

S Conjunction.
SS Semiſextile.
* Sextile.
Q Quintile.
□ Quartile.
Td Tridecile.
△ Trine.
Bq Biquentile.
Vc Quincunx.
☍ Oppoſition.
☊ Scorpion's head.
☋ Scorpion's tail.

CHARACTERS *of Time*.

A. M. *(ante meridiem)* or M. morning.
O. or M. noon.
P. M. *(poſt meridiem)* or A. afternoon.

CHARACTERS *uſed in Chemiſtry, Medicine, and Pharmacy.*

Authors are very redundant, and even fanciful, in pharmaceutical *characters*: but the moſt uſual are exhibited in the *Table of* CHEMICAL, *&c. Characters.*

CHARACTERS *in Commerce.*

D° *Ditto*, the ſame.
N° *Numero*, or number.
F° *Folio*, or page.
R° *Recto*, } folio.
V° *Verſo*, } folio.
l. or £. *ſterling*, Pound ſterling.
s. Shillings.
d. Pence, or Deniers.
℔ Pound weight.
C. or ⊕ Hundred weight, or 112 pound.
qr Quarters.
⅌ *Per*, or by. As ⅌ *ann.* by the year. ⅌ *cent.* in the hundred, &c.
*R*ˣ Rixdollar.
*D*ᵈ Ducat.
P. S. Poſtſcript.

CHARACTERS *in Geometry, and Trigonometry.*

‖ Is the *character* of paralleliſm; implying two lines or planes to be equidiſtant from one another. See PARALLEL.

△ *Character* of a triangle. See TRIANGLE.
□ A ſquare.
▯ ▭ A rectangle.
⊙ A circle.
$\overset{\vee}{=}$ Equality of angles.
$\overset{1}{=}$ Equality of ſides.
< An angle.
∟ A right angle.
⊥ A perpendicular.

° A degree; thus, 75° implies 75 degrees.

′ A minute, or prime; thus, 50′ implies 50 minutes.

″, ‴, ⁗, &c. the characters of ſeconds, thirds, fourths, &c. of a degree: thus, 5″, 6‴, 18⁗, 20′′′′′, denote 5 ſeconds, 6 thirds, 18 fourths, and 20 fifths.

Note. The ſame *characters* are ſometimes uſed, where the progreſſion is by tens, as it is here by ſixties.

CHARACTERS *in Grammar, Rhetoric, Poetry, &c.*

, *Character* of a *Comma*.
; *Semicolon*.
: *Colon*.
. *Period*.
! *Exclamation*.
? *Interrogation*.
() *Parentheſis*.
- *Hyphen*.
’ *Apoſtrophe*.
´ *Emphaſis*, or accent.
˘ *Breve*.
¨ *Dialyſis*.
^ *Caret*, and *Circumflex*.
“ *Quotation*.
† and * *References*.
§ *Section*, or *Diviſion*.
¶ *Paragraph*.

L L. D. *Doctor of Laws*, or, *of the Civil and Canon Law*.
S S. T. D. *Sacro-Sanctæ Theologiæ Doctor*, or D. D. i. e. *Doctor in Divinity*.
M. D. *Doctor in Phyſic*.
V. D. M. *Verbi Dei Miniſter*, *Miniſter of the Word of God*.
A. M. *Artium Magiſter*, *Maſter of Arts*.
A. B. *Artium Baccalaureus*, *Bachelor of Arts*.
F. R. S. *Fellow of the Royal Society*.
F. A. S. *Fellow of the Antiquarian Society*.

CHARACTERS *uſed in the arithmetic of Infinites.*

. The *character* of an infiniteſimal, or fluxion: thus, $\dot{x}$, $\dot{y}$, &c. expreſs the fluxions, or differentials of the variable quantities x and y; two, three, or more dots, denote ſecond, third, or higher fluxions.

This method of denoting the fluxions, we owe to Sir Iſaac Newton, the inventor of fluxions: it is adhered to by the Engliſh; but foreigners generally follow M. Leibnitz, and in lieu of a dot prefix the letter d to the variable quantity; on pretence of avoiding the confuſion ariſing from the multiplication of dots, in the differencing of differentials.

d The *character* of a differential of a variable quantity; thus, dx is the differential of x; dy the differential of y. The *character* was firſt introduced by M. Leibnitz; and is followed by all but the Engliſh. See CALCULUS *Differentialis*.

CHARACTERS *among the Ancient Lawyers, and in Ancient Inſcriptions.*

§ *Paragrapho.*
ff. *Digeſtis.*
E. *Extra.*
S.P.Q.R. *Senatus Populuſque Romanus.*

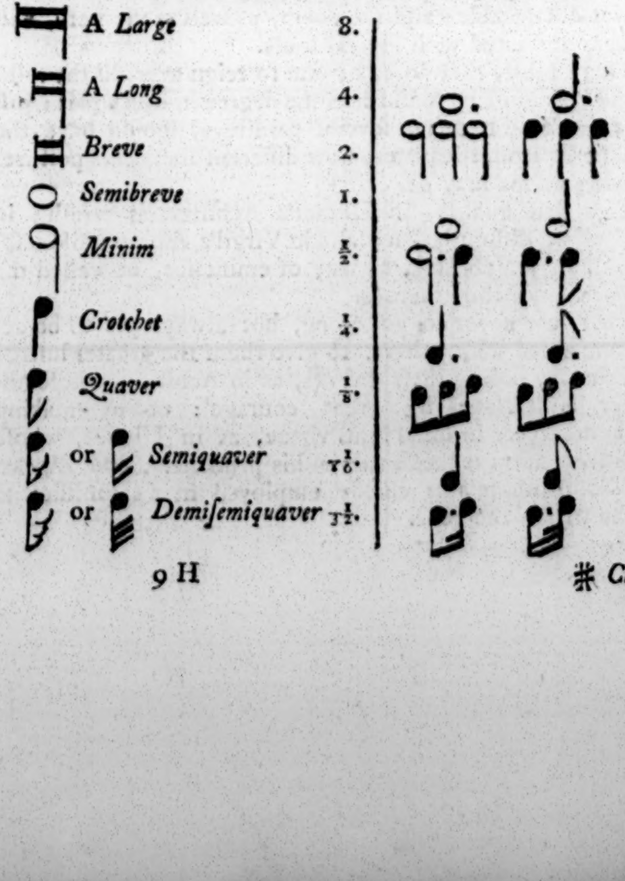
Scto. *Senatuſconſulto.*
P. P. *Pater Patriæ.*
C. *Code.*
CC. *Conſules.*
T. *Titulus*, &c.

CHARACTERS *uſed in Muſic.*

Characters of the muſical notes, with their proportions.



♯ *Character* of a *ſharp note.* This *character* at the beginning of a line, or ſpace, denotes all the notes in that line, or ſpace, to be taken a ſemitone higher than in the natural ſeries. And the ſame affects all their octaves, above and below, though not marked.

When the *character* is prefixed to any particular note, it ſhews that note alone to be a ſemitone higher than it would be without ſuch *character*.

♭ *Character* of a *flat note.* This *character*, at the beginning of a line, or ſpace, ſhews, that all the notes in that line, or ſpace, are to be taken a ſemitone lower than in the natural ſeries; affecting, in like manner, all the octaves, both above and below. When prefixed to any note, it ſhews that note alone to be a ſemitone lower than it would otherwiſe be.

♮ *Character* of a *natural note.* Where, in a line or ſeries of artificial notes, marked at the beginning for either ſharps or flats, the natural note happens to be required, it is denoted by this *character*.

𝄞 *Character* of *treble clef.*

𝄡 *Mean clef.*

𝄢 *Baſs clef.*

For *characters* in *Printing*, ſee **Correction.**

Characters *of Time.*

2, or $\frac{2}{4}$, or $\frac{4}{8}$; *characters* of *common*, or *duple time*; ſignifying the meaſure of two crotchets to be equal to two notes; whereof four make a ſemibreve.

C ₵ Ͽ *Characters* that diſtinguiſh the movements in *common time*: the firſt implying ſlow; the ſecond, briſk; third, very quick.

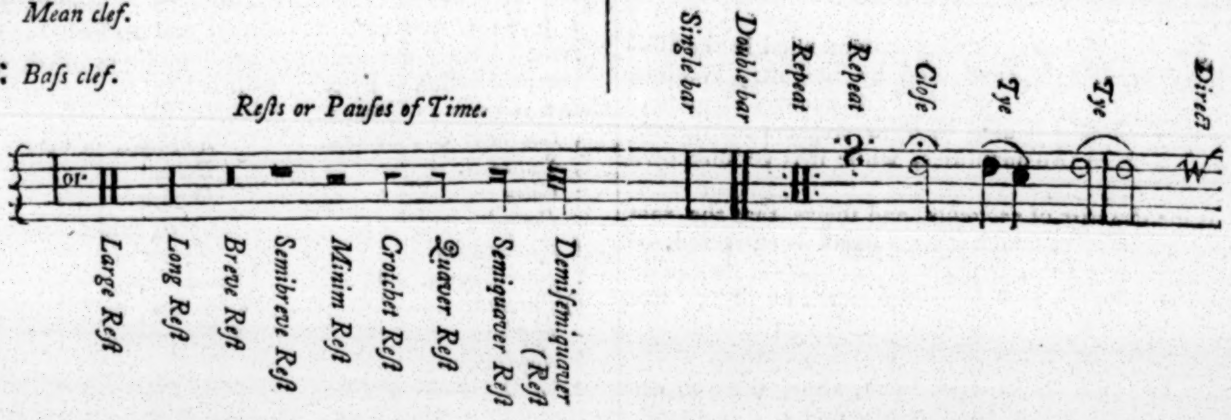
$\frac{3}{10}$, $\frac{3}{1}$, $\frac{3}{2}$, $\frac{3}{8}$, $\frac{3}{16}$; *characters* of the *ſimple triple time*; whoſe meaſure is equal either to three ſemibreves, or to three minims, &c.

$\frac{6}{4}$, or $\frac{6}{8}$, or $\frac{6}{16}$; *characters* of *mixed triple time*; where the meaſure is equal to ſix crotchets, or ſix quavers, &c.

$\frac{9}{4}$, or $\frac{9}{8}$, or $\frac{9}{16}$; $\frac{9}{1}$, or $\frac{9}{2}$; *characters* of *compound triple time.*

$\frac{12}{4}$, or $\frac{12}{8}$, or $\frac{12}{16}$; or $\frac{12}{1}$, or $\frac{12}{2}$; *characters* of the fourth ſpecies of *triple time*; called, *the meaſure of twelve times.*

Reſts or Pauſes of Time.



Characters *on Tomb-ſtones.*

S. V. *Siſte, Viator*; *Stay, Traveller.*

M. S. *Memoriæ Sacrum*; *Sacred to memory.*

D. M. *Diis Manibus.*

IHS. *Jeſus.*

XP. A *character* found on ancient monuments; about the meaning whereof authors are not agreed. See **Catacomb.**

Character is alſo uſed for a certain manner, air, or aſſemblage of qualities, reſulting from ſeveral particular marks, which diſtinguiſh a thing from any other, ſo as it may be known thereby.

Thus, we ſay, the *character* of Achilles; generoſity and greatneſs of mind was the *character* of the Romans; Cicero had a *character* of politeneſs, which is wanting in Demoſthenes; every paſſion has its peculiar *character*.

The writers of *characters* are, Theophraſtus, whoſe fragments are ſtill extant; Du Moulin, in his Exemplar Morum; Paſchal, in his Characteres Virtutum & Vitiorum; M. de la Chambre, in his Characters of the Paſſions; and De la Bruyere, in his Characters and Manners of the Age.

Character, in *Poetry*, eſpecially the epopea and drama, is the reſult of the manners, or that which each perſon has peculiar and ſingular in his manners, whereby he is diſtinguiſhed from others.

The poetical *character*, Boſſu obſerves, is not properly any virtue or quality in particular; but it is a compoſition of ſeveral, mixed and combined in various degrees, according to the occaſions of the fable, and the unity of the action. All the ſimple qualities that enter this compound, muſt not have the ſame rank, nor be equal to each other: ſince, in that caſe, one prevailing on one occaſion, and another on another, the *character* will appear changeable; and the poem, as well as the hero, will ſeem animated with ſeveral ſouls.

There muſt, therefore, be one to reign over all the reſt; and this muſt be found in ſome degree in every part: juſt as the ſame hero, in ſeveral paintings, ſhould have the ſame lines and features, how different ſoever his poſtures and paſſions may be.

This firſt quality, in Homer's Achilles, is wrath; in Ulyſſes, diſſimulation; and in Virgil's Æneas, mildneſs: each of which may, by way of eminence, be called the *character* of thoſe heroes.

Theſe are never to go alone, but always are to be accompanied with others, to give them the greater luſtre; either by hiding their defects, as in Achilles, whoſe anger is palliated by great courage: or by making them center in ſome ſolid virtue, as in Ulyſſes, whoſe diſſimulation makes a part of his prudence; and Æneas, whoſe mildneſs is chiefly employed in a ſubmiſſion to the will of the gods.

Theſe ſecondary qualities of courage, prudence, and ſubmiſſion, make the goodneſs of the *characters* of thoſe heroes, and even of the poems.

Boſſu adds, that the quality of courage muſt always have a ſhare in the *character* of a hero, to ſerve as a ſupport to the reſt: the heroic *character*, therefore, he makes a compound of three kinds of qualities. Thoſe of the firſt kind are neceſſary and eſſential to the fable; thoſe of the ſecond are the ſupplements, or embelliſhments of the firſt; and courage, which ſuſtains the other two, makes the third.

The firſt, which is the chief, is to be ſome univerſal quality, to have place on all occaſions, and to diſtinguiſh the hero wherever he is found.

For the unity of *character*, we have Horace's expreſs command, *Sit quodvis ſimplex duntaxat & unum.* Boſſu adds, that the *character* is not leſs the ſoul of the hero, and the whole action, than the fable is of the poem; and of conſequence the unity muſt be as exact in the one as the other: which accordingly we find obſerved both by Homer and Virgil.

The unity of *character* is ſomewhat different from that of the manners: in the latter, the unity or equality conſiſts in not giving contrary ſentiments to the ſame perſon; which is not ſufficient to the unity of *character*; but to this muſt be added, that the ſame ſpirit muſt always appear on all occaſions, whether contrary, or otherwiſe: thus, Æneas ſhewing great goodneſs in the firſt part of the poem, and much valour in the ſecond, but without diſcovering any of his former piety, and gentleneſs; there had been no offence againſt the evenneſs of the manners, but much againſt the unity of the *character*.

So that beſides the qualities which have their particular place on different occaſions, there muſt be one to have place throughout, and to reign over all the others. Without this there is no *character*: as would be the caſe, ſhould a poet give his hero the piety of Æneas, and the courage of Achilles, without conſidering the ſeverity of the one, and the mildneſs of the other.

A hero, it is true, may be made as brave as Achilles, as mild, or pious, as Æneas, and, if the writer thinks proper, as prudent as Ulyſſes; but it would be a mere chimera to imagine a hero with the particular courage of Achilles, the piety of Æneas, and the prudence of Ulyſſes, at the ſame time.

The unity of *character* is not only to be kept in the hero, and the ſeveral other perſons of the piece; but alſo in that of the poem itſelf: that is, all the *characters*, how oppoſite ſoever, muſt center and re-unite in that of the hero; and be ſo ſwayed by it, as that this alone may ſeem to govern throughout the whole. Thus Homer makes wrath prevail throughout the whole Iliad; and artifice and diſſimulation throughout the Odyſſee: the hero's *character* is perceived every where, has its full ſway, and is favoured by the ſimilitude of the *characters* of ſome of the other perſons. Virgil had a great difficulty to grapple with, to preſerve his unity; becauſe of the direct oppoſition between the humours of his hero, and thoſe of ſome other of his perſons, as Turnus, Mezentius, Dido, &c. He therefore takes care not to carry thoſe oppoſite *characters* to their full length, but moderates and reſtrains them: and as that moderation could not flow naturally from the perſons themſelves, it is produced either by ſome paſſion, as in Dido; or ſome dependence, as in Turnus and Mezentius. To this artifice he adds epiſodes, accommodated to the general *character*, by which he interrupts the particular actions, which require an oppoſite *character*.

Claudian's conduct, in this reſpect, is unpardonable; from the horrible *characters* of Pluto, and the Furies, with all the terrors of hell, he paſſes to the gaiety and pleaſures of the Graces, gilded palaces, flowery fields, &c. He has as many different prevailing *characters* in his three books, as Homer and Virgil in their ſixty.

CHARACTER is alſo uſed for certain viſible qualities, which claim reſpect or reverence, to thoſe veſted therewith.

The majeſty of kings gives them a *character*, which procures reſpect from the people. A biſhop ſhould ſuſtain his *character* by learning and ſolid piety, rather than by worldly luſtre, &c.

CHARACTER is alſo uſed among *Divines*, eſpecially thoſe of the Romiſh church, for an indelible mark, or impreſſion, which certain ſacraments are ſuppoſed to leave behind them in thoſe who receive them.

The ſacraments that leave this *character*, are incapable of being repeated. The *character* is generally ſuppoſed to be ſomething phyſical.

The ſacraments of baptiſm, confirmation, and ordination, in particular, leave ſuch indelible *character*.

CHARACTERS *of fiſhes*, *characteres piſcium*, are thoſe marks by which each particular fiſh is diſtinguiſhed from thoſe other ſpecies of the ſame genus to which it belongs, and by which it is to be referred to its genus. Theſe *characters* are the eſſential foundation of all the natural diviſions in this part of hiſtory, and by means of theſe alone the young ſtudent is led to the real knowlege of the bodies under conſideration, whether according to the works of other authors, or ſome new ſyſtem of his own. The naturaliſts of former ages did not pay a ſufficient regard to theſe marks, and conſequently could not hit upon the natural diviſions of bodies, but had recourſe to the artificial diſtinctions taken from accidents or variable properties in them, and the general external appearance uſually gave rules to them; hence the uncertainty and confuſion of the diviſions of the old authors, and method and regularity of thoſe of the moderns. See GENERICAL *name*.

CHARACTERS *of plants*. See GENUS, &c.

CHARACTERISTIC, in the general, is that which *characterizes* a thing, or perſon, i. e. conſtitutes its *character*, whereby it is diſtinguiſhed from all others.

CHARACTERISTIC is peculiarly uſed in *Grammar*, for the principal letter of a word; which is preſerved in moſt of its tenſes and moods, its derivatives, and compounds.

The *characteriſtic* frequently ſhews its etymology; and ought conſtantly to be retained in its orthography; ſuch is the letter *r* in *courſe*, *fort*, &c.

The *characteriſtics* are of great uſe in the Greek grammar, eſpecially in the formation of the tenſes; as being the ſame in the ſame tenſes of all verbs of the ſame conjugation, excepting in the preſent tenſe, which has ſeveral *characteriſtics*; and the future, the aoriſtus primus, the preterperfect, and the pluſquam perfect tenſe of the fourth conjugation, which have two *characteriſtics*.

CHARACTERISTIC *of a* LOGARITHM, is its INDEX or exponent.

CHARACTERISTIC *triangle of a curve*. See CURVE.

CHARADRIUS, in *Zoology*, a name by which Geſner and Aldrovandus have called the OEDICNEMUS, a bird very improperly called in Engliſh the *ſtone*-CURLEW. Aldrov. lib. xiii. cap. 15.

CHARADRIUS, in the Linnæan ſyſtem of *Zoology*, is a diſtinct genus of birds, of the order of the SCOLOPACES; the diſtinguiſhing character of which is, that the feet have each three toes, and the point of the bill is cylindrical. See *Tab. of Birds*, N° 45.

CHARAG, the tribute which Chriſtians and Jews pay to the grand ſignior.

It conſiſts of ten, twelve, or fifteen francs *per ann.* according to the eſtate of the party. Men begin to pay it at nine, or at ſixteen years old; women are diſpenſed with, as alſo prieſts, rabbins, and religious.

CHARAIMS, a ſect of the Jews in Egypt. They live by themſelves, and have a ſeparate ſynagogue; and as the other Jews are remarkable for their eyes, ſo theſe are for their large noſes, which run through all the families of this ſect. Theſe are the ancient Eſſenes. They ſtrictly obſerve the five books of Moſes, according to the letter, and receive no written traditions. It is ſaid that the other Jews would join the *Charaims*; but thoſe not having obſerved the exact rules of the law with regard to divorces, theſe think they live in adultery.

CHARANTIA, in *Botany*, a name by which ſome authors have called the male balſam. Ger. Emac. Ind. 2.

CHARAX, in *Ichthyology*, a name given by Ælian, Appian, and many other of the Greek writers, to the fiſh called by later writers the CARASSIUS.

It is properly a ſpecies of the CYPRINUS, diſtinguiſhed by the name of the cyprinus with twenty rays in the back fin, and with the *linea lateralis* ſtraight.

CHARBON, in the *Manege*, ſignifies that little black ſpot or mark that remains after a large ſpot, in the cavity of the corner teeth of a horſe. About the ſeventh or eighth year, when the cavity fills, the tooth being ſmooth and equal, it is ſaid to be raiſed.

CHARCOAL, a ſort of artificial coal, or fuel, conſiſting of wood half burnt; chiefly uſed where a clear ſtrong fire, without ſmoke, is required; the humidity of the wood being here moſtly diſſipated, and exhaled in the fire wherein it was prepared.

The microſcope diſcovers a ſurpriſing number of pores in *charcoal*: they are diſpoſed in order, and traverſe it lengthwiſe; ſo that there is no piece of *charcoal*, how long ſoever, but may be eaſily blown through. If a piece be broken pretty ſhort, it may be ſeen through with a microſcope. In a range the eighteenth part of an inch long, Dr. Hook reckoned one hundred and fifty pores; whence he concludes, that in a *charcoal* of an inch diameter, there are not leſs than five millions ſeven hundred twenty-four thouſand pores.

It is to this prodigious number of pores, that the blackneſs of *charcoal* is owing: for the rays of light, ſtriking on the *charcoal*, are received and abſorbed in its pores, inſtead of being reflected; whence the body muſt of neceſſity appear black, blackneſs in a body being no more than a want of reflexion.

Dr. Prieſtley conjectures, that this is owing to the oil of the wood, made empyreumatic, and burnt to a certain degree; and that it is connected with the phlogiſton, united to the earth of the plant, when the union is ſtrengthened by an intenſe heat. The ſame ingenious philoſopher has diſcovered that *charcoal* is an excellent conductor of electricity; and that the degree of its conducting power depends on the degree of heat with which it is prepared; and he aſcribes this power to the phlogiſton united with it in the proceſs, intimating that the ſtrength of the conducting power may depend more on the perfect union between the inflammable principle and its baſe, which reſults from the degree of heat only, than on the quantity of phlogiſton thus united to the earth. He adds, that as *charcoal*, when ſeparated from the external air, will bear a greater degree of heat, without being diſſipated into vapour, than ſilver or gold, it may be poſſible to make this ſubſtance a better conductor of electricity than the moſt perfect metals. Wood in the proceſs of being reduced to *charcoal* is diminiſhed both in weight and bulk: nevertheleſs wood and *charcoal* expand by a certain degree of heat, but the latter in the greateſt proportion; and a greater degree of heat makes them contract.

The noxiouſneſs of air infected with the fumes of burning *charcoal* is well known: the cauſe of this has been ſufficiently explained by Dr. Prieſtley, &c. who accounts for it by the diminution of the air, in conſequence of being overcharged with phlogiſton, and the depoſition of fixed air. See AIR, *fixed*. Prieſtley's Electricity, vol. ii. p. 193. Exper. and Obſ. on Air, vol. i. p. 129. and vol. ii. p. 241. or Phil. Tranſ. vol. lx. art. 19. p. 211.

Mathematical inſtrument-makers, engravers, &c. find *charcoal* of great uſe to poliſh their braſs and copper-plates, after they have been rubbed clean with powdered pumice-ſtone. Mr. Boyle ſays, that the more curious burn it a ſecond time, and quench it in a convenient fluid. Plates of horn are poliſhable the ſame way, and a gloſs may be afterward given with tripoly.

Charcoal and SOOT-*black* are the two moſt durable and uſeful blacks of the painter, and the varniſh-maker. Thoſe of the former kind are uſed both as pigments and pencils; and *charcoal* crayons prepared from the willow are preferred on account of their ſoftneſs. See concerning them Lewis's Commercium Phil. Techn. p. 336.

Charcoal tinges glaſs in fuſion yellow, reddiſh, &c. and by baking ſtains it yellow. See ibid. p. 628. See alſo his obſervations on the differences of different *charcoals*, &c. and on the manner of diſtinguiſhing between the vegetable and animal, ibid. p. 336, & ſeq.

Charcoal was anciently uſed to diſtinguiſh the bounds of eſtates and inheritances; as being ſuppoſed incorruptible, when let very deep within the ground. In effect, it preſerves itſelf ſo long, that there are many pieces found entire in the ancient tombs of the northern nations.

M. Dodart ſays, there is ſometimes found *charcoal* made of corn, probably as old as the days of Cæſar: he adds, that it has kept ſo well, that the wheat may be ſtill diſtinguiſhed from the rye; which he looks on as a proof of its incorruptibility.

Charcoal, *method of making*.—The beſt is that made of oak, cut into lengths of about three feet. The ground whereon the operation is to be performed, is bared of all the turf, and other combuſtible matter; and is in form circular, a ſtake being driven in the center. This area is filled up with wood, eight feet high, placed alternatively lengthwiſe, and perpendicularly; then coped a-top in the form of a ſugar-loaf, and all inequalities filled up with ſmall wood, till it lie very cloſe: the whole is then to be covered over moderately thick with turf, and other rubbiſh.

A moveable ſcreen being then ſet up againſt the wind, the ſtake is pulled up, and fire ſet to the pile, by pouring into the cavity ſome *charcoal*, and other coal fully kindled; the vent, or tunnel a-top, is then covered with turf, and vent-holes are made through the ſtuff that covers the pile, two or three feet apart, quite round, a foot from the top. The next day a new range of holes is made, a foot and a half below the firſt, and thus on to the bottom: obſerving, that as the pile cools, and ſinks to the center, it muſt be continually fed with ſhort wood, that no part remain unfired; and that if any part chars faſter than other, the vent-holes there are to be ſtopped up. A parcel is thus burnt in five or ſix days: as it cools, the ſmoke grows thinner and bluer. The heap requires two or three days to cool; which is promoted by ſtopping the vents, and ſtripping off the covering by degrees, about a yard at a time; at firſt only taking off the coarſeſt part, and leaving the reſt, that the pile may neither cool too faſt, nor endanger the reduction of the whole into aſhes. Laſtly, the coals are taken out from round the bottom, by which means the whole maſs, coals and rubbiſh, ſinks down, and extinguiſhes the fire at once.

Charcoal for powder-mills, is uſually made of elder-wood; the proceſs is the ſame; but is finiſhed in two days.

CHARDS, in *Gardening*.—The *chards* of artichokes are the leaves of good artichoke-plants, tied and wrapped up, all over but the top, in ſtraw, during the autumn and winter; this makes them grow white, and loſe ſome of their bitterneſs.

Chards *of beets* are white beets, covered with dry dung, during the winter-ſeaſon, when they produce large tops, with a downy cotton ſhoot; which is the true *chard*, to be uſed in pottages, intermeſſes, &c.

CHARGE, in *Electricity*, in a ſtrict ſenſe, denotes the accumulation of the electric matter on one ſurface of an electric, as a pane of glaſs, Leyden phial, &c. whilſt an equal quantity paſſes off from the oppoſite ſurface: or, more generally, electrics are ſaid to be *charged*, when the equilibrium of the electric matter on the oppoſite ſurfaces is deſtroyed, by communicating one kind of electricity to one ſide, and the contrary kind to the oppoſite ſide: nor can the equilibrium be reſtored till a communication be made by means of conducting ſubſtances between the two oppoſite ſurfaces. And when this is done, the electric is ſaid to be diſcharged. The *charge* properly refers to one ſide, in contradiſtinction from the other; ſince the whole quantity in the electric is the ſame *before* and *after* the operation of *charging*; and the operation cannot ſucceed, unleſs what is gained on one ſide be loſt by the other, by means of conductors applied to it, and communicating either with the earth, or with a ſufficient number of non-electrics. In order to facilitate the communication of electricity to an electric plate, &c. the oppoſite ſurfaces are coated with ſome conducting ſubſtance, uſually with tin-foil, within ſome diſtance from the edge; in conſequence of which the electricity communicated to one part of the coating is readily diffuſed through all parts of the ſurface of the electric in contact with it; and a *diſcharge* is eaſily made by forming a communication with any conductor from one coating to the other. If the oppoſite coatings approach too near each other, the electric matter forces a paſſage from one ſurface to the other before the *charge* is complete. And ſome kinds of glaſs have the property of conducting the electricity over the ſurface, ſo that they are altogether unfit for the operation of *charging* and *diſcharging*. If indeed the *charge* is too high, and the glaſs plate or phial too thin, the attraction between the two oppoſite electricities forces a paſſage through the glaſs, and makes a ſpontaneous *diſcharge*, and the glaſs becomes unfit for farther uſe. See Conductors, Electrics, Leyden *Phial*, &c.

Charge, in *Gunnery*, the load of a piece; or the quantity of powder and ball, or ſhot, wherewith it is to be prepared for execution.

The rules for *charging* large pieces in war, are, that the piece be firſt cleaned, or ſcoured, within ſide; that the proper quantity of gunpowder be next driven in, and rammed down; care, however, being taken, that the powder be not bruiſed in ramming, for that weakens its effect; that a little quantity of paper, hay, or the like, be rammed over it, and that then the ball, or ſhot, be intruded.

If the ball be red-hot, a tampion, or trencher of green wood, is to be driven in before it.

The weight of gunpowder neceſſary for a *charge*, is commonly in a ſubduple proportion to that of the ball. See Cannon.

In the Britiſh navy, the allowance for thirty-two pounders is but ſeven-ſixteenths of the weight of the bullet. But a late author is of opinion, that if the powder in all ſhip-cannon whatever was reduced to one-third weight of the ball, or even leſs, it would be a conſiderable advantage, not only by ſaving ammunition, but by keeping the guns cooler and quieter, and at the ſame time more effectually injuring the veſſels of the enemy. With the preſent allowance of powder, the guns are heated, and their tackle and furniture ſtrained, and this only to render the bullet leſs efficacious. For a bullet which can but juſt paſs through a piece of timber, and loſes almoſt all its motion thereby, has a much better chance of rending and fracturing it, than if it paſſed through with a much greater velocity. See Robins's Tracts, vol. i. p. 290, 291.

Profeſſor Euler obſerves, in his inveſtigation of this ſubject, that in every caſe there is a certain *charge* which will communicate the greateſt velocity to the ball; ſo that by increaſing or diminiſhing it, the motion of the ball will be diminiſhed; and he concludes by a fluxionary calculus, that an iron ball will go out of a twenty-four pounder with the greateſt velocity when the piece is charged, ſo that the powder extends in length $7\frac{1}{2}$ calibers. Since this is about $\frac{2}{3}$ of the weight of the ball, and the common *charge* half its weight, the maximum, or greateſt *charge*, will be thrice the common *charge*. He has alſo computed the following table, repreſenting the *charges* for the greateſt velocity.

Length of the cylinder in calibers.	Length of the powder in calibers.	Weight of the powder in 100 parts of the wt. of the ball.
2	0.82	16
4	1.54	31
6	2.18	43
8	2.78	56
10	3.35	67
12	3.86	77
14	4.30	86
16	4.77	95
18	5.20	104
20	5.59	112
22	5.96	119
24	6.32	126
26	6.66	133
28	6.99	140
30	7.31	146
32	7.61	152
34	7.90	158
36	8.18	163
38	8.44	169
40	8.69	174
42	8.93	179
44	9.18	184
46	9.42	188
48	9.66	193
50	9.89	198
52	10.11	202
54	10.31	206
56	10.51	210
58	10.71	214
60	10.90	218

From the calculations by which this table is formed, Euler concludes, that the *charges* aſſigned by Mr. Robins for the greateſt velocity are much too great. See True Principles of Gunnery inveſtigated and explained, &c. 1777. p. 129. 266.

Mr. Robins obſerves, that the *charge* is not to be determined by the greateſt velocity that may be produced; but that it ſhould be ſuch a quantity of powder as will produce the leaſt velocity neceſſary for the purpoſe in view; and if the windage be moderate, no field-piece ſhould ever be loaded with more than $\frac{1}{6}$, or at the utmoſt $\frac{1}{5}$ of the weight of its bullet in powder; nor ſhould the *charge* of any battering piece exceed $\frac{1}{3}$ of the weight of its bullet. Tracts, &c. vol. i. p. 266, &c.

CHARGE, in *Heraldry*, is applied to any figure, or thing, borne or repreſented in an eſcutcheon, or coat of arms; whether it be animal, vegetable, or other matter.

Too many *charges* are not deemed ſo honourable as fewer. *Charges* peculiar to the art and uſage of armory, as the croſs, chief, pale, feſſe, &c. are called *proper charges*; and frequently ordinaries.

Bloom reſtrains the term *charges* to thoſe additions, or rewards of honours, frequently placed on eſcutcheons; as cantons, quarters, girons, flaſques, &c.

CHARGE, in *Law*, denotes the inſtructions given to the grand jury with reſpect to the articles of their inquiry, by the judge who preſides on the bench.

CHARGE, in *Law*, alſo ſignifies a thing done that bindeth him who doth it; or that which is his to the performance of it; and DISCHARGE is the removal of that *charge*. Lands may be *charged* in various ways; as, by grant of rent out of it, by ſtatutes, judgments, conditions, warranties, &c.

CHARGE, in the *Manege*, a ſort of unguent, made of oil, honey, greaſe, turpentine, and ſometimes of lees of wine, and other matters, applied externally to a horſe, &c. for the cure of ſtrains, bruiſes, and ſwellings.

CHARGE, or rather OVERCHARGE, in *Painting*, is an exaggerated repreſentation of any perſon; wherein the likeneſs is preſerved, but at the ſame time ridiculed.

Few painters have the genius neceſſary to ſucceed in theſe *charges*: the method is, to ſelect and heighten ſomething already amiſs in the face, whether by way of defect, or redundancy: thus, v. g. if nature have given a man a noſe a little larger than ordinary, the painter falls in with her, and makes the noſe extravagantly long: or if the noſe be naturally too ſhort, in the painting it will be a mere ſtump; and thus of the other parts.

CHARGE *of lead*, is thirty-ſix pigs. See LEAD, PIG, &c.

CHARGE, in *Sea Language*, is ſometimes uſed for burden; thus *a ſhip of charge* is ſuch as draws much water, or ſwims deep in the ſea; though ſometimes an unweildy ſhip, that will not ware nor ſteer, is called a ſhip of *charge*.

CHARGED, in *Heraldry*. A ſhield, carrying on it ſome figure or impreſs, is ſaid to be *charged* therewith.

So, alſo, when one bearing, or *charge*, has another figure added upon it, it is properly ſaid to be *charged*.

CHARGED *cylinder*, is that part of the chaſe of a gun where the powder and ball are contained.

CHARIENTISMUS, in *Rhetoric*, a figure wherein a taunting expreſſion is ſoftened by a jeſt.

CHAR. See CHARR.

CHARIOT. See COACH.

The curious may ſee various repreſentations of *chariots*, and accounts of improvements on *chariots*, and of different conſtructions, Mac. tom. ii. p. 39. tom. iii. p. 33. p. 41. p. 197. and p. 31. And in the Mem. of the A. D. S. an. 1761. Hiſt. 161. and an. 1719. Hiſt. 81.

The ancients made uſe of *chariots* in war. Theſe were of different kinds; but the moſt terrible were thoſe armed with pikes and ſcythes, thus; the beam to which the horſes were faſtened were armed with pikes, having iron points to them which projected forward; the yokes of the horſes had likewiſe two long points of three cubits; to the axle-tree alſo were fixed iron ſpits, armed at their extremities with ſcythes; between the ſpokes of the wheels were placed javelins, and the very fellies of the wheels were furniſhed with ſcythes, which tore every thing they met with to pieces.

The axle-tree was longer than uſual, and the wheels ſtronger, that they might be able to reſiſt the ſhock of the motion, ahd the *chariot* be leſs ſubject to overturn. The driver's ſeat was a kind of little tower, made of very ſolid wood, and raiſed breaſt-high. The charioteer was armed all over, and covered with iron. Sometimes ſeveral men well armed were put in thoſe *chariots*, who fought with darts and arrows. Diodor. Sicul. lib. xvii. Q. Curt. lib. iv. Xenoph. Cyropæd. lib. vi. See a Diſſertation on the Ancient *Chariot* by Mr. Pownall, in Berenger's Art of Horſemanſhip, vol. i. p. 271, &c.

CHARIOTS, in *Mythology*, were ſometimes conſecrated to the ſun: and the Scripture obſerves, that Joſiah burnt thoſe which had been offered to the ſun by the kings his predeceſſors. This ſuperſtitious cuſtom was an imitation of the heathens, and principally of the Perſians, who had horſes and *chariots* conſecrated in honour of the ſun. Herodotus, Xenophon, and Quintus Curtius, ſpeak of white *chariots*, crowned, which were conſecrated to the ſun, among the Perſians, and in their ceremonies were drawn with white horſes, conſecrated to the ſame luminary.

CHARISIA, in *Pagan Theology*, a wake or night-feſtival inſtituted in honour of the graces. It continued the whole night, moſt of which time was ſpent in dancing; after which, cakes made of yellow flour, mixed with honey, and other ſweet-meats, were diſtributed among the aſſiſtants. The word is alſo uſed to ſignify the ſweetmeats diſtributed on ſuch occaſions.

CHARISIUS, in *Pagan Theology*, a ſurname given to Jupiter.

The word is derived from χαρις, *favour*; he being the god by whoſe influence men obtain the favour and affection of one another. On which account the Greeks uſed at their meals to make a libation of a cup to JUPITER *Chariſius*.

CHARISTIA, a family-feaſt celebrated among the Romans, on the eleventh of the calends of March; i. e. on the nineteenth of February, in honour of the goddeſs *Concord*.

The word comes from χαρις, *grace, favour*; q. d. a day of reconciliation, or of reſtoring into favour. It was alſo called *dies charæ cognationis*. Vigenere, on Livy, calls it *the day of good cheer*.

The *chariſta* were inſtituted to re-eſtabliſh peace and amity, in families embroiled, or at variance among themſelves. It conſiſted in a great entertainment made in each family, to which no ſtrangers were admitted, but only relations and kindred. The joy and freedom inſpired by the repaſt, was looked upon as a proper means to reunite divided minds; to which the good offices of ſo many friends would greatly contribute.

CHARISTICARY, *Commendatary*, or *Donatary*, a perſon to whom is given the enjoyment of the revenues of a monaſtery, hoſpital, or benefice.

The *chariſticaries* among the Greeks, were a kind of donataries, or commendataries, who enjoyed all the revenues of hoſpitals and monaſteries, without giving an account thereof to any perſon.—The original of this abuſe is referred to the Iconoclaſtæ, particularly Conſtantine Copronymus, the avowed enemy of the monks, whoſe monaſteries he gave away to ſtrangers.

In after-times, the emperors and patriarchs gave many to people of quality, not by way of gift, to reap any temporal advantage from them; but to repair, beautify, and patronize them. At length avarice crept in, and thoſe in good condition were given, eſpecially ſuch as were rich; and at laſt they were all given away, rich and poor, thoſe of men and of women; and that to laymen, and married men.

M. Coutelier, in his Eccleſiæ Græcæ Monumenta, gives us the form of theſe donations: they were granted for life, and ſometimes for two lives. See ABBOT.

CHARITABLE *Uſes*, in *Law*. See COMMISSION and MORTMAIN.

CHARITATIVE, in the *Canon Law*. A *charitative aid*, or *ſubſidy*, is a moderate allowance, which a council grants a biſhop upon any urgent occaſion; e. g. when his revenues will not bear his expences to a council, &c.

CHARITY, one of the three grand theological virtues; conſiſting in the love of God, and our neighbour.

Charity is the habit or diſpoſition of loving God with all our heart, and our neighbour as ourſelves. It has two material objects, therefore, as the ſchool expreſſes it; viz. God, and our neighbour.

CHARITY is alſo uſed for the effect of a moral virtue, which conſiſts in ſupplying the neceſſities of others, whether with money, counſel, aſſiſtance, or the like.

CHARITY, *briefs*. See BRIEF.

CHARITY, *feaſts of*. See AGAPÆ.

CHARITY-*ſchools*, are ſchools erected and maintained in various pariſhes, by the voluntary contributions of the inhabitants, for teaching poor children to read, write, and other neceſſary parts of education.

In moſt *charity-ſchools* the children are likewiſe clothed, and put out to trades, ſervices, &c. on the ſame charitable foundation.

Charity-ſchools have ſpread throughout moſt of the conſiderable towns of England and Wales.

In London we had likewiſe a CHARITABLE *Corporation* for the relief of the induſtrious poor, erected under queen Anne; for enabling indigent manufacturers and traders to take up money at common and legal intereſt; there being a ſum of 30,000*l.* raiſed for that end.

CHARITY, *order of*. There are ſeveral religious orders which bear this title: one inſtituted by St. John de Dieu, for the aſſiſtance of the ſick: this inſtitute was approved of in 1520, by Leo X. and confirmed by Paul V. in 1617. The religious of this order apply themſelves wholly to the ſervice of the diſeaſed.

CHARITY *of the Holy Virgin*, is a religious order eſtabliſhed in the dioceſe of Chalons, by Guy lord Joinville, &c. towards the cloſe of the thirteenth century, approved under the rule of St. Auguſtine, by the popes Boniface VIII. and Clement VI.

In each pariſh of Paris, there is a ſociety of women, who apply themſelves to find out and relieve the wants of the poor of the pariſh; and on this account called, *Dames de la Charité*, and *Seurs de la Charité*.

CHARKING, or **CHARRING**, the burning of wood to make CHARCOAL.

CHARKS, pit-coal charked, or charred. See COAL.

CHARLATAN, or **CHARLETAN**, an EMPIRIC, or quack, who retails his medicines on a public ſtage, and draws the people about him with his buffoonries, feats of activity, &c.

The word, according to Calepine, comes from the Italian *ceretano*, of *Cæretum*, a town near Spoletto in Italy, where theſe impoſtors are ſaid to have firſt riſen. Menage derives it from *ciarlatano*, and that from *circulatorius*, of *circulator*, *a quack*.

CHARLES's WAIN, in *Aſtronomy*, ſeven ſtars in the conſtellation Urſa Minor.

CHARLOCK, in *Huſbandry*; for the botanical characters, ſee MUSTARD; a very troubleſome weed among corn, being more frequent than almoſt any other. There are two principal kinds of it; the one with a yellow flower, the other with a white. Some fields are particularly ſubject to be over-run with it, eſpecially thoſe which have been manured with cow-dung alone, that being a manure very favourable to the growth of it. The farmers in ſome places are ſo ſenſible of this, that they always mix horſe-dung with their cow-dung, when they uſe it for arable land.

When barley, as is often the caſe, is infeſted with this weed to ſuch a degree as to endanger the crop, it is a very good method to mow down the *charlock* in May, when it is in flower, cutting it ſo low as juſt to take off the tops of the leaves of the barley with it: by this means the barley will get up above the weed; and people have got four quarters of grain from an acre of ſuch land, as would have yielded them ſcarce any thing without this expedient. Where any land is particularly ſubject to this weed, the beſt method is to ſow it with graſs-ſeed, and make a paſture of it; for then this plant will not be troubleſome, as it does not grow where there is a coat of graſs upon the ground.

CHARM, a magic power, or ſpell, by which, with the aſſiſtance of the devil, ſorcerers and witches are ſuppoſed to do wondrous things, far ſurpaſſing the powers of nature. See MAGIC.

The word comes from the Latin *carmen*, *verſe*.

Phylacteries, ligatures, &c. are, all, kinds of *charms*.

CHARNEL, a portico, or gallery, anciently near the church-yard; over which were diſpoſed the bones of the dead, when the fleſh was conſumed.

The *charnels*, or *charnel-houſes*, are now uſually contiguous to the church.

CHARNUB, in the *Materia Medica*, a name given by ſome of the ancient writers to the *ſiliqua dulcis*, or carob-tree. The Arabian phyſicians mention two kinds of this; the Syrian, and Nabathæan: the firſt they call *aijembut*, and the other *alnabat*. Avicenna tells us, that the firſt of theſe was a purge, and was given with ſucceſs in pains of the bowels; and the other an aſtringent, given in profluvia of the menſes.

CHARONIUS, *Charonean*, is uſed as an epithet for caves, ſome of which are found in Italy, and in other parts of the world, where the air is ſo loaded with a poiſonous vapour, that animals cannot live in them even a few moments.

CHARR, in *Ichthyology*, a name given to a fiſh of the truttaceous kind, of which there are two ſpecies, diſtinguiſhed by the *red charr*, and the *gilt charr*; the former of which is called by ſome of the ichthyographiſts UMBLA *minor*, and by Linnæus *ſalmo alpinus*; and the latter, the CARPIO *lacus benaci*.

CHARR, *red*, is a large fiſh, longer and ſlenderer in its general ſhape than the trout, caught in the lakes of Wales, Weſtmorland, and of the mountainous parts of Europe; and is eſteemed a very fine fiſh; but its fleſh does not boil ſo red as that of the trout.

The *red charr* is called by the Welch *torgoch*; a compound of *tor*, *the lower part of the belly*, and *goch*, *red*; *Anglicè*, *red-belly*. In one reſpect the *charr* ſeems nearly allied to the eel and tench, being very ſlimy; and the curing and potting them well, depend on draining them properly of this mucilaginous quality. See an account of the Welch *charrs*, in Phil. Tranſ. vol. xlix. part i. N° 34. p. 212.

The Weſtmorland *charrs* called *caſe charrs*, ſpawn about Michaelmas; and at this time will take a bait, and at no other. They are ſuppoſed to be in the higheſt perfection about May, and in the ſummer, though rarely caught after April. The *charrs* of Wales are rather ſmaller, and of a paler colour than thoſe of Weſtmorland.

CHARR, *gelt*, or *barren*, is one which had not ſpawned the preceding ſeaſon, and on that account reckoned to be in greateſt perfection.

CHARR, *gilt*, is ſomething like the trout in figure; but it is broader, and its belly is prominent, eſpecially when the fiſh is large: the uſual ſize is about a foot in length, which it rarely exceeds. This is very common in ſome of the lakes of Italy, but is not peculiar to that kingdom, as has by ſome been imagined, being frequent in ſome foreign, and in ſome of the northern lakes; and there is no doubt, but that the fiſh there caught, and called the *gilt charr*, and the CARPIO *lacus benaci*, are entirely the ſame fiſh. It is a very finely flavoured fiſh, and much valued at the tables of the great.

This ſpecies ſpawns from the beginning of January to the end of March: and they are taken in greateſt plenty from the end of September to the end of November.

CHART, or *Sea*-**CHART**, a hydrographical map; or a projection of ſome part of the ſea, *in plano*; for the uſe of navigation.

The invention of *ſea-charts*, Fournier refers to Henry ſon of John king of Portugal. They differ very conſiderably from geographical, or land-maps, which are of no uſe in navigation. Nor are *ſea-charts* all of the ſame kind; ſome being what we call *plain charts*, others *reduced*, or *Mercator's charts*, and others *globular charts*.

CHARTS, *plain*, are thoſe wherein the meridians and parallels are exhibited by right lines, parallel to each other.

Theſe, Ptolemy, in his Geography, rejects for the following faults, though their inventor judged them of good uſe; and experience has confirmed his judgment, eſpecially in ſhort voyages. Their defects are, 1. That ſince in reality all the meridians meet in the poles, it is abſurd to repreſent them, eſpecially in large *charts*, by parallel right lines. 2. That *plain charts* exhibit the degrees of the ſeveral parallels, equal to thoſe of the equator; and of conſequence the diſtances of places lying eaſt and weſt, much larger than they ſhould be. And, 3. In a *plain chart*, while the ſame rhumb is kept, the veſſel appears to ſail in a great circle, which is yet falſe.

But notwithſtanding theſe defects in the *plain chart*, yet the eaſineſs of its application has ſo reconciled it to the mariners, that it is uſed almoſt alone; in excluſion of the more accurate ones.

Conſtruction of a plain CHART.—1. Draw a right line, as AB (*Tab. Navigation*, *fig*. 9.), and divide it into as many equal parts, as there are degrees of latitude in the portion of the ſea to be repreſented. 2. Add another to it at right angles BC, divided into as many parts, and thoſe equal to one another, and to the former, as there are degrees of longitude in the portion of the ſea to be repreſented. 3. Complete the parallelogram ABCD, and reſolve its area into little ſquares; then right lines, parallel to AB and CD, will be meridians; and thoſe parallel to AD and BC parallels. 4. The coaſts, iſlands, bays, ſands, rocks, &c. inſert from a table of longitudes and latitudes, in the ſame manner as is laid down under MAP.

Hence, 1. The latitude and longitude of a ſhip being given, her place is eaſily exhibited in the *chart*. 2. The places F and G, to and from which the ſhip ſails, being given in a map, the right line FG, drawn from the one to the other, makes, with the meridian AB, an angle AFG, equal to the inclination of the rhumb: and ſince the parts F 1, 12, 2 G, intercepted between equidiſtant parallels, are equal; and the inclination of the right line FG, to all the meridians or right lines parallel to AB, is the ſame; the right line FG truly repreſents the rhumb. After the ſame manner it may be ſhewn, that this *chart* exhibits *latus mecodynamicum*, or miles of longitude, truly. It follows, that *plain charts* may be uſed to very good purpoſe in directing a ſhip; provided care be taken there eſcape no error in the diſtance of the places F and G.

Conſtruction of a Scale to correct the errors of the diſtances in plain CHARTS.—1. Upon the right line AB (*fig*. 10.), from the map transfer five degrees, and divide them into 300 equal parts, or geographical miles. 2. On this deſcribe a ſmall circle ACB, to be divided into 90 equal parts: if then it be deſired to know how many miles make five degrees in the parallel fifty; in the compaſſes take the interval fifty, and transfer it on to the diameter AB; the number of miles required will here be ſhewn. It follows, that if a ſhip ſail on an eaſtern or weſtern rhumb, out of the equator; the miles anſwering to the degrees of longitude will be found as in the preceding article. If it ſail on any collateral rhumb, ſtill the ſailing is ſuppoſed to be an eaſtern or weſtern rhumb, in an intermediate parallel, between the parallel of the place whence the ſhip proceeds, and parallel of the place at which ſhe arrives.

It is true, this reduction, by an arithmetically mean parallel, is not accurate; yet it is frequently uſed in practice, as being accommodated to the apprehenſions of the generality of mariners. In effect, it does not err conſiderably, if the whole courſe be divided into parts, whereof each does not exceed one degree; whence it appears adviſeable, not to take the diameter of the ſemicircle AB above one degree, and to divide it at moſt into geographical miles.

For the application of the plain Chart *in ſailing*, ſee *Plain* Sailing.

Chart, *reduced*, or **Chart** *of reduction*, is that wherein the meridians are repreſented by right lines converging towards the poles; and the parallels by right lines parallel to one another, but unequal. Theſe, therefore, it appears by their conſtruction, muſt correct the errors of the *plain charts*.

But ſince the parallels ſhould cut the meridians at right angles; theſe *charts* are defective, inaſmuch as they exhibit the parallels inclined to the meridians.

Hence, another kind of *reduced charts* has been invented, wherein the meridians are parallel, but the degrees thereof unequal; theſe are called *Mercator's charts*.

Chart, *Mercator's*, is that wherein the meridians and parallels are repreſented by parallel right lines; but the degrees of the meridians are unequal; ſtill increaſing, as they approach the pole, in the ſame proportion as thoſe of the parallels decreaſe: by means whereof, the ſame proportion is preſerved between them, as on the globe.

This *chart* has its name from that of the author who firſt propoſed it for uſe in the year 1556, and made the firſt *chart* of this projection, Gerardus Mercator: but neither was the thought originally his own, as having been hinted by Ptolemy near two thouſand years ago; nor is the perfection of it owing to him; our countryman Mr. Wright being the firſt who demonſtrated it, about the year 1590, and ſhewed a ready way of conſtructing it, by enlarging the meridian line by the continual addition of ſecants. See his Correction of Errors in Navigation, publiſhed in 1599.

For a farther account of Mr. Wright's method, and the conſtruction of a table of meridional parts; ſee Meridional *parts*.

Conſtruction of Mercator's Chart.—1. Draw a right line, and divide it into equal parts, repreſenting degrees of longitude either in the equator, or in the parallel wherein the *chart* is to terminate. From the ſeveral points of diviſion erect perpendiculars to repreſent meridians; ſo as right lines may cut them all under the ſame angle, and therefore repreſent rhumbs; thus far as in the *plain chart*.

That the degrees of the meridians may have their juſt proportion to thoſe of the parallels, the former are to be increaſed; in regard the latter continue the ſame, becauſe of the paralleliſm of the meridians.

With the interval therefore of one degree in the equator CD (*Tab. Navig. fig.* 11.), deſcribe the quadrant CDE, and in D erect a perpendicular DG; make the arch DL equal to the parallel of latitude, and through L draw CG: this CG will be the enlarged degree of the meridian, to be transferred to the meridian of the *chart*: the reſt as in *plain charts*.

In practice, ſuppoſe it required to draw a *Mercator's chart* from the fortieth degree of north latitude to the fiftieth, and from the ſixth degree of longitude to the eighteenth. Firſt draw a right line repreſenting the fortieth parallel of the equator; which divide into twelve parts, for the twelve degrees of longitude the *chart* is to contain. Then take a line of equal parts, on a ſcale whereof a hundred parts are equal to each of theſe degrees of longitude; and at each extreme of the line raiſe two perpendiculars, to repreſent two parallel meridians to be divided by the continual addition of ſecants, which are proved to increaſe in the ſame proportion, as the degrees of longitude ſhould decreaſe.

Thus, for the diſtance from forty degrees of latitude, take 131 ½ equal parts, from the ſcale which is the ſecant of forty degrees thirty minutes. For the diſtance from forty-one degrees to forty-two degrees, take 133 ½ equal parts, from the ſcale which is the ſecant of forty-one degrees thirty minutes; and ſo on to the laſt degree of your *chart*, which will be 154 equal parts, viz. the ſecant of forty-nine degrees thirty minutes, and will give the diſtance from forty-nine degrees of latitude to fifty degrees. By this means, the degrees of latitude will be augmented, in the ſame proportion as the degrees of longitude on the globe decreaſe.

The meridians being divided, add the card, or compaſs; chooſing ſome convenient place near the middle thereof: from this draw a line parallel to the divided meridians, which will be the north rhumb; and from this the other thirty-one points of the compaſs are to be ſet off.

Laſtly, Lay down the towns, ports, iſlands, coaſts, &c. from a table of longitudes and latitudes; and the *chart* is complete. In *Mercator's chart*, the ſcale changes as the latitude is changed: if then, v. g. a ſhip ſails between the fortieth and fiftieth parallels of latitude, the degrees of the meridians between thoſe two parallels, are to be the ſcale for meaſuring the ſhip's way: whence it follows, that though the degrees of longitude be equal in extent on the *chart*, yet they muſt contain unequal numbers of miles, or leagues; and that they will decreaſe as they approach nearer the pole, becauſe meaſured by a magnitude continually increaſing. This *chart* is demonſtratively true; though to appearance falſe: it is found by experience very accurate, and withal very eaſy of application. In effect, it has all the qualifications required to render it of ſervice in navigation; yet do the generality of mariners decline the uſe of it, and rather chooſe to keep the old erroneous *plain chart*.

For the uſe of Mercator's Chart *in ſailing*, ſee *Mercator's* Sailing.

Chart, *globular*, is a projection ſo called, from the conformity it bears to the globe itſelf: this has been ſince the others propoſed to the world by Meſſrs. Senex, Wilſon, and Harris; wherein the meridians are inclined: the parallels equidiſtant, and curvilinear; and the rhumbs real ſpirals, as on the ſurface of the globe.

We might be allowed to expect ſomething from this, as it came out under the protection of his majeſty's patent, and with the recommendation of ſeveral able navigators, and among others, that of Dr. Halley; and as it has now ſtood the teſt of a pretty ſevere inquiſition. We ſhall only add, that the projection is perfectly agreeable to nature, and therefore eaſily conceivable; and that it has been found to anſwer very exactly, even in very large diſtances; where its failure, if it hath any, muſt needs be moſt conſpicuous.

Charts *compoſed by rhumbs and diſtances*, are thoſe wherein there are no meridians or parallels; but all is effected by the rhumbs, and the ſcale of miles.

Theſe are chiefly uſed by the French, and eſpecially in the Mediterranean.

They are patched up, without any great art, from the obſervations of the mariners; any regular account, therefore, how to make them, would be needleſs. They are only uſed in ſhort voyages.

See a diſſertation on *charts*, by Dr. Murdoch, in the Phil. Tranſ. vol. l. art. 73. with remarks upon it by Mr. Mountaine, art. 74.

CHARTA primarily ſignifies a ſort of paper made of the plant *papyrus*, or *biblus*.

Charta *emporetica*, in *Pharmacy*, &c. a kind of paper made very ſoft and porous, and uſed to filtre withal.

Charta is alſo uſed in *Ancient Cuſtoms* for a charter, or deed in writing.

Charta *de foreſta*. See Charter *of the foreſt*.

Charta *magna*, the great *charter*, is an ancient inſtrument, containing ſeveral privileges, and liberties, granted to the church and ſtate, by Edward the Confeſſor, together with others relating to the feudal laws of William the Conqueror, granted by Henry I. all confirmed by the ſucceeding princes about thirty times. See Magna *charta*.

Charta *pardonationis ſe defendendo*, is the form of a pardon for a perſon's killing another man in his own defence.

Charta *pardonationis utlagariæ*, is the form of a pardon of a man who is outlawed.

Charta *ſimplex*, is a ſingle deed, or deed-poll.

CHARTARIUS, the ſame with chartophylax.

CHARTEL. See Cartel, Champion, Combat, Duel, &c.

CHARTER, *Charta*, an inſtrument, or written evidence of a thing under the ſeal of a prince, lord, church, chapter, or community.

The word *charter* comes from the Latin *charta*, anciently uſed for a public or authentic act; from χαρτης, *thick paper*, or *paſtboard*, whereon public acts were uſed to be written.

Bracton ſays, donations are ſometimes made in *charters*, *in perpetuam rei memoriam*. He adds, that of *charters*, ſome are *royal*, others of *private perſons*.

Of *royal*, ſome are private, ſome common, ſome univerſal.

Of *private charters*, ſome are *de puro feoffamento*, others *de conditionali feoffamento*, others of recognition, pure or conditional, others of confirmation, &c.

Charters *of community*, were certain privileges firſt obtained by violence, or purchaſe, and afterwards freely beſtowed by emperors, kings, and barons; whereby the inhabitants of towns and cities were enfranchiſed, all marks of ſervitude aboliſhed, and theſe cities, &c. were formed into corporations and bodies politick, to be governed by a council and magiſtrates of their own nomination. The firſt perſon who conferred theſe privileges, was Lewis the Groſs in France, about the beginning of the twelfth century: and his example was ſoon very generally followed. See Cities.

Charter *of the foreſt*, is that wherein the laws of the FOREST are compriſed and eſtabliſhed.

Charter, *Great*, *Magna charta*. See MAGNA *charta*.

Charters *of the king*, are thoſe whereby a king makes a grant to a perſon, or community; v. gr. a *charter of exemption*, that a perſon ſhould not be impanelled on a jury, &c. See LETTERS *patent*.

Charter *of pardon*, is that whereby a perſon is forgiven a felony, or other offence againſt the king's crown and dignity. See PARDON.

Charter *governments in America*, are in the nature of civil corporations, with the power of making bye-laws for their own interior regulation, not contrary to the laws of England; and with ſuch rights and authorities as are ſpecially given them in their ſeveral *charters* of incorporation. The form of government is borrowed from that of England. They have a governor named by the king (or in ſome proprietary colonies by the proprietor), who is his repreſentative or deputy. They have courts of juſtice of their own, from whoſe deciſion an appeal (as ſome ſay, in the nature of a reference by way of arbitration) lies to the king in council here in England. Their general aſſemblies, which are their houſe of commons, together with their council of ſtate, being their upper houſe, with the concurrence of the king, or his repreſentative the governor, make laws ſuited to their own emergencies. But it is particularly declared, by ſtat. 7 and 8 W. III. c. 22. that all laws, bye-laws, uſages, and cuſtoms, which ſhall be in practice in any of the plantations, repugnant to any law, made or to be made in this kingdom, relative to the ſaid plantations, ſhall be utterly void and of none effect. Theſe are called *charter governments*, by way of diſtinction from the *provincial eſtabliſhments*, the conſtitutions of which depend on the reſpective commiſſions iſſued by the crown to the governors, and the inſtructions attending them; under the authority of which, provincial aſſemblies are conſtituted, with the power of making local ordinances, not repugnant to the laws of England; and alſo from *proprietary governments*, granted out by the crown to individuals, in the nature of feudatory principalities, with all the inferior regalities, and ſubordinate powers of legiſlation, which formerly belonged to the owners of counties palatine. See farther Blackſtone's Comm. vol. i. p. 108.

Charter-house. See CHARTREUSE.

Charter-land, in *Law*, is ſuch as a man holds by *charter*, that is, by evidence in writing; otherwiſe called FREEHOLD.

This the Saxons called BOCK-LAND; which Lambard renders, *terra ex ſcripto*.

It was held on more eaſy conditions than the folk-land, or *terra ſine ſcripto*, held without writing: the former being *hæreditaria libera & immunis*; whereas the latter *cenſum penſitabat annuum, atque officiorum quadam ſervitute erat obligatus*.

CHARTERER is in ſome places, as Cheſhire, uſed for a FREEHOLDER.

CHARTERPARTY, in *Commerce*, denotes the inſtrument of freightage, or articles of agreement for the hire of a veſſel.

The *charterparty* is to be in writing; and is to be ſigned both by the proprietor, or the maſter of the ſhip, and the merchant who freights it.

The *charterparty* is to contain the name and the burden of the veſſel; thoſe of the maſter and the freighter; the price, or rate of freight; the time of loading, and unloading; and the other conditions agreed on.

It is properly a deed, or policy, whereby the maſter, or proprietor of the veſſel, engages to furniſh immediately a tight ſound veſſel, well equipped, caulked and ſtopped, provided with anchors, ſails, cordage, and all other furniture to make the voyage required, as equipage, hands, victuals, and other munitions; in conſideration of a certain ſum to be paid by the merchant for the freight. Laſtly, the ſhip, with all its furniture, and the cargo, are reſpectively ſubjected to the conditions of the *charterparty*.

The *charterparty* differs from a *bill of lading*, in that the firſt is for the entire freight, or lading, and that both for going and returning; whereas the latter is only for a part of the freight, or at moſt only for the voyage one way.

The common law conſtrues *charterparties*, as near as may be, according to the intention of them, and not according to the literal ſenſe of traders, or thoſe that merchandiſe by ſea; but they muſt be regularly pleaded.

The preſident Boyer ſays, the word comes from hence, that *per medium charta incidebatur*, *& ſic fiebat charta partita*; becauſe in the time when notaries were leſs common, there was only one inſtrument made for both parties: this they cut in two, and gave each his portion, and joined them together at their return, to know if each had done his part. This he obſerves to have ſeen practiſed in his time; agreeable to the method of the Romans, who, in their ſtipulations, uſed to break a ſtaff, each party retaining a moiety thereof as a mark.

CHARTIS *reddendis*, a writ which lies againſt him that has charters of feoffment intruſted to his keeping, and refuſeth to deliver them to the owner.

CHARTOPHYLACIUM, a place where records were kept.

CHARTOPHYLAX, an officer in the church of Conſtantinople, intruſted with the cuſtody of the archives.

The word is formed from χαρτα, and φυλαττω, *cuſtodio*; and ſignifies *charter-keeper*.

Codin calls the *grand chartophylax* the judge of all cauſes, and the right arm of the patriarch. He adds, that he was the depoſitary or keeper of all the *charters* relating to the eccleſiaſtical rights; and that he preſided over matrimonial cauſes, and was judge of all the clergy. He drew up all ſentences and deciſions of the patriarch, who ſigned and ſealed them: he preſided in the grand council of the patriarch: he took cognizance of all matters and cauſes eccleſiaſtical and civil, whether among the clergy, the monks, or the people.

He took place of all the biſhops, though himſelf only a deacon; and, on occaſion, diſcharged the functions of the prieſts: he had twelve notaries under him.

The *chartophylax* was much the ſame at Conſtantinople with the *chartulary* at Rome.

There were, in reality, two officers who bore this title; the one for the court, the other for the patriarch; the firſt was called alſo *regiſtrator*, and the latter *ſcriniarius*: though the two are uſually confounded together. Leunclavius, and others, confound *chartophylax* with *chartulary*.

CHARTREUSE, a celebrated monaſtery of Carthuſians; ſo called from the name of a ſteep rocky place, in a frightful deſart, five leagues from Grenoble in France; where S. Bruno retired from the world, and firſt inſtituted the order of Carthuſians.

The name has ſince paſſed to all houſes of Carthuſians; and that near Grenoble, is now diſtinguiſhed by the name of the *great Chartreuſe*.

That of London, corruptly called *Charter-houſe*, is now converted into a college, called alſo from its founder *Sutton's hoſpital*; firſt endowed with 4000*l. per ann.* ſince improved to 6000*l.*

It is to conſiſt of decayed gentlemen, ſoldiers, and merchants; eighty of whom have a plentiful maintenance of diet, lodging, cloaths, phyſic, &c. living together in a collegiate manner: and of ſcholars, or youths, forty-four of whom are taught, and ſupplied with neceſſaries; and ſuch of them as are fit for the univerſity ſent thither, with an exhibition of 20*l. per ann.* for eight years; the reſt are put to trades.

For the ſuperintendency of this hoſpital there are ſixteen governors, generally of the prime quality; vacancies being ſupplied by the election of the remaining governors. The ordinary officers are, a maſter, preacher, regiſter, treaſurer, ſchoolmaſter, &c.

CHARTREUX, religious of the order of St. Bruno, called alſo CARTHUSIANS.

CHARTULARY, *Chartularius*, a title given to an ancient officer in the Latin church, who had the care of charters and papers relating to public affairs.

The *chartulary* preſided in eccleſiaſtical judgments, in lieu of the pope.

In the Greek church, the *chartulary* was called *chartophylax*; but his office was there much more conſiderable; and ſome even diſtinguiſh the *chartulary* from the CHARTOPHYLAX in the Greek church.

CHARVIL, in *Botany*. See CHERVIL.

CHARYBDIS, in *Geography*, originally the name of a rock in the ſtreights of Meſſina, between Italy and Sicily; much celebrated in the writings of the ancient poets.

Charybdis is alſo a word uſed by Dr. Plott to expreſs certain openings which he ſuppoſes in the bottom of the ſea, by which its waters are received and conveyed by a ſubterranean circulation to the origin of fountains and ſprings. The *fluxus moſchonicus*, or *maalſtrome* on the coaſt of Norway, is ſuppoſed to be owing to ſome ſuch ſubterranean indraught; and it is advanced alſo, that the Mediterranean ſea could not be emptied of the vaſt quantities of waters which it receives, but muſt overflow the land of Egypt, unleſs ſwallowed by ſome ſuch *charybdis*, which is either in ſome part of the baſon of that ſea, or near the mouth of it; in which caſe, it may be the occaſion of that ſtrong under-current, deſcribed by all thoſe who have treated of this ſea. An immenſe *charybdis*, placed near the ſtreight's mouth, may be hid under the immenſity of waters there; but as it would abſorb the deep waters continually, and that in large quantities, it would neceſſarily cauſe ſuch an under-current there. See Vapour.

CHASCUSA, or Cascusa, in the *Botanical Writings of the Ancients*, a name given by the Greeks to the *antirrhinum* of the Latin writers. It has been ſuppoſed by ſome, that the *chaſcuſa*, or *caſcuſa*, was the ſame with the *phyteuma* of Dioſcorides; but that author tells us the *phyteuma* was prickly, and had leaves like the *ſtruthium*, which was a kind of thiſtle uſed in the dying of wool: whereas Pliny tells us, that the *chaſcuſa*, or *antirrhinum*, has leaves like thoſe of flax, that is, ſmooth, narrow, and oblong.

CHASE, or Chace, in *Law*, is uſed for a driving of cattle to or from any place; as to a diſtreſs, a fortlet, &c.

Chase, or Chace, is alſo a place of retreat for deer and wild beaſts; of a middle kind, between a foreſt and a park; being uſually leſs than a foreſt, and not poſſeſſed of ſo many privileges; but wanting, v. g. courts of attachment, ſwainmote, and juſtice-ſeat.

Yet it is of a larger extent, and ſtocked both with a greater diverſity of wild beaſts, or game, and more keepers, than a park. Crompton obſerves, that a foreſt cannot be in the hands of a ſubject, but it forthwith loſes its name, and becomes a *chaſe*: in regard, all thoſe courts loſe their nature when they come into the hands of a ſubject; and that none but the king can make a lord chief juſtice in eyre of the foreſt.

By the common law, no perſon is at liberty to take or kill any beaſts of *chaſe*, but ſuch as hath an ancient *chaſe* or park; unleſs they be alſo beaſts of prey.

Yet the ſame author adds, that a foreſt may be granted by the king to a ſubject, in ſo ample a manner, as that there may be courts equivalent to a court of attachment, ſwainmote, and juſtice-ſeat.

Chace, *wild gooſe*, a term uſed to expreſs a ſort of racing on horſeback, uſed formerly, which reſembled the flying of wild geeſe, thoſe birds generally going a train one after another, not in confuſed flocks as other fowls do. In this ſort of race the two horſes after running twelve ſcore yards had liberty, which horſe ſoever could get the leading, to ride what ground the jockey pleaſed, the hindmoſt horſe being bound to follow him within a certain diſtance agreed on by articles, or elſe to be whipped in by the tryers and judges who rode by; and which ever horſe could diſtance the other, won the race. This ſort of racing was not long in common uſe, for it was found inhuman and deſtructive to good horſes, when two ſuch horſes were matched together. For in this caſe neither was able to diſtance the other, until they were both ready to ſink under their riders, and often two very good horſes were both ſpoiled, and the wagers forced to be drawn at laſt. The miſchief of this ſort of racing ſoon introduced the method now in uſe, of running only a certain quantity of ground, and determining the plate or wager, by the coming in firſt at the poſt.

Chase, in *Sea-Language*, ſignifies a veſſel purſued by another, apprehended or known to be an enemy. Hence, to *chaſe* is to purſue a ſhip; which is called alſo *giving chaſe*.

In *chaſing* at ſea, theſe rules are generally obſerved: if the *chaſed* be found any thing to the windward, the *chaſer* is to bring all his tacks aboard, and to ſhape his courſe to meet her at the neareſt angle. If the *chaſed* be to the leeward, then the *chaſer* may come in with her, except ſhe bear upright before the wind, and ſo outſail her; or that ſhe bring herſelf cloſe by the wind, and the *chaſer* prove the more leeward ſhip, and ſo loſe her that way. If the *chaſe* be found right a-head, and ſo the *chaſer* be put to a ſtern-*chaſe*, then the beſt ſailer ſhall carry it, if there be ſea-room and day-light. Being come up cloſe with the *chaſe*, endeavour to croſs her fore-foot; and by that means you will both hinder her way, and avoid the fury of her ordnance (except thoſe in her *chaſe*), and uſe your own, if required, to more advantage; and that as well your *chaſe*-pieces, at your firſt getting up within reach, as your broadſide and quarter-pieces, as you paſs thwart her hawſe, and ſcour her decks from ſtem to ſtern. If ſhe makes away from you, ply your guns, as many as poſſible, at her ſails, yards, maſts, and general tackling; and, being near, ſpare not your caſe-ſhot, or croſs-bar-ſhot, to make the greater damage.

Chase, *ſtern*, is when the chaſer follows the chaſed aſtern, directly upon the ſame point of the compaſs.

To lie with a ſhip's fore-foot in a chaſe, is to ſail, and meet with her by the neareſt diſtance, and ſo to croſs her in her way, or to come acroſs her fore-foot.

A ſhip is ſaid to have a *good chaſe*, when ſhe is ſo built forward on, or a-ſtern, that ſhe can carry many guns to ſhoot forwards, or backwards; according to which, ſhe is ſaid to have a *good forward*, or *good ſtern-chaſe*.

Chase-*guns*, are ſuch whoſe ports are either in the head, called *bow-chaſes* (and then they are uſed in chaſing of others); or in the ſtern, called *ſtern-chaſes*, which are only uſeful when they are purſued or chaſed by any other ſhip.

Chase *of a gun*, is that part of the bore, which begins at the ſame circle where the ſecond reinforce ends, and terminates at the extremity of the muzzle: or it is the part denoted by FB, *fig.* 1. *Tab. Gunnery.* If the length of a gun be divided into ſeven equal parts, the *chaſe* is four of theſe parts, wanting the diameter of the bore. Some have called the whole length of the bore the *chaſe*. See Cannon.

Chase-*girdle*, is the part under FI in the ſame figure; and the CHASE-*aſtragal* and *fillet* is repreſented at *x*.

CHASING, a method of working, or enriching gold, ſilver, &c. properly called ENCHASING.

CHASLEU. See Cisleu.

CHASM, Χασμη. See Grotto and Hiatus.

CHASME, or Chasmos, among *Ancient Phyſicians*, denotes oſcitation, or gaping. Hippocrates informs us, that long reſpiration is a cure for continual OSCITATION.

CHASTE-*tree*. See Agnus *caſtus*, and Vitex.

CHASTISEMENTS, or Corrections, in the *Manege*, are the ſevere and rigorous effects of the aids; for when the aids are given with ſeverity, they become puniſhments.

CHASTITY. The Roman law juſtifies homicide in defence of the *chaſtity* either of one's ſelf or relations; and according to Selden (De Leg. Heb. lib. iv. cap. 3.) the law in the Jewiſh republic had the ſame latitude. The Engliſh law alſo juſtifies a woman in killing one who attempts to raviſh her. Bac. Elem. 34. 1 Hawk. P. c. 71. And the father or huſband may juſtify killing a man, who attempts a rape upon his wife or daughter: and the forcible attempt of a more deteſtable crime may be equally reſiſted by the death of the unnatural aggreſſor. Blackſt. Com. vol. iv. p. 181.

CHATE, in *Botany*, a name given by ſome authors to a ſpecies of wild CUCUMBER; called by others *cucumis Ægyptius rotundi-folius*, the round-leaved cucumber of Egypt.

CHATELET, anciently ſignified a little CASTLE, or fortreſs, wherein the *chatelain*, or governor, lodged.

The word is a diminutive of *chateau*, formed from *caſtellum*, a diminutive of *caſtrum*; or from *caſtelletum*, a diminutive of *caſtellum*, *caſtle*.

At preſent, the term is uſed for certain courts of juſtice eſtabliſhed in ſeveral cities in France: the *grand chatelet* in Paris, v. g. is the place where the preſidial, or ordinary court of juſtice of the prevot of Paris is kept; conſiſting of a preſidial, a civil chamber, criminal chamber, and a chamber of policy. The term ſignifies the ſame at Montpelier, Orleans, &c.

The *little chatelet* at Paris is an ancient fort, now ſerving as a priſon.

CHAT-PARD, in *Natural Hiſtory*, a creature of the LEOPARD kind. See Pardus.

The French academicians, who diſſected this creature with great care, found a defect of ſpermatic veſſels, and other parts abſolutely neceſſary to generation; and this not proceeding from caſtration, but from ſome other cauſe.

CHATTELS, *Catalis*, *Catalla*, a Norman term, under which were anciently comprehended all moveable goods; thoſe immoveable being termed *fief*, or, as we now ſay, *fee*.

Spelman defines *chattels* to be *bona quæcunque mobilia & immobilia*; *propriè tamen ea bonorum pars*, *quæ in animalibus conſiſtat*, *à quorum* capitibus *res ipſe*, *alias* capita, *alias* capitalia *dictæ ſunt*.

Chattels, in the modern ſenſe of the word, are all ſorts of goods, moveable or immoveable, except ſuch as are in the nature of freehold, or parcel thereof.

Chattels are either *perſonal*, or *real*.

Chattels *perſonal*, are ſuch as do either belong immediately to the perſon of a man, as his horſe, ſword, &c. or ſuch things as being injuriouſly with-held from him, a man has no way to recover but by PERSONAL action: or, ſtrictly ſpeaking, they are things *moveable*, which the owner may carry with him from one place to another; ſuch are animals, houſhold furniture, money, jewels, corn, garments, and every thing that is capable of being removed.

Chattels perſonal are, immediately upon the death of the teſtator, in the actual poſſeſſion of the executors; whereas *chattels real* are not in his poſſeſſion till he hath made an entry, or recovered them. An owner of *chattels* is ſaid to be *poſſeſſed* of them; but a perſon is ſaid to be *ſeiſed* of a freehold.

Chattels *real*, are either ſuch as do not appertain immediately to the perſon, but to ſome other thing, by way of dependence; as charters of land, apples upon a tree, &c. or ſuch as neceſſarily iſſue out of ſome immoveable thing to a perſon, as a leaſe, or rent for years. They are called *chattels*, becauſe their duration is limited to a certain time; and *real*, becauſe they are intereſts annexed to, and iſſuing out of *real* eſtates.

CHATTERER, in *Ornithology*. See AMPELIS and GARRULUS.

CHATUS, in *Middle Age Writers*, a kind of gold coin.

CHATUS was alſo called, by ſome French writers, *mailles auchat*.

Du-Cange makes it a queſtion, whether the *chatus* was the ſame coin as the *chapotenſis*, and ſuppoſes that the latter might be formed from *chati Pictavenſes*; in French, *chats de Poitou*.

CHAVARIGHTS, a ſect of Mahometans, who deny that God ever ſent a prophet that was infallible; and who had a commiſſion to give a law to mankind: they pretend likewiſe that if ſuch an office ſhould ever become neceſſary, it would not be confined to a ſingle family, but that every man of probity and virtue would be capable of that honour.

CHAUD-*Medley*, in *Law*, and according to its proper etymology, denotes an affray that happens in the *heat* of blood, or paſſion. See CHANCE-*Medley*.

CHAULIODONTA, from χαλαω, *I put forth*, and οδους, *tooth*; among *Ancient Naturaliſts*, is applied to thoſe animals, the teeth of which grow to a great length out of their mouths; as the boar, and the elephant.

CHAUMPERT. See CHAMPART.

CHAUNTOR, CHAUNTER. See CHANTOR.

CHAUNTRY, or CHANTRY, was anciently a church, or chapel, endowed with lands, or other yearly revenue, for the maintenance of one or more prieſts, daily ſaying or ſinging maſs for the ſouls of the donors, and ſuch others as they appointed. Theſe *chauntries* were diſſolved by 1 Ed. VI. cap. 14.

Hence, *chauntry-rents*, are rents paid to the crown by the tenants, or purchaſers of *chauntry-lands*.

CHAUFFE-WAX. See CHAFFE-WAX.

CHAURUS, or CHORUS, among the Romans, the north-weſt wind, or that which blew between the wind called *favonius* and the north.

CHAUSE *Trappes*. See CALTROP, and CROWSFEET.

CHAUSSE' *trop-haut*, in the *Manege*. A white-footed horſe is ſaid to be ſuch, when the white marks run too high upon the legs.

CHAYQUARONA, in *Zoology*, a name given by the Portugueſe to a fiſh of the TURDUS kind, caught on the Braſilian ſhores, and more frequently called by authors by its Braſilian name, PIRAUMBU.

CHAZINZARIANS, or CHATZINZARIANS, a ſect in Armenia in the ſeventh century.

The word is formed of the Armenian *chazus*, *croſs*. In the Greek text of Nicephorus, they are called *Chatzintzarians*, χατζιντζαριοι.

They are alſo called *Staurolatræ*, which, in Greek, ſignifies the ſame as *Chazinzarians* in Armenian, viz. *adorers of the croſs*; they being charged with paying adoration to the croſs alone.

In other reſpects they were Neſtorians; and admitted two perſons in Jeſus Chriſt. Nicephorus, lib. xviii. cap. 54. aſcribes other ſingularities to them, particularly their holding an annual feaſt, in memory of the dog of their falſe prophet Sergius; which they called *Artzibartzes*.

CHEATS, in *Law*, are deceitful practices in defrauding, or endeavouring to defraud another of his known right by ſome artful and diſhoneſt device; as by playing with falſe dice, by fraudulently obtaining the execution of deeds and truſts, by ſuppreſſing wills, by raiſing money under falſe pretences, &c. Any deceitful practice, whether in trade or otherwiſe, is puniſhable with fine, impriſonment, and pillory. And by the ſtatutes 33 Hen. VIII. cap. 1. and 30 Geo. II. cap. 24. if any man defraud another of any valuable chattels by any falſe token, counterfeit letter, or falſe pretences, or pawns or diſpoſes of another's goods without the conſent of the owner, he ſhall ſuffer ſuch puniſhment by impriſonment, fine, pillory, tranſportation, whipping, or other corporal pains, as the court ſhall direct. And by 9 Anne, cap. 14. if any perſon *cheats* at play, and at one time wins more than 10*l.* or any valuable thing, he may be indicted thereupon, and ſhall forfeit five times the value, ſhall be deemed infamous, and ſuffer ſuch corporal puniſhment, as in caſe of wilful perjury. Blackſt. Com. vol. iv. p. 158, and 173.

CHECAYA, in *Turkiſh Affairs*, is the ſecond officer of the janizaries, and ſynonymous with lieutenant, or the ſecond in any office.

CHECK-*roll*, a roll, or book, containing the names of ſuch as are attendants, and in pay to the king, or other great perſons; as their houſhold ſervants.

It is otherwiſe called the *chequer-roll*. See ROLL.

CHECK, *clerk of the*, in the king's houſhold, has the *check* and controulment of the yeomen of the guard, and all the uſhers belonging to the royal family; allowing their abſence or defects in attendance, or diminiſhing their wages for ſame, &c.—He alſo, by himſelf, or deputy, takes the view of thoſe that are to watch in the court, and has the ſetting of the watch. 33 Hen. VIII. c. 12.

CHECK, *clerk of the*, in the king's dock-yards, is alſo the name of an officer, who keeps a muſter or regiſter of all the men employed aboard his majeſty's ſhips and veſſels, and of the artificers and others in the ſervice of the navy, in the port to which he belongs.

CHECK, in *Falconry*, is where a hawk forſakes her proper game, to follow rooks, pies, or other birds that croſs her in her flight.

CHECKER. See EXCHEQUER.

CHECKER-*courſe*, in *Brick-Making*. See BRICK.

CHECKY, in *Heraldry*, is where the ſhield, or a part thereof, as a bordure, &c. is chequered, or divided into chequers, or ſquares. See *Tab. Heraldry, fig.* 15.

Where there is but one row of ſquares, it is not properly called *checky*, but *countercomponed*.

Checky, according to Colombiere, is one of the moſt noble and ancient figures in all armory; and ought never to be given, but to perſons who have diſtinguiſhed themſelves in war: for it repreſents a cheſs-board, which itſelf is a repreſentation of a field of battle. The pawns and men, placed on both ſides, repreſent the ſoldiers of the two armies; which move, attack, advance, or retire, according to the will of the two gameſters, who are the generals.

Checky is always compoſed of metal, and colour. Some authors, however, would have it ranked among the ſorts of furs.

When the whole eſcutcheon is chequered, it ſhould ordinarily contain ſix ranges: there is no need of blazoning to expreſs them; only it muſt be obſerved, to begin to blazon by the firſt ſquare in chief on the dexter ſide. So that if that be *or*, and the next *gules*, the houſe, or family, is ſaid to bear *checky*, *or*, and *gules*.

When the whole ſhield is not chequered, but only the chief, a bend, croſs, or the like, the number of ranges ſhould be expreſſed.

CHEEK, in *Anatomy*, that part of the face ſituated below the eyes on either ſide.

Wounds of the *cheeks*, if ſmall, may be cured by means of the dry ſuture; but, if very large, will require the bloody one, to bring their lips together: they are then eaſily healed with vulnerary balſams. But if it happen that one of Steno's ſalivary ducts is wounded in its paſſage acroſs the *cheek* from the parotid gland, the conſtant diſcharge of ſaliva into the wound will prevent the cure, till the duct is perforated in the internal part of the *cheek*, to make a paſſage for the ſaliva into the mouth. This method is propoſed by Cheſelden in his anatomy.

CHEEKS, a general name among *Mechanics*, for almoſt all thoſe pieces of their machines and inſtruments, that are double, and perfectly alike.

The *cheeks of a printing-preſs*, are its two principal pieces: they are placed perpendicular, and parallel to each other; ſerving to ſuſtain the three ſommers, viz. the head, ſhelves, and winter, and to bear the ſpindle, and other parts of the machine.

The *cheeks of a turner's lathe*, are two long pieces of wood, between which are placed the *puppets*, which are either pointed, or otherwiſe, ſerving to ſupport the work, and the mandrils of the workman. Theſe two pieces are placed parallel to the horizon, ſeparated from one another by the thickneſs of the tail of the puppets, and joined with tenons to two other pieces of wood, placed perpendicularly, called the *legs of the lathe*.

Cheeks of the glazier's vice, are two pieces of iron joined parallel at top and bottom; in which are the axis, or ſpindles, little wheel, cuſhions, &c. whereof the machine is compoſed.

CHEEKS *of a mortar*, or BRACKETS, in *Artillery*, are made of ſtrong planks of wood, bound with thick plates of iron, and are fixed to the bed by four bolts; they riſe on each ſide of the mortar, and ſerve to keep her at what elevation is given her, by the help of ſtrong bolts of iron which go through both *cheeks*, both under and behind the mortar, betwixt which are driven coins of wood; theſe bolts are called the bracket-bolts, and the bolts which are put one in each end of the bed, are the traverſe-bolts, becauſe with hand-ſpikes the mortar is by theſe traverſed to the right or left.

CHEEKS, in *Ship-Building*, are two pieces of timber, fitted on each ſide of the maſt, at the top, ſerving to ſtrengthen the maſts there. The uppermoſt bail or piece of timber in the beak of a ſhip, is called the *cheek*. The knees which faſten the beak-head to the bow of the ſhip, are called *cheeks*; and the ſides of any block, or the ſides of a ſhip's carriage of a gun, are called *cheeks.*

CHEEKS, *upper and lower*, are thoſe pieces of timber on each ſide of the TRAIL-*board.*

CHEESE, a kind of food; being a preparation of milk curdled by means of rennet, and afterwards dried, and hardened.

Cheeſe is nothing but milk purged of its ſerum, or whey; and ſometimes too of the cream, or butyrous part of the milk.

Cheeſe, when new, is found to load the ſtomach, by reaſon of its moiſture and viſcidity; and when too old, it heats and inflames it by its ſalts. The phyſicians adviſe it to be eat in ſmall quantities: hence that Latin verſe,

Caſeus ille bonus, quem dat avara manus.

Dr. Quincy ſays, it cannot be too old: it is certain, the more it abounds with ſalts, the more will it contribute to digeſtion, and the clearing of the ſtomach of other food. Indeed ſome condemn all uſe of *cheeſe*; ſheltering themſelves under that ancient maxim, *Caſeus eſt nequam, quia concoquit omnia ſe quam.*

The Laplanders make a ſort of *cheeſe* of the milk of their rein-deer, which is not only of great ſervice to them as food, but on many other occaſions. Scheffer's Hiſt. of Lapl.

CHEESE *Runnet*, in *Botany.* See LADY's *Bedſtraw.*

CHEEVANCE. See CHEVISANCE.

CHEF. See CHIEF.

CHEF *d'oeuvre.* See MASTERPIECE.

CHEGGIO, in *Botany*, a name given to a ſort of lacteſcent plant, common in Cambaya. It is reported by authors, and by the people of the country, that thoſe knobs and beards of this plant which grow facing the north, are a very noble medicine in the cure of apoplexies and other nervous diſorders, but that thoſe knots and beards of the ſame plant which look ſouthward are poiſonous. Redi proved ſome of this famous plant, and gave it ſeveral fair trials, but found the hiſtory of its nature and effects wholly falſe.

CHEILOCACE, among *Phyſicians*, literally ſignifies the *lip-evil.* It is a ſwelling of the lips, to which the inhabitants of northern countries, eſpecially children, are ſaid to be very ſubject; particularly thoſe in England and Ireland, if we may credit Caſtellus.

CHEIRANTHUS, in *Botany.* See STOCK *Gilly-flower.*

CHEKAO, in *Natural Hiſtory*, the name of an earth found in many parts of the Eaſt Indies, and ſometimes uſed by the Chineſe in their porcelain manufactures. It is a hard and ſtony earth, and the manner of uſing it is this: they firſt calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water, and ſtirring the whole together, they let the coarſer part ſubſide, and pouring off the reſt, yet thick as cream, they leave it to ſettle, and uſe the matter at the bottom, which is found in form of ſoft paſte, and will retain that humidity a long time. This ſupplies the place of the earth called *hoache*, in the making that elegant ſort of china-ware which is all white, and has flowers which ſeem formed by a mere vapour within its ſurface. The manner of their uſing it is this: they firſt make the veſſel of the common matter of the manufacture; when this is almoſt dry, they paint upon it the flowers, or whatever other figures they pleaſe, with a pencil dipt in this preparation of the *chekao*; when this is thoroughly dry, they cover the whole veſſel with the varniſh, in the common way, and bake it as uſual. The conſequence is, that the whole is white; but the body of the veſſel, the figures, and the varniſh, being three different ſubſtances, each has its own particular white; and the flowers, being painted in the fineſt white of all, are diſtinctly ſeen through the varniſh upon the veſſel, and ſeem as if traced by a fine vapour only. The *hoache* does this as well as the *chekao*, and has beſide this the quality of ſerving for the making the porcelain ware, either alone, or in the place of the *kaolin:* the *chekao* has not this property, nor any other ſubſtance beſide this *hoache*, which appears to be the ſame with our ſteatites or ſoap-rock.

CHELA, in *Medicine*, has ſeveral ſignifications. It imports a forked probe, mentioned by Hippocrates, lib. ii. De Morbis, uſed in extracting a polypus of the noſe. But in Ruffus Epheſius, cap. 4. *chelæ* implies the extremities of the *cilia*, which touch each other when the eyes are ſhut. But the moſt frequent ſignification of *chelæ* is claws, particularly thoſe of the crab.

Chelæ further ſignifies fiſſures in the heels, feet, or pudenda.

CHELANDIUM, in *Middle Age Writers*, is uſed for a kind of veſſel or ſhip. It is alſo called *chelandrium*, *chelindrus*, *chelindra*, *ſalandra*, and *ſalandria*, and, by the Byzantine writers, χελανδριον. It is mentioned by Ditmar as a veſſel of great length, carrying oars, and a hundred and fifty ſeamen. It ſeems to have reſembled an Italian galley.

CHELANDURUS, in *Middle Age Writers*, a ſmall kind of CHELANDIUM.

CHELAZIUM, a name uſed by ſome authors for a moveable tubercle in the eye-lid, commonly called in Engliſh a *ſlithe* or *ſtye.*

CHELIDON, in *Ichthyology*, the name given by many of the old Greek writers to a kind of flying-fiſh, called by ſome authors *milvus* and *hirundo*, and by ſome *accipiter*, or the HAWK-*fiſh.* It is properly a ſpecies of *trigla*, and is diſtinguiſhed by Artedi by the name of the *trigla* with the head a little aculeated, and with a ſingular fin near the pectoral fins. This method of reducing the fiſh to their true *genera*, and diſtinguiſhing them by their proper ſpecific names, is the only method of truly knowing them. The arbitrary names of *milvus* and *hirundo* carry ſo little idea of the peculiar fiſh with them, that they may be as well applied to one ſpecies as another; and accordingly we find two or three different ſpecies of the *trigla* called *milvus*, &c. by different authors.

CHELIDONIA, among the Romans, a name given to the wind more commonly called FAVONIUS.

It was only called *chelidonia* for a fortnight in the middle of February, becauſe at that time the ſwallow makes its firſt appearance.

CHELIDONIUM, in *Botany.* See CELANDINE.

CHELIDONIUS, in *Botany*, a name given by ſome writers to the ANEMONE. The reaſon ſeems to have been its flowering about the time of the ſwallows coming from their winter retreats.

CHELIDONIUS, in *Inſectolcgy*, the name of a fly called the ſwallow fly, by reaſon of its ſwift flight. It is in moſt parts of a brown colour, and has black prominent ſhoulders, a black head, and ſhort black *antennæ.* The wings are ſilvery, and edged with black. It often ſits a long time together on the leaves of plants; but is very quick-ſighted, and when any perſon comes near it, it is gone in a moment, and uſually takes ſuch long flights, that it is not eaſily caught afterwards.

CHELIDONIUS, in *Natural Hiſtory*, a ſtone pretended to be found in the ſtomachs of young ſwallows; much eſteemed by ſome for the falling ſickneſs.

The word is formed from χελιδων, a *ſwallow.* See SWALLOW-*ſtone.*

CHELON, in *Zoology*, the name of a fiſh of the mullet kind, and much reſembling the common mullet in its general ſhape, but its eyes are more prominent, and its head ſmaller. It has alſo its ſide-lines, which run from the head to the tail, very evenly ranged, and placed at equal diſtances, and its lips are remarkably thick and prominent. It is of the ſize of the common MULLET.

CHELONE, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower is of the ringent kind, having a ſhort cylindrical tube, which is ſwollen at the chaps, where it is oblong, convex above, and plain below; the mouth almoſt cloſed. It hath four ſtamina, the two ſide ones being a little longer than the other. It hath an oval germen, which afterward becomes an oval capſule, having two cells, which are filled with flat, roundiſh ſeeds, having a border. There are three ſpecies, which grow naturally in North America.

CHELONITES, a ſtone ſaid to be found in the Indian tortoiſes, and to have the faculty of reſiſting poiſon.

The word is formed from χελωνη, a *tortoiſe.*

Some confound the *chelonites* with the bufonites, or toad-ſtones.

CHELSEA *College.* See HOSPITAL.

CHELYDRUS, in *Natural Hiſtory*, a ſpecies of ſerpents, the ſame with the CHERSYDRUS.

CHELYS, among the *Ancients*, a muſical inſtrument of the pulſative kind, ſaid to be invented by Mercury, and formed of a ſhell found in the river Nile, at the time of low water.

CHELYSMA, in *Antiquity*, a thick piece of wood which the Greeks fixed to the keels of their ſhips, to ſave them from being worn or broken. It was alſo called *cuneus.*

CHEMA, according to Blancard, is the name of a certain meaſure ſometimes mentioned by the Greek phyſicians, and which he thinks contained two ſmall ſpoonfuls.

The determined weight of this quantity cannot be accurately aſcertained, in conſequence of the different ſpecific gravities of different ſubſtances: juſt as, at preſent, the word *ſpoonful* is uſed in a vague and undetermined ſenſe, eſpecially with reſpect to ſubſtances, of which it is a matter of indifference whether a little more or a little leſs be uſed.

CHEME, among the Romans, was a liquid meaſure, containing the fifth part of a CYATHUS.

CHEMICAL *glaſſes*, how to cement when cracked, ſee CEMENT.

CHEMIN *des rondes*, in *Fortification*. See WAY *of the rounds*.

CHEMISE, in *Fortification*, a wall wherewith a baſtion, or ditch, is lined, for its greater ſupport and ſtrength.

CHEMISE, *fire*, is a piece of linen cloth, ſteeped in a compoſition of oil of petrol, camphor, and other combuſtible matters; uſed at ſea, to ſet fire to an enemy's veſſel.

CHEMISTRY. See CHYMISTRY.

CHEMOSIS, in *Medicine*, a diſeaſe of the eye, proceeding from an inflammation, when the white of the eye ſwells above the black, and overtops it to ſuch a degree, that there appears a ſort of χημη, *hiatus*, or gap between them, whence it takes its name. Galen calls it a red and carnous inflammation of the *cornea tunica*.

Dr. Burghart, in a *chemoſis* where the *cornea* was already burſt, dilated the opening, and extracted the cryſtalline *lens*, which had come forward before the *iris*. The *lens* was ſo changed and ſuppurated, that it reſembled a piece of white amber: after extracting it, the pain of the eye became milder.

CHENCE, in *Old Cuſtoms*, ſeems to be much the ſame as AMABYR.

CHENILLES, *fauſſe*, *baſtard caterpillars*. See FAUSSE.

CHENISCUS, from χην, *a gooſe*; among the *Ancients*, an ornament in the form of little geeſe, uſed on the prows and ſterns of their ſhips.

CHENOCORPUS, *Gooſe-dung*, in *Medicine*, is accounted very acrimonious and reſolvent, and therefore preſcribed with ſucceſs in the jaundice. The greeniſh dung is eſteemed the beſt. It is gathered in the meadows in ſpring time, and being dried with a moderate heat, and pulveriſed, is given from half a dram to a full dram at a doſe. It is recommended alſo in the ſcurvy, and other diſeaſes.

CHENOPODIUM, in *Botany*. See GOOSE-*foot*.

CHENSERS, in our *Statutes*, is uſed for ſuch as paid tribute or *cenſe*, quit-rent, or chief-rent.

CHEQ, or CHERIF, the prince, or high-prieſt of Mecca; ſovereign pontiff of the Muſſulmans; and owned as ſuch by all the ſects into which they are divided.

The grand ſignior, ſophies, mogols, khans of Tartary, &c. ſend him yearly preſents; eſpecially tapeſtry, to cover Mahomet's tomb, and tents for himſelf: for the *cheq* has a tent near the moſque of Mecca, wherein he lives during the ſeventeen days of devotion in pilgrimage to Mecca. The tapeſtry and tent are changed each year, and pieces thereof are ſent to the princes who furniſh new ones.

His revenue is very conſiderable, conſiſting of preſents made by the Mahometan princes, and pilgrims, to the moſque of Mecca and Medina.

The *cheq* ſubſiſts all the pilgrims during the ſeventeen days of devotion; on which account he is every year furniſhed with a very conſiderable ſum of money from the grand ſignior: the better to obtain this, he makes him believe, that there are conſtantly, during this time, ſeventy thouſand pilgrims; and that, ſhould the number fall ſhort, the angels, in form of men, would make it up.

CHERAMIS, in *Antiquity*, a medical meaſure. According to Erotian on Hippocrates, it was the hollow of a ſhell-fiſh called *myax*, and took that name from χηραμος, which ſignifies a *hollow place*. It frequently occurs in Hippocrates, and ſeems not much different from the *chema*, which in Galen's Exegeſis is expounded by it. Cornavius alſo explains *cheramis* by the meaſure of a CHEMA; and Calvus on another paſſage expounds it by a *pugil*.

CHEREF, a title aſſumed by the emperors of Morocco. See CALIPHATE.

CHEREM, among the Jews, is uſed to ſignify a ſpecies of ANNIHILATION.

The Hebrew word *cherem* ſignifies properly *to deſtroy*, *exterminate*, *devote*, *anathematize*.

CHEREM is ſometimes likewiſe taken for that which is conſecrated, vowed, or offered to the Lord, ſo that it may no longer be employed in common or profane uſes. There are ſome who aſſert, that perſons thus devoted were put to death; whereof, they ſay, Jephtha's daughter is a memorable example. Judg. xi. 29, &c.

CHEREM is alſo uſed for a kind of excommunication in uſe among the Jews. See NIDDUI.

CHERLERIA, in *Botany*, a name given by Haller and Linnæus to a genus of plants of the *decandria trigynia* claſs, the characters of which are theſe: the perianthium is compoſed of five equal lanceolated leaves. There are no petals; but there ſtand within the cup five very ſmall, roundiſh, and emarginated *nectaria*, diſpoſed in a circular order. The ſtamina are ten ſubulated filaments, five of which are affixed to the *nectaria*. The *antheræ* are ſimple; the germen of the piſtil is of an oval figure; the ſtyles are three, and ſtand open; the ſtigmata are ſimple. The fruit is an oval capſule, compoſed of three valves, and divided into three cells. The ſeeds are numerous, convex on one ſide, and angular on the other. The *nectaria* of this genus ſhew, that they are of kin to the *ſedums* or houſeleeks; but in the fruit it differs altogether from the *ſedums*, and rather approaches to the nature of the *lychnis*; it would therefore be very improper to confound it with either of thoſe *genera*.

CHERMES, in *Zoology*, a genus of four-winged inſects, the characters of which are theſe: its *roſtrum*, or trunk, is ſituated under its breaſt; the abdomen is mucronated, or pointed, at the hinder extremity; and the legs are formed for leaping.

Theſe inſects, which in Engliſh are called bugs, take particular denominations from the trees or plants on which they feed: as the *elm*-BUG, the *fir*-BUG, the *birch*-BUG, the *maple*-BUG, the *willow*-BUG, the *nettle*-BUG, &c.

CHERMITES, or CHERNITES, in the *Natural Hiſtory of the Ancients*, a name given by many to a ſpecies of very bright and white marble or alabaſter, which ſeems to have been the ſame with that called afterwards LYGDINUM *marmor*.

CHERNIBS, in *Antiquity*, a veſſel wherein people uſed to waſh their hands before they went to attend religious ſervice.

The word is derived from χειρ, the *hand*, and νιπτω, *to waſh*.

CHERRY-*Tree*, *Ceraſus*, in *Botany*, the name of a genus of trees, according to ſome writers, but a ſpecies of the PRUNUS in the Linnæan ſyſtem. For the botanical characters, ſee PLUM-*Tree*.

This tree is called *ceraſus*, according to Servius, from the name of a city in Pontus, which Lucullus deſtroyed; and the fruit of it was brought by him to Rome, in the year of the city 680, and into Britain about a hundred and twenty years afterwards, or A. D. 55. Soon after it was ſpread through moſt parts of Europe. The ſpecies of the *cherry-tree* enumerated by Miller are five, viz. 1. the common or Kentiſh *cherry*, from which many modern botaniſts ſuppoſe that moſt of the varieties cultivated in the Engliſh gardens are derived; ſuch as the early May *cherry*, the May-duke *cherry*, the arch-duke *cherry*, the Flemiſh *cherry*, the red-heart, the white-heart, the black-heart, the amber-heart, the ox-heart, the lukeward, the carnation, the Hertfordſhire-heart, the morello, the bleeding-heart, and the yellow Spaniſh *cherry*, beſides two ſorts with double flowers, which are propagated for ornament. 2. The *cherry-tree* with ſpear-ſhaped ſawed leaves, or the greater wild *cherry-tree* with a ſweetiſh fruit, whoſe juice yields a black colour. This is a black *cherry*, ſuppoſed to be a native of England. This tree grows to a large ſize, produces beautiful flowers, affords good food for birds, and the wood of it is uſeful for turners. The French plant them for avenues to their houſes, where other trees will not thrive, and cultivate them for the manufacture of hoops. The varieties raiſed by ſeeds from this tree are the black coroun, which is a good bearer, and yields excellent fruit, and the ſmall wild *cherry*. 3. The *cherry-tree* with oval ſpear-ſhaped leaves, and flowers growing in cluſters, commonly called the cluſter *cherry*. 4. The *cherry-tree* with flowers growing in round bunches, and oval-leaves, called the *Mahaleb*, or perfumed *cherry*. The wood of this ſort is eſteemed by the French for cabinet-making, on account of its agreeable odour. 5. The *cherry-tree* with ſmooth, ſpear-ſhaped, entire leaves, of a bluiſh green on their under-ſide, and ſpreading branches, called the dwarf *Canada cherry*.

The ſeveral ſorts of *cherry-trees* are propagated by binding or grafting the ſeveral kinds into ſtocks of the black or wild red *cherries*, which are ſtrong ſhooters, and of a longer duration than any of the garden kinds. The ſtones of theſe two kinds are ſown in a bed of light ſandy earth in autumn, and the young ſtocks produced from them are to remain where they riſe till the ſecond autumn after their ſowing, when in October they ſhould be planted out into a rich earth, at three feet diſtance from row to row, and at about ten inches diſtance in the rows. The ſecond year after the planting out, they will be fit to bud, if they are intended for dwarfs; but if they are intended for ſtandards, they will not be tall enough till the fourth year; for they ſhould be budded or grafted near ſix feet from the ground. The grafting is uſually performed in ſummer, and the head of the ſtock is to be cut off in the beginning of the March following, about ſix inches above the bud; and if the bud has ſhot well, and there is any fear of its being diſplaced by winds, it muſt be gently tied up to the part of the ſtock left above it. The autumn afterwards, theſe trees will be fit to remove, and be ſet where they are to remain; or they may be left two years. Many, when they plant theſe trees in their places, lop off a great part of their heads, but this is an injury that often kills them; and when they eſcape, they ſeldom get well over it for four or five years. If the trees are intended for walls, it is adviſeable to plant dwarfs between the ſtandards, that theſe may cover the lower part of the wall, while the others ſpread over the upper part; and when the dwarfs riſe to fill the whole walls, the ſtandards ſhould be taken entirely away. When theſe trees are taken up from the nurſery, the dead fibres of the roots muſt be carefully taken off, and the upper part of the ſtock which is above the bud, muſt be cut off cloſe down to the back part of it: the bud muſt be placed directly from the wall.

Cherry-trees thrive beſt on a dry hazley loam, and in a gravelly ſoil are very ſubject to blights, and ſeldom ſtand long good. They ſhould be placed at fourteen feet aſunder, with a ſtandard-tree between each two. In pruning theſe trees, their ſhoots ſhould never be ſhortened, for they moſtly produce their fruit from their extreme part. All the fore-right ſhoots are to be diſplaced, and the others trained horizontally; and where there is a vacancy in the wall, the branches being ſhortened, will throw up a ſhoot or two to fill it.

Cherry, *Barbadoes*, *Malpighia*, in *Botany*, a genus of the *decandria trigynia* claſs. Its characters are theſe: the flower hath five kidney-ſhaped petals, which are concave, and ſpread open; and ten awl-ſhaped ſtamina, with two mellous glands adhering to the empalement. It has a ſmall roundiſh germen, ſupporting three ſlender ſtyles. The germen turns to a large, furrowed, globular berry, with one cell, incloſing three rough, angular, ſtony ſeeds. There are eight ſpecies, natives of the Weſt Indies, where the fruit is eaten by the natives.

Cherry, *Cornelian*, *Cornus*, in *Botany*, a genus of the *tetrandria monogynia* claſs. Its characters are theſe: it hath many flowers, which are included in one common four-leaved coloured involucrum; the flowers have four plain petals, and four erect ſtamina, which are longer than the petals. The round germen ſituated below the empalement becomes an oval or roundiſh berry, incloſing a nut with two cells, having an oblong kernel. There are ſix ſpecies. Miller's Gard. Dict.

The fruit of this tree is cooling, drying, and aſtringent, ſtrengthens the ſtomach, ſtops all kinds of fluxes, and is good in fevers, eſpecially if accompanied with a diarrhœa. The only officinal preparation of this fruit is the *rob de cornis*.

Cherry, *Dwarf*, and **Cherry** *of the Alps*, *Lonicera*. See *Upright* Honey-suckle.

Cherry, *Hottentot*, *Maurocenia*, in *Botany*, Lin. Gen. Plant. Edit. 2. 289. Its characters are theſe: the flower has five oval petals, which ſpread open. It hath five ſtamina, which are ſituated between the petals; and in the center is ſituated a roundiſh germen, crowned by a trifid ſtigma. The germen turns to an oval berry with one or two cells, each containing a ſingle oval ſeed. There are three ſpecies, natives of the Cape of Good Hope, and one diſcovered at Jamaica. This plant is annexed to the genus of cassine, in the laſt edition of Linnæus's Genera.

Cherry, *Winter*, *Phyſalis*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower has a ſwelling permanent empalement, which is five-cornered, and cut at the top into five acute points. The flower has one wheel-ſhaped petal, with a ſhort tube, and a large brim, which is five-cornered, and plaited. It has five ſmall awl-ſhaped ſtamina, which join together, and a roundiſh germen ſupporting a ſlender ſtyle, crowned by an obtuſe ſtigma. The germen afterwards turns to an almoſt globular berry, with two cells incloſed in the large inflated empalement, filled with compreſſed kidney-ſhaped ſeeds. There are ſixteen ſpecies.

This plant is eaſily propagated, either by ſeed, or by parting the roots. Its only beauty is in the autumn, when the fruit is ripe, at which time their red bladders opening and diſcloſing the *cherry*-ſhaped fruit, make a pretty appearance.

The leaves are cooling, and of the nature of common nightſhade. The berries are a ſingular good diuretic, and uſeful againſt the gravel and ſtone: being boiled in milk, and ſweetened with ſugar, they cure the heat of urine, making bloody water, and ulcers in the kidneys and bladder. They relieve the jaundice, by opening obſtructions of the liver and gall-bladder; and the dropſy, by carrying off the water through the urinary paſſages. The only officinal preparation is the *trochiſci alkekengi*.

Cherry-*brandy*, a drink made of brandy, with the addition of *cherries*.

The *cherries* commonly uſed therein, are of the black kind; with theſe, a bottle being half filled, is filled up with brandy, or ſpirits. The whole is to be ſhaken up now-and-then; and in a month's time it becomes fit for uſe.

To ſweeten it, and improve the flavour, ſome chooſe to put in ſugar, with a quantity of raſberries.

Cherry-*wine* is made by adding two pounds of ſugar to every two gallons of the juice of *cherries*. The liquor is afterwards put into a veſſel to ferment; and after ſtanding about two months in the caſk, is bottled off with a little ſugar for uſe.

CHERSA, called alſo *fecula*, in ſome medical writers, ſignifies a root reduced to a farinaceous powder. This way of preparation ſome condemn, as exhauſting the virtues of the drug, and rendering it good for nothing; others defend it.

CHERSÆA, *earthy*, from χηρσος, *earth*; an epithet of the three ſpecies of asps, mentioned by Galen and Ægineta.

CHERSETUM, in *Old Cuſtoms*, is uſed for *churcheſſet*. See Church-Scot.

CHERSONESUS, in *Geography*, a peninſula; or a continent almoſt encompaſſed round with the ſea, only joining to the main land, by a narrow neck, or iſthmus.

The word is Greek, χερσονησος; of χερσος, *land*, and νησος, *iſland*; which ſignifies the ſame.

This term is uſed by the moderns, in complaiſance to the ancients, who called all their peninſulas by this name: accordingly, ſuch places as were hereby diſtinguiſhed among them, retain the name among us; as the *cherſoneſus* of Peloponneſus, of Thrace, Cherſoneſus Cimbrica, Aurea, &c.

CHERSYDRUS, χερσυδρος, an amphibious ſerpent; ſo called, becauſe it lives firſt in watery places, whence it is called *hydrus*; after which it ſhifts its habitation, and lives on dry ground, and thence has its compound appellation *cherſydrus*.

CHERT, or **Cherk**, in *Natural Hiſtory*, a name given by ſome of our miners to a peculiar fine kind of ſtone found in ſtrata, but of the hardneſs and ſmoothneſs of flint. It is called alſo in ſome places *whern*, and by ſome authors *nicomia*.

Dr. Martyn, when he examined the mines of Derbyſhire, found great quantities of this ſtone, and in ſome places varying from its common colours and manner of appearance. In ſome places, inſtead of the thin ſtrata which this ſtone uſually forms, he found it in beds of three or four yards thick, and ſometimes much more. Such thick ſtrata of it he alſo found in the peak of Derbyſhire. He obſerved, that they were always found among ſtrata of lime-ſtone; and that ſometimes the *chert* did not form regular ſtrata, but lay in large looſe nodules. In many places the *chert* was black, and in others of a dark greeniſh colour; the workmen hence call them black *cherts*, and green *cherts*. Phil. Tranſ. Nº 407.

Cherts are uſed as grinding-ſtones for calcined flints, and other hard ſubſtances; but are of too ſmooth and cloſe a texture for grinding corn.

CHERUB, or **Cherubin**, a celeſtial ſpirit, which, in the hierarchy, is placed next in order to the ſeraphim. The word is formed of the Hebrew כרוב, *cherub*; the plural whereof is *cherubim*.

The figure of the *cherubim* was not always uniform, ſince they are differently deſcribed in the ſhapes of men, eagles, oxen, lions, and in a compoſition of all theſe figures put together. Moſes likewiſe calls theſe ſymbolical or hieroglyphical repreſentations, which were repreſented in embroideries upon the veils of the tabernacle, *cherubim* of coſtly work. Such were the ſymbolical figures which the Egyptians placed at the gates of their temples, and the images of the generality of their gods, which were commonly nothing but ſtatues compoſed of men and animals.

Cherubim was alſo the name of an ancient military order in Sweden, otherwiſe called the *order of Seraphim*. It was inſtituted by Magnus IV. in 1334, and aboliſhed by Charles IX. It took its denomination from the golden figures of *cherubim*, whereof the collar of the order was compoſed.

CHERVIL, *Chaerophyllum*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe; it is a plant with umbellated flowers; the principal umbel is ſpreading, and compoſed of ſeveral ſmall ones called rays: the flowers have five heart-ſhaped inflexed petals, and five ſtamina. The germen is ſituated below the flower, ſupporting two reflexed ſtyles, which afterward becomes an oblong pointed fruit, dividing in two parts, each having one ſeed, which is convex on one ſide, and plain on the other. There are five ſpecies.

The firſt ſort grows naturally on the ſides of highways, and the borders of the fields in moſt parts of England, ſo is never cultivated in gardens. It is frequently called cow-parſley, but from what reaſon does not appear, becauſe few animals care to eat it, except the aſs; it having in a leſs degree ſomething of the quality of hemlock. It is a weed which ſhould be rooted out of all paſtures early in the ſpring, for it is one of the moſt early plants in

CHEMIN *des rondes*, in *Fortification*. See WAY *of the rounds*.

CHEMISE, in *Fortification*, a wall wherewith a baſtion, or ditch, is lined, for its greater ſupport and ſtrength.

CHEMISE, *fire*, is a piece of linen cloth, ſteeped in a compoſition of oil of petrol, camphor, and other combuſtible matters; uſed at ſea, to ſet fire to an enemy's veſſel.

CHEMISTRY. See CHYMISTRY.

CHEMOSIS, in *Medicine*, a diſeaſe of the eye, proceeding from an inflammation, when the white of the eye ſwells above the black, and overtops it to ſuch a degree, that there appears a ſort of χημη, *hiatus*, or gap between them, whence it takes its name. Galen calls it a red and carnous inflammation of the *cornea tunica*.

Dr. Burghart, in a *chemoſis* where the *cornea* was already burſt, dilated the opening, and extracted the cryſtalline *lens*, which had come forward before the *iris*. The *lens* was ſo changed and ſuppurated, that it reſembled a piece of white amber: after extracting it, the pain of the eye became milder.

CHENCE, in *Old Cuſtoms*, ſeems to be much the ſame as AMABYR.

CHENILLES, *fauſſe*, *baſtard caterpillars*. See FAUSSE.

CHENISCUS, from χην, *a gooſe*; among the *Ancients*, an ornament in the form of little geeſe, uſed on the prows and ſterns of their ſhips.

CHENOCORPUS, *Gooſe-dung*, in *Medicine*, is accounted very acrimonious and reſolvent, and therefore preſcribed with ſucceſs in the jaundice. The greeniſh dung is eſteemed the beſt. It is gathered in the meadows in ſpring time, and being dried with a moderate heat, and pulveriſed, is given from half a dram to a full dram at a doſe. It is recommended alſo in the ſcurvy, and other diſeaſes.

CHENOPODIUM, in *Botany*. See GOOSE-*foot*.

CHENSERS, in our *Statutes*, is uſed for ſuch as paid tribute or *cenſe*, quit-rent, or chief-rent.

CHEQ, or CHERIF, the prince, or high-prieſt of Mecca; ſovereign pontiff of the Muſſulmans; and owned as ſuch by all the ſects into which they are divided.

The grand ſignior, ſophies, mogols, khans of Tartary, &c. ſend him yearly preſents; eſpecially tapeſtry, to cover Mahomet's tomb, and tents for himſelf: for the *cheq* has a tent near the moſque of Mecca, wherein he lives during the ſeventeen days of devotion in pilgrimage to Mecca. The tapeſtry and tent are changed each year, and pieces thereof are ſent to the princes who furniſh new ones.

His revenue is very conſiderable, conſiſting of preſents made by the Mahometan princes, and pilgrims, to the moſque of Mecca and Medina.

The *cheq* ſubſiſts all the pilgrims during the ſeventeen days of devotion; on which account he is every year furniſhed with a very conſiderable ſum of money from the grand ſignior: the better to obtain this, he makes him believe, that there are conſtantly, during this time, ſeventy thouſand pilgrims; and that, ſhould the number fall ſhort, the angels, in form of men, would make it up.

CHERAMIS, in *Antiquity*, a medical meaſure. According to Erotian on Hippocrates, it was the hollow of a ſhell-fiſh called *myax*, and took that name from χηραμος, which ſignifies a *hollow place*. It frequently occurs in Hippocrates, and ſeems not much different from the *chema*, which in Galen's Exegeſis is expounded by it. Cornavius alſo explains *cheramis* by the meaſure of a CHEMA; and Calvus on another paſſage expounds it by a *pugil*.

CHEREF, a title aſſumed by the emperors of Morocco. See CALIPHATE.

CHEREM, among the Jews, is uſed to ſignify a ſpecies of ANNIHILATION.

The Hebrew word *cherem* ſignifies properly *to deſtroy*, *exterminate*, *devote*, *anathematize*.

CHEREM is ſometimes likewiſe taken for that which is conſecrated, vowed, or offered to the Lord, ſo that it may no longer be employed in common or profane uſes. There are ſome who aſſert, that perſons thus devoted were put to death; whereof, they ſay, Jephtha's daughter is a memorable example. Judg. xi. 29, &c.

CHEREM is alſo uſed for a kind of excommunication in uſe among the Jews. See NIDDUI.

CHERLERIA, in *Botany*, a name given by Haller and Linnæus to a genus of plants of the *decandria trigynia* claſs, the characters of which are theſe: the perianthium is compoſed of five equal lanceolated leaves. There are no petals; but there ſtand within the cup five very ſmall, roundiſh, and emarginated *nectaria*, diſpoſed in a circular order. The ſtamina are ten ſubulated filaments, five of which are affixed to the *nectaria*. The *antheræ* are ſimple; the germen of the piſtil is of an oval figure; the ſtyles are three, and ſtand open; the ſtigmata are ſimple. The fruit is an oval capſule, compoſed of three valves, and divided into three cells. The ſeeds are numerous, convex on one ſide, and angular on the other. The *nectaria* of this genus ſhew, that they are of kin to the *ſedums* or houſeleeks; but in the fruit it differs altogether from the *ſedums*, and rather approaches to the nature of the *lychnis*; it would therefore be very improper to confound it with either of thoſe *genera*.

CHERMES, in *Zoology*, a genus of four-winged inſects, the characters of which are theſe: its *roſtrum*, or trunk, is ſituated under its breaſt; the abdomen is mucronated, or pointed, at the hinder extremity; and the legs are formed for leaping.

Theſe inſects, which in Engliſh are called bugs, take particular denominations from the trees or plants on which they feed: as the *elm*-BUG, the *fir*-BUG, the *birch*-BUG, the *maple*-BUG, the *willow*-BUG, the *nettle*-BUG, &c.

CHERMITES, or CHERNITES, in the *Natural Hiſtory of the Ancients*, a name given by many to a ſpecies of very bright and white marble or alabaſter, which ſeems to have been the ſame with that called afterwards LYGDINUM *marmor*.

CHERNIBS, in *Antiquity*, a veſſel wherein people uſed to waſh their hands before they went to attend religious ſervice.

The word is derived from χειρ, the *hand*, and νιπτω, *to waſh*.

CHERRY-*Tree*, *Cerasus*, in *Botany*, the name of a genus of trees, according to ſome writers, but a ſpecies of the PRUNUS in the Linnæan ſyſtem. For the botanical characters, ſee PLUM-*Tree*.

This tree is called *cerasus*, according to Servius, from the name of a city in Pontus, which Lucullus deſtroyed; and the fruit of it was brought by him to Rome, in the year of the city 680, and into Britain about a hundred and twenty years afterwards, or A. D. 55. Soon after it was ſpread through moſt parts of Europe. The ſpecies of the *cherry-tree* enumerated by Miller are five, viz. 1. the common or Kentiſh *cherry*, from which many modern botaniſts ſuppoſe that moſt of the varieties cultivated in the Engliſh gardens are derived; ſuch as the early May *cherry*, the May-duke *cherry*, the arch-duke *cherry*, the Flemiſh *cherry*, the red-heart, the white-heart, the black-heart, the amber-heart, the ox-heart, the lukeward, the carnation, the Hertfordſhire-heart, the morello, the bleeding-heart, and the yellow Spaniſh *cherry*, beſides two ſorts with double flowers, which are propagated for ornament. 2. The *cherry-tree* with ſpear-ſhaped ſawed leaves, or the greater wild *cherry-tree* with a ſweetiſh fruit, whoſe juice yields a black colour. This is a black *cherry*, ſuppoſed to be a native of England. This tree grows to a large ſize, produces beautiful flowers. affords good food for birds, and the wood of it is uſeful for turners. The French plant them for avenues to their houſes, where other trees will not thrive, and cultivate them for the manufacture of hoops. The varieties raiſed by ſeeds from this tree are the black coroun, which is a good bearer, and yields excellent fruit, and the ſmall wild *cherry*. 3. The *cherry-tree* with oval ſpear-ſhaped leaves, and flowers growing in cluſters, commonly called the cluſter *cherry*. 4. The *cherry-tree* with flowers growing in round bunches, and oval-leaves, called the *Mahaleb*, or perfumed *cherry*. The wood of this ſort is eſteemed by the French for cabinet-making, on account of its agreeable odour. 5. The *cherry-tree* with ſmooth, ſpear-ſhaped, entire leaves, of a bluiſh green on their under-ſide, and ſpreading branches, called the dwarf *Canada cherry*.

The ſeveral ſorts of *cherry-trees* are propagated by binding or grafting the ſeveral kinds into ſtocks of the black or wild red *cherries*, which are ſtrong ſhooters, and of a longer duration than any of the garden kinds. The ſtones of theſe two kinds are ſown in a bed of light ſandy earth in autumn, and the young ſtocks produced from them are to remain where they riſe till the ſecond autumn after their ſowing, when in October they ſhould be planted out into a rich earth, at three feet diſtance from row to row, and at about ten inches diſtance in the rows. The ſecond year after the planting out, they will be fit to bud, if they are intended for dwarfs; but if they are intended for ſtandards, they will not be tall enough till the fourth year; for they ſhould be budded or grafted near ſix feet from the ground. The grafting is uſually performed in ſummer, and the head of the ſtock is to be cut off in the beginning of the March following, about ſix inches above the bud; and if the bud has ſhot well, and there is any fear of its being diſplaced by winds, it muſt be gently tied up to the part of the ſtock left above it. The autumn afterwards, theſe trees will be fit to remove, and be ſet where they are to remain; or they may be left two years. Many, when they plant theſe trees in their places, lop off a great part of their heads, but this is an injury that often kills them; and when they eſcape, they ſeldom get well over it for four or five years. If the trees are intended for walls, it is adviſeable to plant dwarfs between the ſtandards, that theſe may cover the lower part of the wall, while the others ſpread over the upper part; and when the dwarfs riſe to fill the whole walls, the ſtandards ſhould be taken entirely away. When theſe trees are taken up from the nurſery, the dead fibres of the roots muſt be carefully taken off, and the upper part of the ſtock which is above the bud, muſt be cut off cloſe down to the back part of it: the bud muſt be placed directly from the wall.

Cherry-trees thrive beſt on a dry hazley loam, and in a gravelly ſoil are very ſubject to blights, and ſeldom ſtand long good. They ſhould be placed at fourteen feet aſunder, with a ſtandard-tree between each two. In pruning theſe trees, their ſhoots ſhould never be ſhortened, for they moſtly produce their fruit from their extreme part. All the fore-right ſhoots are to be diſplaced, and the others trained horizontally; and where there is a vacancy in the wall, the branches being ſhortened, will throw up a ſhoot or two to fill it.

Cherry, *Barbadoes*, *Malpighia*, in *Botany*, a genus of the *decandria trigynia* claſs. Its characters are theſe: the flower hath five kidney-ſhaped petals, which are concave, and ſpread open; and ten awl-ſhaped ſtamina, with two mellous glands adhering to the empalement. It has a ſmall roundiſh germen, ſupporting three ſlender ſtyles. The germen turns to a large, furrowed, globular berry, with one cell, incloſing three rough, angular, ſtony ſeeds. There are eight ſpecies, natives of the Weſt Indies, where the fruit is eaten by the natives.

Cherry, *Cornelian*, *Cornus*, in *Botany*, a genus of the *tetrandria monogynia* claſs. Its characters are theſe: it hath many flowers, which are included in one common four-leaved coloured involucrum; the flowers have four plain petals, and four erect ſtamina, which are longer than the petals. The round germen ſituated below the empalement becomes an oval or roundiſh berry, incloſing a nut with two cells, having an oblong kernel. There are ſix ſpecies. Miller's Gard. Dict.

The fruit of this tree is cooling, drying, and aſtringent, ſtrengthens the ſtomach, ſtops all kinds of fluxes, and is good in fevers, eſpecially if accompanied with a diarrhœa. The only officinal preparation of this fruit is the *rob de cornis*.

Cherry, *Dwarf*, and Cherry *of the Alps*, *Lonicera*. See *Upright* Honey-suckle.

Cherry, *Hottentot*, *Maurocenia*, in *Botany*, Lin. Gen. Plant. Edit. 2. 289. Its characters are theſe: the flower has five oval petals, which ſpread open. It hath five ſtamina, which are ſituated between the petals; and in the center is ſituated a roundiſh germen, crowned by a trifid ſtigma. The germen turns to an oval berry with one or two cells, each containing a ſingle oval ſeed. There are three ſpecies, natives of the Cape of Good Hope, and one diſcovered at Jamaica. This plant is annexed to the genus of cassine, in the laſt edition of Linnæus's Genera.

Cherry, *Winter*, *Phyſalis*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower has a ſwelling permanent empalement, which is five-cornered, and cut at the top into five acute points. The flower has one wheel-ſhaped petal, with a ſhort tube, and a large brim, which is five-cornered, and plaited. It has five ſmall awl-ſhaped ſtamina, which join together, and a roundiſh germen ſupporting a ſlender ſtyle, crowned by an obtuſe ſtigma. The germen afterwards turns to an almoſt globular berry, with two cells incloſed in the large inflated empalement, filled with compreſſed kidney-ſhaped ſeeds. There are fixteen ſpecies.

This plant is eaſily propagated, either by ſeed, or by parting the roots. Its only beauty is in the autumn, when the fruit is ripe, at which time their red bladders opening and diſcloſing the *cherry*-ſhaped fruit, make a pretty appearance.

The leaves are cooling, and of the nature of common nightſhade. The berries are a ſingular good diuretic, and uſeful againſt the gravel and ſtone: being boiled in milk, and ſweetened with ſugar, they cure the heat of urine, making bloody water, and ulcers in the kidneys and bladder. They relieve the jaundice, by opening obſtructions of the liver and gall-bladder; and the dropſy, by carrying off the water through the urinary paſſages.

The only officinal preparation is the *trochiſci alkekengi*.

Cherry-*brandy*, a drink made of brandy, with the addition of *cherries*.

The *cherries* commonly uſed therein, are of the black kind; with theſe, a bottle being half filled, is filled up with brandy, or ſpirits. The whole is to be ſhaken up now-and-then; and in a month's time it becomes fit for uſe.

To ſweeten it, and improve the flavour, ſome chooſe to put in ſugar, with a quantity of raſberries.

Cherry-*wine* is made by adding two pounds of ſugar to every two gallons of the juice of *cherries*. The liquor is afterwards put into a veſſel to ferment; and after ſtanding about two months in the caſk, is bottled off with a little ſugar for uſe.

CHERSA, called alſo *fecula*, in ſome medical writers, ſignifies a root reduced to a farinaceous powder. This way of preparation ſome condemn, as exhauſting the virtues of the drug, and rendering it good for nothing; others defend it.

CHERSÆA, *earthy*, from χηρσος, *earth*; an epithet of the three ſpecies of asps, mentioned by Galen and Ægineta.

CHERSETUM, in *Old Cuſtoms*, is uſed for *churcheſſet*. See Church-Scot.

CHERSONESUS, in *Geography*, a peninſula; or a continent almoſt encompaſſed round with the ſea, only joining to the main land, by a narrow neck, or iſthmus.

The word is Greek, χερσονησος; of χερσος, *land*, and νησος, *iſland*; which ſignifies the ſame.

This term is uſed by the moderns, in complaiſance to the ancients, who called all their peninſulas by this name: accordingly, ſuch places as were hereby diſtinguiſhed among them, retain the name among us; as the *cherſoneſus* of Peloponneſus, of Thrace, Cherſoneſus Cimbrica, Aurea, &c.

CHERSYDRUS, χερσυδρος, an amphibious ſerpent; ſo called, becauſe it lives firſt in watery places, whence it is called *hydrus*; after which it ſhifts its habitation, and lives on dry ground, and thence has its compound appellation *cherſydrus*.

CHERT, or Cherk, in *Natural Hiſtory*, a name given by ſome of our miners to a peculiar fine kind of ſtone found in ſtrata, but of the hardneſs and ſmoothneſs of flint. It is called alſo in ſome places *whern*, and by ſome authors *nicomia*.

Dr. Martyn, when he examined the mines of Derbyſhire, found great quantities of this ſtone, and in ſome places varying from its common colours and manner of appearance. In ſome places, inſtead of the thin ſtrata which this ſtone uſually forms, he found it in beds of three or four yards thick, and ſometimes much more. Such thick ſtrata of it he alſo found in the peak of Derbyſhire. He obſerved, that they were always found among ſtrata of lime-ſtone; and that ſometimes the *chert* did not form regular ſtrata, but lay in large looſe nodules. In many places the *chert* was black, and in others of a dark greeniſh colour; the workmen hence call them black *cherts*, and green *cherts*. Phil. Tranſ. Nº 407.

Cherts are uſed as grinding-ſtones for calcined flints, and other hard ſubſtances; but are of too ſmooth and cloſe a texture for grinding corn.

CHERUB, or Cherubin, a celeſtial ſpirit, which, in the hierarchy, is placed next in order to the ſeraphim. The word is formed of the Hebrew כרוב, *cherub*; the plural whereof is *cherubim*.

The figure of the *cherubim* was not always uniform, ſince they are differently deſcribed in the ſhapes of men, eagles, oxen, lions, and in a compoſition of all theſe figures put together. Moſes likewiſe calls theſe ſymbolical or hieroglyphical repreſentations, which were repreſented in embroideries upon the veils of the tabernacle, *cherubim* of coſtly work. Such were the ſymbolical figures which the Egyptians placed at the gates of their temples, and the images of the generality of their gods, which were commonly nothing but ſtatues compoſed of men and animals.

Cherubim was alſo the name of an ancient military order in Sweden, otherwiſe called the *order of Seraphim*. It was inſtituted by Magnus IV. in 1334, and aboliſhed by Charles IX. It took its denomination from the golden figures of *cherubim*, whereof the collar of the order was compoſed.

CHERVIL, *Chaerophyllum*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe; it is a plant with umbellated flowers; the principal umbel is ſpreading, and compoſed of ſeveral ſmall ones called rays: the flowers have five heart-ſhaped inflexed petals, and five ſtamina. The germen is ſituated below the flower, ſupporting two reflexed ſtyles, which afterward becomes an oblong pointed fruit, dividing in two parts, each having one ſeed, which is convex on one ſide, and plain on the other. There are five ſpecies.

The firſt ſort grows naturally on the ſides of highways, and the borders of the fields in moſt parts of England, ſo is never cultivated in gardens. It is frequently called cow-parſley, but from what reaſon does not appear, becauſe few animals care to eat it, except the aſs; it having in a leſs degree ſomething of the quality of hemlock. It is a weed which ſhould be rooted out of all paſtures early in the ſpring, for it is one of the moſt early plants in ſhooting; and by the beginning of April, the leaves are near two feet high.

The fourth ſort is the common garden *chervil*, and flowers in May and June. Its leaves and ſeeds are uſed in medicine; the ſeed contains the principal virtue of the plant, and is eſteemed a great medicine in jaundices and dropſies. It is very certain that it is a powerful diuretic, and therefore recommended in the gravel and ſtone; and likewiſe a promoter of the menſes. It reſolves coagulated blood, and generally diſpoſes the perſon to ſleep. It is uſed alſo externally in fomentation in colicky pains and retenſion of urine.

The leaves of this plant are what the good women call *ſweet fern*, from which they diſtil a water, and eſteem it a very great remedy for colics.

This will thrive on any ſoil, and in any ſituation.

CHESS, an ingenious game, performed with little round pieces of wood, on a board divided into ſixty-four ſquares; where ſkill and addreſs are ſo indiſpenſably requiſite, that chance has no place; and a perſon never loſes but by his own fault.

Saraſin has a preciſe treatiſe on the different opinions of the origin of the Latin *ſchacchi*; whence the French *echecs*, and our *cheſs*, is formed. Manege is alſo very full on the ſame head. Leunclavius takes it to come from the *uſcoches*, famous Turkiſh robbers. P. Sirmond from the German *ſcackhe*, *theſt*; and that from *calculus*. He takes *cheſs* to be the ſame with *ludus latrunculorum* of the Romans, but miſtakenly. This opinion is countenanced by Voſſius and Salmaſius, who derive the word from *calculus*, as uſed for *latrunculus*. Some derive it from the Hebrew סיג, *ſjag*, *ſepes*, whence *vallare*, *vallavit*; & מות, *mut*, *mori*, *mortuus*; others again from שחוק, *ſchok*, *luſus*, and מות, *mori*; whence *cheſs* and *cheſs-mate*. Fabricius ſays, a celebrated Perſian aſtronomer, one Schatrenſcha, invented the game of *cheſs*; and gave it his own name, which it ſtill bears in that country. Nicod derives it from *ſcheque*, or *xeque*, a Mooriſh word for *lord*, *king*, and *prince*: Bochart adds, that *ſchach* is originally Perſian, and that *ſchachmat*, in that language, ſigniſies the *king is dead*.

But the learned Hyde has ſhewn from undoubted authorities, that this game was firſt invented in India, and paſſed from thence to Perſia before the year of Chriſt 576, and from Perſia to Arabia. He adds, that the antiquity of this game is traced much higher, or to the middle of the ſecond century, in an Iriſh chronicle, the authenticity of which is doubtful. And he ſhews, that *ſhah*, i. e. *rex*, was a term much in uſe among the orientals, whilſt engaged in this play, and that they uſed it to caution the king againſt any danger; and hence the Europeans and others have denominated the game *ſhachiludium* and *ſhahiludium*, and in Engliſh *cheſs*, from this circumſtance. He alſo derives the word *mat* from the Perſic *manit*, *laſſatus eſt*; and ſays that it was uſed in play, when any of the men was fixed in its place, or taken captive. See Hiſtoria Shahiludii apud Syntagma Diſſertationum, &c. Hyde, editum a Doctore Sharpe, vol. ii. p. 1, &c.

Donatus, on Terence's Eunuch, obſerves, that Pyrrhus, the moſt knowing and expert prince of his age, ranging a battle, made uſe of the men at *cheſs* to form his deſigns; and to ſhew the ſecrets thereof to others. Vopiſcus, in his life of Proculus, informs us, that one of the Roman emperors had the title Auguſtus given him, becauſe of his gaining ten games at *cheſs* ſucceſſively.

Tamerlane is alſo recorded as a very expert gameſter at *cheſs*.

Cheſs is doubtleſs a moſt ancient and univerſal game; the common opinion is, that it was invented by Palamedes at the ſiege of Troy. Others attribute the invention to Diomedes, who lived in the time of Alexander; the romance of the Roſe aſcribes it to one Attalus; but the truth is, the game is ſo very ancient, there is no tracing its author.

In China, it makes a conſiderable part of the education of their females, and ſeems to take the place of dancing among us. In Spain, whole cities challenge each other at *cheſs*; and it has been much in uſe in moſt parts of Europe.

John of Saliſbury relates, that in a battle between the French and Engliſh in 1117, an Engliſh knight ſeizing the bridle of Louis le Gros, and crying to his comrades, *the king is taken*, that prince ſtruck him to the ground with his ſword, ſaying, *Ne ſcais tu pas qu' aux echecs on ne prend pas le roy? Doſt thou not know, that at* cheſs *the king is never taken?* The reaſon is, that when the king is reduced to ſuch a paſs, that there is no way for him to eſcape, the game ends, without expoſing the royal piece to further affront.

Lydgate, a monk of St. Edmund's Bury, calls it the *game-royal*. It was anciently of ſuch repute in Ireland, that ſome of their beſt eſtates depended upon it; and it is a condition whereby two noble families enjoy their lands, that the one engages the other every year at this game: and the Italians have been ſo much addicted to it, that a father, who has died before the concluſion of a game at *cheſs* has bound his ſon to finiſh it; and the ſame cuſtom is ſaid to obtain among the Germans. See Hyde, ubi ſupra, &c. p. 7 and 8.

Cardinal Cajetan, and other caſuiſts, rank *cheſs* in the number of prohibited games, as requiring too much application; and Montaigne blames it as too ſerious for a game.

In this game each player has eight dignified pieces, viz. a king, a queen, two biſhops, two knights, and two rooks, and alſo eight pawns, which were anciently called *ſcachi*, q. d. *milites*, and made in different figures, and of various materials, moſtly of wood or ivory. Theſe pieces are diſtinguiſhed by being painted in white and black colours.

As to their diſpoſition on the board, the white king is to be placed on the fourth black houſe from the corner of the board, in the firſt and lower rank; and the black king is to be placed on the fourth white houſe on the oppoſite, or adverſary's ſide of the board. The queens are placed next to the kings, on houſes of their own colour. Next to the king and queen, on each hand, place the two biſhops; next to them, the two knights; and laſt of all, on the corners of the board, the two rooks. As to the pawns, they are placed, without diſtinction, on the ſecond rank of the houſe, one before each of the dignified pieces.

Having thus diſpoſed the men, the onſet is commonly begun by the pawns, which march ſtrait forward in their own file, one houſe at a time, except the firſt move, when they may advance two houſes, but they never move backwards: the manner of their taking the adverſary's men is ſideways, in the next houſe forwards; where, having captivated the enemy, they move forward as before. The rook goes forward or croſs-ways through the whole file, and back again. The knight ſkips backward and forward to the next houſe, ſave one, of a different colour, with a ſidling march, or aſlope, and thus kills his enemies that fall in his way, or guards his friends that may be expoſed on that ſide. The biſhop walks always in the ſame colour of the field which he is placed in at firſt, forward or backward, aſlope or diagonally, as far as he pleaſes. The queen's walk is more univerſal, as ſhe takes all the ſteps of the fore mentioned pieces, excepting that of the knight; and as to the king's motion, it is one houſe at a time, and that in any direction. As to the value of the different pieces, next to the king is the queen, after her the rooks, then the biſhops, and laſt of all the knights. The difference of the worth of pawns is not ſo great as that of noblemen; however, the king's biſhop's pawn is the beſt, and therefore particular care is taken of him. It ought alſo to be obſerved, that, whereas any man may be taken, when he falls within the reach of any of the adverſary's pieces, it is otherwiſe with the king, who, in ſuch a caſe, is only to be ſaluted with the word *check* (*ſhack*), warning him of his danger, out of which he muſt move; and if he cannot move without expoſing himſelf to a ſimilar inconvenience, it is *check-mate*, and the game is loſt

CHESS-*trees*, in *Ship-Building*, are two ſmall pieces of timber with a hole in them, bolted on each ſide of the ſhip, and placed as far before the main-maſt as the length of the main-beam; their uſe is to confine the clue of the main-ſail, and for this purpoſe a rope paſſes through, that uſually extends the clue of the ſail to windward.

CHEST, in *Anatomy*, that part of the body which contains the heart and lungs. See BREAST and THORAX.

CHEST, in *Commerce*, a kind of meaſure, containing an uncertain quantity of ſeveral commodities.

A *cheſt of ſugar*, v. g. contains from ten to fifteen hundred weight; a *cheſt of glaſs*, from 200 to 300 feet; of *Caſtile ſoap*, from two and a half to three hundred weight; *of indigo*, from one and a half to two hundred weight; five ſcore to the hundred.

CHEST *at Chatham* was eſtabliſhed in 1588, for the benefit of maimed and ſuperannuated Engliſh mariners, out of which penſions are paid to ſuch for their lives. This fund was at firſt raiſed by a voluntary monthly contribution of the mariners out of their pay, and afterwards made perpetual by queen Elizabeth.

CHESTNUT, *Caſtanea*, from *Caſtana*, a city in Theſſaly, where this tree anciently grew in great plenty; in *Botany*, is ranged by Linnæus in the claſs of *monoecia polyandria*, and joined to the genus of *fagus* or BEECH. Its characters are theſe: it hath male and female flowers on the ſame tree, ſometimes at ſeparate diſtances, at other times near each other. The male flowers form a ſort of catkin, have no petals, but include about ten or twelve briſtly ſtamina. The female flowers are of one leaf, divided into four parts; having no petals, but a germen fixed to the empalement, which becomes a roundiſh fruit armed with ſoft ſpines, including one or more nuts. There are three ſpecies.

The *cheſtnut* tree is a tree which deſerves our care as much as any of the trees which are propagated in this country, either for its uſe or beauty; being one of the beſt ſorts of timber, and affording a good ſhade. It will grow to a great ſize, and ſpread its branches finely on every ſide where it has room. The leaves are large, of a lucid green, nor are they ſo liable to be eaten by inſects as thoſe of the oak. There is no better food for deer, and many other animals, than their nuts; which moſt of them prefer to acorns: yet they ſhould not be planted near habitations; becauſe when they are in flower they emit a diſagreeable odour, very offenſive to moſt people.

Some remains of old decayed *cheſtnuts* in Enfield chaſe, plainly prove that this tree is not ſo great a ſtranger to this climate as many people believe. Dr. Ducarel maintains, in his Anglo-Norman Antiquities, that they are indigenous or native trees of this iſland: for this purpoſe he alleges, that many of our old buildings in London, and other places, contain a great quantity of this timber; that *cheſtnut* trees were familiarly known to the Saxons, and that they are very common ſtill in ſeveral parts of England, particularly in the north-eaſt part of Kent; and that remains of them are ſeen in the foreſt of Dean and elſewhere. The Hon. Mr. Daines Barrington has controverted this opinion. See on the ſubject, Phil. Tranſ. vol. lix. N° 5. and vol. lxi. N° 17, 18, 19, and 20.

Cheſtnut trees may be cultivated in England, to afford equal profit with any of the large timber trees; the wood being of equal value with the beſt oak, and for many purpoſes far exceeding it. It is particularly good for veſſels for all kinds of liquor; having a property, when once thoroughly ſeaſoned, of maintaining its bulk conſtantly, without ſhrinking or ſwelling, as other timber is too apt to do; and it is ſaid that all the large caſks for their wines in Italy, are made of this timber: it is for this and many more purpoſes, in greater eſteem among the Italians, than any other timber whatever. It is alſo very valuable for pipes to convey water under ground, as enduring longer than elm, or any other wood.

Theſe trees are propagated by planting the nuts in February, in beds of freſh undunged earth. The beſt nuts for ſowing, are ſuch as are brought from Portugal or Spain, which are commonly ſold in winter for eating; provided they are not kiln dried, which is frequently done to foreign nuts, to prevent their ſprouting in the paſſage. The time generally allowed them in the nurſery, is three or four years; but the younger they are tranſplanted, the better they will ſucceed.

See an ingenious and an effectual method of preſerving *cheſtnuts*, diſcovered by Mr. Ellis. Phil. Tranſ. vol. li. part i. p. 213. an. 1759.

CHESTNUT, *horſe*, *Hippocaſtanum*, ÆSCULUS, in *Botany*. Its characters are theſe: the empalement of the flower is ſlightly cut into five ſegments; the flower is compoſed of five unequal petals, folded at their border, and waved; and it has ſeven ſtamina. The empalement becomes a thick, rounded, echinated capſule, opening into three cells, in one or two of which are lodged globular ſeeds. We have but one ſpecies.

The *horſe cheſtnut* was brought from the northern parts of Aſia about the year 1550, and ſent to Vienna about the year 1588.

As this tree is quick in its growth, ſo in a few years it will arrive to a ſize large enough to afford a good ſhade in ſummer; as alſo to produce plenty of flowers. Trees raiſed from nuts, have in twelve or fourteen years become large enough to ſhade two or three chairs under the ſpread of their branches; and have been covered with flowers in the ſeaſon. But the wood is of little value.

In Turky the nuts of this tree are ground, and mixed with the provender for their horſes, eſpecially thoſe which are troubled with coughs, or are broken-winded: in both which diſorders they are accounted very good.

M. Raimont, a gentleman of Anjou, gave them, mixed with other food, to his cows; and they increaſed the quantity of milk, without injuring its quality: and he apprehends, that if they were blanched and raſped, or otherwiſe prepared, they might be given to hogs and poultry. Memoirs of the Royal Society of Agriculture at Tours, vol. i. p. 121.

Jo. Jac. Zannichelli affirms, that after a great many trials, he has found the bark of the *hippocaſtanum* to have the ſame effect as the PERUVIAN *bark*.

The *horſe cheſtnut* is employed for the purpoſe of bleaching yarn in France and Switzerland; and it is recommended in the Memoirs of the Society of Berne, vol. ii. part 2. as capable of extenſive uſe in whitening not only flax and hemp, but alſo ſilk and wool. It contains an aſtringent ſaponaceous juice, which is obtained by peeling the nuts, and grinding or raſping them. They are then mixed with hot rain or running water, in the proportion of twenty nuts to ten or twelve quarts of water. Wove caps and ſtockings were milled in this water, and took the dye extremely well; and ſucceſsful trials were made of it in fulling ſtuffs and cloths. Linen waſhed in this water takes a pleaſing light ſky-blue colour: and the filaments of hemp ſteeped in it for ſome days, were eaſily ſeparated. The author of the memoir above referred to, imagines, that if the meal of the *cheſtnuts* could be made into cakes or balls, it would anſwer the purpoſes of ſoap in waſhing and fulling. The ſediment, after infuſion, loſes its bitter taſte, and becomes good food for fowls when mixed with bran.

CHESTNUT, *ſcarlet flowering horſe*, *Pavia*, in *Botany*. This genus is joined to *æſculus* in the Linnæan diſtribution. Its characters are theſe: the flower has a ſmall empalement of one leaf, indented in five parts at the top: it has five roundiſh petals, waved and plaited on their borders, and narrow at their baſe, which are inſerted in the empalements. It hath eight ſtamina, which are declined, as long as the petals; terminated by riſing ſummits, and a roundiſh germen ſitting upon an awl-ſhaped ſtyle, crowned by an acuminated ſtigma. The germen afterward becomes an oval, pear-ſhaped, leathery capſule, with three cells, in which is ſometimes one, and at others two, almoſt globular ſeeds.

This plant grows naturally in Carolina and the Braſils; from the firſt, the ſeeds were brought to England, where the plants have been of late years much cultivated in the gardens. This tree may be propagated by buddings, or grafting it upon the common *horſe cheſtnut*, which is the uſual method practiſed by the nurſerymen: but the trees thus raiſed, ſeldom make a good appearance long; for the ſtock of the common *horſe cheſtnut* will be more than twice the ſize of the other, and frequently put out ſhoots below the graft; and ſometimes the grafts are blown out of the ſtocks, after ten years growth. But theſe ſtocks render the trees hardy, and of a large growth.

CHESTNUT, *Indian roſe*. See MESUA.

CHEST-ROPE, in a ſhip, is the ſame with the gueſt or gift-rope, and is added to the boat-rope, when the boat is towed at the ſtern of the ſhip, to keep her from ſhearing, i. e. from ſwinging to and fro.

CHEVAGE, or CHIEFAGE, according to Bracton, ſignifies a tribute by the head; or a kind of poll-money, anciently paid by ſuch as held lands in villainage, or otherwiſe, to their lords, in acknowledgment.

The word is formed of the French, *chef*, *head*.

The word ſeems alſo to have been uſed for a ſum of money yearly given to a man of power, for his patronage and protection, as to a chief, head, or leader.

In the firſt ſenſe, Coke obſerves, there is ſtill a kind of *chevage* ſubſiſting in Wales, called *amabyr*; paid to the prince of Wales for the marriage of his daughters; anciently by all, now only by ſome. Lambard writes it *chivage*.

The Jews allowed to live in England, long paid *chevage*, or poll-money, viz. three pence per head: it was paid at Eaſter.

CHEVAL *de friſe*, in *Fortification*, a large piece of timber, either round or cut into ſeveral faces, pierced, and traverſed with wooden ſpikes, armed or pointed with iron, five or ſix feet long. See *Tab. Fortif. fig.* 15.

The term is French, and properly ſignifies a *Frieſland horſe*; as having been firſt invented in that country. It is alſo called a *turnpike*, or *tourniquet*.

Its uſe is, to defend a paſſage, ſtop a breach, or make a retrenchment to ſtop the cavalry.

It is ſometimes alſo mounted on wheels, with artificial fires, to roll down in an aſſault.

Errard obſerves, that the prince of Orange uſed to incloſe his camp with *chevaux de friſe*; placing them over one another.

On a medal of Licinius, is found a kind of *cheval de friſe*, made with ſpikes interpoſed; ſerving to expreſs a fortified camp.

CHEVALER, in the *Manege*. A horſe is ſaid to *chevaler*, when, in paſſaging upon a walk, or a trot, his far foreleg croſſes or over-laps the other fore-leg every ſecond time or motion.

CHEVALIER, a French term, ordinarily ſignifying a *knight*.

The word is formed of the French, *cheval*, *horſe*; and that of the Latin *cavallus*.

It is uſed, in *Heraldry*, to ſignify any *cavalier*, or horſeman armed at all points; by the Romans called *cataphractus* Eques, now out of uſe, and only to be ſeen in coat armour.

CHEVAN. See Chiun.

CHEVANTIA, in our *Old Law Writers*, is uſed for a loan or advance of money upon credit.

CHEVAUX *de friſe*. See Cheval *de friſe*.

CHEVELLE, a term uſed by the *French Heralds* to expreſs a head where the hair is of a different colour from the reſt of the head.

CHEVILS, or Kevels, in *Ship-building*. See Kevels.

CHEVIN, a name uſed in ſome parts of England for the chubb. See Capito, and Fishing.

CHEVISANCE, in the *Law of England*, is ſaid to be an agreement, or compoſition, or bargain between a creditor and debtor; but it ſeems chiefly to denote an indirect gain, in point of uſury, &c. In our ſtatutes it is often mentioned, and moſt commonly uſed for an unlawful bargain or contract. See the ſtatutes againſt uſury, anno 12 Annæ.

The word is ſaid to be derived from the law French *chevir*, *to come to the end*, or *finiſh any thing*; in the ſame ſenſe as the modern French uſe *achever*.

CHEVRETTE, in *Artillery*, an engine to raiſe guns or mortars into their carriages; it is made of two pieces of wood of about four feet long, ſtanding upright upon a third, which is ſquare: they are about a foot aſunder, and parallel, and are pierced with holes exactly oppoſite to one another, having a bolt of iron, which being put through theſe holes, higher or lower at pleaſure, ſerves with a hand-ſpike, which takes its poiſe over this bolt, to raiſe any thing by force.

CHEVRON, or Cheveron, in *Heraldry*, one of the honourable ordinaries of a ſhield; repreſenting two rafters of a houſe joined together, without any diviſion.

It deſcends from the chief towards the extremities of the coat, in form of a pair of compaſſes half open. Thus, he bears gules, a *chevron* argent. See *Tab. Heraldry*, *fig.* 16.

The *chevron* is the ſymbol of protection, ſay ſome; or of conſtancy, according to others: ſome ſay, it repreſents the knights ſpurs; others, the head-attire of prieſteſſes; others, a piece of the liſt, or the barrier or fence of a park.

When it is alone, it ſhould take up the fifth part of the field, according to Leigh; and according to others, a third part: when it is accompanied with any other bearings, its breadth muſt be adjuſted thereby.

It is borne divers ways: ſometimes in chief, ſometimes in baſe, ſometimes enarched, ſometimes reverſed, &c.

The *chevron* is ſometimes charged with another *chevron*, one third of its own height.

Two *chevrons* are allowed in the ſame field, but no more: when they exceed that number, they are called *chevronwiſe*, or *chevronels*. There are *chevrons* of ſeveral pieces.

A *chevron* is ſaid to be *abaſed*, when its point does not approach the head of the chief, nor reach farther than the middle of the coat; *mutilated*, when it does not touch the extremes of the coat; *cloven*, when the upper point is taken off, ſo that the pieces only touch at one of the angles; *broken*, when one branch is ſeparated into two pieces; *couched*, when the point is turned towards one ſide of the eſcutcheon; *divided*, when the branches are of ſeveral metals, or when metal is oppoſed to colour; and *inverted*, when the point is towards the point of the coat, and its branches towards the chief.

A coat is ſaid to be *chevroned*, when it is filled with an equal number of *chevrons*, of colour and metal.

Counterchevroned, is when it is ſo divided, as that colour is oppoſed to metal, and *vice verſa*.

Per Chevron, or *Party per* Chevron, is when the field is divided by only two ſingle lines, riſing from the two baſe points, and meeting in a point above, as the *chevron* does.

CHEVRONEL, a diminutive of *chevron*; and, as ſuch, only containing half a *chevron*.

CHEVRONNE, or Chevronny, ſignifies the parting of the ſhield, ſeveral times *chevronwiſe*: Gibbon ſays, *chevronne of ſix*.

CHEWING-*balls*, a ſort of balls contrived for horſes to chew, not ſwallow at once; not intended as food, but as incentives to appetite; and on other medicinal occaſions very uſeful to the creature. The receipt now moſt eſteemed for theſe balls is this: take liver of antimony, and of aſſa fœtida, of each one pound; wood of the bay-tree, and juniper wood, of each half a pound; pellitory of Spain, two ounces: let all theſe be powdered together; then add as much fine grape-verjuice as is neceſſary to make the whole into a paſte. This is to be formed into balls of about an ounce and half weight, which are to be dried in the ſun. Theſe are the *chewing*-balls, and are to be uſed one at a time in the following manner. The ball is to be wrapped up in a linen rag, and a thread is to be faſtened to this, in ſuch a manner that it may be tied to the bit of the bridle, and kept in the mouth: when the bridle is taken off, the horſe will immediately eat; and when one ball is conſumed, another is to be tied up, and put in its place, till the intent is anſwered.

CHIA *terra*. See Terra *chia*.

CHIAN *marble*. See Marble.

CHIAOUS, an officer in the grand ſignior's court, doing the buſineſs of an uſher.

The word, in the original Turkiſh, ſignifies *envoy*.

He bears arms offenſive and defenſive, and has the care of priſoners of diſtinction. His badge is a ſtaff covered with ſilver; and he is armed with a ſcimiter, bow, and arrows.

The emperor uſually chooſes one of this rank to ſend as embaſſador to other princes.

The *chiaous* are under the direction of the *chiaous-baſchi*, an officer who aſſiſts at the divan, and introduces thoſe who have buſineſs there.

CHIARO *ſcuro*, & *obſcuro*, among *Painters*. See Clair *obſcure*.

CHIASMOS, in *Ancient Greek Medical Writers*, is the concourſe or meeting of any two things under the form and figure of a croſs, or the letter X *chi*, whence it is named. The adverbs χιαςι, and χιαςικως, ſignify the ſame thing: thus the optic nerves are ſaid to meet χιαςικῶς, ſo as to croſs each other.

CHIASTOS, the name of a bandage in Oribaſius, ſo called from its reſembling a croſs, or the letter X.

Chiastos, in *Rhetoric*, the ſame with what is otherwiſe called diallelos.

CHIAUSI, among the Turks, officers employed in executing the vizirs, baſhaws, and other great men; the orders for doing which the grand ſignior ſends them wrapped up in a black cloth; on the reception of which they immediately perform their office.

CHICANE, or Chicanery, in *Law*, an abuſe of judiciary proceeding, tending to delay the cauſe, and deceive or impoſe on the judge, or the parties.

Some derive the word from *ciccum*, *the ſkin of a pomegranate*; whence the Spaniards formed their *chico*, *little*, *ſlender*; *chicane* being converſant about trifles.

The French call ſolicitors, attorneys, &c. *gens de chicane*.

Chicane is alſo applied, in the ſchools, to vain ſophiſms, diſtinctions, and ſubtilties, which immortaliſe diſputes, and obſcure the truth: as, the *chicane* of courts does juſtice.

CHICH *pea*. See *Chich* Pea.

CHICHLING *vetch*. See Vetch.

CHICKEN, in *Ornithology*, the young of the gallinaceous order of birds, and eſpecially of the common hen. *Chickens* require no meat for two days after they are hatched: and they are firſt fed with ſmall oat-meal, dry or ſteeped in milk, and the crumbs of white bread: and as they acquire ſtrength, with curds, cheeſe-parings, &c. Green chives chopped with their food will preſerve them from the rye, and other diſeaſes of the head: and care ſhould be taken to furniſh them with a proper ſupply of clean water. In order to have fat crammed *chickens*, they ſhould be cooped up when the hen forſakes them, and fed with wheat-meal mixed with milk, and made into a paſte: this diet will fatten them in about a fortnight. See Cock, Fowl, and Hatching.

Chicken-*pox*. See Pox.

CHICKWEED, *Alſine*, in *Botany*, the name of a very large genus of plants; for the characters of which, ſee Alsine.

The *alſine* is a medicinal plant, called alſo *morſus gallinæ*, popularly *chickweed*, on account of its being much coveted by poultry.

The word is αλσινη, formed of αλσος, *a wood* or *grove*, on account of this plant's delighting chiefly to grow in ſhady places.

Alſine is alſo called *myoſoton*, q. d. *mouſe-ear*, on account of the reſemblance its leaves bear to the ears of that animal.

It is held a cooler, calmer, thickner, &c. in moſt reſpects reſembling pellitory of the wall; though now little uſed in medicine.

Some commend its diſtilled water againſt fervors of the blood, and conſumptions of the body, ariſing from hectics, &c. The herb fried in linſeed oil, and externally applied to the belly, is ſaid to relieve the iliac pain.

Chickweed, *African*. See Mollugo.

Chickweed, *berry-bearing*, *Cucubalus*, in *Botany*, a genus of the *decandria trigynia* claſs. Its characters are theſe: the flower has five petals, with tails as long as the empalement, but ſpread open at the top; and ten ſtamina, five of which are alternately inſerted in the tail of the petals. In the center is ſituated an oblong germen, ſupporting three ſtyles. The empalement becomes a pointed cloſe capſule with three cells, opening at top into five parts, and filled with many roundiſh ſeeds. According to Miller, there are thirteen ſpecies; but according to Tournefort, only one. See *Tab. of Botany, Claſs* 8.

CHICKWEED, *great*, *Stellaria*, in *Botany*, a genus of the *decandria trigynia* claſs; having a five-leaved patent calyx, five bipartite petals, and a ſingle-celled polyſpermous capſule.

CHICKWEED, *mountain*, *Moehringia*, in *Botany*. See MOEHRINGIA.

CHICKWEED, *mouſe-ear*, *Ceraſtium*. See MOUSE-*ear*.

CHICKWEED, *ſea*, *Arenaria*, in *Botany*, a genus of the *decandria trigynia* claſs: the characters of which are, that the calyx conſiſts of five patent leaves; the corolla, of five entire petals; and the fruit is a capſule containing one cell, with ſeveral ſeeds.

CHICKWEED, *ſmall water*. See MONTIA.

CHICORACEOUS, in *Botany*. M. Vaillant divides plants with compoſite flowers into three claſſes or families; the *cynarocephalous*, the *corymbiferous*, and the *chicoraceous*.

CHICUATLI, in *Zoology*, the Indian name of a bird deſcribed by Nieremberg, and by him called *noctua canora*. Its beak is long, black, and ſlender; its head is marked with undulated ſtreaks of yellow near the eyes. Its breaſt and belly are of a whitiſh colour, and it has ſome black feathers intermixed with white ones on the throat; its back is variegated with black, yellow, and grey. It is found principally among the mountains; where it generally runs about the ground; is eaſily bred in cages, and feeds on any thing that is offered it. It is moſt frequent in the hotter climates, and is uſually fat and nouriſhing.

CHIEF, a term denoting head, or a principal thing, or perſon. The word is formed of the French *chef*, *head*.

We ſay, the *chief* of a party; the *chief* of a family, &c. Agamemnon was the *chief* of the Greeks who beſieged Troy. The Romans ſometimes refuſed triumphs to their victorious generals, becauſe the conduct of the *chief* was not anſwerable to his ſucceſs. The abbeys that are *chiefs* of their order are all regular; and it is there the general chapters are held.

CHIEF *baron*. See BARONS and COURT *of exchequer*.

CHIEF, in *Heraldry*, is the upper part of the eſcutcheon, reaching quite acroſs, from ſide to ſide.

The arms of France are, three golden flowers de lys, in a field azure; two in *chief*, and one in point.

CHIEF is more particularly uſed for one of the honourable ordinaries, placed athwart the top of the coat, and containing one third part of its height. *Tab.* I. *Heraldry*, *fig.* 41.

When the eſcutcheon is cut in ſtone, or in relievo, the *chief* ſtands out prominent beyond the reſt; and is ſuppoſed to repreſent the diadem of the ancient kings and prelates; or the caſque of the knights.

It is frequently without any ornament; ſometimes it is charged with other bearings; ſometimes it is of a colour or metal different from that of the coat.

The line that bounds it at the bottom is ſometimes ſtrait, ſometimes indented, engrailed, embattled, lozenged, &c. Thus, ſay they, the field is gules, a *chief* argent, &c. Again, he bears gules, a *chief*, crenelle, or embatteled, argent.

Sometimes one *chief* is borne on another; expreſſed by a line drawn along the upper part of the *chief*: when the line is along the under part, it is called a *fillet*. The firſt is an addition of honour, the ſecond a diminution.

The *chief* is ſaid to be *abaſed*, when it is detached from the upper edge of the coat, by the colour of the field which is over it; and which retrenches from it one third of its height. We alſo ſay, a *chief* is *cheveroned*, *paled*, or *bended*, when it has a chevron, pale, or bend, contiguous to it, and of the ſame colour with itſelf. A *chief* is ſaid to be *ſupported*, when the two thirds at top are of the colour of the field, and that at bottom of a different colour.

In CHIEF. By this is underſtood any thing borne in the *chief* part, or top of the eſcutcheon.

CHIEF *juſtice*, in *Law*. See JUSTICE.

CHIEF *juſticiary of England*. See JUSTICIARY.

CHIEF *lord*, denotes the feudal lord, or LORD of an HONOUR, on whom others depend.

CHIEF, *holding in*. See CAPITE, and TENURE.

CHIEF *pledge*, is the ſame as HEADBOROUGH.

CHIEF *point*. See POINT.

CHIEF *rents*, *Reditus capitales*, in *Law*, denote the rents of freeholders of manors. See QUIT *rents*.

CHIEFTAIN, the chief, leader, or general of an army; or the like.

CHIEPA, in *Zoology*, a name uſed by ſome authors for the fiſh more uſually known by the name of the *alauſa*, and called in Engliſh the SHAD, or the mother of herrings. See AGONUS.

CHIFFIR, or CHIFIR, according to Libavius, in the preparation of the philoſophers ſtone, is called *lapis animalis*, as the mineral is called *chaos minerale*. Johnſon ſays, that the *chifir minerale* is by ſome interpreted *gold*, but that he rather takes it to be any ſulphur of the metalline kind.

CHIFUNG, among the Chineſe, the name of an herb found about Canton, by which the ſailors pretend to know how many ſtorms will happen every year. This they compute from the number of knots or joints; and from the diſtances of the knots from the root, they determine what months the ſtorms will fall in.

CHILBLAIN, *Pernio*, in *Medicine*, a tumour afflicting the feet and hands; accompanied with an inflammation, pain, and ſometimes an ulcer, or ſolution of continuity: in which caſe it takes the denomination of *chaps*, on the hands; and *kibes*, on the heels.

Chilblain is compounded of *chill*, and *blain*; q. d. a blain, or ſore, contracted by cold.

Chilblains are occaſioned by exceſſive cold ſtopping the motion of the blood in the capillary arteries and ſuperficial veins.

The tumour, from white, generally inclines to blueneſs. For the prevention of *chilblains*, the ſkin ſhould be rendered firmer by frequent waſhing and bathing in cold water; the vicious quality of the temperaments or humours, which contributes to this diſorder, ſhould be corrected by the milder preparations of antimony, and moderate purges. For the cure of *chilblains*, it is uſual to waſh them with warm brine, urine, &c. but *petroleum*, or warm Hungary water, with ſpirit of wine camphorated, uſed with a ſponge, are much better. For chaps and kibes, nothing exceeds the *unguentum deſiccativum rubrum*, or *diapompholyx* mixed with a little camphor; and uſed, for the dreſſings, with *emplaſtrum de minio*, or *diachylon ſimplex*, let down with oil of roſes.

When theſe tumours tend to ſuppuration, it is proper to treat them like other recent abſceſſes; the beſt method is firſt to cleanſe the wound with ſome digeſtive ointment, then to dreſs it with balſam of Peru, or other ſimilar application; and, laſtly, to apply ſome of the lead or litharge plaſters. Oil of myrrh *per deliquium* is alſo found of great ſervice in theſe caſes; as is alſo the applying a compreſs, dipped in a mixture of equal parts of lime-water and camphorated ſpirit of wine, over the other remedies.

In people who have been uſed to be afflicted with *chilblains* at the return of a certain ſeaſon, it will be found a great preſervative againſt thoſe troubleſome tumours, to anoint the parts where they are expected to appear, both before and during the acceſs of the ſevere cold, with oil of turpentine or petroleum; and, when the diſorder firſt begins to ſhew itſelf, it is a very good method to wrap round the affected part a piece of a hog's bladder, well wetted with one or other of thoſe oils; and care muſt be taken to keep off the cold.

CHILD, a term of relation to parent.

We ſay, NATURAL *child*, LEGITIMATE *child*, PUTATIVE *child*, BASTARD *child*, ADOPTIVE *child*, POSTHUMOUS *child*, &c.

Mr. Derham computes, that marriages, one with another, produced four *children*; not only in England, but in other parts alſo.

It is well known that *children*, for ſome time after they are born, ſee but very imperfectly; and M. Petit, after taking a great deal of pains to inveſtigate the cauſe of it, found it to be owing in part to the thickneſs of their CORNEA, and the ſmall quantity of their aqueous humour. Not that the mere thickneſs of the *cornea* could have this effect; but becauſe the thickneſs is owing to its not being well ſtretched, and conſequently having wrinkles and inequalities on its ſurface, which occaſion an irregular refraction of the light. On the ſame account alſo the *cornea* has not a ſufficient degree of convexity, to bring the PENCILS of rays to a focus ſoon enough. All theſe defects, he ſhews, are remedied by the increaſe of the aqueous humour. See Dr. Prieſtley's Hiſtory of Viſion, &c. 4to. p. 187.

Dr. Harris has an expreſs treatiſe Of the Acute Diſeaſes of Children, De Morbis Acutis Infantum. He takes them all to ariſe from the humours in the *primæ viæ* growing ſour, and degenerating into acidities: which is confirmed from their ſour belches and dejections. Hence, all that is required to cure them, is to combat this acidity; which is to be effected two ways: by diſpoſing it to be evacuated, and by actual evacuation by rhubarb, and other gentle purgatives.

To diſpoſe the peccant acid for evacuation, no ſudorifics or cordials are to be uſed, thoſe remedies being too violent; but magneſia, crabs eyes and claws, oyſter-ſhells, cuttle-fiſh bones, egg-ſhells, chalk, coral, pearls, bezoar, burnt ivory, ſcrapings of the unicorn's horn, Armenian bole, *terra ſigillata*, and *lapis hæmatites*; the Goa ſtone, and the confection of hyacinth: but of all theſe, he prefers old ſhells that have lain long on the edge of the ſea, expoſed to the ſun, which is better than any chemical furnace.

Bartholine, Paré, Licetus, and many other writers, give an account of a *petrified child*, which has ſeemed wholly incredible to ſome people. The *child*, however, which they deſcribe, is ſtill in being, and is kept as a great rarity in the king of Denmark's muſeum at Copenhagen. The woman who went big with this, lived at Sens in Champaign in the year 1582; it was cut out of her belly, and was univerſally ſuppoſed to have lain there about twenty years. That it is a real human *fœtus*, and not artificial, is evident to the eye of any obſerver; and the upper part of it, when examined, is found to be of a ſubſtance reſembling the gypſum or ſtone of which they make the plaſter of Paris; the lower part is much harder; the thighs and buttocks being perfect ſtone, of a reddiſh colour, and as hard as common quarry-ſtone: the grain and ſurface of this part appears exactly like that of the calculi, or ſtones taken out of human bladders; and the whole ſubſtance examined ever ſo nearly, and felt ever ſo carefully, appears to be abſolute ſtone. It was carried from Sens to Paris, and there purchaſed by a goldſmith of Venice; and Frederick the Third, king of Denmark, purchaſed it at Venice of this man for a very large ſum, and added it to his collection of rarities. Phil. Tranſ. Nº 285. p 1400. See INFANTS.

Children, beſides the honour and reverence which they owe to their parents, ought likewiſe to contribute to their ſupport, when they need aſſiſtance. The Athenian laws obliged all *children* to provide for their father, when reduced to poverty; with an exception to ſpurious *children*, to thoſe whoſe chaſtity had been defiled by conſent of the father, and to thoſe who had not been put into any way of gaining a livelihood. Our laws agree with thoſe of Athens in the firſt particular; but in the other caſes, a *child* is compellable by ſtat. 43 Eliz. c. 2. if able, to provide for a wicked and unnatural progenitor. Blackſt. Com. vol. i. p. 453. See PARENT, &c.

CHILD-*bed*.
CHILD-*birth*. } See DELIVERY.

CHILDREN, *expoſing of*. See EXPOSING.

CHILDREN, *naming of*. See NAME.

CHILDREN, *overlaying of*. This is a misfortune which frequently happens; to prevent which, the Florentines have contrived an inſtrument called ARCUTIO.

CHILD-*wit*, a power to take a fine of a bond-woman unlawfully gotten with *child*; that is, without conſent of her lord.

Every reputed father of a *baſe* child, got within the manor of Writtel in Eſſex, pays to the lord, for a fine, 3*s*. 4*d*. where, it ſeems, *child-wit* extends to free, as well as bond-women.—*Quicunque fecerit* child-wit, *archiepiſcopus aut totam, aut dimidiam emendationis partem habebit, quietum eſſe de* child-wit. Du-Cange.

CHILDREN, *charity*. See CHARITY-*ſchool*, and HOSPITAL.

CHILDERMASS *Day*, called alſo *Innocents Day*, an anniverſary feaſt of the church, held on the 28th of December, in memory of the *children* of Bethlehem, maſſacred by order of Herod.

CHILIAD, an aſſemblage of ſeveral things ranged by thouſands.

The word is formed of χιλιας, *mille, a thouſand.*

CHILIAGON, in *Geometry*, a regular plane figure of 1000 ſides and angles. We can eaſily demonſtrate, that the ſum of all its angles are equal to 1996 right ones; for the internal angles of every plane figure are equal to twice as many right angles as the figure hath ſides, except thoſe four which are about the center of the figure, from whence it may be reſolved into as many triangles as it has ſides. The author of L' Art de Penſer, p. 44, 45, brings this inſtance to ſhew the diſtinction between imagining and conceiving. See NOTION.

CHILIARCHA, or CHILIARCHUS, an officer in the armies of the ancients, who had the command of a thouſand men. The word comes from χιλιας, *a thouſand*, and αρχη, *command*.

CHILIARTÆ, in *Church-Hiſtory*, the ſame with MILLENARII.

CHILIASTS. See MILLENARII.

CHILMINAR, CHELMINAR, or TCHELMINAR, the nobleſt and moſt beautiful piece of architecture remaining of all antiquity; being the ruins of the famous palace of Perſepolis, to which Alexander the Great, being drunk, ſet fire, at the perſuaſion of the courteſan Thais.

Authors and travellers are exceedingly minute in their deſcriptions of the *Chilminar*; particularly Gracias de Silva Figueroa, Pietro de la Valle, Chardin, and Le Brun. A general idea thereof may be conceived as follows:

There appear the remains of near fourſcore columns; the fragments whereof are at leaſt ſix feet high: but there are only nineteen that can be called entire; with a twentieth all alone, 150 paces from the reſt.

A rock of black hard marble ſerves for the foundation of the edifice. The aſcent to the firſt plan of the building is by fourſcore and fifteen ſteps, cut in the rock. The gate of the palace is twenty feet wide; on one ſide is the figure of an elephant, and on the other of a rhinoceros, each thirty feet high, and of a ſhining marble; near theſe animals are two columns; and not far off the figure of a Pegaſus.

After this gate is paſſed, there are found a great number of columns of white marble; the remains whereof ſhew the magnificence of the work: the ſmalleſt of theſe columns is fifteen cubits high, the largeſt eighteen; each has forty flutings, three inches broad; whence the height of the whole may be gueſſed at, with the other proportions. Near the gate is an inſcription on a ſquare piece of marble, ſmooth as glaſs, containing about twelve lines: the characters are of a very extraordinary figure, reſembling triangles and pyramids.

Theſe noble ruins are now the ſhelter of beaſts, and birds of prey. Beſides the inſcription above mentioned, there are others in Arabic, Perſian, and Greek. Dr. Hyde obſerves, that the inſcriptions are very rude and unartful; and that ſome, if not all of them, are in praiſe of Alexander the Great; and therefore are later than that conqueror.

M. Le Brun took his voyage to the Eaſt Indies, merely for the ſake of viewing the *Chilminar*.

CHILON, among the *Greek Phyſiologers*, one who has great lips, called by the Latins *labeo*. Thus alſo among the ſpecies of fiſhes, under the claſs of *capitones*, ſome are called *chilones*, that is, *labeones*.

CHILTENHAM *water* contains a neutral purgative ſalt, ſomewhat reſembling Glauber's *ſal mirabile*. It contains no alcaline or acid ſalt, no iron, copperas, or ſulphur. Theſe waters are thought uſeful in lax conſtitutions, where the humours are alcaleſcent, but hurtful when aceſcent. See Phil. Tranſ. Nº 461 ſect. 21. and the remarks. See WATER.

CHIMALATH, in *Botany*, a name given by ſome authors to the great *corona ſolis*, or ſun-flower.

CHIMERA, or CHIMÆRA, a fabulous monſter, which the poets feign to have the head and breaſt of a lion, the belly of a goat, and the tail of a dragon; and to have been killed by Bellerophon, mounted on the horſe Pegaſus

The foundation of the fable is this: that anciently, in Lycia, there was a volcano, or burning mountain, of this name; the top whereof, which was deſert only inhabited by lions; the middle, having good paſtures, was frequented by goats; and the foot, being marſhy, by ſerpents. Thus Ovid:

> —— *mediis in partibus hircum,*
> *Pectus & ora leæ, caudam ſerpentis habebit.*

Bellerophon being the firſt who cauſed this mountain to be inhabited, it was feigned, he ſlew *Chimera*. Pliny ſays, the fire thereof would burn in water, and could be extinguiſhed with nothing but earth, or dung.

CHIMERA is uſed in *Writers of the Middle Age*, for a kind of veſſel or ſhip. It ſeems to have been leſs than the chelandium.

CHIMES *of a clock*, a kind of periodical muſic, produced at certain hours of the day, by a particular apparatus added to a clock; ſuch as a *chime*-barrel, bells and hammers, &c.

To calculate numbers for the *chimes*, and to fit and divide the *chime*-barrel, it muſt be obſerved, that the barrel muſt be as long in turning round, as you are in ſinging the tune it is to play.

As for the *chime*-barrel, it may be made up of certain bars which run athwart it, with a convenient number of holes punched in them, to put in the pins that are to draw each hammer: by this means, the tune may be changed, without changing the barrel. In this caſe, the pins, or nuts, which draw the hammers, muſt hang down from the bar, ſome more, ſome leſs; and ſome muſt ſtand upright in the bar: the reaſon whereof is, to play the time of the tune rightly. For the diſtance of each of theſe bars may be a ſemibreve; but the uſual way is, to have the pins, which draw the hammers, fixed on the barrel.

For the placing of theſe pins, you may proceed by the way of changes on bells; viz. 1, 2, 3, 4, &c. or rather, make uſe of the muſical notes: where it muſt be obſerved, what is the compaſs of the tune, or how many notes, or bells, there are from the higheſt to the loweſt; and, accordingly, the barrel muſt be divided from end to end.

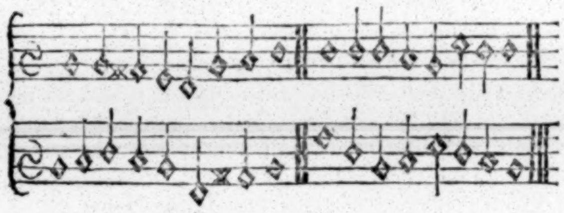
Thus, in the following example, each of the tunes are eight notes in compaſs; and, accordingly, the barrel is divided into eight parts: theſe diviſions are ſtruck round the barrel; oppoſite to which are the hammer-tails.

We ſpeak here as if there were only one hammer to each bell, that it may be more clearly apprehended; but when two notes of the ſame ſound come together in a tune, there muſt be two hammers to the bell to ſtrike it; ſo that if, in all the tunes you intend to *chime* of eight notes compaſs, there ſhould happen to be ſuch double notes on every bell; inſtead of eight, you muſt have ſixteen hammers; and, accordingly, you muſt divide the barrel, and ſtrike ſixteen ſtrokes round it, oppoſite to each hammer-tail: then you are to divide it round about, into as many diviſions as there are muſical bars, ſemibreves, minims, &c. in the tune.

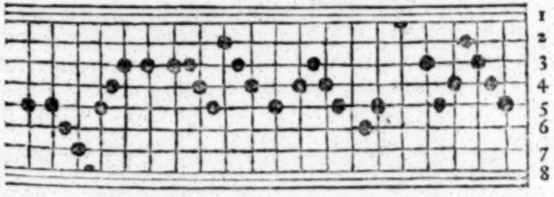
Thus, the hundredth pſalm tune has twenty ſemibreves, and each diviſion of it is a ſemibreve: the firſt note of it, alſo, is a ſemibreve; and therefore on the *chime*-barrel there muſt be a whole diviſion, from five to five; as you may underſtand plainly, if you conceive the ſurface of a *chime*-barrel to be repreſented by the following tables; as if the cylindrical ſuperficies of the barrel were ſtretched out at length, or extended on a plane: and then ſuch a table, ſo divided, if it were to be wrapped round the barrel, would ſhew the places where all the pins are to ſtand in the barrel: for the dots running about the table, are the places of the pins that play the tune.

Indeed, if the *chimes* are to be complete, you ought to have a ſet of bells to the gamut notes; ſo as that each bell, having the true ſound of *ſol*, *la*, *mi*, *fa*, you may play any tune with its flats and ſharps; nay, you may, by this means, play both the baſs and treble with one barrel: and by ſetting the names of your bells at the head of any tune, that tune may eaſily be transferred to the *chime*-barrel, without any ſkill in muſic. But it muſt be obſerved, that each line in the muſic is three notes diſtant: that is, there is a note between each line, as well as upon it.

The notes of the hundredth Pſalm.



A Table for dividing the Chime-barrel *of the hundredth Pſalm.*



CHIMIN, or CHEMIN, in *Law*, a road, or way. See HIGHWAY and ROAD.

CHIMINAGE, a toll for wayfarage, or paſſage through a foreſt. The feudiſts call it *pedagium*.

CHIMNEY, in *Architecture*, a part of a houſe, or lodging, wherein the fire is made.

The word *chimney* comes from the French *cheminée*; and that from the Latin *caminata*, *a chamber wherein is a chimney: caminata*, again, comes from *caminus*; and that from the Greek καμινος, *a chimney*; of καω, *uro*, *I burn*.

The parts of a *chimney* are, the jambs, or ſides; the back, or hood; the mantle-tree, reſting on the jambs: the tube, or funnel, which conveys away the ſmoke; the *chimney*-piece, or moulding, on the fore-ſide of the jambs over the mantle-tree; and the hearth, or fire-place.

Palladio ſettles the proportions of a chamber-*chimney* thus: breadth on the inſide, five and a half, ſix, or ſeven feet; height to the mantle-tree, four, or four and a half; depth, two, or two and a half feet.

According to Wolfius, the breadth of the aperture, at bottom, ſhould be to the height, as three to two; to the depth, as four to two. In ſmall apartments, the breadth is three feet; in larger, five; in bed-chambers, four; in ſmall banquetting-rooms, five and a half; in large, ſix: but the height is never to exceed two and a half; leſt, there being too much room for the air and wind, the ſmoke be driven down into the room. Nor muſt the height be too little; leſt the ſmoke miſs its way, and be checked at firſt ſetting out. The ſame author adviſes, to have an aperture, through which the external air may, on occaſion, be let into the flame, to drive up the ſmoke; which the internal air would otherwiſe be unable to do.

The mouth of the tube, or that part joined to the *chimney*-back, Felibien orders to be a little narrower than the reſt; that the ſmoke coming to be repelled downwards, meeting with this obſtacle, may be prevented from getting into the room.

Some make the funnel twiſted, to prevent the ſmoke's deſcending too eaſily; but the better expedient is, to make the funnel narrower at bottom than at top; the fire impelling it upward more eaſily when contracted at bottom; and in mounting, it finds more ſpace to diſengage itſelf, and therefore has leſs occaſion to return into the chamber.

To prevent ſmoking CHIMNEYS, M. Lucar adviſes two holes, or two pipes, one over the other, to be left in each ſide of the *chimney*; one ſloping upwards, the other downwards: through one of theſe, he ſays, the ſmoke will paſs in any poſition.

De l'Orme orders a braſs ball full of water, with one ſmall aperture, to be hung up in the *chimney*, at a height a little above the greateſt flame: here, as the water grows hot, it will rarefy, and drive through the aperture in a vapoury ſteam, which will drive up the ſmoke that would otherwiſe linger in the funnel.

Others place a kind of moveable vane, or weathercock, on the top of the *chimney*: ſo that what way ſoever the wind comes, the aperture of the *chimney* will be ſcreened, and the ſmoke have free egreſs: but, in truth, the beſt prevention of a ſmoking *chimney* ſeems to lie in the proper ſituation of the doors of the room, and the apt falling back of the back, and convenient gathering of the wings and breaſt of the *chimney*.

It is a rule, in building, that no timber be laid within twelve inches of the fore-ſide of the *chimney*-jambs; that all joiſts on the back of the *chimney* be laid with a trimmer, at ſix inches diſtance from the back; and that no timber be laid within the funnel.

Chimneys are uſually ſuppoſed a modern invention; the ancients only making uſe of ſtoves: but Octavio Ferrari endeavours to prove *chimneys* in uſe among the ancients. To this end, he cites the authority of Virgil:

> *Et jam ſumma procul villarum culmina fumant.*

And that of Appian, who ſays, "That of thoſe perſons "proſcribed by the triumvirate, ſome hid themſelves in "wells, *cloacæ*, and common-ſewers; ſome in the tops of "houſes, and *chimneys*:" for ſo he underſtands καπνωδεις ὑπωροφιας, *fumaria ſub tecto poſita*. Add, that Ariſtophanes, in one of his comedies, introduces his old man, Polycleon, ſhut up in a chamber; whence he endeavours to make his eſcape by the *chimney*. However, the few inſtances remaining among the ancients, together with the obſcurity of the rules of Vitruvius on this head, make us rather conclude the uſe of ſtoves, whereof the ancients had entire apartments, induced them to neglect this part of building, which the coldneſs of our climates obliges us to have a principal regard to.

In the year 1709, there appeared a French book, entitled La Mechanique du Feu, or the art of augmenting the effects, and diminiſhing the expence, of fire, by M. Gauger; ſince publiſhed in Engliſh, by Dr. Deſaguliers: wherein the author examines what diſpoſition of *chimneys* is moſt proper to augment the heat; and proves geometrically, that the diſpoſition of parallel jambs, with the back inclined as in the common *chimney*, is leſs fitted for reflecting heat into the room, than parabolical jambs, with the bottom of the tablette horizontal.

He gives ſeven ſeveral conſtructions of his new *chimneys*, in which there are hollow cavities made by iron plates in the back, jambs, and hearth, through which plates the heat paſſing, warms the air in thoſe cavities, which is continually coming into the room freſh and warm; and the manner of executing them.

M. Gauger, however, does not appear to be the firſt inventor of the *chimney* he deſcribes; the deſcription of a like *chimney* being found in a German book, printed at Leipſick in 1699. See FIRE-PLACES and STOVES.

CHIMNEY-*jambs*, are the ſides of a *chimney*, uſually ſtanding out perpendicularly, ſometimes circularly, from the back; on the extremities whereof the mantle-tree reſts.

CHIMNEY-*money*, or *hearth-money*, a tax impoſed by ſtatute 13 and 14 Car. II. c. 10. expreſſing, that every fire-hearth, and ſtove of every dwelling, or other houſe, within England and Wales, except ſuch as pay not to church and poor, ſhall be chargeable with two ſhillings *per ann.* payable at Michaelmas and Lady-day, to the king and his heirs. But this tax was declared to be an oppreſſion and badge of ſlavery, and accordingly aboliſhed by ſtat. 1 W. and M. c. 10. and the window-tax eſtabliſhed in its room. See FUAGE and WINDOW-*tax*.

CHIMNEY-*piece*, in *Building*, a compoſition of certain mouldings, of wood or ſtone, ſtanding on the fore-ſide of the jambs, and coming over the mantle-tree.

CHIMPANZEE, in *Natural Hiſtory*, the name of an Angolan animal, very much approaching to the human figure; but of a fierce diſpoſition, and remarkably miſchievous. In the year 1738, we had one of theſe creatures

tures brought over into England, by the captain of a ſhip in the Guinea trade; it was of the female ſex, and was two feet four inches high: it naturally walked erect, and was hairy on ſome part of the body and limbs, and of a ſtrong muſcular make. It would eat very coarſe food, and was very fond of tea, which it drank out of a cup with milk and ſugar, as we do; it ſlept in the manner of the human ſpecies, and in its voice made ſome imitation of the human ſpeech, when people ſpeak very haſtily, but without any articulate ſounds. The males of this ſpecies are very bold, and will fight a man, though they ſee him armed. It is ſaid that they often ſet upon, and raviſh the negro women, when they meet them in the woods. The creature we ſaw here was but about twenty months old, and very tame; the parent had it in her arms in the country, and did not part with it till ſhe was killed with a ſpear by one of the Moors: ſhe was five feet high. Act. Eruditor. Germ. ann. 1739.

CHINA, or CHINA-*ware*, a fine ſort of earthen ware, properly called PORCELAIN.

CHINA, *gilding on.* See GILDING *on China*.

CHINA, *party*. See PARTY.

CHINA, *broken, a cæment for*. See CÆMENT.

CHINA-CHINA, a name ſometimes given to the quinquina, or Peruvian bark. See CORTEX *Peruvianus*, and QUINQUINA.

CHINA-*root*, a medicinal root, brought from the Eaſt Indies; and lately alſo from Peru, and New Spain.

It is of a ruddy brown colour, bordering on black, without-ſide; and white, or reddiſh, within. It grows chiefly in fenny places, uſually covered with the ſea; which, upon its withdrawing, leaves great quantities thereof on the ſhore. The beſt is that which is firm, ruddy, and freſh.

It is ſuppoſed to be the root of a rough ſort of *ſmilax*, called *lampatam* in China, where it grows plentifully; and being exported thence, is called *China*.

It is eſteemed a ſweetener of the blood; and uſed as ſuch in decoction, in venereal and ſcorbutic caſes.

It has indeed been a generally received opinion for a conſiderable time paſt, that *China-root* is of ſervice in the gout, ſciatica, œdematous tumours, ſtrumæ, imbecillity of the ſtomach, hemicranias, and in ulcers of the reins and bladder; but to be of little effect in the *lues*: or if it be perhaps of any uſe, yet to be far inferior in virtue to guaiacum.

CHIN-COUGH, a diſeaſe which children are chiefly ſubject to. It conſiſts in a violent and immoderate coughing, to a danger of ſuffocation.

In the *chin-cough*, Dr. Huxham uſes the common evacuations, and propoſes to correct the lentor of the blood, and to ſtrengthen the nerves and ſtomach by mercurials, the cortex, and proper ſtomachics.

Dr. Burton declares againſt bleeding, vomiting, and purging in the *chin-cough*, except in very urgent caſes; the medicine which he ſays has had great ſucceſs, is a ſcruple of fine powder of cantharides, and as much camphor, mixed with three drams of the extract of Jeſuits bark. Of this mixture he gives eight or nine grains to children every third or fourth hour, in a ſpoonful of ſome ſimple water, or ſome julep, in which a little balſam of capivi had been diſſolved. He ſays this method is not proper in ſuch *chin-coughs* as proceed from thin ſharp rheum; but, he believes, that in the *chin-cough* from a tough viſcid phlegm, it will ſcarce ever fail, at leaſt it has not failed yet. Med. Eſſ. Edinb.

As this diſeaſe ariſes from obſtructed perſpiration, and a relaxation of the ſolids, its cure muſt depend on cleanſing and ſtrengthening the ſtomach, bracing the ſolids, and, at the ſame time, promoting perſpiration and the different ſecretions. The diet, therefore, ſhould be light, and eaſy of digeſtion: the drink ſhould be hyſſop or penny-royal tea, ſweetened with honey or ſugar-candy; or ſmall wine whey. One of the moſt effectual remedies is change of air. When the diſeaſe is violent, and there is any danger of an inflammation of the lungs, or ſuffocation, repeated bleeding may be proper. Small doſes of ipecacuanha ſhould be adminiſtered in this diſorder. The preparations of rhubarb ſhould alſo be uſed, in order to keep the body open. Oily and balſamic medicines, though often exhibited, ſhould be avoided. Millepedes, bruiſed and infuſed in ſmall white wine, have been much recommended. Two ounces of theſe ſhould be allowed to a pint of wine, and a table-ſpoonful taken three or four times a day. Opiates, as a little of the ſyrup of poppies, or five, ſix, or ſeven drops of laudanum, may be occaſionally repeated, to allay the violence of the *cough*. The feet ſhould be occaſionally bathed in luke-warm water, and a Burgundy pitch plaſter kept between the ſhoulders. If the diſeaſe continues, unattended with a fever, the bark and other bitters are proper medicines. Buchan's Domeſtic Medicine, ed. 5. p. 309, &c.

CHINE, in the *Manege*, is uſed for the back-bone, or the ridge of the back of a horſe. The French call it *échine*, and the ancient Italian maſters *eſquine*.

CHINESE *Chronology*. See CHRONOLOGY.

CHINESE *Stoves*. See KANG.

CHINESE, or CHINESE *Tongue*, the LANGUAGE of the people of China. F. le Comte obſerves, that the *Chineſe* has no analogy to any other language in the world. It only conſiſts of 330 words, which are all monoſyllables; at leaſt, they are pronounced ſo ſhort, that there is no diſtinguiſhing above one ſyllable, or ſound, in them. Yet they have four accents, which, by an inflexion of voice, multiply almoſt every word into four, and give alſo a harmony and pointed cadence to the moſt ordinary phraſes. Their characters are divided into ſix ſorts: the firſt exhibiting the ſhape or image of ſenſible things; the ſecond indicating the object by ſome viſible addition to the ſhape or ſymbol; the third aſſociating two characters to expreſs an object, which neither would denote ſeparately; the fourth expreſſing the ſound, in order to ſupply the defect of the figure, as *ya* adjoined to the figure of a bird, to repreſent a duck, &c.; the fifth being a metaphorical application of their characters, whereby their language acquires a force and vivacity of colouring peculiar to itſelf, but at the ſame time rendering it extremely obſcure; the ſixth extending the primitive ſenſe of a character, ſo that the ſame character may denote a verb or adverb, an adjective or ſubſtantive From theſe ſources their various characters are derived, and increaſed from 300 to 80,000.

Some learned men have imagined, particularly Mr. Turbeville Needham, F. R. S. that the *Chineſe* characters are the ſame in many reſpects as the Egyptian hieroglyphics; and that the ſenſe of the latter may be diſcovered by the comparative and appropriated ſignification of the former. But it has been urged, that there is not the leaſt trace now remaining of any communication, ſince the confuſion of tongues, between the *Chineſe* and Egyptians: nor can there be diſcerned any connection between the two modes of writing at this day. Nevertheleſs, it has been maintained, that the *Chineſe* language is one of the moſt ancient; and perhaps the only one that has been ſpoken without interruption; and yet remains as a living language, to which it is apprehended the ſmall number and ſhortneſs of its words have greatly contributed. The *Chineſe* characters have been repreſented as images for ſenſible things, and ſymbols for mental objects, which are tied to no ſound, and may be read in every tongue; and this ſeems to have been the caſe in the moſt remote antiquity, when their characters, which are now abbreviated and disfigured, might have been more ſimple and natural. See farther on this ſubject, Phil. Tranſ. vol. lix. N° 66. p. 489, &c.

CHINNOR, an inſtrument of muſic among the Hebrews, conſiſting of thirty-two chords. Kircher has given a figure of it; for which, ſee *Tab. Muſic*.

CHINSE, in *Sea-Language*, is uſed for thruſting oakum into a ſeam or chink, with the point of a knife or chiſſel.

CHIO *pear*, a name given to a ſmall ſpecies of pear, called alſo by ſome the baſtard muſk pear, from its reſembling the little muſk pear in its ſweet flavour. Its ſkin is yellow ſtreaked with red; it is of a roundiſh ſhape, and does not hang in cluſters, but ſingly on the tree.

CHIOCOCCA, in *Botany*, a genus of the *pentandria monogynia* claſs, having a funnel-ſhaped flower, and a ſingle-celled berry containing two ſeeds.

CHIONANTHUS, in *Botany*. See SNOW-*drop tree*.

CHIPPING, a phraſe uſed by the potters and china-men to expreſs that common accident both of our own ſtone and earthen ware, and the porcelain of China, the flying off of ſmall pieces, or breaking at the edges. Our earthen wares are particularly ſubject to this, and are always ſpoiled by it before any other flaw appears in them. Our ſtone wares eſcape it better than theſe, but leſs than the porcelain of China, which is leſs ſubject to it than any other manufacture in the world. The method by which the Chineſe defend their ware from this accident, is this: they carefully burn ſome ſmall bambou canes to a ſort of charcoal, which is very light, and very black; this they reduce to a fine powder, and then mix it into a thin paſte, with ſome of the varniſh which they uſe for their ware: they next take the veſſels when dried, and not yet baked, to the wheel, and turning them ſoftly round, they, with a pencil dipt in this paſte, cover the whole circumference with a thin coat of it: after this, the veſſel is again dried; and the border made with this paſte appears of a pale greyiſh colour when it is thoroughly dry. They work on it afterwards in the common way, covering both this edge and the reſt of the veſſel with the common varniſh. When the whole is baked on, the colour given by the aſhes diſappears, and the edges are as white as any other part; only when the baking has not been ſufficient, or the edges have not been covered with the ſecond varniſhing, we ſometimes find a duſky edge, as in ſome of the ordinary thick tea-cups.

It may be a great advantage to our Engliſh manufactures to attempt ſomething of this kind. The willow is known to make a very light and black charcoal; but the elder, though a thing ſeldom uſed, greatly exceeds it. The young green ſhoots of this ſhrub, which are almoſt all pith, make the lighteſt and the blackeſt of all charcoal; this readily mixes with any liquid, and might be eaſily uſed in the ſame way that the Chineſe uſe the charcoal of the bambou cane, which is a light hollow vegetable, more reſembling the elder ſhoots than any other Engliſh plant. It is no wonder that the fixed ſalt and oil contained in this charcoal ſhould be able to penetrate the yet raw edges of the ware, and to give them in the ſubſequent baking a ſomewhat different degree of vitrification from the other parts of the veſſel, which, though if given to the whole, it might take off from the true ſemivitrified ſtate of that ware; yet at the edges is not to be regarded, and only ſerves to defend them from common accidents, and keep them entire.

The Chineſe uſe two cautions in this application: the firſt in the preparation; the ſecond in the laying it on. They prepare the bambou canes for burning into charcoal, by peeling off the rind. This might eaſily be done with our elder ſhoots, which are ſo ſucculent, that the bark ſtrips off with a touch. The Chineſe ſay, that if this is not done with their bambou, the edges touched with the paſte will burſt in the baking: this does not ſeem indeed very probable; but the charcoal will certainly be lighter made from the peeled ſticks, and this is a known advantage. The other caution is, never to touch the veſſel with hands that have any greaſy or fatty ſubſtance about them; for if this is done, they always find the veſſel crack in that place. Obſ. ſur les Cout. de l'Aſie.

CHIPPINGAVEL, or CHEAPINGAVEL, in our *Old Writers*, toll paid for buying and ſelling.

CHIRAGRA, in *Medicine*, the gout in the hands.

The word comes from χειρ, *manus*, *hand*, and αγρα, *captura*, *ſeizing*.

The *chiragra* has its ſeat in the *carpus*, or extreme part of the hand, or the ligaments and junctures of the fingers.

CHIRAMAXIUM, in *Antiquity*, a kind of chariot or conveyance, which was drawn by men inſtead of horſes.

The word is derived from χειρ, *the hand*, and αμαξα, *a chariot*.

CHIRCHSED. See CHURCH-SCOT.

CHIRITES, in *Natural Hiſtory*, a name given by authors to a ſtone reſembling the human hand. The accounts we have of it ſay, that it is of a white colour, and of the nature of gypſum or plaſter-ſtone; and that it repreſents the palm of the hand, with the fingers, and their nails on the other ſide. This ſeems to have been a name given to ſome ſingle ſpecimen in a cabinet of ſome collector; for it is certainly no diſtinct ſpecies of foſſil, but a mere *luſus naturæ*, in the configuration of ſome accidental piece of gypſum.

CHIROGRAPH, *Chirographum*, was anciently a deed which, requiring a counterpart, was engroſſed twice on the ſame piece of parchment, counterwiſe; leaving a ſpace between, wherein was wrote CHIROGRAPH; through the middle whereof the parchment was cut, ſometimes ſtrait, ſometimes indentedly; and a moiety given to each of the parties.

The word is compounded of χειρ, *hand*, and γραφω, *ſcribo*, *I write*; q. d. *hand-writing*.

This was afterwards called *dividenda*, and *chartæ diviſæ*; and was the ſame with what we now call CHARTER-PARTY.

The firſt uſe of theſe *chirographs* with us, was in the time of king Henry III.

According to ſome, a deed was properly a *chirograph*, when it was ſubſcribed by the hand-writing of the vendor, or creditor, and delivered to the buyer, or debtor. Theſe authors make the *chirograph* differ from a *ſyngraph*, in this; that in the latter, the word *ſyngraph* was wrote in the middle, and cut through, in the manner juſt obſerved of *chirograph*. Thoſe authors, therefore, make the *ſyngraph* and the *chirograph* a different thing.

CHIROGRAPH was alſo anciently uſed for a fine: the manner of ingroſſing the fines, and cutting the parchment in two pieces, is ſtill retained in the office called the *Chirographer's Office*.

CHIROGRAPHER *of fines*, an officer in the common pleas, who ingroſſes fines, acknowleged in that court, into a perpetual record (after they have been examined and paſſed by other officers); and writes and delivers the identures thereof to the party.

He makes two indentures; one for the buyer, the other for the ſeller: and a third indented piece, containing the effect of the fine, and called the *foot of the fine*; and delivers it to the *cuſtos brevium*.

The ſame officer alſo, or his deputy, proclaims all fines in court every term, and indorſes the proclamations on the back-ſide of the foot; keeping, withal, the writ of covenant, and the note of the fine.

CHIROMANCY, the art of divining the fate, temperament, and diſpoſition of a perſon, by the lines and lineaments of the hand: this is otherwiſe called *palmiſtry*.

The word comes from χειρ, *hand*, and μαντεια, *divination*.

We have a great number of authors on this vain and trifling art: as Artemidorus, Fludd, and Johannes de Indagine. Taiſnerus, and M. de le Chambre, are eſteemed the beſt.

CHIRONIA, in *Botany*, a name by which ſome have called the black bryony. In the Linnæan ſyſtem it is a genus of the *pentandria monogynia* claſs: the characters are; the flower hath a permanent empalement of one leaf, cut into five oblong ſegments: it hath one petal, with a roundiſh tube divided above into five equal parts, which ſpread open: it hath five ſhort broad ſtamina, terminated by large oblong ſummits, which, when the flowers drop, are ſpirally twiſted: it hath an oval germen, ſupporting a declining ſtyle, which becomes an oval capſule with two cells, filled with ſmall ſeeds.

CHIRONIUM, in *Medicine*, is ſometimes uſed to ſignify a great ulcer, and of difficult cure.

CHIRONOMI, on the *Grecian Stage*, were thoſe actors who performed without uſing words, by the motions of the hand.

CHIRONOMIA, in *Antiquity*, the art of repreſenting, by the motions of the hand, and other geſtures of the body, any paſt tranſaction, whether of true or fabulous hiſtory. This made a part of a liberal education among the ancients: it had the approbation of Socrates, and was ranked by Plato among the political virtues.

CHIROTHECA. See GLOVE.

CHIROTHESIA, the impoſition of hands in conferring any prieſtly orders.

The word comes from χειρ, *manus*, and τιθημι, *pono*, which ſignifies the laying hands upon another.

CHIROTONIA, the ſtretching forth, or holding up of hands, in electing any magiſtrate, &c.

The word comes from χειρ, *manus*, and τεινω, *tendo*, *the action of ſtretching out the hands*; and becauſe the ancients gave their ſuffrages by ſtretching out the hands, they gave the name *chirotonia* to the election of magiſtrates.

This cuſtom was firſt eſtabliſhed in Greece; as appears from an oration of Demoſthenes againſt Neæra, and that of Æſchines againſt Cteſiphon: thence it paſſed to the Romans. From prophane authors it paſſed to eccleſiaſtical ones; and was uſed by them, not only in ſpeaking of elections, but alſo of ordinations. See IMPOSITION and ORDINATION.

For the difference between *chirotheſia*, and *chirotonia*, ſee Harrington's Prer. of popular Government.

CHIRURGERY, popularly called *Surgery*, the third branch of medicine; conſiſting in operations performed by the hand, for the cure of wounds, and other diſorders.

The word *chirurgery* is formed from χειρ, *manus*, *hand*; and εργον, *opus*, *operation*.

Chirurgery is divided into *ſpeculative* and *practical*; one whereof does that in effect, which the other teaches to do.

All the operations of *chirurgery* are reduced under four kinds: the firſt whereof rejoins what has been ſeparated, and is called *ſyntheſis*.

The ſecond divides, with diſcernment, thoſe parts whoſe union is prejudicial to health; and is called *diæreſis*.

The third extracts, with art, foreign bodies; called *exæreſis*.

And the fourth, called *proſtheſis*, adds and applies what is wanting.

The principal things that come under the conſideration of *chirurgery* are, tumors, ulcers, wounds, diſlocations, and fractures.

Chirurgery has the advantage of medicine, in the ſolidity of its foundation, the certainty of its operations, and the ſenſibility of its effects; inſomuch that thoſe who deny medicine to be of any ſignificancy, yet allow the uſefulneſs of *chirurgery*.

Chirurgery is very ancient; and even much more ſo than medicine, whereof it now makes a branch. It was, in effect, the ſole medicine of the firſt ages; they betaking themſelves to the cure of external diſorders, before they came to examine or diſcover what related to the cure of internal ones.

Apis, king of Egypt, is ſaid to be the firſt inventor of *chirurgery*; after him, Æſculapius compoſed a treatiſe of wounds and ulcers: he was ſucceeded by the philoſophers of the following ages, in whoſe hands *chirurgery* wholly lay: ſuch were Pythagoras, Empedocles, Parmenides, Democritus, Chiron, Pæon, Cleombrotus, who cured king Antiochus, &c.

Pliny tells us, upon the authority of Caſſius Hemina, that Archagathus was the firſt of the profeſſion that ſettled at Rome; that the Romans were wonderfully pleaſed with this *Vulnerarius*, as they called him, at his firſt coming, and ſhewed him ſome extraordinary marks of their eſteem, but that they were diſguſted at him afterwards, and nicknamed him *Carnifex*, for his cruelty in cutting off limbs. Some pretend, that he was even ſtoned by them to death in the Campus Martius; but if he really came to ſuch an unlucky end, it is ſtrange Pliny ſhould take no notice of it. Plin. Hiſt. Nat. lib. xxix. cap. 1.

Chirurgery was cultivated with much more earneſtneſs by Hippocrates, than by any of the preceding phyſicians: it is ſaid to have been perfected in Egypt by Philoxenus, who wrote ſeveral volumes on that ſubject. Among the Greeks, Gorgias, Soſtrates, Heron, the two Apollonii, Ammonius of Alexandria; and at Rome, Trypho the father, Euelpiſtus, and Meges, made it flouriſh, each in their time.

The more modern authors, who have contributed moſt to the perfection of *chirurgery*, are, Paræus, Fab. ab Aquapendente, Harvey, Wharton, Gliſſon, Du Laurence, Diemerbroeck, Vieuſſens, Barbette, Dionis, Charriere, Heiſter, &c.

Scultetus has publiſhed a deſcription of all the inſtruments uſed in *chirurgery*, under the title of Armamentarium Chirurgicum; and our countryman, Mr. Wiſeman, ſerjeant-*chirurgeon* to king Charles II. a folio volume of *chirurgical* treatiſes, containing practical obſervations, both in reſpect to the internals and externals, of a number of caſes in each branch of the art, from his own experience, under the title of Several chirurgical Treatiſes. This work has been made uſe of ever ſince, by the moſt knowing of our Engliſh *chirurgeons*; and has been the foundation of moſt *chirurgical* treatiſes ſince its publication, anno 1676.

In England there are two diſtinct companies now occupying the ſcience or faculty of ſurgery; the one company called *barbers*, the other *ſurgeons*; which latter were not till very lately incorporated. The two were united to ſue and be ſued, by the name of maſters or governors and commonalty of the myſtery of Barbers and Surgeons of London, 32 Hen. VIII. cap. 42.

No perſon uſing any barbery, or ſhaving, in London, was to occupy any ſurgery, letting of blood, or other matter; drawing of teeth only excepted. And no perſon uſing the myſtery or craft of ſurgery was to occupy or exerciſe the ſeal or craft of barbery, or ſhaving; neither by himſelf, nor any other for his uſe. 32 Hen VIII. cap. 42. By the ſame ſtatute, ſurgeons were obliged to have ſigns at their doors.

The French *chirurgeons*, being refuſed to be admitted into the univerſities, notwithſtanding that their art makes a branch of medicine, one of the four faculties, on pretence of its bordering a little on butchery, or cruelty, aſſociated themſelves into a brotherhood, under the protection of St. Coſmus, and St. Damian: on which account, according to the laws of their inſtitution, they are obliged to dreſs and look to wounds *gratis*, the firſt Monday of each month.

They diſtinguiſh between a *chirurgeon of the long robe*, and a *barber chirurgeon*: the firſt has ſtudied phyſic, and is allowed to wear a gown.

The ſkill of the other, beſide what relates to the management of the beard, is ſuppoſed to be confined to the more ſimple and eaſy operations in *chirurgery*; as bleeding, tooth-drawing, &c. They were formerly diſtinguiſhed by badges: thoſe of the long gown bore a caſe of inſtruments; and the barber a baſon.

CHISSEL, an inſtrument much uſed in ſculpture, maſonry, joinery, carpentry, &c.

There are *chiſſels* of different kinds; though their chief difference lies in their different ſize and ſtrength, as being all made of ſteel well ſharpened and tempered: but they have different names, according to the different uſes to which they are applied.

The *chiſſels* uſed in carpentry and joinery are, 1. The *former*, which is uſed firſt of all before the *paring-chiſſel*, and juſt after the work is ſcribed. 2. The *paring-chiſſel*, which has a fine ſmooth edge, and is uſed to pare off, or ſmooth the irregularities which the *former* makes. This is not ſtruck with a mallet, as the *former* is, but is preſſed with the ſhoulder of the workman. 3. *Skew-former*: this is uſed for cleanſing acute angles with the point, or corner of its narrow edge. 4. The *mortiſe-chiſſel*, which is narrow, but very thick and ſtrong, to endure hard blows; and it is cut to a very broad baſil: its uſe is, to cut deep ſquare holes in the wood, for mortiſes. 5. The *gouge*, which is a *chiſſel* with a round edge; one ſide whereof ſerves to prepare the way for an augre, and the other to cut ſuch wood as is to be rounded, hollowed, &c. 6. *Socket-chiſſels*, which are chiefly uſed by carpenters, &c. to have their ſhank made with a hollow ſocket at top, to receive a ſtrong wooden ſprig, fitted into it with a ſhoulder. Theſe *chiſſels* are diſtinguiſhed, according to the breadth of the blade, into half-inch *chiſſels*, three quarters of an inch *chiſſels*, &c. 7. *Ripping-chiſſels*, which is a ſocket *chiſſel* of an inch broad; having a blunt edge, with no baſil to it; its uſe is to rip, or tear two pieces of wood aſunder, by forcing in the blunt edge between them.

CHISELY *land*, in *Agriculture*, a term appropriated to that ſort of land which breaks, when it is turned up by the plough, into pieces like the chips made by the ſtonecutter's chiſſel in the hewing of ſtones. It is of a middle nature, between the ſandy land that falls off from the plough-ſhare, like bran or ſaw-duſt, and the clayey, that is raiſed in large glebes.

It is of ſeveral colours, grey, brown, reddiſh, and blackiſh, and uſually contains a large quantity of ſand, and no ſmall number of pebbles.

CHIT is the name of an inſtrument uſed in cleaving laths.

CHITSEE, in *Botany*, the name of a Chineſe tree, called alſo SETSE.

CHITTING, in *Gardening*. A ſeed is ſaid to *chit*, when it firſts ſhoots its ſmall roots into the earth.

CHI-TUA, in the *Materia Medica*, a name uſed by ſome authors for a kind of *lignum aloes*, which is reddiſh, and of a very fine ſcent.

CHIVAGE. See CHEVAGE.

CHIVALRY, in *Antiquity*, an inſtitution which ſucceeded the CRUSADES, and which, though founded in caprice, and productive of extravagance, had a very conſiderable influence in refining the manners of the European nations, during the twelfth, thirteenth, fourteenth, and fifteenth centuries. The objects of this inſtitution were, to check the inſolence of overgrown oppreſſors, to ſuccour the diſtreſſed, to reſcue the helpleſs from captivity, to protect or to avenge women, orphans, and eccleſiaſtics, who could not bear arms in their own defence, to redreſs wrongs, and to remove grievances. Valour, gallantry, and religion, were blended in this inſtitution; men were trained to knighthood by long previous diſcipline; they were admitted into the order by ſolemnities no leſs devout than pompous; every perſon of noble birth courted the honour; it was deemed a diſtinction ſuperior to royalty, and monarchs were found to receive it from the hands of private gentlemen. Theſe various circumſtances contributed to render a whimſical inſtitution of ſubſtantial benefit to mankind. See Robertſon's Hiſt. of Charles V. vol. i. p. 82, &c. ed. 2. 8vo.

Dr. Hurd, in his Letters on *Chivalry* and Romance, traces the origin of this inſtitution immediately to the feudal conſtitution; and he ſuppoſes that the ſpirit of *chivalry* had conſiderably prevailed before the riſe of the CRUSADES.

CHIVALRY, or CHEVALRY, in *Law*, a tenure of land by knight-ſervice; whereby the tenant was anciently bound to perform ſervice in war, to the king, or to the meſne lord of whom he held by that tenure.

By a ſtatute of 12 Car. II. cap. 24. all tenures by *chivalry*, *in capite*, &c. are aboliſhed. See COURT and GUARDIAN.

CHIUDENDO, in *Italian Muſic*, *to conclude*; as *chiudendo col ritornello*, *col l'aria*, ſignifies to end with a RITORNELLO, or ſome paſſage which has been before ſung in ſome parts of the piece.

CHIVEN, in *Zoology*, a name given by many to the MUSCICAPA, or *fly-catcher*, a ſmall bird little bigger than the wren.

CHIVES, or CHIEVES, in *Botany*, the ſmall knobs growing on the ends of the fine threads, or ſtamina of flowers: by Ray, and others, called alſo *apices*. See ANTHERÆ. Dr. Grew calls the *ſtamina*, or threads themſelves, on which the *apices* are fixed, the *chives*.

CHIVES, in *Botany*, a very ſmall ſpecies of the ONION kind, is alſo called by this name.

CHIUM *Marmor*. See MARBLE.

CHIUM *vinum*, *Chian wine*, or wine of the growth of the iſland of Chios, now Scio, is commended by Dioſcorides, as affording a good nouriſhment, fit to drink, leſs diſpoſed to intoxicate, endued with the virtue of reſtraining defluxions, and a proper ingredient in opthalmic medicines. Hence Scribonius Largus directs the dry ingredients in *collyria* for the eyes, to be made up with *Chian* wine.

CHIUN, or CHEVAN, in *Hebrew Antiquity*. We meet with this word in the prophet Amos, cited in the Acts of the Apoſtles. St. Luke reads the paſſage thus: It *took up the tabernacle of Moloch, and the ſtar of your god Remphan, figures which ye made to worſhip them.* The import of the Hebrew is as follows: *Ye have borne the tabernacle of your kings, and the pedeſtal* (the chiun) *of your images, the ſtar of your gods, which ye made to yourſelves.* The Septuagint in all probability read *Repham* or *Revan*, inſtead of *Chiun* or *Chevan*, and took the pedeſtal for a god.

Some ſay that the Septuagint, who made their tranſlation in Egypt, changed the word *Chiun* into that of *Remphan*, becauſe they had the ſame ſignification. M. Baſnage, in his book entitled Jewiſh Antiquities, after having diſcourſed a good deal upon *Chion* or *Remphan*, concludes that Moloch was the ſun, and *Chion*, *Chiun*, or *Remphan*, the moon.

CHIUREA, in *Natural Hiſtory*, a name given by Cardan, Oviedo, and ſome others, to the OPOSSUM.

CHLÆNA, in *Antiquity*, a kind of thick, ſhaggy, upper garment; its uſe was very ancient; for we find Homer makes his heroes firſt put off their *chlænæ*, and afterwards their tunics, or coats.

CHLAMYDULA, in *Antiquity*, a ſmall upper garment worn by children. See CHLAMYS.

CHLAMYS, in *Antiquity*, a military habit, worn by the ancients over the *tunica*.

Chlamys was the ſame, in time of war, that the *toga* was in time of peace; each belonged to the patricians. It did not cover the whole body, but chiefly the hind-part; though it alſo came over the ſhoulders, and was faſtened with a buckle on the breaſt. There were four or five kinds of *chlamys*; that of children, that of women, and that of men; which laſt was divided into that of the people, and that of the emperor.

CHLIASMA, in *Medicine*, a warm fomentation of the moiſt kind; as pyria is of the dry kind.

CHLOEIA, in *Antiquity*, a feſtival celebrated at Athens, in honour of Ceres, to whom, under the name Χλοη, i. e. *Graſs*, they ſacrificed a ram.

CHLORA, in *Botany*, a genus of the *octandria monogynia* claſs: the calyx is compoſed of eight leaves; the corolla has a ſingle petal, and is divided into eight ſections; and the capſule conſiſts of a ſingle cell, with two valves, containing many ſeeds.

CHLOREUS, in *Zoology*, a name by which Turner, and ſome others, have called the common YELLOW-*hammer*, or *emberiza lutea*.

CHLOREUS, in *Zoology*, is alſo a name by which ſeveral authors, and particularly many of the earlieſt writers, have called the GALBULA, a very elegant and beautiful bird of the thruſh kind, almoſt all over yellow.

CHLORIS, in *Ornithology*, the name of the bird commonly called in Engliſh the greenfinch, a well-known bird of the ſize of a common ſparrow, and remarkable for its green colour, whence it has its name, and for the largeneſs of its beak, in which it approaches to the *coccothrauſtes*; it builds in our hedges, and feeds on the ſeeds of vegetables.

CHLORITES, in *Natural Hiſtory*, a name given by the ancients to a green ſtone ſeeming to have been a jaſper, but ſo pellucid as to approach to the nature of the coarſer emeralds.

CHLOROSIS, in *Medicine*, a feminine diſeaſe, vulgarly called the *green-ſickneſs*, *white jaundice*, &c.

The word *chloroſis* ſignifies *greenneſs*, *verdure*; formed from χλοη, *graſs*.

Its uſual ſubjects are, girls, maids, and widows; or even wives, whoſe huſbands are deficient, &c. It gives a pale, yellow, or greeniſh tincture to the complexion, with a circle of violet under the eyes. The patient is melancholy and uneaſy; has frequently a low wandering fever, with an unequal pulſe, vomiting, heavineſs, liſtleſſneſs, drowſineſs, difficulty of breathing, longing for abſurd foods, &c.

It comes on, commonly, antecedent to, or about the time of the eruption of the menſes. Though the ſtoppage of the menſes is not always the cauſe of this diſtemper; for they ſometimes, though but ſeldom, flow regularly, in the progreſs thereof. According to Etmuller, the ſuppreſſion of the *menſes* is rather the effect than the cauſe of this diſeaſe.

The cure is chiefly to be attempted by chalybeats and bitters. In the colder conſtitutions, decoctions of guaiacum are found of uſe.

CHNUS, in Hippocrates, is fine ſoft wool, to which he compares an aqueous ſpleen, on account of its ſoftneſs.

CHOANA, in *Ancient Anatomiſts*, a cavity in the brain like a funnel, called alſo *pelvis*.

CHOASPITES, a name given by the ancients to a ſpecies of the *chryſopraſius*, a gem of a mixed colour between yellow and green. It was called *choaſpites* from the name of a river in which it was frequently found.

CHOCK, in *Sea Language*, a wedge uſed to confine a caſk, or other heavy body, to prevent it from fetching away when the ſhip is in motion.

CHOCOLATE, a kind of cake, or confection, prepared of certain drugs; the *baſis*, or principal whereof, is the *cacao-nut*.

The name *chocolate* is alſo given to a drink, prepared from this cake, of a duſky colour, ſoft, and oily; uſually drank hot, and eſteemed not only an excellent food, as being very nouriſhing, but alſo a good medicine; at leaſt a diet, for keeping up the warmth of the ſtomach, and aſſiſting digeſtion.

The Spaniards were the firſt who brought *chocolate* into uſe in Europe; and that, perhaps, as much out of intereſt, to have the better market for their cacao-nuts, vanilla, and other drugs which their Weſt Indies furniſh, and which enter the compoſition of *chocolate*, as out of regard to thoſe extraordinary virtues which their authors ſo amply enumerate in it. The qualities above mentioned are all that the generality of phyſicians, and others, allow it.

For the ſtatutes relating to the manufacture and trade of *chocolate* in Great Britain, ſee 10 Geo. I. cap. 10. § 1. 2. 18. 19. 22. 24. 11 Geo. I. cap. 10. § 13. 23. 25. 11 Geo. I. cap. 30. § 14. 15.

CHOCOLATE, *original manner of making*. The method firſt uſed by the Spaniards was very ſimple, and the ſame with that in uſe among the Indians: they only uſed cacao-nut, maiſe, and raw ſugar, as expreſſed from the canes, with a little achiotl, or rocou, to give it a colour: of theſe four drugs, ground between two ſtones, and mixed together in a certain proportion, they made a kind of bread, which ſerved them equally for ſolid food, and for drink; eating it dry when hungry, and ſteeping it in hot water when thirſty.

This drink the Mexicans called *chocolate*, from *chocao*, *ſound*; and *alte*, or *atte*, *water*; q. d. *water that makes a noiſe*: from the noiſe which the inſtrument, uſed to mill and prepare the liquor, made in the water.

But the Spaniards, and other nations, afterwards added a great number of other ingredients to the compoſition of *chocolate*; all of which, however, vanilla alone excepted, ſpoil, rather than mend it.

CHOCOLATE, *method of making, now in uſe among the Spaniards of Mexico*. The fruit, being gathered from the cacao-tree, is dried in the ſun, and the kernel taken out, and roaſted at the fire, in an iron pan pierced full of holes; then pounded in a mortar; then ground on a marble ſtone, with a grinder of the ſame matter, till it be brought into the conſiſtence of a paſte; mixing with it more or leſs ſugar, as it is to be more or leſs ſweet. In proportion as the paſte advances, they add ſome long pepper, a little achiotl, and, laſtly, vanilla: ſome add cinnamon, cloves, and aniſe; and thoſe who love perfumes, muſk and ambergris.

There is alſo a kind of Mexican *chocolate*, in the compoſition whereof there enter almonds and filberts; but it is rather to ſpare the cacao, than to render the *chocolate* better: and, accordingly, this is looked on as ſophiſticated *chocolate*.

CHOCOLATE, *the, made in Spain*, differs ſomewhat from that made in Mexico: for, beſides the drugs uſed in this laſt, they had two or three kinds of flowers, pods of campeche, and generally almonds and hazel nuts. The uſual proportion, at Madrid, is, to an hundred kernels of cacao, to add two grains of *chilé*, or Mexican pepper; or, in lieu thereof, Indian pepper; a handful of aniſe; as many flowers, called by the natives *vinacaxtlides*, or little ears; ſix white roſes in powder; a little machuſia; a pod of campeche; two drachms of cinnamon; a dozen almonds, and as many hazel nuts; with achiotl enough to give it a reddiſh tincture; the ſugar and vanilla are mixed at diſcretion; as alſo the muſk and ambergris. They frequently work their paſte with orange-water, which they think gives it a greater conſiſtence and firmneſs.

The paſte is uſually made up into cakes, ſometimes into large rolls; and ſometimes the cakes are made up of pure *chocolate*, without any admixture; thoſe who uſe it being to add what quantity they pleaſe of ſugar, cinnamon, and vanilla, when in the water.

Among us, in England, the *chocolate* is chiefly made thus ſimple and unmixed, though (perhaps not unadulterated) of the kernel of the cacao; excepting that ſometimes ſugar, and ſometimes vanilla, is added: any other ingredients being ſcarce known among us.

The neweſt *chocolate* is eſteemed the beſt; the drug never keeping well above two years, but uſually degenerating much before that time.

It is to be kept in brown paper, put up in a box; and that in another, in a dry place.

Mr. Henly, an ingenious electrician, has lately diſcovered that *chocolate*, freſh from the mill, as it cools in the tin-pans into which it is received, becomes ſtrongly electrical; and that it retains this property for ſome time after it has been turned out of the pans, but ſoon loſes it by handling. The power may be once or twice renewed by melting it again in an iron ladle, and pouring it into the tin pans as at firſt; but when it becomes dry and powdery, the power is not capable of being revived by ſimple melting: but if a ſmall quantity of olive-oil be added, and well mixed with the *chocolate* in the ladle, its electricity will be completely reſtored by cooling it in the tin pan as before. From this experiment he conjectures, that there is a great affinity between phlogiſton and the electric fluid, if indeed they be not the ſame thing. Phil. Tranſ. vol. lxvii. part i. p. 94, &c.

The manners of preparing the maſs into a liquor, with the proportions, are various: ordinarily, the *chocolate* is boiled in water, ſometimes in milk; and ſometimes, by good œconomiſts, in water-gruel: when boiled, it is milled, or agitated with a wooden machine for the purpoſe, and boiled again, till it be of the proper conſiſtence for drinking; then ſugared, if the maſs were pure; then milled afreſh, and poured off.

Note, the beſt *chocolate* is that which diſſolves entirely in the water; leaving no grounds, or ſediment, at the bottom of the pot.

The Spaniards eſteem it the laſt misfortune that can befal a man, to be reduced to want *chocolate*: they are never known to leave it, excepting for ſome other liquor that will intoxicate.

CHOCOLATE-*tree*. See CACAO.

CHOENICIS, in the *Ancient Surgery*, the trepan, ſo called by Galen and Ægineta, and mentioned by Celſus, where he calls it *modiolus*.

CHOENIX, an Attic dry meaſure, containing three *cotylæ*, or one *ſextarius* and an half, which is two pounds and a quarter. Its mark was a χ with a ν over it.

The *choenix* likewiſe contained the forty-eighth part of a medimnus, and was otherwiſe called HEMEROTROPHIS.

CHOERINÆ, in *Antiquity*, a kind of ſea-ſhells, with which the ancient Greeks uſed to give their ſuffrage, or vote.

CHOEROGRYLLUS. See *Hedge*-HOG.

CHOES, in *Antiquity*, an Athenian feſtival in honour of Bacchus, celebrated in the month Antheſterion.

CHOIR, that part of a church, cathedral, &c. where the clergy and choriſters, or ſingers, are placed.

The word, according to Iſidore, is derived *à coronis circumſtantiam*; becauſe, anciently, the choriſters were diſpoſed round the altar to ſing; which is ſtill the manner of building altars among the Greeks.

The *choir* with us is diſtinguiſhed from the chancel, or ſanctuary, where the communion is celebrated: as alſo from the nave, or body of the church, where the people are placed.

The patron is ſaid to be obliged to repair the *choir* of a church; and the pariſhioners the nave.

The *choir* was not ſeparated from the nave, till the time of Conſtantine: from that time the *choir* was railed in with a balluſtrade, with curtains drawn over, not to be opened till after the conſecration.

In the twelfth century they began to incloſe the *choir* with walls; but the ancient balluſtrades have been ſince reſtored; out of a view to the beauty of the architecture.

The chantor is maſter of the *choir*.

In nunneries, the *choir* is a large hall, adjoining to the body of the church, ſeparated by a grate, where the religious ſing the office.

CHOIR *muſic*, muſic ſung in a chorus, as in churches. It is ſometimes uſed for *muſica piena*, *canto fermo*, or what we call *plain chant*, or *ſong*.

CHOIROS, in *Ichthyology*, a name given by Ariſtotle and others of the old Greek writers to the *cernua* or *acerina* of the Latins, called by us the RUFFE. This fiſh has been called by a great variety of names, but it is properly a ſpecies of pearch, or PERCA, and is diſtinguiſhed from the others of that genus by Artedi under the name of the pearch with only one fin on the back, and with a cavernous head.

CHOLAGOGUE, a medicine which purges the bile downward.

The word comes from χολη, *bile*; and αγειν, *to lead*, or *draw*.

Of theſe ſome are ſimple, others compound; and both the one and the other are diſtinguiſhed into three kinds, with regard to their activity; the *benign*, the *moderate*, and the *violent*.

Of the firſt kind are, MANNA, CASSIA, roſes, tamarinds, *oleum ricini*, &c.

Of the ſecond are SENA, RHUBARB, ALOES, &c.

Of the third JALAP, SCAMMONY, &c.

CHOLEDOCHUS, in *Anatomy*, a term applied to a canal, or duct, called alſo *ductus communis*; formed of the union of the *porus bilarius*, and *ductus cyſticus*.

The word comes from χολη, *choler*; and δεχομαι, *I receive*, or *contain*.

The *choledochus ductus*, paſſing obliquely to the lower-end of the *duodenum*, ſerves to convey the BILE from the LIVER to the inteſtines. Some have imagined, that it conveyed the bile from the liver to the GALL-*bladder*: but it being obſerved, that it is the *duodenum*, not the gall-bladder, that ſwells, upon blowing through this duct, it is evident, the bile contained therein is conveyed nowhere elſe but to the *duodenum*.

CHOLER. See BILE.

CHOLERA MORBUS, a ſudden overflowing, or eruption, of the BILE, or bilious matters, both upwards and downwards.

It is ſuppoſed to have its riſe from the great abundance of bilious humours; which, being very acrimonious, vellicate the membranes of the ſtomach and inteſtines; and, by that means, occaſion unuſual and violent contractions.

It is very dangerous: whence the French anciently called it *trouſſe-galand*.

It has its name, either from the great quantity of *choler* it evacuates; or becauſe the matter is inceſſantly expelled at the inteſtines, which they anciently called *cholades*.

Dr. Sydenham obſerves, it generally attacks people about the latter end of ſummer; and proceeds, not unfrequently, from ſurfeits: that the cure depends upon large quantities of chicken-broth, drank ſo as to excite vomiting plentifully; and that the broth is alſo to be injected clyſterwiſe: after which, he ſays, the cure is to be completed by laudanum, given at proper intervals, and in proper doſes.

The remedy in the Indies for the *cholera morbus*, or *mandechin*, is, to keep the patient from drinking; and to burn the ſoals of his feet.

The free uſe of the columbo root has been found an excellent remedy in this diſeaſe.

CHOLOBAPHIS, in *Natural Hiſtory*, a name given by ſome of the ancient Greeks to a peculiar kind of emerald which was inferior to many others, and was of a colour tending to yellow.

It is plain that the Romans called all the green cryſtals found in copper-mines by the name of emeralds; for they expreſs in their deſcriptions all the defects we find in theſe cryſtals, ſuch as their having hairs, or ſubſtances like hairs, within, as alſo ſalts, and the like.

CHOLOMA, or CHOLOSIS, ſignifies, according to Galen, any diſtortion of a member, or depravation of it with reſpect to motion. It is taken alſo, in a particular ſenſe, for halting or lameneſs of a leg, ariſing from luxation.

CHOMER. See CORUS.

CHONDRILLA, in *Botany*. See GUM-*ſuccory*.

CHONDROGLOSSUM, in *Anatomy*, a very ſmall muſcle of the tongue, mentioned by Verheyen, and ſeveral other authors, exceedingly ſhort and narrow; ariſing from the cartilaginous proceſſes of the *os hyoides*, and meeting in the middle of the baſis of the tongue, where it is inſerted, forming an arch under it.

This pair of muſcles is not found in all ſubjects; whence ſome have queſtioned its exiſtence.

CHONDROPTERYGII, in *Natural Hiſtory*, a name given by Artedi and Linnæus to one of the great claſſes or families of the fiſhes: the characters of which are, that the rays of the fins are not bony, but cartilaginous.

The bones of the body of theſe fiſhes are alſo cartilaginous, and the mouth in moſt of the ſpecies is placed in the lower part of the body.

The word is derived from χονδρος, a *cartilage*, and πτερυγιον, a *wing* or *fin*. Of this order are the *ſcate*, *ſturgeon*, *lamprey*, &c.

CHONDROS, in *Ancient Medical Writers*, the ſame as ALICA.

It ſignifies alſo ſome grumous concretion, as of maſtich, or frankincenſe.

It is, beſides, the Greek word for a cartilage.

CHONDROSYNDESMUS, in *Ancient Medical Writers*, ſignifies a cartilaginous ligament.

The word is derived from χονδρος, a *cartilage*, and συνδεσμος, a *ligament*.

CHOP-CHURCH, or CHURCH-CHOPPER, a name, or rather nick-name, given to parſons, who make a practice of exchanging benefices.

Chop-church occurs in an ancient ſtatute as a lawful trade, or occupation; and ſome of the judges ſay, it was a good addition. Brook holds, that it was no occupation, but only a thing permiſſible by law.

CHOPIN, or CHOPINE, a French and Scotch liquid meaſure, containing half their PINT.

CHORAGIUM, in *Antiquity*, was uſed to denote the funeral of a young unmarried woman.

Some think it ſhould be writ *coragium*, from κορὰ, *puella*, and αγω, *duco*. But Pitiſcus chooſes rather to derive it from *chorus*; becauſe a chorus or company of virgins always attended ſuch funerals.

Choragium ſignified alſo the tiring or dreſſing-room belonging to the ſtage; and ſometimes was taken for the dreſs itſelf.

CHORAGUS, in *Antiquity*, he who had the ſuperintendence of the chorus, whoſe buſineſs it was to take care they obſerved the rules of the muſic, and performed their parts with decorum.

Choragi were likewiſe certain Athenian citizens choſen annually, who were obliged to be at the expence of players, ſingers, dancers, and muſicians, as often as there was occaſion, at the celebration of their public feſtivals.

CHORAIC *muſic*, a ſort of muſic, proper for dancing, by the variety of its different motions.

CHORAL, ſignifies any perſon that, by virtue of any of the orders of the clergy, was in ancient times admitted to ſit and ſerve God in the choir.

Dugdale, in his Hiſtory of St. Paul's Church, ſays, that there were with the chorus formerly ſix vicars *choral* belonging to that church.

CHORD, or **Cord**, primarily denotes a ſlender rope, or cordage.

The word is formed of *chorda*, and that from χορδὴ, a *gut*; whereof ſtrings may be made.

Chord, Chorda, in *Anatomy*, a little nerve extended over the *membrana tympani*, or drum of the ear. See Tympanum.

Anatomiſts are not agreed about the uſe of the *chorda tympani*: ſome ſay, it ſerves to vary and modify the ſound of the tympanum, in the ſame manner as the ſtrings, or braces, ſtretched over the war-drum: others will have it to be no more than a branch of the fifth pair.

Chord, Chorda, in *Geometry*, a right line connecting the two extremes of an arch.

Or, it is a right line, terminated at each extreme in the circumference of a circle, without paſſing through the center; and dividing the circle into two unequal parts, called *ſegments*. Such is the line AB, *Tab. Geometry, fig*. 6.

Chord *of the complement of an arch* is the *chord* that ſubtends the reſt of the arch; or ſo much as makes up the arch a ſemicircle.

The *chord* is perpendicular to a line drawn from the center of the circle to the middle of the arch, as CE; and has the ſame diſpoſition thereto, as the *cord*, or ſtring of a bow, has to the arrow; which occaſioned the ancient geometricians to call this line the *chord* of the arch, and the other the *ſagitta*, or *arrow*; the former of which names is ſtill continued, though the latter is diſuſed. What the ancients called *ſagitta*, is now termed the *verſed ſine*.

Half the *chord* of the double arch BD, is what we now call the *right ſine*; and the exceſs of the radii beyond the *chord*, DE, *the verſed ſine*.

The *chord* of an angle, and the *chord* of its complement to a whole circle, are the ſame thing: the *chord* of fifty degrees is alſo the *chord* of 310.

It is demonſtrated, in geometry, that the radius CE, biſecting the *chord* BA in D, does alſo biſect the arch in E, and is perpendicular to the *chord* AB, and *vice verſa*: and again, if the right line NE biſect the *chord* AB, and be perpendicular thereto; that it paſſes through the center, and does biſect both the arch AEB, and the circle ANB.

Hence we derive ſeveral uſeful corollaries: as, 1. To divide a given arch AB into two equal parts; draw a perpendicular to the middle point D of the *chord* AB; this biſects the given arch AB.

2. To deſcribe a circle, that ſhall paſs through any three points, A, B, C, *fig*. 7. From A and C deſcribe arches interſecting in D and E; and alſo others, G and H, from C and B: draw the right lines DE and GH; the point of interſection I, is the center of the circle to be deſcribed through A, B, and C.

Demonſtration. For the points A, B, and C, are in the periphery of ſome circle; and therefore the lines AC and CB are *chords*: but ED is perpendicular to AC, and GH to BC; ED biſects AC, and GH biſects BC; wherefore each paſſes through the center. Now as DE and GH only interſect in I; I will be the center of a circle, paſſing through the given points, A, C, and B. Hence, aſſuming three points in the periphery, or arch, of any circle, the center may be found, and the given arch completed: hence, alſo, if three points of one periphery do agree or coincide with three points of another; the whole peripheries agree, and therefore the circles are equal.

And hence, laſtly, every triangle may be inſcribed in a circle.

The chord *of an arch* AB (*fig. 6.*) *and the radius* CE, *being given*; *to find the* chord *of the half-arch* AE. From the ſquare of the radius CE, ſubtract the ſquare of half the given *chord* AD, the remainder is the ſquare of DC; from which, extract the ſquare root; and then DC ſubtracted from the radius EC, leaves DE. Add the ſquares of AD, and EO; the ſum is the ſquare of AE: whence, the root being extracted, we have the *chord* of the half-arch AE.

Chords, *line of*, is one of the lines of the ſector and plain ſcale. See its deſcription and uſe under Sector and Plain Scale. See alſo Sine.

Chords, or **Cords**, in *Muſic*, denote the ſtrings, or lines, by whoſe vibrations the ſenſation of ſound is excited; and by whoſe diviſions the ſeveral degrees of tune are determined.

They are called *cords*, or *chords*, from the Greek χορδὴ, a name which the phyſicians give to the inteſtines; in regard the ſtrings of muſical inſtruments are ordinarily made of guts: though others are made of braſs or iron wire; as thoſe of ſpinets, harpſichords, &c.

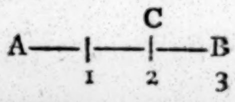
Chords of gold wire, in harpſicords, yield a ſound almoſt twice as ſtrong as thoſe of braſs: *chords*, or ſtrings, of ſteel, yield a feebler ſound than thoſe of braſs; as being both leſs heavy, and leſs ductile.

Mr. Perrault obſerves, that of late they have invented a way of changing the *chords*, to render the ſound ſtronger, without altering the tone.

The ſixth *chord* of baſs-viols, and the tenth of large theorbos, conſiſt of fifty threads, or guts: there are ſome of them a hundred feet long, twiſted and poliſhed with equiſetum, or horſe-tail.

Chords, *for the diviſion of, ſo as to conſtitute any given interval*, the rules are as follow: 1. *To aſſign ſuch part of a* chord AB, *as ſhall conſtitute any concord*, v. g. a fifth, or any other interval, with the whole.

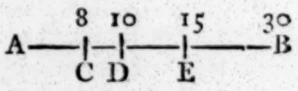
Divide AB into as many parts, as the greateſt number of the interval has units; v. g. the fifth being 2 : 3, the line is divided into 3. Of theſe take as many of the leſſer number, v. g. 2=AC; then is AC the part ſought: that is, two lines, whoſe lengths are to each other as AB to AC, make a fifth.



Hence, if it be required to find ſeveral different ſections of the line AB, v. g. ſuch as ſhall be 8ve, 5th, and 3d *g*: reduce the given ratios 1 : 2, 2 : 3, and 4 : 5, to one fundamental; the ſeries becomes 30 : 24, 20, 15. The fundamental is 30; and the ſections ſought are 24, the third *g*; 20 the fifth; and 15, the octave.

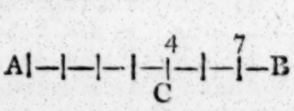
2. *To find ſeveral ſections of a line* AB, *that from the leaſt, gradually to the whole, ſhall contain a given ſeries of intervals in any given order*; viz. ſo that the leaſt to the next greater contains a third *g*; that to the next greater, a fifth; and that to the whole, an octave.

Reduce the three ratios 4 : 5, 2 : 3, 1 : 2, to one ſeries; hence we have 8 : 10 : 15 : 30: divide the line into the number of parts of the greateſt extreme of the ſeries; viz. 30. we have the ſections ſought at the points of diviſion, anſwering the ſeveral numbers of the ſeries, viz. at the points C, D, and E; ſo that AC to AD is a third, AD to AE a fifth, and AE to AB octave.



3. *To divide a line* AB *into two parts, to contain betwixt them any interval*, v. g. a fourth.

Add together the numbers containing the ratio of the interval, v. g. 3 : 4; and the line divided into as many parts as the ſum contains, v. g. 7; taken to any of the given numbers, v. g. 4, or C, gives the thing ſought.



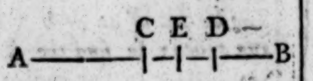
4. *For the harmonical diviſion of* Chords. *To find two ſections of a line, which with the whole ſhall be in harmonical proportion, with regard to their quantity.*

Take any three numbers in harmonical proportion, as 3, 4, 6; and divide the whole line into as many parts as the greateſt of theſe three numbers, v. g. 6; and at the points of diviſion anſwering the other two numbers, v. g. 3 and 4, you have the ſections ſought.

5. *To find two ſections of a line, which together with the whole ſhall be harmonical, with reſpect to quality, or tune.*

Take any three numbers concords with each other, v. g. 2, 3, and 8, and divide the line by the greateſt; the points of diviſion anſwering the other two, give the ſections ſought.

6. *To divide a* Chord AB, *in the moſt ſimple manner, ſo as to exhibit all the original concords.*



Divide the line into two equal parts at C, and ſubdivide the part CB into equal parts at D; and again, the part CD into two equal parts at E. Here AC to AB is an octave; AC to AD a fifth; AD to AB a fourth; AC to AE a third *g*; AE to AD a third *l*; AE to EB a ſixth *g*, and AE to AB a ſixth *l*. Malcolm's Treat. of Muſic, ch. 6. ſect. 1, 2, 3.

To find the number of vibrations made by a muſical *chord* or ſtring, in a given time, its weight, length, and tenſion being given. Let N repreſent the weight of the *chord*; L its length; P the tenſion, or weight equivalent to it, by which the *chord* is extended; and D the length of a given pendulum; *p* the circumference of a circle, the diameter of which is 1: then will the number of vibrations made by the given *chord*, while the pendulum vibrates once, be expreſſed by $p\sqrt{\frac{DP}{LN}}$. If we take L for the number of inches and decimals contained in the length of the *chord*, and the proportion of the tenſion to the weight of the *chord* as n to 1, then will the number of vibrations of the *chord* in one ſecond be $\frac{355}{113}\sqrt{\frac{39\cdot 2n}{L}}$. Where $\frac{355}{113}$ denotes the proportion of the circumference to the diameter of the circle; and 39.2 the length of a pendulum vibrating ſeconds, in inches and decimals of an inch, Engliſh meaſure. This laſt expreſſion coincides with Mr. Euler's rule, only we here expreſs in Engliſh what he gives in Rhinland meaſure. To illuſtrate this rule by an example: ſuppoſe the length of the *chord* to be 18.7 inches, its weight $6\frac{1}{5}$ grains, and the tenſion or weight extending this *chord* to be 8*lb.* troy, or 46080 grains. Then $L = 18.7$, and $n = \frac{46080}{6.2} = 7432$. The number of vibrations therefore by the rule will be $\frac{355}{113}\sqrt{\frac{39.2 \times 7432}{18.7}} = 392$. Taylor's Method. Increm. Prop. 23. Tentam. Nov. Theor. Muſ. p. 6, 7. See alſo Mac Laurin's Fluxions, ſect. 929.

By logarithms the rule may be thus expreſſed, $\frac{L+W}{2} + C = V$. Where L is the logarithm of the ratio of a pendulum, vibrating ſeconds, to the length of the given ſtring; W the logarithm of the ratio of the tenſion to the weight of the ſtring; C the logarithm of the ratio of the circumference of a circle to its diameter, or 0.4971500; and laſtly, V = logarithm of the required number of vibrations in one ſecond. In every *chord*, the number of vibrations in a given time will be as $\sqrt{\frac{n}{a}}$, that is, the ſquare root of the extending weight divided by the weight of the *chord*, and its length. If therefore *chords* be of the ſame length, their vibrations in a given time will be as the ſquare roots of the extending weights, divided by the weights of the *chords*. If *chords* be equal in length and weight, their vibrations will be as the ſquare roots of their lengths, multiplied by their weight: that is, reciprocally as the lengths of the *chords*, becauſe the weights of the *chords* will in this caſe be proportional to their lengths. Euler, ibid. p. 7. See alſo Smith's Harmonics, prop. 23 and 24.

Mr. Euler informs us, that he found the *chord*, making 392 vibrations in a ſecond, to be at uniſon with the key called *a* in inſtruments, that is, an octave and ſixth major above the loweſt C in our harpſichords or violoncellos. Conſequently the note C, being to *a* as 3 to 10, will make 118 vibrations in one ſecond. And the higheſt C, or c''', as Mr. Euler calls it, being four octaves above the loweſt c, will vibrate 1888 times in one ſecond of time. Mr. Euler ſuppoſes the limits of the human ear to be, with reſpect to gravity, two octaves lower than C; and with reſpect to acuteneſs, two octaves higher than c'''. See INTERVAL and VIBRATION.

CHORD is ſometimes alſo uſed for accord. Thus we ſay the common *chords* to ſuch a baſs note, meaning its third, fifth, and octave.

CHORD is alſo uſed in *Muſic*, for the note or ſtring to be touched, or ſounded; in which ſenſe it is applicable to all the intervals of muſic.

CHORDAPSUS, in *Medicine*, a diſeaſe of the inteſtines, otherwiſe called *volvulus*, the *iliac paſſion*, and *miſerere mei*: though others make it a diſtinct ſpecies of the *miſerere*.

The word comes from *χορδη*, *gut*; and *απτω*, *necto*, *I knot*, or *tye*.

Galen defines it, a tumidity, or inflation of the ſmall inteſtines, which makes them appear filled, and ſtretched like a *cord*. Archigenes makes it a kind of *miſerere*; conſiſting in a tumor in a certain place of the ſmall inteſtines, which ſinks in, and gives way to the hand, when preſſed: he adds, that it is exceeding dangerous, and ordinarily kills in three or four hours, unleſs it comes to ſuppuration; which, however, does not remove all the danger.

It is probable, however, that the *chordapſus* is, in reality, nothing elſe but the *miſerere* not well underſtood. Celſus informs us, that in his time they were eſteemed the ſame thing.

CHORDEE, in *Medicine*, an inflammation and contraction of the *frænum*, and under-part of the *penis*; ſo as to render erection painful.

It happens in *gonorrhœas*, and is generally proportional to the degree of the *virus* received; ſo that in virulent *gonorrhœas*, it is uſually a very troubleſome ſymptom.

It proceeds from the acrimony of the matter which runs from the *urethra*, irritating the under-part of the *penis*; by which it is, as it were, tied or held forcibly downwards in erection, eſpecially its *frænum*. Dr. Rutherford of Edinburgh, in his Clinical Lectures, attributes it to the inflammation and ſwelling of the *corpus cavernoſum urethræ*. When the acrimony is conſiderable, it ſometimes gives riſe to unnatural erections, or the ſymptom called a *priapiſm*.

If the *chordee* be violent, or does not decreaſe proportionally to the other ſymptoms in *gonorrhœas*, an emetic of turbith mineral is uſually given with ſucceſs; it cauſing a revulſion from the part.

Though women have no glans or *frænum* to be affected with the ſharp running, yet the ſphincter of the *vagina*, *clitoris*, and lips themſelves, are inflamed after the ſame manner; and therefore the method of their cure muſt be the ſame; which is by ſuch medicines as allay the preſſing inflammation, and ſecure the parts againſt their being corroded by the ſharpneſs of the corruption.

CHOREA *ſancti Viti*, in *Medicine*. See VITUS's *Dance*.

CHOREPISCOPUS, an officer in the ancient church, about whoſe function the learned are extremely divided.

The word comes from *χωρος*, a *region*, or *little country*, and *επισκοπος*, a *biſhop*, or *overſeer*.

The *chorepiſcopi* were ſuffragan or local biſhops, holding a middle rank between biſhops and preſbyters, and delegated to exerciſe epiſcopal juriſdiction within certain diſtricts, when the boundaries of particular churches, over which ſeparate biſhops preſided, were conſiderably enlarged.

It is not certain when this office was firſt introduced: ſome trace it to the cloſe of the firſt century; others tell us, that *chorepiſcopi* were not known in the Eaſt till the beginning of the fourth century; and in the Weſt, about the year 439. They ceaſed, both in the Eaſt and Weſt, in the tenth century.

CHOREPISCOPUS is alſo the name of a dignity ſtill ſubſiſting in ſome cathedrals, particularly in Germany; ſignifying the ſame with *chori epiſcopus*, or biſhop of the choir.

The word, in this ſenſe, does not come from *χωρος*, *place*, but *χορος*, *choir*, &c.

In the church of Cologne, &c. the firſt chantor is called *chorepiſcopus*.

CHOREUS, a foot in the ancient poetry, more commonly called *trochæus*, or TROCHEE.

CHORIAMBUS, in the *Latin Poetry*, a foot compounded of a *choreus*, or *trochæus*, and an *iambus*.

It conſiſts of four ſyllables; of which the firſt and laſt are long, and the two middle ones ſhort: as *fīlĭŏlūm*.

CHORION, the exterior membrane which inveſts the *fœtus* in the womb.

The word comes from the Greek *χωρειν*, *capere*, *to contain*.

It is very thick and ſtrong; on the inſide, where it joins another membrane, called *amnios*, very ſmooth; but rough and uneven withoutſide; interſperſed with a great number of veſſels, and faſtened to the *matrix*, or womb, by means of the *placenta*, which adheres very cloſely to it.

This membrane is found in all animals.

The *chorion*, with the *amnios* and *placenta*, make what we call the SECUNDINE, or after-birth.

CHORIST, or CHORISTER, a chantor or ſinger in the choir.

CHORIZANTES, the name of a ſect in Germany, ann. 1374, ſaid to be demoniacs that aſſembled in ſtreets and churches.

We may [illegible] their enemies called them demoniacs. Du-Can[illegible] not mention any of their tenets.

CHORO *[illegible]vorito*, in the *Italian Muſic*, a *chorus*, in which are employed the beſt voices and inſtruments to ſing the recitatives, play the ritornellos, &c. It is otherwiſe called the little *chorus*, or *choro recitante*.

CHORO *ſpezzato*, in the *Italian Muſic*, a compoſition of two, three, or more choruſſes. It is often met with inſtead of *tutti* or *da capella*, which mean the grand chorus. *A doi, a tre, a quatro chori*, is for two, three, or four choruſſes. When after the name of a part we find *primo*,

primo, 1^{o} *choro*, we muſt underſtand that it is to be played in the firſt chorus; if 2°, II^{do}, or *ſecondo choro*, the part muſt be ſung or played in the ſecond chorus. And conſequently it ſhews, that the compoſition is for eight voices or different parts.

CHOROBATES, a kind of water-level, uſed among the ancients; compoſed of a double ſquare, in form of a T, deſcribed by Vitruvius.

The word comes from χωροϐατειν, *to over-run a country.*

CHOROGRAPHY, the art of making a MAP, or deſcription of ſome country or province.

The word comes from χωρος, *region*, and γραφω, *I deſcribe.* *Chorography* is diſtinguiſhed from GEOGRAPHY, as the deſcription of a particular country is from that of the whole earth. And from *topography*, as the deſcription of the ſame country is from that of a ſingle place, town, or diſtrict in it.

CHOROIDES, or **Choroeides**, in *Anatomy*, a term applied to ſeveral parts of the body; bearing ſome reſemblance to the chorion.

The word is formed from χοριον, *chorion*, and ειδος, *likeneſs.*

Choroides is particularly uſed for the inner membrane which immediately inveſts the brain; ſo called as being intermingled with a great number of blood-veſſels, like the *chorion*; but more uſually denominated the *pia mater*, or MENINX *tenuis.*

Plexus, or *Lacis* **Choroides**, is a knot of veins and arteries in the anterior ventricle of the brain, woven out of the branches of the carotid.

Choroides is alſo applied to the inner, and poſterior tunic of the eye, immediately under the ſclerotica.

It is ſoft, thin, and black; and its inner, or concave ſurface, is very ſmooth and poliſhed. It has its name from its being interſperſed with veſſels. Its anterior part is called the *uvea*; or rather the *iris*, as the internal ſurface is called the *Ruyſchia* coat.

Next under the *choroides* is the *retina.* Ruyſch, indeed, ſays, he has found another tunic between the *choroides* and *retina*; and denominates it from himſelf, *tunica Ruyſchiana.* He adds, that it grows ſo firmly to the *choroides*, that it is overlooked in the common diſſections.

But Verheyen, though he found the *choroides* of a bird diviſible into two membranes, could never ſeparate thoſe of the human eyes; and thereſore he thinks there needed not any new name. The *choroides* is, for the moſt part, black in men; though it appears often, as M. Pecquet has obſerved, in very different ſhades; in lions, camels, bears, ſheep, cattle, dogs, cats, and moſt fiſhes, it is of a ſhining colour, like the brilliance of ſilver, or the luſtre of oriental pearl; and makes what naturaliſts call the *tapis*, or colour of the eye.

M. Mariotte maintains, that viſion is performed rather in the *choroides* than the *retina*; in which he agrees with Bar. Torinus, and is ſeconded by M. Mery; but moſt other authors are of a different ſentiment.

He was led to this hypotheſis by obſerving, that part of the *retina*, at the inſertion of the optic nerve, is inſenſible to the impreſſion of light, and that in this part the *choroides* is wanting.

He was confirmed in opinion, that the *retina* could not be the ſeat of viſion, becauſe of its tranſparency; though M. Pecquet obſerves in reply, that it is very imperfectly tranſparent, only reſembling oiled paper. He urges likewiſe the greater ſenſibility of the *choroides* than that of the *retina*, as is evident by the alternate contraction and dilatation of the *iris*, which is a continuation of the *choroides*, in light and ſhade.

It has been replied, that ſome creatures, ſuch as the porcupine and ſea-calf, have the optic nerves inſerted into the axis of their eyes. This fact, according to Dr. Porterfield, overturns Mariotte's hypotheſis of the *choroides* being the principal and immediate organ of ſight.

Mr. Le Cat ſtrenuouſly defends Mariotte's opinion, that the *choroid* coat, which is the production of the *pia mater*, and not the *retina*, is the immediate organ of viſion. The *retina*, according to him, is to the *choroid* what the *epidermis* is to the ſkin; receiving the impreſſion of light, and preparing it for its proper organ. Mr. Michell has likewiſe urged ſome further conſiderations in favour of the *choroides*, as the proper ſeat of viſion, deduced from its greater ſenſibility, and from the variety of its colours in different animals, according to their ſituation and neceſſity. He adds, that the *choroides* is in no caſe tranſparent, and has no reflecting ſurface beyond it, and that it is better formed as an organ of diſtinct viſion than the *retina.* M. de la Hire has advanced another hypotheſis; alleging, that the *choroides* receives the impreſſions of images, in order to tranſmit them to the *retina.* Againſt which hypotheſis, Mr. Michell objects, that the impulſions which are thus *ſecondarily* communicated to the nerves muſt be fainter, and that it is more natural to ſuppoſe, that the impreſſion firſt made upon the *choroides* ſhould be conveyed to the brain by its own proper nerves. Prieſtley's Hiſtory of Viſion, chap. ii. p. 189, &c. See VISION.

It had been long obſerved that the *choroides* in men is black; but no obſervation had been made on the change it ſuffers by age, before M. Petit, who perceived that it appears quite brown under the *retina* in children, and grows conſiderably brighter as they advance in age.

CHORUS, in *Dramatic Poetry*, one, or more perſons, preſent on the ſtage during the repreſentation, and ſuppoſed to be by-ſtanders thereto, without any particular ſhare or intereſt in the action.

Tragedy, in its origin, M. Dacier obſerves, was no more than a ſingle *chorus*, who trod the ſtage alone, and without any other actors; ſinging dithyrambics, or hymns, in honour of Bacchus. Theſpis, to relieve the *chorus*, added an actor, who rehearſed the adventures of ſome of their heroes. Æſchylus, finding a ſingle perſon too dry an entertainment, added a ſecond; and at the ſame time greatly reduced the ſinging of the *chorus*, to make more room for the recitation.

Every thing introduced between the four ſongs of the *chorus*, they called by the term *epiſode*; and thoſe four ſongs made the four intervals, or acts of the piece.

But when once tragedy began to be formed, thoſe recitatives, or epiſodes, which at firſt were only intended as acceſſory parts, to give the *chorus* a breathing time, became now the principal parts of the performance: and whereas, before, they were taken from various ſubjects, they were now all drawn from one and the ſame.

The *chorus*, by degrees, became inſerted and incorporated into the action, to which at firſt it was only intended as an addition or ornament. Sometimes the *chorus* was to ſpeak, and then their chief, whom they called *Coryphæus*, ſpoke in behalf of all the reſt: the ſinging was performed by the whole company; ſo that when the *Coryphæus* ſtruck into a ſong, the *chorus* immediately joined him.

Beſides the four ſongs, which made the diviſion of the piece, and which were managed by the *chorus*, the *chorus* ſometimes alſo joined the actors in the courſe of the repreſentation, with their plaints and lamentations; on occaſion of any unhappy accidents that befel them.

But the proper function of the *chorus*, when tragedy was formed, and that for which it ſeemed chiefly retained, was to ſhew the intervals of the acts: while the actors were behind the ſcenes, the *chorus* engaged the ſpectators; their ſongs uſually turned on what was juſt exhibited; and were not to contain any thing but what was ſuited to the ſubject, and had a natural counexion with it: ſo that the *chorus* concurred with the actors for advancing the action.

It is a fault obſerved in Euripides's tragedies, that his *choruſes* are detached from the action, and not taken from the ſame ſubject. There were ſome other poets, who, to ſave the *pains* of compoſing *choruſes*, and adapting them to the piece, contented themſelves with invented ſongs, which had no relation at all to the action. Theſe foreign *choruſes* were the leſs pardonable, as the *chorus* was eſteemed to act a part in the piece; and to repreſent the ſpectators, who were looked on as intereſted therein; inſomuch that the *chorus* was not always to be mute, even in the courſe of the acts. In the modern tragedies, the *chorus* is laid aſide, and the muſic ſupplies its place.

That which occaſioned the ſuppreſſion of the *chorus*, was its being incompatible with certain complots, and ſecret deliberations of the actors. For it is in no-wiſe probable, that ſuch machinations ſhould be carried on in the eyes of perſons intereſted in the action. As the *chorus*, therefore, never went off the ſtage, there ſeemed a neceſſity of laying it aſide, to give the greater probability to thoſe kinds of intrigues, which require ſecrecy.

M. Dacier obſerves, there was a *chorus*, or grex, alſo in the ancient comedy; but this too is ſuppreſſed in the new: chiefly becauſe it was made uſe of to reprove vices, by attacking particular perſons.

The *chorus* in comedy was at firſt no more than a ſingle perſon, who ſpoke in the ancient compoſures for the ſtage; the poets, by degrees, added to him another; then two, afterwards three, and at laſt more: ſo that the moſt ancient comedies had nothing but the *chorus*, and were only ſo many lectures of virtue.

Chorus, *to give the*, among the Greeks, was to purchaſe a dramatic piece of the poet, and defray the expences of its repreſentation.

The perſon who did this was called *choragus.* At Athens, the office of *choragus* was impoſed on the *archon*; and at Rome on the *ædiles.*

Chorus is likewiſe uſed in muſic, where, at certain periods of a ſong, the whole company are to join the ſinger in repeating certain couplets, verſes, or clauſes.

CHOSE, *thing.* This word, in *Law*, is uſed in various circumſtances, and with various epithets; as,

Choſe *in action*, is not any thing corporeal, but only a right, v. g. an annuity, obligation, covenant, &c.

Choſe in action, may alſo be called *choſe in ſuſpenſe*, as having no real exiſtence, and not being properly in poſſeſſion: being a thing, as it is expreſſed, rather *in potentia* than *in eſſe*.

No *choſe in action* could, by the ancient common law, be transferred or aſſigned; but this is now allowed; and the form of doing it is in the nature of a declaration of truſt, and an agreement to permit the aſſignee to make uſe of the name of the aſſignor, in order to recover the poſſeſſion: and when a debt or bond is aſſigned over, it muſt ſtill be ſued in the original creditor's name.

Choſe *local*, is ſomething annexed to a place, v. g. a mill.

Choſe *tranſitory*, ſomething moveable, and which may be tranſported from place to place.

CHOUAN, in the *Materia Medica*, the name of a ſmall ſeed, called by ſome alſo carmine ſeed. It is a very light and chaffy ſeed, in a great meaſure reſembling worm ſeed, of an acid taſte, and a yellowiſh green colour, but is larger than worm-ſeed. It is brought into Europe from Turky, and many parts of the Eaſt, and the choice ſhould be made of ſuch as is largeſt, cleaneſt, of the greeneſt colour, and leaſt marked with ſpecks or holes. It is not uſed in medicine, but is of ſome value among the people who make CARMINE for the painters. It is called *ſantonium viride*, or the green worm-ſeed, in our catalogues of the *Materia Medica*, but is unknown in the ſhops. Lemery.

CHOUGH, *Coracias*, in *Zoology*. See HEART-*ſhells*.

CHOUS, in the *Eaſtern Military Orders*, the title of the meſſengers of the divan of janiſaries. There are ſeveral degrees of honour in this poſt. When a perſon is firſt advanced to it, he is called a *cuchuck*, or little *chous*; after this he is advanced to be the *alloy chous*, that is, the meſſenger of the ceremonies; and from this, having paſſed through the office of *petelma*, or procurator of the effects of the body, he is advanced to be the *bas chous*.

CHOUX, in *Natural Hiſtory*, a name given by the French to a ſpecies of ſhell-fiſh of the *cordiform* or *bucardium* kind, Fabius Columna has elegantly deſcribed it, and Liſter has given a figure of it twice over, in two different parts of his book. There is another ſpecies leſs elegant, and wanting the hollowed ribs. See CORDIFORMIS.

CHOWDER-*Beer*, a provincial phraſe of Devonſhire, denoting a cheap and eaſily prepared drink, highly commended for preventing the ſcurvy in long voyages, or for the cure of it where it may have been contracted. It is prepared in the following manner: take twelve gallons of water, in which put three pounds and a half of black ſpruce; boil it for three hours, and having taken out the fir or ſpruce, mix with the liquor ſeven pounds of melaſſes, and juſt boil it up; ſtrain it through a ſieve, and, when milk warm, put to it about four ſpoonfuls of yeaſt to work it. In two or three days ſtop the bung of the caſk, and in five or ſix days, when fine, bottle it for drinking. Two gallons of melaſſes are ſufficient for an hogſhead of liquor; but if melaſſes cannot be procured, treacle or coarſe ſugar will anſwer the purpoſe.

CHRABRATE, in *Natural Hiſtory*, a name given by the writers of the middle ages to a pellucid ſtone, ſaid to have great virtues againſt diſorders of the liver and ſpleen, and many other imaginary qualities. It appears by their deſcriptions to have been no other than the common pebble cryſtal.

CHREMPS, in *Ichthyology*, a name given by the eldeſt Greek writers to the fiſh ſince called *chromis*. It is a ſpecies of the *ſpari*, and is diſtinguiſhed by Artedi by the name of the *ſparus*, with the ſecond ray of the belly-fins very long.

CHRENECRUDA, a term occurring in *Writers of the Middle Age*, and expreſſing a cuſtom of thoſe times, but its ſignification is doubtful. It is mentioned in Lege Salica, Tit. 61. which ſays, he who kills a man, and hath not wherewithal to ſatisfy the law, or pay the fine, makes oath that he has delivered up every thing he was poſſeſſed of; the truth of which muſt be confirmed by the oaths of twelve other perſons. Then he invites his next relations by the father's ſide to pay off the remainder of the fine, having firſt made over to them all his effects by the following ceremony. He goes into his houſe, and taking in his hand a ſmall quantity of duſt from each of the four corners, he returns to the door, and with his face inwards throws the duſt with his left hand over his ſhoulders upon his neareſt of kin. Which done, he ſtrips to his ſhirt; and coming out with a pole in his hand, jumps over the hedge. His relations, whether one or ſeveral, are upon this obliged to pay off the compoſition for the murder. And if theſe (or any one of them) are not able to pay, *iterum ſuper illum chrenecruda qui pauperior eſt, jactat, & ille totam legem componat.* Whence it appears, that *chrenecruda jactare*, is the ſame with throwing the duſt, gathered from the four corners of the houſe. Goldaſtus and Spelman tranſlate it *viridem herbam, green graſs*, from the German *gruen kraut*, or from the Dutch *groen, green*, and *gruid, graſs*. Wendelinus is of a contrary opinion, who thinks that by this word *denotari purificationis approbationem*, from *chrein, pure, chaſte, clean*; and *keuren, to prove*; ſo that it muſt refer to the oaths of the twelve jurors. Be this as it will, king Childebert reformed this law by a decree, chap. 15. both becauſe it favoured of pagan ceremonies, and becauſe ſeveral perſons were thereby obliged to make over all their effects: *De chrenecruda lex quam paganorum tempore obſervabant, deinceps nunquam valeat, quia per ipſam cecidit multorum poteſtas.*

CHRISM, from χριω, *I anoint*, oil conſecrated by the biſhop, and uſed in the Romiſh and Greek churches, in the adminiſtration of baptiſm, confirmation, ordination, and extreme unction, which is prepared on Holy Thurſday with much ceremony. In Spain, it was anciently the cuſtom for the biſhop to take one third of a ſol for the *chriſm* diſtributed to each church, on account of the balſam that entered its compoſition.

Du-Cange obſerves, there are two kinds of *chriſm*; the one prepared of oil and balſam, uſed in baptiſm, confirmation, and ordination; the other of oil alone, conſecrated by the biſhop, uſed anciently for the catechumens, and ſtill in extreme unction.

The Maronites, before their reconciliation with Rome, beſides oil and balſam, uſed muſk, ſaffron, cinnamon, roſes, white frankincenſe, and ſeveral other drugs mentioned by Rynaldus, in 1541, with the doſes of each. The jeſuit Dandini, who went to mount Libanus in quality of the pope's nuncio, ordained, in a ſynod held there in 1596, that *chriſm*, for the future, ſhould be made only of two ingredients, oil and balſam; the one repreſenting the human nature of Jeſus Chriſt, the other his divine nature.

The action of impoſing the *chriſm*, is called *chriſmation*: this the generality of the Romiſh divines hold to be the next matter of the ſacrament of confirmation.

The *chriſmation* in baptiſm is performed by the prieſt; that in confirmation by the biſhop; that in ordination, &c. is more uſually ſtiled *unction*.

Chriſm *pence*, **Chriſmatis** *denarii*, or **Chriſmales** *denarii*, a tribute anciently paid to the biſhop by the pariſh-clergy, for their *chriſm*, conſecrated at Eaſter for the enſuing year: this was afterwards condemned as ſimoniacal.

CHRISOM, **Chriſmale**, was anciently the face-cloth, or piece of linen laid over the child's head when it was baptized.

Whence, in our bills of mortality, children who die in the month, are called *chriſoms*.—The time between the child's birth and baptiſm, was alſo called *chriſomus*.

CHRIST, an appellation ſynonymous with MESSIAH, uſually added to Jeſus: and, together therewith, denominating the Saviour of the world.

The word χριστὸς ſignifies *anointed*, from χριω, *inungo, I anoint*.

Sometimes the word *Chriſt* is uſed ſingly, by way of *antonomaſis*, to denote a perſon ſent from God, as an anointed prophet, king, or prieſt.

Chriſt, *Order of*, a military order, founded in 1318, by Dionyſius I. king of Portugal, to animate his nobles againſt the Moors.

Pope John XXII. confirmed it in 1320, and appointed the knights the rule of St. Bennet. Alexander VI. permitted them to marry. The order became afterwards inſenſibly reunited to the crown of Portugal; and the king took upon him the adminiſtration of it.

The arms of the order are, gules, a patriarchal croſs, charged with another croſs argent. They had their reſidence, at firſt, at Caſtromarin; afterwards they removed to the city of Thomar, as being nearer to the Moors of Andaluſia and Eſtramadura.

Chriſt is alſo the name of a military order in Livonia, inſtituted in 1205, by Albert biſhop of Riga. The end of their inſtitution was to defend the new Chriſtians who were ſucceſſively converted in Livonia, but were perſecuted by the heathens.

They wore on their cloaks a ſword with a croſs over it; whence they were alſo denominated *brothers of the Sword*.

Chriſt-*thorn*, in *Botany*, *Paliurus*. See *Chriſt*-THORN.

CHRISTENING. See BAPTISM.

CHRISTIAN, ſomething that relates to CHRIST.

The king of France bears the title, or ſurname, of the *moſt Chriſtian king*. The French antiquaries trace the origin of the appellation up to Gregory the Great; who, writing a letter to Charles Martel, occaſionally gave him that title, which his ſucceſſors have ſince retained.

Lambecius, in the third tome of his Catalogue of the emperor's library, holds, that the quality of *moſt Chriſtian* was not aſcribed to the ancient French kings, Louis le Debonair, &c. as kings of France, but as emperors of Germany: but the French hiſtorians endeavour to refute this plea.

Christian *Church.* See **Church.**

Christian *Court.* See **Court** *Chriſtian.*

Christian *Name*, that given at baptiſm. See **Name.**

Christian *Religion*, or **Christianity**, that inſtituted by Jeſus Chriſt, comprehending doctrines of faith, and rules of practice; all of which are contained in the New Teſtament, and are deſigned to recover mankind from ignorance and vice, from guilt and death, to true knowlege and virtue, to the divine favour and everlaſting life. Its aptitude to this end, its conformity to reaſon, and to the ſtate of man, the ſublimity and excellence of its doctrines, the equally venerable and lovely character of its author, the purity of its precepts, its benign tendency and ſalutary effects, concur, with the external evidence of **prophecy** and **miracles**, to eſtabliſh its divine origin and truth.

Christian is peculiarly and abſolutely uſed for a perſon who believes in Chriſt, and is baptized in his name.

The name *Chriſtian* was firſt given at Antioch, in the year 42, to ſuch as believed in Chriſt, as we read in the Acts: till that time they were called *diſciples.*

Christians *of St. John*, a corrupt ſect of *Chriſtians*, very numerous in Baſſora, and the neighbouring towns.

They formerly inhabited along the river Jordan, where St. John baptized; and it was thence they had their name. But after the Mahometans became maſters of Paleſtine, they retired into Meſopotamia and Chaldea.

They hold an anniverſary feaſt of five days; during which, they all go to their biſhops, who baptize them with the baptiſm of St. John: their baptiſm is always performed in rivers, and that only on Sundays.

They have no notion of the third Perſon in the Trinity; nor have they any canonical books, but ſeveral which are full of charms, &c. Their biſhopricks deſcend by inheritance, as our eſtates do; though they have the ceremony of an election. There is no ſatisfactory account of the origin or principles of this ſect. See **Sabæans.**

Christians *of St. Thomas*, or *San Thoma*, a ſect of ancient *Chriſtians* found in the Eaſt Indies, when the Europeans touched at the port of Calicut; who pretend to be deſcended from thoſe St. Thomas converted in the Eaſt Indies; whence the name.

The natives call them, by way of contempt, *Nazarenes*; their more honourable appellation is *Mappuleymar.* See **Thomæans.**

Some learned men in Europe ſay, it was not St. Thomas the apoſtle that converted that country, but another St. Thomas: others ſay, it was a Neſtorian merchant, called Thomas. It is certain they are Neſtorians, and have been ſo a long time; inſomuch that *Chriſtians of St. Thomas* now paſſes for the name of a ſect.

They have a patriarch, who reſides at Moſul. The pope has made ſeveral attempts to reduce them under his obedience, but to no purpoſe.

CHRISTMAS, the feaſt of the nativity of Jeſus Chriſt.

It appears from St. Chryſoſtom, that in the primitive times, *Chriſtmas* and Epiphany were celebrated at one and the ſame feaſt: that father obſerves, it was but of a little while that *Chriſtmas* had been celebrated at Antioch on the twenty-fifth of December, as a diſtinct feaſt; and that the uſe thereof came from the Weſt. The Armenians made but one feaſt of them, as low as the twelfth century.

It is commonly maintained, that pope Teleſphorus was the firſt who ordered the feaſt of the Nativity to be held on the twenty-fifth of December. John, archbiſhop of Nice, in an epiſtle upon this ſubject, relates, that at the inſtance of St. Cyril of Jeruſalem, pope Julius procured a ſtrict enquiry to be made into the day of our Saviour's nativity, which being found to be on the twenty-fifth of December, they began thenceforth to celebrate the feaſt on that day. However, the preciſe day, or even the month, in which our Saviour was born, is extremely uncertain. Some, as Clemens Alexandrinus, informs us, affixed it to the twenty-fifth of the month Pachon, correſponding to the ſixteenth of May. But there are ſome circumſtances which ſhould rather lead us to conclude, that he was born in autumn; as this was, in every reſpect, the moſt proper ſeaſon of the year for a general aſſeſſment, which took place at the birth of Chriſt, and which required perſonal attendance; and as there were ſhepherds watching their flocks by night at the time when Chriſt was born; and therefore it is probable, that the æra of the Nativity was either in September or October, A. U. 748 or 749. See **Epocha.**

Christmas *Roſe.* See **Hellebore.**

CHRISTOGENON, from χριϛος, *Chriſt*, and γινομαι, *I am born*; in the *Greek Church*, a faſt of forty days, immediately preceding the ſuppoſed time of Chriſt's nativity.

CHRISTOLYTI, a ſect mentioned by Damaſcenus; ſo called, becauſe they maintained that Chriſt deſcended into hell, body and ſoul; and that he left both there; aſcending to heaven with his divinity alone.

The word comes from χριϛος, *Chriſt*, and λυω, *I diſſolve.*

CHRISTOMACHI, χριϛομαχοι, in *Church Hiſtory*, a deſignation given to all ſorts of heretics who deny the divinity of our Saviour, or hold heterodox opinions concerning his incarnation.

The word comes from the Greek χριϛος, *Chriſt*, and μαχομαι, *I fight*, or *oppoſe.*

CHRISTOPHORIANA, called by ſome *actæa.* See **Herb** *Chriſtopher.*

CHRISTOPHORUS *piſcis*, a name by which ſome have called the *faber*, or as we call it the *doree*, or *jaune* **doree**, the gilded fiſh.

CHROÆ, in the *Muſic of the Ancients.* See **Colours, Genus**, and **Species.**

CHROASTACES, in *Natural Hiſtory*, a genus of pellucid gems, comprehending all thoſe of variable colours, as viewed in different lights: of which kind are the opal and the **asteria**, or the *cati oculus.*

CHROMA, in the *Botanical Writings of the Ancients*, a word uſed to expreſs a famous root brought from Syria into Greece, and uſed by the women of that country to paint their cheeks red. It was alſo called *rhizium* and *fucus*, and by the Latins *radicula.*

Chroma, in *Rhetoric*, a colour, or fair pretence.

The word is Greek, and literally denotes *colour.*

Chroma, in the *Italian Muſic.* The Italians take this term from the Greeks, but uſe it to ſignify a note or character of time, by us called a quaver, and when the word ſemi is added thereto, it means our ſemiquaver. Eight of the former are contained in a bar, and ſixteen of the latter in common time.

Chroma is alſo a graceful way of ſinging, or playing, with quavers and trilloes.

Chroma alſo ſometimes ſignifies the ſame as the chromatic **diesis** or ſemitone minor.

Chroma is alſo uſed to ſignify the *genus chromaticum.* In this ſenſe we find it uſed by Ariſtoxenus, and in Ptolemy's Harmonics.

CHROMATIC, in the *Ancient Muſic*, the ſecond of the three *genera*, or kinds, in which the conſonant intervals were ſubdivided into their concinnous parts.

The other two kinds were, the *enharmonic*, and the *diatonic.* The *chromatic* conſiſted of ſemitones, and minor thirds: it had its name, either becauſe the Greeks marked it with the character of colour, which they call χρωμα; or, as P. Parran ſuggeſts, becauſe the *chromatic* kind is a medium between the other two, as colour is between black and white: or elſe becauſe the *chromatic* kind varies and embelliſhes the diatonic kind, by its ſemitones; which have the ſame effect in **music**, with variety of colours in painting. M. Rouſſeau ſays, that this ſpecies of muſic was written in coloured notes. Ariſtoxenus divides the *chromatic genus* into three ſpecies; the *molle*, *hemiolion*, and *tonicum*: Ptolemy, into *molle* or *antiquum*, and *intenſum.*

Theſe ſpecies were alſo called *chroai*, or colours of the *genera*: the *molle* expreſſes a progreſſion by ſmall intervals, the *intenſum* by greater.

The *chromatic* and enharmonic kinds only contain the ſmalleſt of the diatonic degrees; ſo that they have the ſame proportion to the diatonic, as fractions have to integers.

Boethius, and after him Zarlin, attribute the invention of the *chromatic* genus to Timotheus a Mileſian, in the time of Alexander the Great. The Spartans baniſhed it their city, on account of its ſoftneſs. The character of this genus, according to Ariſtides Quintilianus, were ſweetneſs and pathos.

Mr. Malcolm obſerves, that we are at a loſs what uſe the ancients could make of theſe diviſions and ſubdiviſions into *genera* and *ſpecies.* All acknowleged the diatonic to be the true melody; the others ſeem only humorous irregularities, calculated to pleaſe the fancy by their novelty and oddneſs; and were beſides ſo very difficult, that few, if any, are ſaid to have ever practiſed them accurately.

The moderns have been much perplexed to underſtand the different ſpecies of *chromatic* muſic in uſe among the ancient Greeks. Moſt of our muſicians have no other notion of the *chromatic*, than of a melody proceeding by ſemitones major, and minor. This is what Broſſard ſays of it. But this is not ſufficient to convey a true notion of the *chromatic.* Dr. Pepuſch has given us a clearer light in this affair: his doctrine is as follows.

The ancients diſtinguiſhed three ſorts of *chromatic*, which were denoted by the names, *molle*, *ſeſquialterum*, and *toniæum*.

The *chromaticum molle* was a diviſion of the diateſſaron, or fourth, into three intervals, which were two ſubſequent ſemitones minor, and the interval, which is the complement of theſe two to the fourth; and this interval will be found equal to a third minor added to an enharmonic dieſis. This ſpecies is not to be met with among the moderns.

The *chromaticum ſeſquialterum*, or *hemiolium*, was a diviſion of the fourth into a ſemitone major, a ſemitone minor, and a third minor. This is mentioned by Ptolemy as the *chromatic* of Didymus. It occurs in modern compoſitions.

The *chromaticum toniæum*, or *tonicum*, was a diviſion of the fourth into a ſemitone major ſucceeded by another ſemitone major, and the complement of theſe two to the fourth, which is the interval, commonly called a ſuperfluous tone. This often occurs in modern muſic. Dict. de Muſique, p. 19. Phil. Tranſ. Nº 481. p. 272. Wallis, Append. Ptolem. Harm. p. 164.

Chromatic is alſo applied by ſome to the ſcience of colours; and in painting, it is uſed to ſignify the colouring.

CHROMIS, in *Zoology*, the name of a little fiſh caught frequently in the Mediterranean, which ſeldom exceeds three inches in length, is moderately thick, and of a duſky brown colour.

Artedi, who very accurately examined this fiſh, does not allow it a diſtinct generical name, but makes it only a ſpecies of his *genus* of the *ſpari*, calling it the SPARUS with the ſecond ray of each belly-fin carried to a great length.

Chromis is alſo the name by which Bellonius, and ſome others, have called a large fiſh caught in the Mediterranean, more uſually known by the name of UMBRA, and brought to market in Italy while young and ſmall.

CHRONIC, **Chronical**, in *Medicine*, is applied to a ſlow DISEASE, which laſts a long time; at leaſt upwards of forty days: ſuch as are the gout, dropſy, aſthma, &c. The word comes from χρονος, *time*.

Chronic diſeaſes ſtand in oppoſition to acute diſeaſes, which are ſpeedy, and haſten to a criſis; as fevers, ſmall-pox, &c.

Chronic diſeaſes are uſually owing either to ſome natural defect in the conſtitution, or to an irregular manner of living; and moſt of the *chronical* diſeaſes, ſays Dr. Cheyne, the infirmities of old age, and the ſhort periods of the lives of Engliſhmen, are owing to repletion: this is evident hence, that evacuation, of one kind or another, is nine parts in ten of their remedy.

The ſources of *chronical* diſtempers, ſays the ſame author, are, 1 Viſcidity in the juices, or the over-largeneſs of their conſtituent particles; which, not being ſufficiently broken by the concoctive powers, ſtop or retard the circulation. Or, 2. Too great abundance of ſharp acrimonious ſalts; whereby the juices themſelves are rendered ſo corroſive, as to burſt or wear out the ſolids. Or, 3 A relaxation, or want of due force or ſpringineſs of the ſolids themſelves.

An exceſs in the quantity of our meats and drinks begets the firſt; the bad condition of the ſame foods the ſecond; and both together, with want of due exerciſe, the third.

The cauſes of all *chronical* diſorders, according to Dr. Cadogan, in his Eſſay on the Gout, &c. are indolence, intemperance, or vexation. And Dr. Fothergill obſerves, that in the cure of all *chronic* complaints, however diſtant their ſeat may be from the ſtomach, thoſe will have the greateſt ſucceſs, who attentively conſider the preſent ſtate of this organ; who remove every obſtruction to its performing the office of digeſtion with eaſe, conſtancy, and expedition. Lond. Med. Obſ. vol. i. p. 314.

CHRONICLE, **Chronicon**, denotes a hiſtory digeſted in order of time; though the term is ſeldom uſed but in ſpeaking of our old Engliſh hiſtories, as Holinſhed's *Chronicle*, Stow's *Chronicle*, &c. See ANNALS.

CHRONICLES, in the *Canon of Scripture*, are two ſacred books called by the Greeks *Paralipomena*, Παραλειπομενα, becauſe they contain many ſupplemental relations omitted in the other hiſtorical books. They are an abridgment of ſacred hiſtory, to the return of the Jews from the Babyloniſh captivity. The firſt book traces the genealogies of the Iſraelites from Adam, relates the death of Saul, and gives a brief account of David's reign. The ſecond traces the progreſs of the kingdom of Judah, its various revolutions, its period under Zedekiah, and the reſtoration of the Jews by Cyrus.

CHRONOGRAM, a kind of compoſition, whoſe numeral letters, joined together, make up ſome date, or epocha. See ANAGRAM.

The word is compounded of χρονος, *time*, and γραμμα, *letter*.

CHRONOLOGICAL, belonging to CHRONOLOGY. *Chronological characters*, are characters by which *times* are diſtinguiſhed. Of theſe ſome are *natural* or *aſtronomical*; others are *artificial*, or *hiſtorical*. *Natural chronological characters* are ſuch as depend on the motions of the ſtars, as eclipſes, ſolſtices, equinoxes, the different aſpects of planets, &c. *Artificial chronological characters*, are thoſe which men have eſtabliſhed, as the ſolar CYCLE, the lunar CYCLE, &c. *Hiſtorical chronological characters* are thoſe which are ſupported by the teſtimonies of hiſtorians, when they fix the dates of certain events to certain periods. We ſay alſo *chronological* tables, abridgments, machines, &c. M. Barbeu du Bourg invented a curious *chronological* machine, of which there is a particular account communicated by himſelf, in the Encyclopedie, tom. iii. p. 400. 1°.

CHRONOLOGY, the art of meaſuring and diſtinguiſhing time; or the doctrine of epochas, &c.

The word is compounded of χρονος, *time*, and λογος, *diſcourſe*.

Sturmius divides *chronology* into five diſtinct branches; viz. *metaphyſical*, *phyſical*, *political*, *hiſtorical*, and *eccleſiaſtical*; according to the various relations, or habitudes, wherein TIME is conſidered; viz. as in itſelf; as connected and ſubjected to the affections, ſtates, and alterations of natural things; as accommodated to civil uſes; as matched with events that paſs in the world; and particularly as it relates to the celebration of Eaſter.

There is more difficulty in *chronology* than every one is aware of; it requires not only the knowlege of aſtronomy and geography, and conſequently that of arithmetic, geometry, and trigonometry, both plain and ſpherical; but alſo a laboured application to the ancient monuments. Its uſe is very great: it is called one of the eyes of hiſtory; and ſerves many good purpoſes in theology.

Chronology, *Chineſe*. No nation has boaſted more of its antiquity than the Chineſe: but though we allow them to trace their origin as far back as the deluge, they have few, if any, authentic records of their hiſtory for ſo long a period as five hundred years before the Chriſtian æra. This, however, may probably be owing to the general deſtruction of ancient remains by the tyrant Tſin-chi-hoang, in the year 213, or, as ſome ſay, 246, before the Chriſtian æra. We learn from a *chronological* table of the Chineſe hiſtory, for which we are obliged to an illuſtrious Tartar, who was viceroy of Canton in the year 1724, and a Latin tranſlation of which was publiſhed at Rome in 1730, that the moſt remote epocha of the Chineſe *chronology* does not ſurpaſs the firſt year of a prince called Guei-lie-wang, who began his reign four hundred and twenty-four years before the vulgar æra. This opinion is confirmed by the teſtimony of two of the moſt approved hiſtorians of China, who admit nothing into their hiſtories previous to this period. The Chineſe in their computation make uſe of a cycle of ſixty years, called *kiatſe*, from the denomination given to the firſt year of it, which ſerves as the baſis of their whole *chronology*. Every year of this cycle is marked with two letters, which diſtinguiſh it from the others; and all the years of the emperors, for above two thouſand years, have names in hiſtory common to them with the correſponding years of the cycle. Phil Tranſ. abr. vol. viii. part iv. p. 13, &c. According to M. Freret, in his Eſſays, the Chineſe date the epocha of Yao, one of their firſt emperors, about the year 2145, or as others ſtate it, 2057 years before Chriſt; and reckon their firſt aſtronomical obſervations, and the compoſition of their famous calendar, to have preceded Yao a hundred and fifty years: and thence it is inferred, that the aſtronomical obſervations of the Chineſe and Chaldæans coincide. Later authors date the riſe and progreſs of the ſciences in China from the grand dynaſty of Tcheou, about twelve hundred years before the Chriſtian æra, and ſhew; that all hiſtorical relations of events prior to the reign of Yao are fabulous. Mem. de l'Hiſtoire des Sciences, &c. Chinois; a work compiled by the miſſionaries of Pekin, vol. i. Paris, 1776. But it may be expected that ſome new light will be thrown on this obſcure and uncertain ſubject of inveſtigation by the General Hiſtory of China, in 12 vols. 4to. announced to the public by the abbé Groſſier.

Chronology, *Newtonian principles of*. Sir Iſaac Newton has ſhewn, that the *chronology* of ancient kingdoms is involved in the greateſt uncertainty; that the Europeans in particular had no *chronology* before the Perſian empire, which began five hundred and thirty-ſix years before Chriſt, when Cyrus conquered Darius the Mede; that the antiquities of the Greeks are full of fables, becauſe their writings were in verſe only, till the conqueſt of Aſia by Cyrus the Perſian, about which time Pherecydes

Syrius, and Cadmus Mileſius introduced proſe. After this time ſeveral of the Greek hiſtorians introduced the computation by generations. The *chronology* of the Latins was ſtill more uncertain: their old records were burnt by the Gauls a hundred and twenty years after the expulſion of their kings, ſixty-four years before the death of Alexander the Great, and before Chriſt 388. The *chronologers* of Gaul, Spain, Germany, Scythia, Sweden, Britain, and Ireland, are of a ſtill later date. For Scythia, beyond the Danube, had no letters, till Ulphilas, their biſhop, formed them, about ſix hundred years after the death of Alexander the Great, or about A. D. 276. Germany had none, till it received them from the weſtern empire of the Latins, about A. D. 400. The Huns had none in the days of Procopius, about A. D. 526. Sweden and Norway received them ſtill later.

After a general account of the defects and obſcurity of the ancient *chronology*, Sir Iſaac obſerves, that, though many of the ancients computed by generations and ſucceſſions, yet the Egyptians, Greeks, and Latins, reckoned the reigns of kings equal to generations of men, and three of them to a hundred, and ſometimes to a hundred and twenty years; and this was the foundation of their technical *chronology*. He then proceeds to evince, from the ordinary courſe of nature, and a detail of hiſtorical facts, the difference between *reigns* and *generations*; and that, though the latter from father to ſon may at an average be reckoned about thirty-three years, or three of them equal to a hundred years, yet when they are taken by the eldeſt ſons, three of them cannot be computed at more than about ſeventy-five or eighty years; and the *reigns* of kings are ſtill ſhorter, ſo that eighteen or twenty years may be allowed a juſt medium. He then fixes on four remarkable periods, viz. the return of the Heraclides into the Peloponneſus, the taking of Troy, the Argonautic expedition, and the return of Seſoſtris into Egypt, after his wars in Thrace; and ſettles the epocha of each by the true value of a generation. We ſhall confine ourſelves to his eſtimate of that of the Argonautic expedition. Having fixed the return of the Heraclides to about the hundred and fifty-ninth year after the death of Solomon, and the deſtruction of Troy to about the ſeventy-ſixth year after the ſame period, he obſerves, that Hercules the Argonaut was the father of Hyllus, the father of Cleodius, the father of Ariſtomachus, the father of Ariſtodemus, who conducted the Heraclides into Peloponneſus; ſo that their return was four generations, reckoning by the chief of the family, later than the Argonautic expedition, which therefore happened about forty-three years after the death of Solomon. This is farther confirmed by another argument. Æſculapius and Hercules were Argonauts. Hippocrates was the eighteenth incluſively from the former by the father's ſide, and the nineteenth from the latter by the mother's ſide; allowing twenty-eight or thirty years to each of them, the ſeventeen intervals by the father, and the eighteen intervals by the mother, will, at a medium, give five hundred and ſeven years; and theſe, reckoning back from the commencement of the Peloponneſian war, or four hundred and thirty-firſt year before Chriſt, when Hippocrates began to flouriſh, will place the Argonautic expedition in the forty-third year after Solomon's death, or nine hundred and thirty-ſeven years before Chriſt.

The other kind of reaſoning, by which Sir Iſaac endeavours to eſtabliſh this epocha, is purely aſtronomical. The ſphere was formed by Chiron and Muſæus at the time, and for the uſe of the Argonautic expedition, as ſeveral of the aſteriſms referring to this event plainly ſhew: and at this time the cardinal points of the equinoxes and ſolſtices were placed in the middle of the conſtellations Aries, Cancer, Chelæ, and Capricorn. Our author eſtabliſhes this point by a conſideration of the ancient Greek calendar, which conſiſted of twelve lunar months, and each month of thirty days, and which required an intercalary month. Of courſe this luniſolar year, with the intercalary month, began ſometimes a week or a fortnight before or after the equinox or ſolſtice; and hence the firſt aſtronomers were led to the above mentioned diſpoſition of the equinoxes and ſolſtices; and that this was really the caſe is confirmed by the teſtimonies of Eudoxus, Aratus, and Hipparchus. On theſe principles, Sir Iſaac proceeds to argue in this manner. The equinoctial colure in the end of the year 1689 cut the ecliptic in ♉ 6° 44′, and by this reckoning the equinox was then gone back 36° 44′ ſince the Argonautic expedition. But it recedes 50″ in a year, or 1° in ſeventy-two years, and conſequently 36° 44′ in 2645 years; which counted backward from the beginning of 1690, will place this expedition about twenty-five years after the death of Solomon. But, as there is no neceſſity for allowing that the *middle* of the conſtellations, according to the general account of the ancients, ſhould be preciſely the middle between the *prima Arietis*, and *ultima Caudæ*, this great author proceeds to examine what were thoſe ſtars, through which Eudoxus made the colures to paſs in the primitive ſphere, and in this way to fix the poſition of the cardinal points. From the mean of five places he finds, that the great circle, which in the primitive ſphere, deſcribed by Eudoxus, or at the time of the Argonautic expedition, was the equinoctial colure, did, in the end of 1689, cut the ecliptic in ♉ 6° 29′ 15″. He likewiſe, in the ſame manner, determines the mean place of the ſolſtitial colure to be ♋ 6° 28′ 46″, and as it is at right angles with the other, concludes that it is rightly drawn. Hence he infers, that the cardinal points, in the interval between that expedition, and the year 1689, have receded from thoſe colures 1 ſign 6° and 29′; which, allowing ſeventy-two years to a degree, amounts to 2627 years; and theſe counted backwards, as above, will place the Argonautic expedition forty-three years after the death of Solomon. Our author hath, by other methods of a ſimilar nature, eſtabliſhed this epocha, and reduced the age of the world about five hundred years. This elaborate ſyſtem hath not eſcaped cenſure. M. Freret and M. Souciet have attacked it on much the ſame ground: the former hath confounded *reigns* and *generations*, which are carefully diſtinguiſhed in this ſyſtem. The aſtronomical objections of both have been anſwered by Sir Iſaac Newton himſelf, and by Dr. Halley. Phil. Tranſ. abr. vol. viii. part iv, p. 4, &c. Newton's Chronology, ch. i.

M. Gibert, in a Letter publiſhed at Amſterdam in 1743, has attempted to reduce the Babylonian, Egyptian, and Chaldæan annals, to our *chronology*. He begins with ſhewing, by the authorities of Macrobius, Eudoxus, Varro, Diodorus Siculus, Pliny, Plutarch, St. Auguſtin, &c. that by a year, the ancients meant the revolution of any planet in the heavens; ſo that it conſiſted ſometimes only of one day. Thus, according to him, the ſolar day was the aſtronomical year of the Chaldæans; and the boaſted period of 473,000 years aſſigned to their obſervations is reduced to 1297 years, nine months; the number of years which elapſed, according to Euſebius, from the firſt diſcoveries of Atlas in aſtronomy, in the 384th year of Abraham, to the march of Alexander into Aſia in the year 1682 of the ſame æra; and the ſeventeen thouſand years added by Beroſus, to the obſervations of the Chaldæans, reduced in the ſame manner, will give forty-ſix years, and ſix or ſeven months, being the exact interval between Alexander's march, and the firſt year of the hundred and twenty-third Olympiad, or the time to which Beroſus carried his hiſtory. Epigenius attributes 720,000 years to the obſervations preſerved at Babylon; but theſe, according to M. Gibert's ſyſtem, amount only to 1971 years, three months, which differ from Calliſthenes's period of 1903 years, allotted to the ſame obſervations, only by ſixty-eight years, the period elapſed from the taking of Babylon by Alexander, which terminated the latter account, and to the time of Ptolemy Philadelphus, to which Epigenius extended his account.

Chronology, *ſacred*. The ſyſtems of ſacred *chronology* have been very various. Nor is this to be wondered at, ſince our three biblical copies of principal note give a very different account of the firſt ages of the world. The Hebrew text reckons about 4000 years from Adam to Chriſt, and to the flood 1656 years; the Samaritan makes this interval longer, and reckons from Adam to the flood only 1307 years; and the verſion of the Septuagint removes the creation of the world to 6000 years before Chriſt. The interval between the creation and flood, according to Euſebius and the Septuagint, is 2242 years; according to Joſephus and the Septuagint 2256 years; and according to Julius Africanus, Epiphanius, Petavius, and the Septuagint, it is reckoned at 2262 years. Many attempts have been made to reconcile theſe differences; but none are quite ſatisfactory. See Epocha, Samaritan, &c.

Sacred Chronology –

Walton, and I. Voſſius, give the preference to the account of the Septuagint. Walton's Prolegomena. Voſſii. Chronologia ſacra. Others have defended the Hebrew text. The reader may find an abſtract of the different opinions of learned men on this ſubject, in Strauchius's Brev. Chron. tranſlated by Sault, p. 166, &c. and p. 176.

The more eminent writers on *chronology*, among the ancients, are Julius Africanus in the third century; Dionyſius Exiguus, Euſebius, and Cyril.

Among the moderns, Bede, Funccius, Mercator, Lilius, Clavius, Scaliger, Vieta, Petavius, Caſſini, Munſter, Calviſius, Hardouin, Capellus, Uſher, Newton, Marſham, Helvicus, I. Voſſius, Pagi, &c. Strauchius, Perron, Freret, &c.

CHRONOMETER, or CHROMETER, as it is ſometimes written, a general name for any inſtrument uſed in the meaſuring of TIME.

The word is compoſed of *χρονος*, *time*, and *μετρον*, *meaſure*.

In this ſenſe, clocks, watches, dials, &c. are *chronometers*: though there are ſome other inſtruments peculiarly called by the name *chronometer*; particularly one deſcribed by M. Sauveur, in his Principles of Acouſtics: ſo contrived as to meaſure a ſmall part of time very exactly, even to the ſixteenth part of a ſecond.

We have a deſcription of one of theſe, made by the ingenious Mr. George Graham, in Deſaguliers's Experim. Philoſoph. vol. i. p. 373, 374.

A *chronometer* is of great uſe for meaſuring ſmall parts of time in aſtronomical obſervations, the time of the fall of bodies, the velocity of running waters, &c. But long ſpaces of time cannot be meaſured by it with ſufficient exactneſs, unleſs its pendulum be made to vibrate in a cycloid; becauſe, otherwiſe, it is liable to err conſiderably, as all clocks are which have ſhort pendulums that ſwing large arcs of a circle.

CHRONOSCOPE, a word ſometimes uſed for a PENDULUM, or machine, to meaſure time.

The word is formed of *χρονος*, *time*, and *σκεπτομαι*, *I conſider*.

CHROSTASIMA, in *Natural Hiſtory*, a name uſed by Dr. Hill for all pellucid gems, which have one ſimple and permanent appearance in all lights.

Of this kind are the DIAMOND, the CARBUNCLE, the AMETHYST, the SAPPHIRE, the BERYL, the EMERALD, and the TOPAZ.

CHRYSALIS, a term uſed by modern writers of natural hiſtory of inſects, in the ſame ſenſe with NYMPHA and AURELIA.

The word ſeems to imply a peculiar yellow, or golden colour, uſually in the *nymphæ* of ſome ſpecies of inſects: from *χρυσος*, *gold*: but this is purely accidental, and is not found in all *nymphæ*.

Some confine the word *chryſalis* to the *nymphæ* of butterflies and moths. See PUPPET.

CHRYSANTHEMUM, in *Botany*. See *Corn*-MARYGOLD.

CHRYSANTHEMUM, *Baſtard*, in *Botany*, *Silphium*, a genus of the *ſyngeneſia polygamia neceſſaria* claſs. Its characters are theſe: the common empalement of the flower is oval, imbricated, and permanent; the ſcales are oval, prominent, and reflexed in the middle; the diſk of the flower is compoſed of hermaphrodite florets, which are tubulous, indented in five parts at the top. Theſe have five ſhort hair-like ſtamina, terminated by cylindrical ſummits, and a ſlender taper germen, ſupporting a long hairy ſtyle, crowned by a ſingle ſtigma; theſe are barren. The rays of the flower are compoſed of a few female half florets, which are long, ſpear-ſhaped, and for the moſt part have three indentures at their points; theſe have a heart-ſhaped germen, with a ſhort ſingle ſtyle, having two briſtly ſtigmas of the ſame length, and are ſucceeded by ſingle heart-ſhaped ſeeds with a membranaceous border, indented at the top, each point ending with a horn or tooth, and are ſeparated by linear chaff, ripening in the empalement. There are four ſpecies, natives of America.

CHRYSANTHEMUM, *Hard-ſeeded*, *Chryſanthemoides*, or *Oſteoſpermum*, in *Botany*, a genus of the *ſyngeneſia polygamia neceſſaria* claſs. The characters are theſe: the flower hath an hemiſpherical empalement, which is ſingle, and cut into many ſegments. The flower is compoſed of ſeveral hermaphrodite flowers in the diſk, which are tubulous, and cut at the brim into five parts: theſe are ſurrounded by ſeveral female flowers, which are radiated, each having a narrow tongue, which is cut into three parts at the top. The hermaphrodite flowers have each five ſlender, ſhort ſtamina, terminated by cylindrical ſummits, with a ſmall germen ſupporting a ſlender ſtyle, crowned by an obſolete ſtigma; theſe are barren. The female flowers have each a globular germen ſupporting a ſlender ſtyle, crowned by an indented ſtigma; the germen afterwards becomes one ſingle hard ſeed. Miller enumerates five ſpecies, ſome of which are brought from America, and others from the Cape of Good Hope.

CHRYSANTHERINUS *lapis*, in *Natural Hiſtory*, a name given by old writers to a ſtone famous for its imaginary virtues of preventing children from ſickneſſes during the time of dentition, by being worn round the neck by way of necklace; we have no farther account given us of it by authors, than that it was a very brittle ſtone, and not eaſily worked into form.

CHRYSARGYRUM, a tribute formerly levied on courteſans, and perſons of ill fame. Hoffman ſays, it was paid in gold and ſilver; whence its name, *χρυσος*, *gold*, and *αργυρος*, *ſilver*.

Zoſimus ſays, that Conſtantine firſt ſet it on foot; though there appear ſome traces of it in the life of Caligula by Suetonius; and that of Alexander by Lampridius. Evagrius ſays, Conſtantine found it eſtabliſhed, and had ſome thoughts of aboliſhing it. It was paid every four years: ſome ſay, all petty traders were liable to it. It was aboliſhed by Anaſtaſius.

M. Godeau thinks the *chryſargyrum* was a general tribute, levied every four years, on perſons of all conditions, rich and poor, ſlaves and freemen; nay, even on all animals, as low as dogs; for each whereof they paid ſix oboli.

CHRYSITES, a name given by the ancients to *yellow* LITHARGE, ſuch as we call litharge of gold. We diſtinguiſh this only in regard to the colour, and ſo did the ancient Greeks; but Avicenna and the reſt of the Arabians have uſed this word only for the name of ſuch litharge as was made from gold, or whatever colour it happened to be; the reſt they called by the name of *argyrites*, as they tell us, whether it was made of ſilver, copper, or even of the marcaſite melted, and refined by lead. See KLIMIA.

CHRYSOBALANUS, in *Botany*. See *American*, or *Cocoa* PLUM.

CHRYSOBERYL, a precious ſtone; being a kind of pale beryl, with a tincture of yellow.

CHRYSOCERAUNUS *pulvis*, is ſometimes uſed for AURUM *fulminans*.

CHRYSOCERI, in *Antiquity*, a deſignation given to oxen deſigned for ſacrifices. They were ſo called from their horns being gilded.

CHRYSOCOLLA, in the *Materia Medica of the Ancients*, the name of a fine green arenaceous powder, properly one of the *ſaburræ*, and found on the ſhores of the Red Sea, on thoſe of ſome parts of America, and in Ruſſia; and that found at this time has all the properties of that mentioned by the ancients. It ſerves to the ſoldering of gold and other metals, and given internally is a violent and dangerous emetic.

It is of a very elegant colour, ferments violently with aqua fortis, and is wholly diſſolved by it, and tinges it with a blueiſh green; and being calcined it loſes all its green colour.

Chryſocolla is repreſented by Pliny as found in mines of gold, ſilver, copper, and lead: its colour, he ſays, was various, according to that of the matter in which it is found; yellow, if among gold, white in ſilver, green in copper, and black in lead. The Arabs, and inhabitants of Guzuratte, call the modern *chryſocolla*, which is *borax*, *tincar*, or *tincal*. The beſt is that found in copper-mines; and the worſt, in thoſe of lead.

CHRYSOCOLLA is alſo the name of a ſort of precious ſtones, mentioned by Pliny, lib. xxxvii. cap. 10. who calls it alſo *amphitane*. He deſcribes it as of a gold colour, and of a ſquare figure; adding, that it has the virtue of attracting iron, and even gold. But this, in all probability, is fabulous; and the ſtone he ſpeaks of is apparently no other than the cubic pyrites.

CHRYSOCOME, in *Botany*, a name by which ſome authors call the *ſtæchas citrina*, or GOLDYLOCKS.

CHRYSOGONON, or CHRYSOGONUM, in *Botany*, a name by which ſome authors have expreſſed the moth MULLEIN, or *blattaria*. In the Linnæan ſyſtem, it is a diſtinct genus of the *ſyngeneſia polygamia neceſſaria* claſs.

CHRYSOGONUM, in the *Materia Medica*, is alſo the name of a Syrian plant, called the red turnep, the LEONTOPETALON *coſta ſimplici* of Tournefort.

CHRYSOLACHANON, in *Botany*, a name by which Pliny, and ſome other authors, have expreſſed the white garden beet.

CHRYSOLITE, with us, a precious ſtone of a duſky green colour, with a caſt of yellow.

The *chryſolite* of the ancients was no other than the topaz of the moderns; even in its moſt pure and perfect ſtate is a gem of but ſmall beauty, and of no great value. It is found of various ſizes, and ſome of the coarſer pieces of it are vaſtly larger than any of the other gems are ever found to be; its moſt frequent ſize, however, when perfect, is about the bigneſs of a nutmeg. It is found of very various figures, but never columnar, or in the form of cryſtal; it is in ſome places found ſmall, and in roundiſh, or irregular, pebble-like maſſes, and in others generally oblong and flatted, and is always of a rude ſurface, and leſs bright than any other of the native gems. It is caniculated, or ſtriated, lengthwiſe. Its colour is a dead green, with a faint admixture of a pale yellow; it has theſe different tinges in the ſeveral ſpecimens in different degrees of mixture, but its moſt uſual colour is that of an unripe olive, with ſomewhat of a braſſy colour mixt with it, and ſometimes a pale and duſky green obſcured by a mixture of brown, and with a ſlight caſt of the ſame braſſy yellow. It is much ſofter than any of the pellucid gems; its fineſt pieces do not excel cryſtal in hardneſs, and its coarſer are much ſofter; it takes a good poliſh, however, and in ſome of its finer ſpecimens makes a tolerable figure, though greatly inferior to the other gems.

Our jewellers take very little notice of it; and, inſtead of having two or three names for it, as they have for moſt other of the gems, they call it very often a praſius, and the leſs accurate among them often call the chryſopraſius a *chryſolite*.

The *chryſolite* is found in New Spain, and in ſeveral parts of Europe, as Sileſia, Bohemia, &c. The American, however, are greatly ſuperior to the European, but are uſually ſmall; the Bohemian are large, but very few of them are of a good colour, or free from flaws.

The *chryſolite* has been found to exhibit electrical appearances ſimilar to thoſe of the TOURMALIN. The fluid moves always along the ſlender threads or columns, which form the grain of it, without ſuffering any change from their direction; one end being electrified *plus*, and the other *minus*. Phil. Tranſ. vol. lii. p. 445.

CHRYSOLITE is alſo a general name, which the ancients gave to all precious ſtones, wherein the yellow, or golden, was the prevailing colour.

When the ſtone was green, they called it *chryſopraſus*: the red and blue too had their particular denominations, which expreſſed their colour: the gold being ſignified by *chryſo*; which ſtill began the name.

We know but few of theſe *chryſolites* now; or rather, they are referred to the ſpecies of ſtones which they approach the neareſt to: the green to the emerald, the red to the ruby; and ſo of the reſt.

CHRYSOLITE-*paſte*. The way of making an artificial *chryſolite* paſte is this: take of prepared *cryſtal* two ounces, ordinary red lead eight ounces; mix theſe well together, and add *crocus martis* made with vinegar, twelve grains: mix all together; put them into a crucible, lute it over, and bake the whole for twenty-four hours, or longer, in a potter's kiln, and it will produce a very elegant reſemblance of the true *chryſolite*.

CHRYSOMELA, in *Zoology*, a genus of inſects frequently confounded with the beetles, the *antennæ* of which are made in form of bracelets, or necklaces of beads, and are thickeſt toward their extremity: the body, in figure, approaches to oval, and the *thorax* is oblong and rounded. Of this genus Dr. Hill enumerates a great many ſpecies. See SCARABÆUS.

CHRYSOMITHRES, in *Ornithology*, the name by which ſome call the GOLD-FINCH. See CARDUELIS.

CHRYSOPAGION, in *Natural Hiſtory*, a name by which ſome of the middle age writers have called the gem deſcribed by Pliny, under the name of the *chryſolampis*. Salmaſius is of opinion that it was only a foul kind of the *chryſopraſius*, of which Pliny ſays, that ſome of them were full of ſpecks, and of a variable colour.

CHRYSOPETRON, in *Natural Hiſtory*, a name given by Pliny and others, to the yellower kind of the ancient topaz, that is, our chryſolite.

CHRYSOPHYLLUM, in *Botany*. See *Star*-APPLE.

CHRYSOPHRYS, in *Ichthyology*, a name given by the ancient Greek and Latin authors to a fiſh called at this time the AURATA: it is a ſpecies of SPARUS. See GILT-*head*.

CHRYSOPILON, in *Natural Hiſtory*, a name given by ſome ancients to a ſpecies of the beryl, which had a yellowiſh tinge.

CHRYSOPIS, *the golden-eye*, in *Natural Hiſtory*, the name of a ſpecies of fly, ſo called from the beautiful gold colour of its eyes. It is a long-bodied fly, with extremely thin and tranſparent wings of a ſilvery colour, with green ribs or nerves; the body is green, and the *antennæ* very ſlender and blackiſh. This is a very ſlow flyer, and is common in gardens; it is frequently found on the common elder; it is of a very ſtrong ſmell.

CHRYSOPRASUS, in *Chriſtian Antiquity*, the tenth of thoſe precious ſtones which adorned the foundation of the heavenly Jeruſalem; the colour of it was green, much like that of a leek, but ſomething inclining to that of gold, as its name imports.

CHRYSOSPLENIUM. See *Golden* SAXIFRAGE.

CHRYSOXYLON, in *Botany*, a name given by ſome to the Scytharian, or Scythicum lignum, a wood famous for its beautiful yellow colour, and for tinging the hair yellow. This was one of the many ſubſtances called by the name of THAPSUM by the ancient Greeks, from its colour, the word *thapſus* ſignifying a pale yellow, and being applied by theſe authors to every thing that had that colour in itſelf, or could give it to other things.

CHRYSTAL. See CRYSTAL.

CHRYSTAL *mineral*, the ſame as *ſal prunella*.

CHRYSTALLINE. See CRYSTALLINE.

CHRYSTALLIZATION. See CRYSTALLIZATION.

CHTHONIA, in *Antiquity*, a feſtival kept in honour of Ceres, called *Chthonia*. For the ceremonies obſerved in it, ſee Pott. Archæol. lib. ii. cap. 20.

CHUB, the Engliſh name for the fiſh called the CAPITO and CEPHALUS by authors, and by ſome of the ancient Romans *ſqualus*. It is, according to the Artedian and Linnæan ſyſtem, a ſpecies of the CYPRINUS, and the fiſh called by the French the vilain and teſtard.

The reſorts of this fiſh are eaſily found; for they are generally holes overſhaded by trees, and this fiſh will be ſeen floating in ſuch almoſt on the ſurface of the water in a hot day in great numbers. They are but a poor fiſh for the table, and are very full of bones; but they entertain the angler very much, and are of the number of thoſe that are eaſily taken. The beſt manner of fiſhing for him is thus: prepare a very ſtrong rod of a ſufficient length; fix to the hook a graſshopper; place yourſelf ſo as to be perfectly out of ſight of the fiſh, and drop in the bait about two feet from the place where a large *chub* lies; if he does not ſee the angler he very ſeldom fails biting, and is immediately taken; but he is ſo ſtrong a fiſh that he ſhould be taken out carefully, after a great deal of playing, otherwiſe the tackle will be in danger; a beetle, or any large fly, will anſwer the purpoſe in the place of a graſshopper; and if none of them are to be had, the method of fiſhing muſt be altered, and the line be long enough for fiſhing at the bottom. In March and April this fiſh is to be caught with large red worms; in June and July with flies, ſnails, and cherries; but in Auguſt and September the proper bait is good cheeſe pounded in a mortar, with ſome ſaffron, and a little butter; ſome make a paſte of cheeſe and Venice turpentine for the *chub* in winter, at which ſeaſon this fiſh is better than at any other; the bones are leſs troubleſome in this ſeaſon, and the fleſh is more firm and better taſted; the row is alſo well flavoured in general. The angler muſt keep his bait for this fiſh at the bottom in cold weather, and near the top in hot, and the fiſh will bite eagerly.

CHUCHIA, in *Zoology*, a name given by Cardan, Oviedo, and ſome others, to the OPOSSUM.

CHUNNA, in the *Salic Law*, is uſed for an hundred; or rather an hundred pence or *denarii*: the pecuniary penalties of that law are eſtimated by *chunnæ*, and reduced to *ſolidi*, by reckoning forty *denarii* to the *ſolidum*.

CHUPMESSAHITES, a ſect among the Mahometans, who believe that Jeſus Chriſt is God, and the true Meſſiah, the redeemer of the world; but without rendering him any public, or declared worſhip.

The word, in the Turkiſh language, ſignifies *protector of the Chriſtians*.

Ricaut ſays, there are abundance of theſe *Chupmeſſahites* among the people of faſhion in Turky, and ſome even in the ſeraglio.

CHURCH, an aſſembly of perſons united by the profeſſion of the ſame Chriſtian faith, and the participation of the ſame ſacraments.

Bellarmin, and the Romiſh divines, to this definition add, *Under the ſame pope, ſovereign pontiff, and vicar of Jeſus Chriſt on earth*: in which circumſtance it is that the Romiſh and reformed notion of *church* differ.

Amelotte, and others, make a viſible head, or chief, eſſential to a *church*: accordingly, among the Catholics, the pope; in England, the king; are reſpectively allowed heads of the *church*. Biſhop Hoadley ſets aſide the notion of a viſible head: Chriſt alone, according to him, is head of the *church*; which poſition he has maintained with great addreſs, in a celebrated ſermon before king George I. on theſe words, *My kingdom is not of this world*; and in the ſeveral vindications thereof.

Sometimes, we conſider *church* in a more extenſive ſenſe, and divide it into ſeveral branches. The *church militant*, is the aſſembly of the faithful on earth. *Church triumphant*, that of the faithful already in glory. To which the Catholics add the *church patient*, which, according to their doctrines, is that of the faithful in purgatory.

The term *eccleſia*, εκκλησια, ſynonymous with our *church*, is uſed in the Greek and Latin profane authors for any kind of public aſſembly; and even for the place where the aſſembly is held. The ſacred and eccleſiaſtical writers ſometimes alſo uſe it in the ſame ſenſe; but ordinarily they reſtrain the term to the Chriſtians; as the term *ſynagogue*, which originally ſignifies near the ſame thing, is in like manner reſtrained to the Jews.

Thus, in the New Teſtament, the Greek εκκλησια, ſignifies almoſt always, either the place deſtined for prayer, as 1 Cor. xiv. 34. or the aſſembly of the faithful diffuſed over the whole earth, as Epheſ. v. 24. or the faithful of a particular city, or province, as 2 Cor. viii. 1. or even of a ſingle family, as Rom. xvi. 5. or the paſtors or miniſters of a *church*, as Matt. xviii. 17.

The Chriſtian *church* is frequently divided into Greek and Latin.

CHURCH, *Greek*, or *Eaſtern*, comprehends the *churches* of all the countries anciently ſubject to the Greek, or Eaſtern empire; and through which their language was carried; i. e. all the ſpace extended from Greece to Meſopotamia and Perſia, and thence into Egypt; which has been divided ever ſince the emperor Phocas, from the Roman *church*.

The Greek *church*, properly ſpeaking, is that ſociety of Chriſtians, who live in religious communion with the patriarch of Conſtantinople: and it is divided into two parties; one of which acknowleges his ſupreme authority and juriſdiction; whilſt the other, though joined with him in communion of doctrine and worſhip, is governed by its own laws, under the juriſdiction of ſpiritual rulers, independent of all foreign authority. The former branch of the Greek *church* is divided into four provinces; Conſtantinople, Alexandria, Antioch, and Jeruſalem; over each of which a biſhop preſides, under the title of patriarch, the chief of whom is the patriarch of Conſtantinople. The power of electing this patriarch is veſted in the twelve biſhops who reſide neareſt this capital; but the right of confirming his election, and of empowering him to exerciſe his ſpiritual functions, belongs to the Turkiſh emperor. The Greeks receive the Holy Scriptures, and the decrees of the ſeven general councils, as the rule of their faith: but no private perſon has a right to explain, for himſelf or others, the declarations of Scripture, or the deciſions of theſe councils; the patriarch and his brethren being the only perſons authoriſed to conſult theſe oracles, and declare their meaning. Many attempts have been made to unite them to the reformed *church*, but they have hitherto been unſucceſsful.

CHURCH, *Latin*, or *Weſtern*, comprehends all the *churches* of Italy, France, Spain, Africa, the North, and all other countries whither the Romans carried their language.

Great Britain, part of the Netherlands, of Germany, and of the North, have been ſeparated hence ever ſince the time of Henry VIII. and conſtitute what we call the *reformed church*, and what the Romaniſts call the *weſtern ſchiſm*; as the Greek *church* does the eaſtern one.

The *Reformed* CHURCH is again divided into the Lutheran *church*, the Calviniſt *church*, the *church* of England, &c.

CHURCH, *Gallican*, denotes the *church* of France, under the direction and government of its biſhops and paſtors. This *church* has always enjoyed certain immunities and franchiſes, not as grants from the popes, but derived to her from her firſt original, which ſhe has carefully maintained. Theſe privileges depend on two maxims; viz. 1. That the pope has no authority or right to command or order any thing, general or particular, in which the temporalities and civil rights of this kingdom are concerned. 2. That notwithſtanding the pope's ſupremacy is owned in caſes purely ſpiritual, yet in France, his power is limited and regulated by the decrees and canons of ancient councils received in that realm.

CHURCH, *High*, was a denomination originally given to thoſe, otherwiſe called NONJURORS, who refuſed to acknowledge the title of William III. to the crown of Great Britain, under a notion that James II. though excluded, was ſtill their rightful ſovereign. This appellation was given them, becauſe they entertained high notions of the dignity and power of the *church*, and the extent of its prerogatives and juriſdiction. And thoſe, on the contrary, were called *low-church* men, who diſapproved of the ſeceſſion and obſtinacy of the nonjurors, diſtinguiſhed themſelves by their moderation toward diſſenters, and were leſs ardent in extending the limits of *church* authority. The denomination of *high-church* men is now more generally applied to all who form pompous and ambitious conceptions of the authority and juriſdiction of the *church*, and who would raiſe it to an abſolute independence on all human power.

CHURCH is alſo uſed for a Chriſtian temple, built and conſecrated to the honour of God; and, anciently, under the invocation of ſome particular ſaint, whoſe name it aſſumed.

In this ſenſe, *churches* are variouſly denominated, according to the rank, degree, diſcipline, &c. as metropolitan *church*, patriarchal *church*, cathedral *church*, parochial *church*, cardinal *church*, &c. See each under its proper article, METROPOLIS, PATRIARCH, CATHEDRAL, PAROCHIAL, CARDINAL, &c. In eccleſiaſtical writers, we meet with grand *church*, for the chief *church* of a place, particularly in the Greek liturgy, for the *church* of St. Sophia at Conſtantinople, the ſee of the patriarch, founded by Conſtantine, and conſecrated under Juſtinian. It was at that time ſo magnificent, that Juſtinian is ſaid to have cried out in the conſecration thereof, Ενικησα σε, Σολομων; *I have out-done thee, Solomon*. The dome, which is ſaid to have been the firſt that was built, is 330 feet diameter.

The firſt *church* publicly built by the Chriſtians, ſome authors maintain to be that of St. Saviour at Rome, founded by Conſtantine: others contend, that ſeveral *churches* abroad, called by the name of St. *Peter Vivus*, were built in honour of that apoſtle during his life-time.

CHURCH, *Mother*, *Matrix eccleſia*.

CHURCH, with regard to architecture, Daviler defines a large oblong edifice, in form of a ſhip, with nave, choir, iſles, chapel, belfry, &c. See each part under its proper head.

CHURCH, *ſimple*, is that which has only a nave and a choir.

CHURCH *with iſles*, that which has a row of porticos, in form of vaulted galleries, with chapels in its circumference.

CHURCH *in a Greek croſs*, that where the length of the traverſe part is equal to that of the nave; ſo called, becauſe moſt of the Greek *churches* are built in this form.

CHURCH *in a Latin croſs*, that whoſe nave is longer than the croſs part, as in moſt of the Gothic *churches*.

CHURCH *in rotundo*, that whoſe plan is a perfect circle, in imitation of the Pantheon.

For the form of the ancient Greek *churches*, when they had all their parts, it was as follows: firſt was a porch, or portico, called the *vaunt-nave*, προναος this was adorned with columns on the outſide, and on the inſide ſurrounded with a wall; in the middle whereof was a door, through which they paſſed into a ſecond portico. The firſt of theſe porticos was deſtined for the *energumeni*, and penitents in the firſt ſtage of their repentance; the ſecond was much longer, deſtined for penitents of the ſecond claſs, and the catechumens, and hence called ναρθης, *ferula*, becauſe thoſe placed in it began to be ſubject to the diſcipline of the *church*. Theſe two porticos took up about one third of the ſpace of the *church*. From the ſecond portico, they paſſed into the nave, ναος, which took up near another third of the *church*. In the middle, or at one ſide of the nave, was the ambo, where the deacons and prieſts read the goſpel, and preached. The nave was deſtined for the reception of the people, who here aſſiſted at prayers.

Near the entrance of this was the BAPTISTERY, or FONT. Beyond the nave was the choir, χορος, ſet with ſeats, and round: the firſt ſeat on the right, next the ſanctuary, being for the chantor, or *choragus*.

From the choir, they aſcended by ſteps to the ſanctuary, which was entered at three doors. The SANCTUARY had three apſides in its length; a great one in the middle; under which was the altar, crowned with a BALDACHIN, ſupported by four columns. Under each of the ſmall apſides, was a kind of table, or cupboard, in manner of a beaufet.

Though, of the Greek *churches* now remaining, few have all the parts above deſcribed; moſt of them having been reduced to ruins, or converted into moſques.

M. Frezier, engineer to the French king, and F. Cordemoy, a regular canon, have diſputed the form of the ancient and modern *churches*, and the beſt manner of building them, with a good deal of learning, in the Journals de Trevoux.

For the form of the Latin *churches*, though it be various, yet may all the variety be reduced to two heads; viz. thoſe in form of a ſhip, and thoſe of a croſs.

CHURCH-*yard*, a place adjoining to a *church*, employed commonly for the interment of the deceaſed. See COEMETERIUM.

CHURCH-*government*, *diſcipline*, &c. See ECCLESIASTICAL GOVERNMENT, DISCIPLINE, POLICY, &c.

CHURCH-*reves*. See CHURCH-*wardens*.

CHURCH-*ſcot*, or CHURCH-*eſſet*, a payment, or contribution, by the Latin writers frequently called *primitiæ ſeminum*; being, at firſt, a certain meaſure of wheat, paid to the prieſt on St. Martin's day, as the firſt fruits of harveſt.

This was enjoined by the laws of king Malcolm IV. and Canut. c. 10. But after this, *church-ſcot* came to ſignify a reſerve of corn-rent paid to the ſecular prieſts, or to the religious; and ſometimes it was taken in ſo general a ſenſe as to include poultry, or any other proviſion that was paid in kind to the religious.

CHURCH-*wardens*, anciently called CHURCH-*reves*, are officers choſen yearly in Eaſter week, by the parſon, and his pariſhioners, according to the cuſtom of the place; to look to the church, church-yard, church-revenues, &c. obſerve the behaviour of the pariſhioners with regard to faults that come under the juriſdiction of the eccleſiaſtical court; preſent ſcandalous livers to the biſhop; take care none preach without licence, &c.

Counſellors and attornies, ſurgeons and apothecaries, and diſſenting miniſters, are exempt from this office; and perſons who have ſued a felon to conviction, and the firſt aſſignee of the certificate thereof, are exempted from the office of *church-warden*, in the pariſh where the offence was committed. The ſame exemption extends to perſons ſerving in the militia, during ſuch ſervice. Diſſenters are allowed to execute the office by a ſufficient deputy. A perſon, refuſing the office, is liable to excommunication. They are ſworn into their office by the archdeacon, who is compellable by a mandamus to admit thoſe whom the pariſh appoint.

The *church-wardens* are a kind of corporation; and are enabled by law to ſue, and be ſued, for any thing belonging to the church, or the poor of the pariſh.

CHURCHING *of women after child-birth*, took its riſe from the Jewiſh rite of purification. In the Greek church it was limited to the fortieth day after delivery; but in the weſtern parts of Europe no certain time is obſerved. There is an office in the liturgy for this purpoſe.

CHURLE, CEORLE, or CARL, in *Saxon Times*, ſignified a tenant at will, who held of the thanes on condition of rent and ſervice. They were of two ſorts: one rented the eſtate like our farmers; the other tilled and manured the demeſnes, and were called ploughmen.

CHURN-*Owl*. See OWL.

CHURR-*Worm*, a name given by ſome to the GRYLLOTALPA.

CHYLE, in the *Animal Oeconomy*, a whitiſh juice, into which the food is immediately converted by digeſtion, or more properly, by that firſt branch thereof called CHYLIFICATION.

The word comes from χυλος, *juice*.

Some think that all the groſs ſecretions are from the *chyle*; and particularly that *pus* is the product of the *chyle*, and not of the blood or ſerum. Phil. Tranſ. N° 427. § 2.

CHYLIFICATION, the formation of the *chyle*; or the act whereby the FOOD is changed into CHYLE.

Chylification is begun by comminuting, or breaking the aliment in the mouth, mixing it with ſaliva, and chewing it with the teeth.

By ſuch means, the food is reduced into a kind of pulp, which falling through the *œſophagus* into the warm ſtomach, there mixes with the juices thereof; and being thus diluted, begins to ferment, or putrefy, and aſſumes a very different form from what it had before; growing either acid or rancid.

Here it mixes with a juice ſeparated from the blood by the glands of that part, whoſe excretory ducts open into the ſtomach; as alſo with the remains of the former aliment: and thus it becomes better macerated, diluted, diſſolved, and acquires ſtill a greater likeneſs to the animal fluids, and is called *chyme*.

Add to this, that the fleſhy membrane of the ſtomach continually contracting and preſſing its contents by its periſtaltic motion, occaſions a more intimate mixture, and by degrees works the more fluid parts through the *pylorus* into the *duodenum*; along the ſides whereof, and the reſt of the *inteſtina tenuia*, the lacteals are planted; into the minute orifices whereof, the finer part of the maſs is received.

The fabric of the ſtomach being conſidered, the heat of the circumambient parts, the pulſations of innumerable arteries, the great ſtrokes of the *aorta* underneath, the conſtant compreſſion of the *diaphragma*, and abdominal muſcles; it muſt neceſſarily follow, that the finer part of the aliment will be firſt expelled the ſtomach; and that the groſſer will remain; till, by the repeated action of the fluids, and the contraction and pulſation of the ſolids, they alſo become fine enough to go off: thus is the ſtomach left empty; and by means of its muſcular coat, reduced to a ſtate of contraction, and appetite is renewed.

Thus will even the fleſhy membranes, cartilages, &c. of animals fed on, be ſqueezed, and be obliged to give out their juices; and thus is a fluid obtained, that ſhall have in ſome meaſure the ſame properties with thoſe of our bodies.

This juice being got through the *pylorus* into the *duodenum* and ſmaller inteſtines, its liquefaction is ſtill promoted by its mixture with two other diſſolvents, the pancreatic juice, and the bile; and by continued fermentation; which divide and ſubtilize thoſe parts that were left too groſs: and by the periſtaltic motion of the guts it is protruded forwards. In the paſſage through the ſmall inteſtines, the finer part of the maſs, which we call the *chyle*, enters the orifices of the lacteal veins of the firſt kind, wherewith the whole meſentery is intermixed; which either alone, or together with the meſeraic veins, diſcharge themſelves into the glands at the baſis of the meſentery.

Then the *chyle* is taken up by the lacteals of the ſecond kind, and is conveyed into glands between the two tendons of the *diaphragma*, known heretofore under the name of the *lumbary* glands, now called Pecquet's reſervatory, and *receptaculum chyli*; whence, being mixed with great quantities of lymph, it is carried to the heart, by the thoracic duct, and the ſubclavian vein: wherein it begins to be mixed with the blood, and to circulate, and in time becomes aſſimilated thereto. A ſpirit or vapour, which is nothing elſe than the *fixed* AIR of the alimentary ſubſtances, is ſet free from the various mixtures during their fermentation in the firſt paſſages, enters the compoſition of the *chyle*, and is tranſmitted with it to the blood, communicating to it its inteſtine motion, and thus preventing the natural tendency of the fluids to putrefaction. See DIGESTION.

CHYLOSIS, in *Medicine*, the action whereby the aliment is converted into *chyle*, or *chyme*, in the ſtomach, &c. whether it be by a ferment in the ſtomach, or the contractile force of the ſtomach, or both.

CHYME, an animal juice, which is, according to ſome, the ſame with that commonly called CHYLE.

Some, however, diſtinguiſh between *chyme* and *chyle*; reſtraining the word *chyme* to the maſs of food, &c. while in the ſtomach, before it be ſufficiently comminuted and liquefied to paſs the *pylorus* into the *duodenum*, and thence into the lacteals, to be further diluted and impregnated with the pancreatic juice; where it commences *chyle*. And others diſtinguiſh and denominate them the contrary way.

In the common ſignification of the word, it denotes every kind of humour which is incraſſated by concoction. Galen uſes it to ſignify the guſtatory faculty or quality in animals and plants.

CHYMICAL *oils*. See *Chemical* OIL.

CHYMISTRY, or CHEMISTRY, is a ſcience, the object of which is to diſcover the properties of bodies by analyſis and by combination.

Critics are divided as to the etymology of the name *chymiſtry*: it is uſually derived from χυμος, *juice*; or from χεειν, *to melt*. Boerhaave, and others, more juſtly derive it from the Egyptian *chema*, or *kema*, *black*; and write it *chemia*, not *chymia*. Others, making Cham the inventor of *chymiſtry*, derive the term from his name; ſupporting their etymology on the ſignification of the word חם, *cham*, which in the Hebrew ſignifies *heat*, *hot*, *black*; all of them bearing ſome relation to the operations of *chymiſtry*.

Chymiſtry is alſo known under various other names: it is ſometimes called the *Hermetical art*, from a ſuppoſition of its being invented by Hermes Triſmegiſtus. Others call it the *Egyptian art*, from the people among whom it was firſt practiſed: others, the *ſacred*, or *divine art*; and *poieſis*, or the art of *making gold*, &c. Others call it the *ſpagiric art*; Paracelſus, the *hyſſopic art*: and others, *pyrotechnia*.

The chief object of *chymiſtry* is, to analyſe, or decompound, natural bodies; reduce them to their firſt principles; diſcover their hidden virtues; and demonſtrate their inner contexture, or the center, as they call it, wherein natural ſubſtances concur. In a word, *chymiſtry* is the anatomy of natural bodies, by means of fire; which is the definition Hanneman gives us of the art.

Boerhaave defines *chymiſtry* more ſcientifically: "An "art whereby ſenſible bodies contained in veſſels, or "capable of being contained therein, are ſo changed, "by means of certain inſtruments, and principally of "fire, that their ſeveral powers and virtues are thereby "diſcovered, with a view to philoſophy, medicine, &c."

This definition appears very prolix and circumſtantial, and more like a deſcription than a definition; but with all his endeavours, that author aſſures us, he could not frame a ſhorter, that would expreſs the full ſcope, object, and inſtruments of *chymiſtry*, ſo as to diſtinguiſh it from every other art: which is a point all the writers of *chymiſtry* have ſtumbled at.

For *chymiſtry* cannot juſtly be called the art of *reſolving bodies*, as Regius, Paracelſus, &c. define it; ſince mechanics will alſo do that: nor is the matter mended, by ſaying, it is the art of *analyſing bodies by fire*; as Helmont has done: nor by *ſalt*, as others would have it. Theſe definitions include only a part, inſtead of the whole. And with as little propriety is it termed, the art of *ſeparating the pure from the impure*; inaſmuch as it compounds as well as ſeparates, and frequently mixes the pure with the impure. *Chymiſtry*, on this footing, appears a very extenſive art: its object, or the *materia chymica*, is all ſenſible bodies, capable of being contained in veſſels; and is accordingly divided into three kingdoms, *foſſil*, *vegetable*, and *animal*. The operations of *chymiſtry* include all the changes produced in bodies by natural agents or inſtruments; viz. *decoction*, *infuſion*, *exhalation*, *calcination*, *extraction*, *diſtillation*, *cryſtallization*, &c.

The effects, or productions of *chymiſtry*, may be reduced to *magiſteries*, *extracts*, *tinctures*, *elixirs*, and *clyſſuſes*.

The *inſtruments*, or *agents of chymiſtry*, whereby its operations are performed, are *fire*, *water*, *air*, *earth*, *menſtruums*; and *inſtruments* properly ſo called, as *alembics*, *cucurbits*, *retorts*, *pelicans*, *furnaces*, and *lutes*. See *Table of Chemical Veſſels*.

Chymiſtry, as now conceived, is an aſſemblage of very different parts, which anciently ſubſiſted ſeparate, or at leaſt had a ſubſiſtence prior to each other; as the preparing of metals for human uſes, the attempts of tranſmuting the baſer metals into gold, the preparing of medicines, &c. If we are to trace the antiquity of *chymiſtry*, as an art that teaches to convert other metals into gold, or to procure an univerſal remedy for all diſeaſes, the reſearch will not carry us far back; but as it relates to the diſcovery of metals in the mine, and the digging, ſeparating, and purifying them, it challenges even the higheſt antiquity; and is held by ſome very learned perſons to have been practiſed in the antediluvian world.

Be this as it will, *chymiſtry*, no doubt, was firſt practiſed in Egypt. According to Moſes, Tubal Cain ſhould be the firſt inventor. Profane authors refer it to Vulcan; and ſome of the lateſt and beſt critics endeavour to ſhew, that Tubal Cain and Vulcan were the ſame; as indeed there is a great reſemblance between their names.

After Tubal Cain, the firſt *chymiſt* we read of is Moſes; whoſe ſkill in *chymiſtry* is inconteſtable, from his burning and pulverizing the golden calf the Iſraelites had ſet up, and giving it the people to drink; there being ſcarce a more difficult operation in all *chymiſtry*, than to make gold potable.

Democritus likewiſe is ſaid to have been inſtructed by the Egyptian prieſts in many *chymical* operations; e. g. in the arts of ſoftening ivory, vitrifying flints, and imitating precious ſtones. In this abſtract of the hiſtory of *chymiſtry*, it is needleſs to mention the claims of Hermes Triſmegiſtus, or to give any account of books on this ſubject, under his name, as they are generally reckoned to be ſpurious. Some authors obſerve, that Diocleſian, after the taking of Alexandria, ordered all the books of *chymiſtry*, anciently written by the Egyptians, for making gold and ſilver, to be ſought out and burnt; that they might not have the power of enriching themſelves by this art, or of putting themſelves, by this means, into a condition of revolting again.

Chymiſtry had the common fate of the other arts, at the declenſion of the Eaſtern empire; and lay buried and forgot till the time of Roger Bacon, who retrieved it. He was followed by Lully, Ripley, Baſil Valentine, Paracelſus, Agricola, Van Helmont, Glauber, Boyle, Lemery, Homberg, &c. by whom the art has been carried to its preſent degree of perfection.

The firſt *chymiſts* confined themſelves to metals: and they made many abſurd and unſucceſsful attempts for tranſmuting metals into gold; whilſt ſome of them, as Raymond Lully and Paracelſus in particular, were poſſeſſed with the no leſs extravagant notion of an univerſal medicine, to which, however, we may attribute the eſtabliſhment of rational *chymiſtry* on the ruins of alchemy. In theſe latter ages, the bounds of *chymiſtry* have been greatly enlarged; and plants, animals, minerals, &c. have been taken into it.

It is but of late that *chymiſtry* has been applied to the preparation of medicines: Baſil Valentine, and Arnoldus de Villa Nova, ſeem to have been the firſt that attempted it. Paracelſus and Van Helmont carried it to ſuch a length, as to render medicine almoſt wholly *chymical*.

Authors on the ſubject of *chymiſtry* are very numerous: Borel has publiſhed a catalogue of moſt of them, under the title of Bibliotheca Chymica; containing the names of above four thouſand. Barner, phyſician to the king of Poland, was one of the firſt who arranged the principal *chymical* experiments, and added rational explications, in a work entitled Chymia philoſophica perfecte delineata, &c. Norimb. 1689. Becher, Stahl, and Boerhaave deſerve to be particularly recorded: the former have eſtabliſhed an admirable theory, which is the ſureſt guide in *chymical* reſearches, and the conformity of which with the phænomena of *chymiſtry* ſucceſſive experiments have evinced; and the latter has given both the hiſtory, theory, and practice, in an orderly and ſcientifical method. Dr. Freind has attempted to reduce *chymiſtry* to Newtonianiſm, and to account for the reaſons of the operations on *chymical* principles. There are many later writers, who have either directly or indirectly, in various ways, contributed to the extenſion of this ſcience. See Dr. Lewis's valuable edition of Neumann's Works; and the Engliſh tranſlation of Macquer's Chemical Dictionary, with many additions and improvements annexed to it by the tranſlator.

Chymiſtry is divided into *metallurgia*, *alchymia*, *chymical pharmacy*, and *chymical philoſophy*. See METALLURGIA, ALCHYMY, &c.

Chymiſtry again is divided into,

CHYMISTRY, *commercial*, uſed to denote the application both of technical and philoſophical *chymiſtry*, to the eſtabliſhing, ſupporting, or improving any branch of trade or commerce.

CHYMISTRY, *œconomical*, the application of philoſophical, technical, or commercial *chymiſtry*, to the ſervice and accommodation of the affairs of a family.

CHYMISTRY, *philoſophical*. Philoſophic *chymiſtry* conſiſts of three parts, viz. *invention*, *rationale*, and *experiment*; whence we may define it to be a particular exerciſe of the rational and inventive faculties of the mind, leading to experiments, and thence to the diſcovery of cauſes, ſo as to form axioms that ſhall rationally account for phænomena, and diſcover rules of practice for producing uſeful effects. And thus philoſophical *chymiſtry* is not only the key to all the other parts, but it diſcovers of itſelf the cauſes of many natural phænomena, as particularly, earthquakes, volcanoes, vegetation, the growth of minerals, and the like.

This branch of *chymiſtry* alſo explains the general forms and qualities of bodies, whereon their properties and effects depend; as volatility and fixedneſs, fluidity and firmneſs, colours, taſtes, odours, efferveſcences, fermentation, ſolution, precipitation, congelation, extraction, and the like.

To this part of *chymiſtry* it alſo belongs to bring new inventions to the teſt, to diſcover their validity or inſufficiency. Thus when any hint is ſtarted for a new trade, or method invented for the improvement of an old one, before any attempt is made to apply it in the larger way, it ſhould be experimented in miniature; as the aſſay-maſter tells the owner of an ore whether it will be worth the erecting large works for it, or not.

CHYMISTRY, *technical*. By technical *chymiſtry* is meant the application of philoſophical *chymiſtry* to the immediate ſervice of arts, ſo as by its means to invent, form, aſſiſt, promote, or perfect them in the large way of buſineſs.

CHYMISTRY, *theory of*. Under the theory of this art are to be laid down all the general truths which the particular experiments of chemiſts have hitherto demonſtrated. Theſe are, on this occaſion, to be taken for granted, and the whole body of ſuch truths makes the univerſal theory of *chymiſtry*, for *chymiſtry* is no ſcience formed *a priori*; it is no production of the human mind, or raiſed by reaſoning, but collected *a poſteriori* from experiments; it took its riſe from various operations caſually made, and obſerving thoſe that had one and the ſame uniform tendency, without any expectation of what followed; and was only reduced into an art, by collecting and comparing the effects of ſuch uncertain experiments, and noting the tendency thereof: ſo far then as a number of experiments agree to eſtabliſh any unqueſtionable truth, ſo far they may be conſidered as conſtituting the theory of *chymiſtry*. Such a theory is neceſſary to be premiſed to every art; and ſomething equivalent to this is practiſed by every artiſan, in teaching his diſciple how to proceed orderly in the exerciſe of his art; and accordingly it would be impoſſible to teach the practice of *chymiſtry* to advantage, without having firſt given ſome ſuch theory. In the forming ſuch a theory of *chymiſtry*, a direct uſe may indeed be made of the demonſtrations in phyſics, as particularly in mechanics, hydroſtatics, and hydraulics; ſince the properties common to all bodies, and what farther affections certainly flow therefrom, have their place in *chymiſtry*. One cannot, however, be too reſerved in this uſe, ſince thoſe ſingular properties found in ſome bodies, will, if applied to others, falſify the mechanical demonſtrations, which might hold true every where elſe.

Due regard being had to this rule, the diſcoveries of naturaliſts and mathematicians will always be advantageous, never injurious to the art of *chymiſtry*.

CHYMOLOGI, among the *Botanical Students*, ſuch as have employed their time in inveſtigating the qualities and properties of plants from their taſte and ſmell.

CHYMOSIS, in *Medicine*, the act of making, or preparing CHYME.

The word comes from χυμος, *ſuccus*, of χεω, *fundo*, *I melt*.

Chymoſis, according to ſome, is the ſecond of the concoctions made in the body; being a repeated preparation of the moſt impure and groſs parts of the chyle, which being rejected by the lacteals, is imbibed by the meſeraics, and thence carried to the liver, to be there elaborated, purified, and ſubtilized afreſh. It is of this, according to Rogers, that the animal ſpirits are formed.

CHYMOSIS, or rather CHEMOSIS, is alſo uſed for an inflammation of the eye-lids, which turns out their inſide to ſight.

In which ſenſe, the word comes from χαινω, *hiſco*, *I gape*.

CHYTLA, in *Antiquity*, a liquor made of wine and oil, and ſometimes uſed in divination.

CHYTRI, among the Athenians, a feſtival in honour of Bacchus and Mercury, kept on the thirteenth of the month Antheſterion.

CIBDELOPLACIA, in *Natural Hiſtory*, the name of a genus of ſpars. The word is derived from κιϐδηλος, *impure*, and πλαξ, *a cruſt*. The bodies of this genus are terrene ſpars, that is, are compoſed of ſpar, debaſed by a very large admixture of earth, and are not therefore of the leaſt brightneſs or tranſparence; and are found formed into thin cruſts, coating over vegetable and other extraneous bodies in form of incruſtations. Of this genus there are five known ſpecies, ſome of them uſed in medicine, and diſtinguiſhed by particular names.

CIBDELOSTRACIA, in *Natural Hiſtory*, the name of a genus of ſpars. The word is derived from κιϐδηλος, *fouled* or *adulterated with extraneous matter*, and οστρακον, *a cruſt*, or *ſhell.*

The bodies of this genus are cruſtaceous ſpars, ſo highly debaſed with earth, that they appear to the naked eye mere earths; they are deſtitute of all brightneſs or tranſparence, and are formed into thin plates, and uſually found incruſting over the ſides of fiſſures of ſtone.

Of this genus there are ſeven known ſpecies.

CIBORIA, in *Antiquity*, the large huſk of Egyptian beans, which are ſaid to have been ſo large as to ſerve for drinking cups; whence they had their name *ciborium*, ſignifying a *cup*, in the Egyptian language.

CIBORIUM, in *Eccleſiaſtical Writers*, the covering for the altar. This covering is ſupported by four high columns, and forms a kind of tent for the euchariſt, in the Romiſh churches. Some authors call it *turris geſtatoria*, and others *pyxis*. But the *pyxis* is properly the box in which the euchariſt is preſerved.

CIBOULS. See ONIONS.

CIBUS *ferialis*, in *Antiquity*, an entertainment peculiar to a funeral; for which purpoſe, beans, parſley, lettuce, bread, eggs, lentils, and ſalt were in uſe.

CICADA, the *balm cricket*, in *Zoology*, the name of a genus of inſects of the order of *hemiptera*, common in Italy, and ſome other parts of the world, but not found in England. It has large wings, and makes a loud noiſe, ſomething like that of the cricket. See *Tab. of Inſects*, N° 5. and HARVEST-*fly*.

They are recommended by ſome in medicine as remedies for colics, powdered and mixed with pepper; or burnt to aſhes alone, are given in nephritic caſes.

CICADA *aquatica*, the *water-graſshopper*, a name very injudiciouſly given by Rondeletius to an animal found frequently in ſtanding waters, of a greyiſh colour, with ſix legs, and the appearance of the rudiments of wings; it is remarkable for having alſo a ſort of maſk before the face, which it removes or lifts up at pleaſure. It is a poor defenceleſs animal, and is a prey to almoſt all the other water animals, even to many that are ſmaller than itſelf: it has no ſort of relation to the GRASSHOPPER; but is the hexapode, or worm ſtate of one of the *libellæ*, or DRAGON-*flies*.

The hinder pair of legs are much longer than the others, and are uſed in ſwimming, as oars, in the manner of thoſe of the NOTONECTA.

CICADA *of North America*. This inſect is ſeen annually, but in no great numbers, in Penſylvania; but at certain periods of fourteen or fifteen years, they come forth in ſuch ſwarms, that they are called *locuſts*. They are the prey of ſo many animals, that their numbers ſoon decreaſe; and their duration by order of nature being ſhort, they quickly diſappear.

There are two diſtinct ſpecies of *cicadæ* in North America. See a curious account of the largeſt ſort, by Mr. Collinſon, Phil. Tranſ. vol. liv. N° 10. an. 1764.

CICADULA, in *Natural Hiſtory*, the name given by Mr. Ray to a ſmall ſpecies of inſect, called by Swammerdam *locuſta pulex*, and found in May and June on the ſtalks and leaves of plants, involved in a ſpumous white matter, commonly called cuckow-ſpit. This ſpume is not exſudated, as ſome ſuppoſe, from the plant, but from the mouth of the animal; and if it be well wiped away, without injuring the creature, more will be immediately ſeen iſſuing out of its mouth, till there is as large a quantity of it as before.

There are ſeveral ſpecies of this animal, and while they lie in froth they are of the ſhape of a louſe, ſome being of a whitiſh, ſome of a yellowiſh, and ſome of a green colour. Their hinder legs are ſomewhat larger than the others, and there is an appearance of the rudiments of wings at the ſhoulders. They often change their ſkins while they live in this froth, and only creep at this time; but when they leave the plant, they hop and fly, having large wings which cover the whole body.

CICATRICULA, in *Natural Hiſtory*, a little whitiſh ſpeck, or veſicle, in the coat of the yolk of an egg; wherein the firſt changes appear towards the formation of the chick. The *cicatricula* is what is otherwiſe called the eye of the EGG.

CICATRISIVE, CICATRIZANS, in *Medicine*, is applied to ſuch remedies as are very deſiccative; and on that account aid nature to repair the ſkin, and to form a cicatrix, or eſchar.

Such are Armenian bole, powder of tutty, and the unguents *diapompholygis*, *deſiccativum rubrum*, &c.

Cicatriſive medicines are otherwiſe called *eſcharotics*, *epulotics*, *incarnatives*, *agglutinants*, &c.

CICATRIX, in *Medicine*, &c. a little ſeam, or elevation of callous fleſh, riſing on the ſkin, and remaining there after the healing of a wound, &c. ordinarily called a *ſcar*, or *eſchar*.

Some derive the word from *circa cutem:* others form *cicatrix* from *occæcatrix*; the *cicatrix* being only *obductio vulneris*, *the covering up*, or *hiding of the wound:* but it is better derived from *cæcatrix*, which has the ſame force; of the verb *cæcare*, *to blind.*

The *cicatrix* is the ſame with regard to the joining of the fleſhy parts, as a *callus* is to the bones.

In young infants, theſe calloſities, or ſcars, ſometimes much diminiſh, and oftentimes quite vaniſh when come to age, as is particularly obſerved in the pits of the ſmall-pox: and, in growing, they are ſometimes obſerved to change their ſituation.

In large wounds, where there has been a loſs of ſubſtance, an even *cicatrix* is not to be expected, without great care in the ſurgeon. When an even, thick, and white matter appears in the wound, it is to be dreſſed either every day, or every other day, as occaſion ſhall require: the ſuperfluous matter muſt at every dreſſing be wiped away with a very light hand; and it is indeed much better to leave ſome of it in the wound, than to treat that roughly in taking it away; for wiping the wound too roughly, hinders the growth of new fleſh; but a little matter being left, only performs the office of oil or balſam, in keeping the parts moiſt. Theſe rules being obſerved, new fleſh will preſently ſpring up, and the WOUND unite: but that an even *cicatrix* may be procured, the ſurgeon muſt endeavour by degrees to harden the new fleſh, by the application of dry lint, covered with a tight bandage. When this does not prove ſufficient, it may be proper to uſe ſome of the drying balſams, or drying powders, ſuch as tutty, *lapis calaminaris*, maſtich, colophony, &c. Rectified ſpirit of wine is frequently uſed for this purpoſe alſo, with great ſucceſs, for it carries a very great aſtringent and drying virtue with it.

See obſervations on a deep wound of the brain that cicatrized, by Tudecius, in the Col. Acad. tom. iii. P. E. p. 407.

CICATRIZING, in *Medicine*. See CICATRISIVE.

CICCA, in *Botany*, a genus of the *monoecia tetrandria* claſs; the male flowers of which have a four-leaved calyx, and no corolla; the female have a three-leaved calyx, no corolla, four ſtyles, and a capſule including four berries.

CICELY, in *Botany*. See CHERVIL.

CICER, the *chich-pea*, in *Botany*. See *Chich*-PEA.

CICERBITA, in *Botany*, a name given by ſome authors to the common ſonchus, or ſow-thiſtle.

CICERONIASTRI, or CICERONIANI, an appellation given by way of contempt to thoſe moderns, who diſpute the propriety of all expreſſions and words not found in Cicero.

CICERUM *lapis*, the *chich-ſtone*, in *Natural Hiſtory*, a name given by ſome authors to a ſort of ſmall round ſtones, of the nature of the piſolithe or pea-ſtones, but ſmaller than thoſe uſually are, and of a duſky grey colour. They very exactly reſemble the fruit of the cicer or chich-pea, and are found in great abundance near the Old Jeruſalem.

CICERELLUS, in *Ichthyology*, a name given by Boccone, and ſome other authors, to the AMMODYTES or ſand-eel, the *tobianus* of Schoneveldt.

CICHORIUM, *ſuccory*, in *Botany*. See ENDIVE.

CICINDELA, in *Natural Hiſtory*, the name of the GLOW-*worm*.

CICINDELA *volans*. See GLOW-*worm*.

CICISBEO, an Italian term, which in its etymology ſignifies a *whiſperer*; which has been beſtowed in Italy both on lovers, and on thoſe who to outward appearance act as ſuch, attending on married ladies with as much attention and reſpect as if they were their lovers. This Italian cuſtom has been ſpoken of very reproachfully by ſome writers: Mr. Baretti has taken great pains to vindicate it. He aſcribes it to a ſpirit of gallantry, derived from the ages of chivalry, and much heightened and refined by the revival of the Platonic philoſophy in Italy, about the thirteenth century; and by the verſes of Petrarch in complement to the beautiful Laura, and his numerous imitators. Account of the Manners, &c. of Italy, vol. i. chap. 8.

CICLA, in *Botany*, a name given by ſome to the white beet.

CICLA, in *Ichthyology*, a name given by Artedi, and other late writers, to a ſpecies of fiſh called *chichle* by Ariſtotle and Ælian, and TURDUS *minor* by the generality of late writers. See VERDONE.

CIÇONIA, in *Zoology*, the name by which authors call the ſtork. See STORK.

CICUTA. See HEMLOCK.

There are not wanting authors among the Germans, who recommend the ſeed of the common *hemlock* againſt obſtructions in the ſpleen; but as we have already remedies enough in the ſame intention, which are not ſuſpected as poiſonous, it is beſt to be contented with them, till a great many more trials have been made of this new medicine than we have accounts of at preſent.

CICUTA is alſo uſed, chiefly among the ancients, for a poiſonous juice, or liquor, expreſſed from a plant called *cicuta aquatica*; being the common poiſon wherewith the ſtate criminals at Athens were put to death.

The *cicuta* of the ancients is a ſecret now ſcarce poſſible to be diſcovered. Wepfer, in an expreſs treatiſe on the ſubject, will have it the OENANTHE *cicutæ facie, ſucco viroſo*; which he deſcribes by the name of *cicuta aquatica*; and of the diſmal effects of which he gives a very ample relation. At leaſt the violence of this plant makes it a much fitter inſtrument of haſty death than the common *cicuta* or hemlock, which is much leſs malignant. Though ſome have ſuggeſted, that the poiſonous draught to which the Athenians doomed their criminals, was an inſpiſſated juice compounded of the juice of *cicuta*, and ſome other corroſive herbs. Vid. Mead's Eſſay on Poiſons, ap. Bibl. Anal. Med. tom. iii. p. 281.

Socrates drank the *cicuta*. Plato, in his Dialogue on the Immortality of the Soul, obſerves, that "The executioner adviſed Socrates not to talk, for fear of cauſing "the *cicuta* to operate too ſlowly." M. Petit, in his Obſervationes Miſcellaneæ, remarks, that this advertiſement was not given by the executioner out of humanity, but to ſave the *cicuta*: for he was only allowed ſo much poiſon *per ann.* which if he exceeded, he was to furniſh the reſt at his own expence. This conſtruction is confirmed by a paſſage in Plutarch: the executioner who adminiſtered the *cicuta* to Phocion, not having enough, Phocion gave him money to buy more; obſerving, by the way, that it was odd enough, that at Athens a man muſt pay for every thing, even his own death.

CICUTARIA. See HEMLOCK, and CHERVIL.

CIDARIS, the mitre uſed by the Jewiſh high prieſts. Whenever there is mention of the high prieſt's mitre, the Hebrew word made uſe of to expreſs it is always *miznepheth*; and *mygbaoth* is uſed to ſignify the bonnet belonging to common prieſts. The rabbins ſay the ſame thing is meant by both theſe terms, and that the bonnet uſed by prieſts in general was made of a piece of linen cloth ſixteen yards long, which covered their heads like an helmet or a turban: and they allow no other difference to be between the high prieſt's bonnet, and that of other prieſts, than this, that one is flatter, and more in the form of a turban, whereas the other worn by ordinary prieſts roſe ſomething more in a point. Exod. xxviii. 4.

It is to be obſerved, that the Hebrew prieſts never appeared in the temple without covering their heads. And ſtill at this day it is reckoned an incivility in the Eaſt, and a mark of contempt, for any man to pull off his hat or turban to another, or to ſhew his naked head before any one.

CIDARIS, in *Conchyliology*. See TURBAN-*ſhell*.

CIDER, a briſk, tart, cool liquor, prepared from apples. See CYDER.

CIERGE, in *Conchyliology*, a name given by the French to a ſea-ſhell, a ſpecies of VOLUTA. This is of the colour of common yellow wax, without any variegations on the ſurface; but when its rough coat is taken off, it makes a very different appearance, having the zones and colours of the onyx. It is preſerved in many cabinets in this ſtate, under the name of the onyx-ſhell.

CIGALE, in *Natural Hiſtory*, the French name for the *cicada*, particularly for the large kind, called *acheta* by the ancients. See HARVEST-*fly*.

CIGNE, in *Conchyliology*, the SWAN-*ſhell*, a name given by the French virtuoſi to a ſpecies of *voluta*, which, beſide this name, is known by two other very different ones, *cierge* and *onyx*, and is taken by the generality of collectors for three different ſhells. When it has its natural coat on, it is of a rough ſurface, and yellow colour, much like that of common wax, whence it is called cierge, or the wax-ſhell. When this coat is juſt taken off, it appears of a very beautiful white, and is then called the *cigne*, or ſwan-ſhell; and when it is poliſhed farther down, ſo as to ſhew its inner ſtructure, it appears zoned in the manner of the onyx, and is then called the *onyx*.

CIGALON, in *Natural Hiſtory*, the name by which the French writers call the ſmaller ſpecies of cicada, as they do the larger the cigale. The ancients were unacquainted with two ſpecies of cicada; a great one, and a ſmaller one: the laſt of theſe they called *tettigonia*, and the firſt *acheta*. It has been uſually ſuppoſed, that the *cigalon* of the moderns was their *tettigonia*: but Mr. Reaumur obſerves, that we have in reality three kinds of them, a large, a middling, and a ſmall one; and that the large was their *acheta*, the middle one their *tettigonia*; and that the *cigalon*, or ſmall one, which is about the ſize of a hornet, was wholly unknown to them. See HARVEST-*fly*.

CILERY, in *Architecture*, a term uſed to denote the drapery or leavage on the heads of columns.

CILIA, in *Anatomy*, the hairs wherewith the *palpebræ*, or eye-lids, are fringed; eſpecially the upper, which are larger and ſtiffer than thoſe of the under.

Their uſe ſeems to be, to break the too fierce impreſſion of the rays of light; as alſo to keep out flies and moths, and other things floating in the air, which might annoy the eye.

Theſe *cilia* ſpring from a ſmall row of glands, which cover a thin tender cartilage, edging each eye-lid, and ſerving as a kind of rod, or ring, to ſtretch them upon.

CILIARE, in *Anatomy*, an epithet given to a part of the eye, called *ligamentum ciliare*; becauſe of its relation to the *cilia*, or hair of the eye-lids.

The *ligamentum ciliare*, called alſo *proceſſus ciliaris*, conſiſts of a range of black fibres diſpoſed circularly; having their riſe in the inner part of the *uvea*, and terminating in the prominent part of the cryſtalline, which they encompaſs round.

Anatomiſts generally imagine their uſe to be to ſuſpend the cryſtalline in the globe of the eye, to lengthen or ſhorten its figure, and bring it nearer to, or farther from the *uvea*; and even to open or contract the pupil as occaſion requires, i. e. as near or remote objects, obſcure or bright objects, are to be viewed.

The motion of the pupil, ſome ſay, is effected by the circular and ſtrait fibres of the *uvea*; others attribute it to the *ciliary* ligament: yet, there is no great doubt, but they both concur in the ſame action; and that the *ligamentum ciliare* doth, at the ſame time the pupil opens or ſhuts, dilate or compreſs the cryſtalline, and bring it nearer, or carry it farther off the *retina*. Derham, Phyſ. Theol.

M. Mariotte denies the *ligamentum ciliare* to have any connexion with the cryſtalline, or to ſerve for any purpoſes thereof.

CILIARIS, in *Anatomy*, a muſcle, otherwiſe called ORBICULARIS *palpebrarum*.

CILIATED *leaf*, among *Botaniſts*. See LEAF.

CILICIA *terra*, in the *Natural Hiſtory of the Ancients*, a bituminous ſubſtance, though called an earth, which, by boiling, became tough like bird-lime, and was uſed inſtead of that ſubſtance to cover the ſtocks of the vines, for preſerving them from the worms. It probably ſerved in this office in a ſort of double capacity, driving thoſe animals away by its nauſeous ſmell, and entangling them if they chanced to get among it.

CILICIUM, a ſort of habit made of coarſe ſtuff, of a black or dark colour, formerly in uſe among the Hebrews, in times of mourning or diſtreſs. It was called *Cilicium*, becauſe it came from Cilicia, or rather becauſe the Cilicians invented this kind of habit, made of goat's hair, and uſed principally in camps and ſhips, by ſoldiers and mariners.

CIMA, or SIMA, in *Architecture*, a member or moulding, called alſo *ogee*, and *cymatium*. See *Tab. Archit. fig.* 8.

CIMELIANTHUS, in *Natural Hiſtory*, a name given by authors to a ſpecies of the *oculus beli*. It is deſcribed to be of a white colour, reſembling that of marble, with a yellow pupil in the middle. It was found on the ſhores of the Euphrates.

CIMELIARC, in *Church Architecture*, the room where the plate, veſtments, &c. belonging to the church are kept. In Engliſh, a veſtry.

CIMEX, BUG, in *Natural Hiſtory*, the name of a genus of inſects, the characters of which are theſe: the head is ſmall; the back, toward the ſhoulders, is broad, and is covered with a cruſtaceous ſubſtance; its ſhoulders are of an angular make; and its wings partly cruſtaceous, partly membranaceous, and are ſo formed, that they exhibit the figure of a croſs, where they meet at the middle of the back; and they have a long proboſcis, which is bent under the belly, and always lies ſtrait, not in a ſpiral form.

Mr. Ray divides the *cimices* into two kinds, thoſe of a ſhorter, and thoſe of a longer and narrower make. Of the firſt kind he deſcribes eight ſpecies.

Of the other kind of *cimices*, which have longer and narrower bodies, Mr. Ray mentions five kinds.

The houſe-bug, or *cimex lectuarius*, ſo extremely troubleſome about beds, is of a roundiſh figure, of a dark cinnamon colour; and when cruſhed, emits a moſt offenſive ſmell.

Many are the compoſitions and ointments preſcribed for deſtroying them; but it is hardly poſſible to eradicate them when once they get into furniture. Some recommend to waſh the bedſteads with oil of turpentine, or to paint them with verdigreaſe ground in linſeed and oil of turpentine: others, to make an ointment of wormwood, rue, common oil, and water boiled together, and mixed with ſulphur; a mixture of hemp, oil, and ox-gall, has been ſometimes uſed; and an ointment made of equal quantities of black and common ſoap, and quickſilver, has been applied to the places infeſted with *bugs*. After all, cleanlineſs is the greateſt ſecurity againſt theſe vermin.

There are alſo two ſpecies of water-*cimices*.

Beſide all theſe, which are properly of the *cimex* kind, there is another ſet of inſects mentioned by Mr. Ray, as nearly approaching to them, and deſcribed under the name of CIMICIFORMES *muſcæ*.

CIMICIFORMIS *muſca*, in *Natural Hiſtory*, a name given by Mr. Ray to a kind of inſects, partly of the fly, and partly of the CIMEX kind. Of theſe there are eleven ſpecies deſcribed in his hiſtory. Theſe are all found about our hedges in dry places, and are a beautiful ſet of inſects.

CIMICIFUGA, in *Botany*, a genus of the *diœcia polyandria* claſs, bearing male and female flowers; with a five-leaved calyx, twenty ſtamina, and no corolla; the capſule is polyſpermous.

CIMIER, in the *French Heraldry*. See CREST.

CIMOLIA *terra*, in *Natural Hiſtory*, a name by which the ancients expreſſed a very valuable medicinal earth; but which later ages have ſuppoſed to be no other than our common tobacco PIPE *clay* and FULLER'*s earth*.

The *Cimolia terra* of the ancients was found in ſeveral of the iſlands of the Archipelago, particularly the iſland Cimolus, from which it had its name, and which is now called Argentiere; and was uſed with great ſucceſs in the St. Anthony's fire, inflammations, and other external affections of a like kind, being applied by way of a cataplaſm to the part. They alſo uſed, as we do, what we call *Cimolia*, or fuller's earth, for bleaching linen, and cleaning of cloaths. This earth of the ancients, though ſo long diſregarded, and by many ſuppoſed loſt, is however yet very plentiful in Argentiere, Sphanto, and many other of thoſe iſlands; and is a marle of a lax and crumbly texture, and a pure bright white colour, and very ſoft to the touch. It was evidently the ſubſtance we now call *ſteatites*, or the ſoap-rock, common in Cornwall, and alſo in the iſland of Argentiere or Cimolus.

CIMOLIA *alba*, the officinal name of the earth or clay of which we now make tobacco-pipes. Its diſtinguiſhing characters are, that it is a denſe, compact, heavy clay, of a dull white colour, and very cloſe texture; it will not eaſily break between the fingers, and ſlightly ſtains the ſkin in handling. It adheres firmly to the tongue; melts very ſlowly in the mouth, and is not readily diffuſible in water; and is not acted upon by acids. It is found in many places. That of the iſle of Wight is much eſteemed for its colour. When applied to uſe, it is mixed with another ſort of white clay, there called Hayter's clay. We have vaſt plenty of it alſo near Pool in Dorſetſhire, and near Weddenſbury in Staffordſhire.

A third ſort of white *Cimolia*, differing from the former in not being unctuous, and ſuffering no change in the fire, is dug near Lymington in Hampſhire, and hitherto applied to no uſe. A fourth ſort, tinged and veined with yellow, which turns to a pale red, acquires in the fire a whiter colour, but no hardneſs, is dug on the banks of the Medway, near Maidſtone, and uſed for the manufacture of gallypots at Vauxhall. A fifth ſort diſſolves readily in water, and burns to a greater hardneſs and a clearer white: it is dug near Barnſtaple in Devonſhire, and uſed in making the Broſely tobacco-pipes. A ſixth ſort is alcaline; ſuffers little change in the fire; is dug near Wareham in Dorſetſhire, and called Pool clay; and uſed for tobacco-pipes.

CIMOLIA *nigra*, is of a dark lead colour, hard, dry, and heavy; of a ſmooth compact texture, and not viſcid: it does not colour the hands; crumbles when dry; adheres to the tongue; diffuſes ſlowly in water; and is not acted upon by acids. It burns perfectly white, and acquires a conſiderable hardneſs. The chief pits for this clay are near Northampton, where it is uſed in the manufacture of tobacco-pipes. It is alſo mixed with the *critche* clay of Derbyſhire, in the proportion of one part to three, in the manufacture of the hard reddiſh brown ware.

CINÆDA, in *Natural Hiſtory*, the name of a ſtone found in the head of a fiſh, of a whitiſh colour, and oblong figure. The ancients ſuppoſed it preſaged tempeſts when its ſurface looked duſky and obſcure; and, on the contrary, fair weather, when it looked bright and clear.

CINÆDOLOGIA, among the *Ancients*, a kind of ſatyrical poetry, the chief ſubject of which were the *cinædi*.

CINÆDUS, in *Antiquity*, is uſed to ſignify a dancer or pantomime.

At firſt they performed only on the ſtage, but afterwards were admitted to the entertainments of princes.

CINÆDUS, in *Zoology*, the name of a fiſh common in the Archipelago, about the ſhores and rocks, ſuppoſed by many to be the ſame ſpecies with the alpheſtes, and of the turdus kind, only with its back-fin prickly all its length. It is of a yellowiſh hue all over, blended and variegated with an admixture of purple; its ſcales are rounded and indented; and its teeth very ſtrong and firm, and diſpoſed in two rows in each jaw, and are long and ſharp.

CINARA, *artichoak*, in *Botany*. See ARTICHOAK.

CINCHONA, in *Botany*, the name by which Linnæus calls the tree which produces the Jeſuits bark. This is a peculiar genus of plants, of the *pentandria monogynia* claſs; the characters of which are theſe: the cup is a ſmall perianthium, compoſed of one leaf, divided into five ſegments, and remaining after the flower is fallen. The flower conſiſts of one petal, and is of a funnel ſhape; it is a long and cylindric tube, terminating in a wide expanded edge, which is divided into five ſerrated and pointed ſegments: the ſtamina are five ſmall filaments, and the apices oblong, and placed within the tube of the flower; the piſtil conſiſts of a roundiſh germen placed below the cup, a ſtyle which is of the length of the flower, and a thick oblong ſimple ſtigma; the fruit is a roundiſh capſule, at the top of which ſtands the cup by way of a crown; this capſule contains two cells, and when ripe opens longitudinally into two parts. The ſeeds are very numerous, and are oblong, compreſſed, and ſurrounded with a foliaceous edge. See CORTEX *Peruvianus*.

CINCLUS, in *Zoology*, a ſpecies of the TRINGA. It is given by ſome to the bird called in Engliſh the greater reed-ſparrow, and by the generality of authors JUNCO.

CINCLUS is alſo the name of a ſpecies of STURNUS or STARLING.

CINCLUS *prior*, is alſo a name given by Aldrovandus to a bird, the ſame with what we call the STINT.

CINCLUS *tertius*. See GIAROLO.

CINCTURE, or CEINTURE, in *Architecture*, a ring, or liſt, at the top and bottom of the ſhaft of a column; ſeparating the ſhaft, at one end, from the baſe; and at the other from the capital. See *Tab. Archit. fig.* 24. and 25.

The word, in its original French, ſignifies *girdle*; of the Latin, *cingo, I gird*.

That at the bottom is peculiarly called *apophyge*; as if the pillar took its flight hence: and that at top, *colarin*, or collar.

The *cincture* is ſuppoſed to be an imitation of the girths, or ferrils, anciently uſed to ſtrengthen and preſerve the primitive wooden columns. See ORDER.

CINEFACTION. See CINERATION.

CINERARIA, *ſky-flower*, in *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs: with a naked receptacle; and ſingle, polyphyllous, equal calyx.

CINERARIA, in *Botany*, a name by which ſome authors have called the *jacoba maritima*, or ſea ragwort, becauſe of the grey colour of its leaves.

CINERARIUS, in *Antiquity*, an officer retained by the women, whoſe buſineſs it was to provide aſhes proper for tinging the hair with a deep yellow colour. He was otherwiſe called *ciniflo*.

CINERARIUS is alſo uſed to ſignify one who paid a veneration to the aſhes and relics of martyrs and ſaints.

CINERATION, in *Chemiſtry*, the reduction of wood, or any other combuſtible matter, into aſhes, by means of fire.—This, others call *cinefaction*.

CINERES. See ASHES.

CINERES *Ætnæ*, a name given by authors to a duſty and ſaline ſubſtance thrown out of mount Ætna, in form of powder, and reſembling aſhes. After an eruption of this mountain, theſe ſaline aſhes are found ſcattered about the opening itſelf, down the ſides of the mountain, and over the country for ten miles, or more, round. Thoſe aſhes, which are found thrown to the diſtance of eight or ten miles, are generally taken up in form of a very dry duſt, almoſt inſipid to the taſte: but what lie upon, and round about the ſkirts of the mountain, are very different; they are never dry, though they lie many months expoſed to the ſun's heat, which is very great there, but always feel damp and wet, and are compoſed of larger or ſmaller lumps, and not of a fine powder, as the more diſtant are. They are of a very ſtrongly vitriolic taſte, reſembling that of our common green copperas. From this taſte, and from the great quantities of matter reſembling a ſort of crocus Martis, and with theſe a great abundance of ſulphur, which is burnt away, and the vaſt quantities alſo which are ſublimed about the mouths, and left unburnt, it appears, that the common pyrites is contained in vaſt abundance in the bowels of the mountain, ſince green vitriol and ſulphur are its produce, and nothing is ſo eaſy as to calcine it with the purple powder reſembling crocus Martis, which is the third ſubſtance ſo frequent there. This gives great weight to the opinion of thoſe who believe all the eruptions of the burning mountains in the ſeveral parts of the world to be owing to this mineral. See PYRITES and VOLCANO.

CINERES *clavellati*, among *Chemiſts*, are the aſhes of tartar, or lees of wine, burnt.

CINERITIOUS, a term applied to things reſembling aſhes; particularly in point of colour and conſiſtence.

Thus, the cortical part of the brain is alſo called the *cineritious* part.

CINGULUM *ſapientiæ*. See GIRDLE.

CINIFLO, in *Antiquity*, the ſame with CINERARIUS.

CINNA, in *Botany*, a genus of the *monandria digynia* claſs. The calyx is a bivalve ſingle-flowered glume; and the corolla is a bivalve glume. The ſeed is ſingle.

CINNABAR, in *Natural Hiſtory*, a mineral ſubſtance, red, heavy, and brilliant; found chiefly in the quickſilver mines, and being one of the ores of that mineral.

The word comes from *κιναϐρα, the ſmell of goats*; becauſe, ſays Matthiolus, in digging one kind of mineral *cinnabar*, it yields ſo ſtrong a ſcent, that the diggers are obliged to ſtop their noſtrils.

Some have wildly imagined *cinnabar* to be DRAGON'*s-blood*, gathered, as Pliny and Solinus have it, when the dragon and elephant fight together. This fable is refuted by Dioſcorides, and Scaliger.

Cinnabar is either *native*, or *factitious*.

CINNABAR, *native*, or *mineral*, which is that above mentioned, is found in moſt places where there are quickſilver mines.

It may be eſteemed as an ore of quickſilver, or rather, as quickſilver petrified and fixed, by means of ſulphur, and a ſubterraneous heat; chemiſtry being found to reduce it, without much trouble or loſs, to the nature of MERCURY. Each pound of good *cinnabar* yields fourteen ounces of mercury. Accordingly, the principal property and uſe of this mineral is to yield a moſt excellent mercury; and that which the alchemiſts maintain to be the beſt diſpoſed for attaining to the tranſmutation of gold.

The principal mines of *cinnabar* are thoſe of Kremnitz in Hungary; of Hydica in Sclavonia; of Horowitz in Bohemia; of Carinthia, of Frioul, and of Guangavelica in Peru. The *cinnabar* of the Philippines in Aſia is of the higheſt colour; but the richeſt is that of Almaden in Spain, on the frontiers of Eſtramadura.

Juſſieu has given a circumſtantial memoir on the ſubject of *cinnabar*, in the A. D. S. an. 1719.

To diſcover whether a mineral contains mercury, or is true *cinnabar*, Juſſieu recommends reddening a bit of it in the fire; and when it appears covered with a little bluiſh luſtre, to put it under a glaſs cover, through which we are to obſerve whether the vapours condenſe under the form of ſmall drops of mercury adhering to the glaſs, or running down the ſides of it. The falſification of *cinnabar*, the ſame author obſerves, may be diſcovered by the colour of its flame when put upon burning coals. If it be blue approaching to violet, and without ſmell, it is a mark of its purity; if the flame be of a reddiſh caſt, there is ground to ſuſpect that it has been adulterated with MINIUM; and if it boils as it were on the coals, it is a preſumption, if not a proof, that it contains a mixture of DRAGON'*s-blood*. Fixed alcalies, quick-lime, calcareous earths, iron, copper, tin, lead, ſilver, biſmuth, and regulus of antimony, have a greater AFFINITY than mercury has to ſulphur, and conſequently are capable of decompoſing *cinnabar*.

The beſt mineral *cinnabar* is of a high colour, brilliant, and free from ſtony matter. It is uſed by phyſicians in venereal caſes, and others occaſioned by ſharp ſeroſities. It is eſteemed a good cephalic, and accounted of ſervice in epilepſies, and other nervous diſtempers: and is reckoned of efficacy in cutaneous caſes, as the ſcurvy; and uſed in fumigations, when its vapours penetrate the pores of the ſkin, and produce ſimilar effects to thoſe which are produced by mercury adminiſtered by friction. Care muſt be taken, however, that the patient be not expoſed to breathe the vapours of the mercury and burning ſulphur, by which he might be injured.

CINNABAR, *factitious*, or *artificial*, is formed of a mixture of mercury and ſulphur, ſublimed, and thus reduced into a kind of fine red glebe. The beſt is of a high colour, and full of fibres, like needles.

The method of preparing factitious CINNABAR is thus: they take ſulphur, one part, melt it in a pipkin; then put to it, by a little at a time, from ſix to eight parts of quickſilver, ſtirring them together till no mercury appears: then letting them cool, they grind the mixture, put it in a bolt-head, bake it, and place it over a naked fire, which they augment by degrees; a coloured fume ariſes firſt to the top of the ſubliming veſſel, which, in the further progreſs of the heat, becomes, at length, of a red, crimſon hue. Taking it off the fire, the *cinnabar* is found at top.

Hoffman ſays, that *cinnabar* may be produced without ſublimation, by ſhaking or digeſting a little mercury with volatile tincture of ſulphur, by which means the mercury imbibes the ſulphur from the volatile ſpirit, and forms with it a deep red powder, not inferior in colour to ordinary *cinnabar*.

This ſerves for the ſame medicinal purpoſes with the *native cinnabar:* beſides which, it is likewiſe uſed by the farriers, to make pills for their horſes; and by painters, as a colour: it being a very vivid red; but drying with ſome difficulty.

This *cinnabar*, called alſo by the painters VERMILION, is rendered more beautiful by grinding it with gum-water, and a little ſaffron to prevent its growing black.

There is likewiſe a *blue cinnabar*, made by mixing two parts of ſulphur with three of quickſilver, and one of *ſal ammoniac:* theſe being ſublimed, produce a beautiful blue ſubſtance; whereas quickſilver and ſulphur alone produce a red.

The chemiſts prepare other kinds of artificial *cinnabar*; as,

CINNABAR *of antimony*, ſo called, becauſe its ſulphur has been furniſhed by antimony, is obtained from the decompoſition of corroſive ſublimate by antimony. Theſe compound ſubſtances are mixed together, and diſtilled: and during the operation, the marine acid of the corroſive ſublimate quits the mercury, and combines with the regulus of antimony, forming *butter of* ANTIMONY; and the mercury of the ſublimate, diſengaged from its marine acid, unites with the ſulphur of the antimony diſengaged from its regulus: theſe two ſubſtances, thus united, are ſublimed in form of *cinnabar*, after the butter of antimony has been diſtilled. This kind of *cinnabar* contains more ſulphur than the *factitious*, and conſequently appears of a darker colour.

Mercury revived from *cinnabar* of antimony is greatly to be preferred to that obtained by any other means, both for amalgamating with metals, and for all uſes in medicine; for this mercury is perfectly freed and depurated from its metallic, terrene, and heterogeneous particles, by the ſulphur of antimony.

The manner of reviving mercury from *cinnabar* of antimony, is variouſly delivered by different authors; but moſt of them prefer the uſe of pot-aſhes to any thing elſe on the occaſion. Hoffman, however, who has written expreſsly on the ſubject, ſays, that filings of ſteel or copper are greatly to be preferred to theſe ſalts. In the making *cinnabar* of antimony, it ſhould be ſublimed often, in order to render it quite pure, and perfect; and afterwards, when it is to be given internally, it ſhould be powdered extremely fine, ſince in the common way of giving theſe medicines groſsly ground, they can only exert their operations in the *primæ viæ*, it being impoſſible for them ever to reach the lacteals, and thence to be received into the maſs of blood. Many ways have been thought of for exalting the virtues of this excellent medicine, ſuch as ſolution, fixation, and the drawing a tincture from it. Solution in acid menſtrua is wholly to be condemned, for it renders it corroſive and dangerous to be taken internally; and the other inſipid and ætherial diſſolvents which many chemiſts boaſt of, are not yet known. The only medicinal preparation that has been contrived of *cinnabar* on this plan, is that by pouring ſweet ſpirit of vitriol on it. This makes only a ſlight and ſuperficial ſolution; but the liquor becomes very rich, in virtues far exceeding the *cinnabar* itſelf, when taken in powder.

Many ways have been attempted to fix *cinnabar*, by means of common ſalt, oil of ſulphur, and oil of vitriol; and Hoffman gives a method of doing this in ſo perfect a manner, by means of ſpirit of nitre and oil of vitriol, that the mercury of it will not tinge gold white, and a piece of the *cinnabar* thus fixed being thrown upon burning charcoal, will burn all away, leaving no remainder. Cneſelius boaſts of a preparation of *cinnabar* of this kind, with which he cured the gout; and by his own accounts this ſeems to be the very preparation; and the ſame preparation has been found an excellent cure for ſtubborn quartans, mixed with extract of bark, gentian, and ſalt of wormwood.

The drawing a tincture from *cinnabar* of antimony ſeems impracticable for many reaſons; all that is pretended to be done of this kind being in reality only drawing a tincture from one part, not from the whole of the medicine; and therefore ſuch a tincture cannot be expected to contain all its virtues.

Cinnabar is the beſt of all correctors of opium; and an excellent preparation of this kind is publiſhed by the ſame author.

Cinnabar is by ſome much dreaded as a medicine, in all caſes of inflammation, hæmorrhages, and the like diſtemperatures of the body; but Stahl reports, from repeated experience, that it is one of the greateſt of all medicines in theſe very caſes, nothing more efficaciouſly quieting the violent emotions of the blood, or ſupplying ſo happily the place of opiates; his general preſcription in hæmorrhages, head-achs, and other the like affections, being nitre, crabs eyes, and *cinnabar*. Frid. Hoffman, Diſſert. de Cin. Ant.

It is held a diaphoretic, and alterative; and is uſed in ſcrophulous and other chronic caſes.

Hoffman recommends it as a ſedative and antiſpaſmodic; Stahl makes it an ingredient in his *temperate powder*. Others deny its internal efficacy, and urge that it is unſoluble by any menſtruum.

CINNAMOLOGUS, in *Natural Hiſtory*, among the ancients, the name given to a bird which built its neſt either in the cinnamon-tree, or upon rocks and precipices, with the broken branches of that tree. The ancients have a great many idle traditions concerning this bird: ſome ſay it is the phœnix; and others, that it is a peculiar ſpecies of fowl. The common opinion of the phœnix building its neſt of ſpices, ſeems to have given birth to all the idle ſtories that we hear of this bird in Pliny and other credulous authors.

CINNAMON, an agreeable aromatic ſpice, brought from the Eaſt Indies; the whole taſte and flavour of which may be extracted by digeſtion with ſpirit of wine.

Cinnamon is allowed to be the bark of a tree growing in the iſland of Ceylon; and, as ſome ſay, alſo in Java, and in Malabar. It is a ſpecies of the bay; for the characters of which, ſee BAY-*tree*.

By *cinnamon* is now underſtood that only produced in Ceylon; that of Java, Sumatra, and Malabar, is called CASSIA *lignea*.

The *cinnamon*-tree grows in woods, like other trees. It never riſes high: its leaves reſemble thoſe of the laurel, both as to ſubſtance, and colour. The flowers, when they firſt begin to open, are red as ſcarlet; and if rubbed between the hands, they yield an odour more like that of cloves than of *cinnamon*. Seba ſays he found them blue, and of the bigneſs of the Italian bean-flower. The fruit reſembles an acorn, or olive; and has neither the ſmell nor taſte of the bark. Theſe berries are an excellent carminative, and are much uſed in medicine. When boiled in water, it yields an oil, which, as it cools and hardens, becomes as firm and white as tallow; and is called by the Dutch, *cinnamon wax*. Its ſmell is agreeable; and they make candles of it, which are only allowed to be burnt in the king's palace. It is alſo uſed in phyſic, as a balſamic and healer.

The leaves of the *cinnamon*-tree are called *folia malabathri*, and yield a bitteriſh aromatic oil, called *oleum malabathri*, reputed excellent againſt cephalalgias, &c.—See an account of the *cinnamon*-tree, by Mr. Watſon, F. R. S. Phil. Tranſ. vol. xlvii. an. 1751. Nº 46. p. 301.

The chief virtue of the *cinnamon*-tree is in its bark; which, when green, appears to be double: its exterior ſurface being browniſh, and the inner of the common *cinnamon* colour.

It is then diviſible into two barks of different colours; but theſe drying together become inſeparable, and paſs for the ſame bark; the browniſh colour changing in proportion as it dries.

When the *cinnamon* is freſh taken from the tree, it is flat, and has little taſte, ſmell, or colour; but it twiſts, or convolves, as it dries, in form of a ſtick, or cane: whence the French call it *canelle*.

By thus exhaling its ſuperfluous humidity, it acquires a ſweet briſk ſmell, and a ſharp pungent taſte. It is ſaid, that after the tree has been ſtripped of its bark, in three years it forms a new one, which is as good as the firſt: but this is not very probable. The Ceyloneſe cut down their *cinnamon*-trees, as ſoon as they are ſtripped, cloſe to the root: and from the ſtump there ſpring up new ones, which in five or ſix years time become trees fit for barking. A ſort of pigeons which feed on the fruit of the *cinnamon*-tree, are the chief agents in propagating it. In carrying the fruit to a diſtance to their young, they drop it in various places, where it takes root. Vid. Phil. Tranſ. Nº 409. p. 104, ſeq.

Some hold, that the ſmall branches of the ſame tree make the CASSIA; but that is a great miſtake.

The natives draw from the roots of the tree a liquor, which, as it hardens, in all reſpects reſembles camphor; and which in reality is a true camphor.

Cinnamon, to be good, muſt have a briſk, agreeable taſte, and a bright brown colour. Its qualities are, to heat and dry; to promote the menſes, to fortify the ſpirits, and to help digeſtion: but its chief uſe, in medicine, is as an aſtringent; with which intention it is preſcribed in diarrhœas, and weakneſſes of the ſtomach.

The *cinnamon* of the ancients was different from that of the moderns; they diſtinguiſhed five kinds of *cinnamon*: the *moſylitic*; *cinnamon of the mountain*; *black* and *branched cinnamon*; another white and ſpongious; and a fifth of leſs value, reddiſh, and of a ſtrong ſmell: as alſo a *baſtard cinnamon*, called *zinziber*. This laſt ſpecies was anciently in very high eſteem, but is now no longer known.

They extract an oil from *cinnamon*, called its *eſſence*, or *quinteſſence*, which is an excellent cardiac: it is drawn by diſtillation, like the oils of other vegetables. Indeed, being heavier than moſt other eſſential oils, it requires a greater heat to raiſe it. And for the ſame reaſon it ſinks to the bottom of the water that comes over with it into the receiver; whereas others ſwim on the ſurface; the eſſential oil of cloves, ſaſſafras, guaiacum, and box, excepted. The Dutch are ſaid to have a method of preparing, or rather, adulterating oil of *cinnamon*, which is kept a ſecret among themſelves. And the common *cinnamon* is often adulterated with that out of which this eſſence has been extracted.

Cinnamon, by means of fire, furniſhes, beſides its oil, waters, extracts, and ſalts; out of which are compounded ſyrups, and paſtils, called *oleo ſacchara*; together with an eſſence, that ſerves to turn all manner of wines, white and red, into hypocras.

CINNAMON-*water* is made by diſtilling the bark (firſt infuſed for ſome days) in ſpirit of wine, brandy, or white wine.

All the *cinnamon* conſumed in Europe comes from the Dutch; who have got the whole commerce thereof in their own hands, by becoming maſters of the iſle of Ceylon, and deſtroying all the other *cinnamon*-trees about the kingdom of Cochin.

The Dutch, who are the proprietors of Ceylon, are ſo jealous of this tree, which affords ſo valuable an article of their commerce, that the fruit or young plants are forbidden, by an order of the ſtates, to be ſent from thence, leſt other powers might avail themſelves of it. But it appears, from Mr. Watſon's account above referred to, that this prohibition has not been of very long ſtanding. The Dutch, however, have been fortunate enough hitherto to keep it to themſelves.

CINNAMON, *clove*, is alſo the bark of a tree growing in Braſil and Madagaſcar; where it is known under the name of *ravendſara*. The Portugueſe call it *cravo de marenham*.

This bark, pulveriſed, is ſometimes ſubſtituted for real cloves, though far ſhort of them in reſpect of flavour.

Saſſafras is ſometimes alſo called *cinnamon-wood*. See SASSAFRAS.

CINNAMON, *white*, which ſome call *coſtus corticus*, or *corticoſus*, or *cortex Winteri*, *Winter's bark*, from the perſon's name who firſt brought it into England, is the bark of a tree reſembling the olive-tree, frequent in the iſlands of St. Domingo, Guadaloupe, and Madagaſcar; called by the natives *ſimpli*.

This bark, which dries like that of *cinnamon*, is at firſt browniſh, of a ſharp biting taſte, like pepper, and a ſmell like muſk: as it dries, it whitens. Some uſe it in lieu of nutmeg: and in medicine it is uſed as a ſtomachic, and ſometimes as an antiſcorbutic.

The ſame tree alſo yields a gum called *alouch*, ſometimes *bdellium*, which is no diſagreeable perfume. See *Winteranus* CORTEX.

CINNAMUM, the name given by many of the old writers on the materia medica to *cinnamon*.

The Arabian writers, when they treat of *cinnamon*, have three words by which they expreſs it; theſe are *ſelicha*, *daſini*, and *kanſe*.

CINNUS, in *Ancient Medicine*, a drink made of the decoction of wheat, to which was added ſome flour of barley, honey, and wine.

CINQUEFOIL, *Quinquefolium*, or *Potentilla*, in *Botany*, a genus of the *icoſandria polygynia* claſs. Its characters are theſe: the empalement of the flower is of one leaf, which is ſlightly cut into ten parts; the ſegments are alternately leſs and reflexed. The flower is compoſed of five petals, which are inſerted into the empalement, and ſpread open. It hath twenty awl-ſhaped ſtamina inſerted in the empalement, terminated by moon-ſhaped ſummits. In the center of the flower are ſeveral germina collected into one head, with very ſlender ſtyles inſerted in the ſides, crowned by obtuſe ſtigmas. After the flower is paſt, the germina become a head of roundiſh ſeeds, included in the empalement.

There are many ſpecies of this genus preſerved in botanic gardens for variety, but they are not cultivated in other places either for uſe or beauty.

The firſt ſort grows naturally upon cold ſtiff land in moſt parts of England, and is a ſure mark of the ſterility of the ſoil. It ſpreads its ſtalks upon the ground, which ſend out roots from their joints, and thereby propagate ſo faſt as to ſpread over ground to a great diſtance: it flowers great part of the ſummer. It is never cultivated. The leaves of this plant are uſed in medicine, and are accounted reſtringent and vulnerary.

The other ſorts are natives of different parts of Europe.

Cinquefoil, *marſh*. See Comarum.

Cinquefoil *root*, in the *Materia Medica*, the name of a root which is an ingredient in ſeveral of the officinal compoſitions. The plant which produces it is the common *cinquefoil*, which grows every where by way-ſides. The root conſiſts of a cortical, and ligneous or ſticky part, but the cortical only is uſed. It is eſteemed drying and aſtringent, and antifebrific. Some have given it in agues in as large doſes as the cortex, and have cured with it. It ſtops fluxes of the bowels, and is good in diſorders of the lungs, and in the *fluor albus*, and gonorrhœas, either in men or women. It is, however, very little regarded in the preſent practice. See Phil. Tranſ. vol. xlix. part ii. p. 835.

CINQUE-PORTS, *Quinque portus*, five havens that lie on the eaſt part of England, towards France; thus called by way of eminence, on account of their ſuperior importance; as having been thought by our kings to merit a particular regard, for their preſervation againſt invaſions.

Hence, they have a particular policy, and are governed by a keeper, with the title of *lord warden of the cinque-ports*; which office belongs to the conſtable of Dover: and their repreſentatives are called barons of the *cinque-ports*.

They have various privileges granted them, as a particular juriſdiction; their warden having the authority of an admiral among them, and ſending out writs in his own name: and the king's writs do not run there.

Camden tells us, that William the Conqueror firſt appointed a warden of the *cinque-ports*; but king John firſt granted them their privileges; and that upon condition they ſhould provide eighty ſhips at their own charge for forty days, as often as the king ſhould have occaſion in the wars: he being then ſtreightened for a navy to recover Normandy.

There are alſo ſeveral towns adjoining, to which the privileges of the *cinque-ports* extend.

There are ſeveral courts belonging to theſe ports; one before the lord warden; others within the ports themſelves, before the mayor and jurats; another, which is called *curia quinque portuum apud Shepway*: a writ of error lies from the mayor and jurats of each port to the lord warden, in his court of Shepway; and from this court to the king's bench: and a writ of error lies from all the other juriſdictions to the ſame ſupreme court of judicature, in token of the ſuperiority of the crown when theſe franchiſes were created. All prerogative writs, as thoſe of *habeas corpus*, prohibition, *certiorari*, and *mandamus*, may likewiſe iſſue to all theſe juriſdictions. They have likewiſe a court of chancery, to decide matters of equity; but no original writ iſſues thence.

Theſe five ports are, Haſtings, Romney, Hythe, Dover, and Sandwich; to which Winchelſea and Rye have been ſince added.—Thorn tells us, that Haſtings provided twenty-one veſſels; and in each veſſel twenty-one men. To this port belong Seaford, Pevenſey, Hedney, Winchelſea, Rye, Hamine, Wakeſbourn, Creneth, and Forthclipe.—Romney provided five ſhips, and in each twenty-four men. To this belong Bromhal, Lyde, Oſwarſtone, Dangemares, and Romenhal.—Hythe furniſhed five ſhips, and in each twenty-one ſeamen. To this belongs Weſtmeath.—Dover, the ſame number as Haſtings. To this belong Folkſton, Feverſham, and Marge.—Laſtly, Sandwich furniſhed the ſame with Hythe. To this belong Fordiwic, Reculver, Serre, and Deal.

Cinque-Port *net*. See Net.

CINTRE, in *Building*, the mould on which an arch is turned; popularly called *centre*, ſometimes alſo *cradle*.

CINYRA, in the *Jewiſh Antiquities*, a muſical inſtrument. This and the Hebrew *cinnor*, which is generally tranſlated *cithara*, *lyra*, or *pſalterium*, are the ſame. It was made of wood, and was played on in the temple of Jeruſalem. Joſephus ſays, that the *cinyra* of the temple had ten ſtrings, and that it was touched with a bow. In another place he ſays that Solomon made a great number of them with a precious kind of metal called *electrum*, wherein he contradicts the Scripture, which informs us that Solomon's *cinnors* were of wood.

CION, or **Cyon**, in *Gardening*, a young ſhoot, ſprout, or ſprig, put forth by a tree.

Grafting is performed by the application of the *cion* of one plant upon the ſtock of another.

To produce a ſtock of *cions* for grafting, planting, &c. the gardeners ſometimes cut off the bodies of trees, a little above the ground, and only leave a ſtump or root ſtanding: in this caſe the redundant ſap will not fail next ſpring to put forth a great number of ſhoots.

In dreſſing DWARF-*trees*, a great many *cions* are to be cut off. See Pruning.

Cion, in *Anatomy*, is ſometimes uſed for the UVULA.

CIONES, in *Antiquity*, a kind of idols very common, being only oblong ſtones erected pillar-wiſe; whence alſo they had their name.

CIPHER, or **Cypher**, one of the numeral characters, or figures; formed thus, o.

The word *cipher* comes from the Hebrew סָפַר *ſaphar*, *to number*.

The *cipher* of itſelf implies a privation of value; but when diſpoſed with other characters on the left thereof, in the common arithmetic, it ſerves to augment each of their values by ten; and in decimal arithmetic, to leſſen the value of each figure to the right thereof, in the ſame proportion.

Cipher denotes alſo a kind of enigmatic character, compoſed of ſeveral letters interwoven; which are ordinarily the initial letters of the perſons names, for whom the *cipher* is intended.

Theſe are frequently uſed on ſeals, coaches, and other moveables. Anciently, merchants and tradeſmen were not allowed to bear arms: in lieu thereof they bore their *ciphers*, or the initial letters of their names, artfully interwoven about a croſs; of which we have divers inſtances on tombs, &c.

Cipher is alſo applied to certain ſecret characters, diſguiſed and varied; uſed for the writing of letters that contain ſecrets not to be underſtood by any but thoſe between whom the *cipher* is agreed on. This is now reduced into a ſeparate art, called *cryptographia*, *polygraphia*, and *ſteganographia*; but it appears to have been little known to the ancients.

De la Guilletiere, in his Lacedæmon Ancient and Modern, endeavours to make the ancient Spartans the inventors of the art of writing in *cipher*.

Their ſcytala, according to him, was the firſt ſketch of this myſterious art: theſe ſcytalæ were two rollers of wood, of equal length and thickneſs; one of them kept by the ephori; the other by the general of the army ſent on any expedition againſt the enemy.

Whenſoever thoſe magiſtrates would ſend any ſecret orders to the general, they took a ſlip of parchment, and rolled it very juſtly about the ſcytala which they had reſerved; and in this ſtate wrote their intentions, which appeared perfect and conſiſtent while the parchment continued on the roller: when taken off, the writing was maimed, and without connexion; but it was eaſily retrieved by the general, upon his applying it to his ſcytala. Polybius ſays, that Æneas Tacticus, two thouſand years ago, collected together twenty different manners of writing, ſo as not to be underſtood by any but thoſe in the ſecret; part whereof were invented by himſelf, and part uſed before his time. Trithemius, Bap. Porta, Vigenere, and P. Niceron, have written expreſly on the ſubject of *ciphers*.

As the writing in *cipher* is become an art; ſo is the reading, or unravelling thereof, which is called *deciphering*. See Deciphering.

Cipher *with a ſingle key*, is that wherein the ſame character is conſtantly uſed to expreſs the ſame word, or letter: this is eaſily deciphered with a little application.

Cipher *with a double key*, is that wherein the alphabet, or key, is changed in each line, or in each word; and wherein are inſerted many characters of no ſignificancy, to amuſe and perplex the meaning.

CIPHERING, or **Cyphering**, is popularly uſed for the art of accompting; properly called *arithmetic*.

CIPPUS, among *Antiquaries*, a little, low column, erected in roads, or other places, with an inſcription thereon; either to ſhew the way to travellers, to ſerve as a boundary, or preſerve the memory of ſomething remarkable, and particularly the grave of a defunct.

The *cippi* placed in the highway, for the convenience of travellers, were more properly called MILLIARY *columns.* Hottinger has an expreſs treatiſe of the *cippi* of the Jews, *de cippis Hebræorum*; wherein he takes *cippus* for the tomb-ſtone of a defunct.

CIPPUS was alſo uſed in antiquity for a wooden inſtrument wherewith criminals and ſlaves were puniſhed; being a kind of clog, or ſtocks for the feet.

CIRCADA, a tribute anciently paid to the biſhop or archdeacon, for viſiting the churches.

CIRCÆA, in *Botany.* See *Enchanter's* NIGHT-*ſhade.*

CIRCEA. See CIRCÆA.

The name *circea* is given by ſome to the mandrake, or common mandragora.

CIRCELLIONES. See AGONISTICI.

CIRCENSES *ludi*, CIRCENSIAN *games, or games of the* CIRCUS, a general term, under which were comprehended all combats exhibited in the Roman *circus*, of what kind ſoever; whether on foot, or horſeback, or in a car; wreſtling, or boxing; with ſwords, pikes, darts, or arrows; againſt men, or againſt beaſts; on the ground, or aboard veſſels.

There were few except ſlaves that gave the people this cruel pleaſure: it was an exerciſe that would have diſgraced people of any account. See the article GLADIATORS.

Some ſay, the *circenſian games* were ſo called from the Latin *circumenſes*; becauſe they were held in a place incompaſſed round with naked ſwords, that the combatants might not have an opportunity of eſcaping.

At firſt they are ſaid to have been exhibited on the brink of the river Tyber, and the ground encompaſſed toward the land with naked ſwords.

Moſt of the feaſts of the Romans were accompanied with *circenſian games*; and the magiſtrates, or other officers of the republic, frequently preſented the people with them on other occaſions.—The grand ones were held for five days, commencing on the 15th of September.

CIRCERELLUS, in *Zoology*, a name uſed by ſome authors for the fiſh uſually called AMMODYTES, or the *ſand-eel.*

CIRCITOR, in *Ancient Military Diſcipline*, one whoſe buſineſs it was to go the ROUNDS.

CIRCITOR is alſo uſed to ſignify a hawker, or pedlar, who goes about from place to place to vend his goods.

CIRCINALEA *Folia.* See LEAF.

CIRCINNALIS, in *Botany*, a name given by ſome authors to the ADIANTUM, or *maiden-hair.*

CIRCIUM, a genus of plants according to Tournefort; but comprehended by Linnæus under the carduus. See THISTLE.

CIRCLE, CIRCULUS, in *Geometry*, a plane figure, comprehended under one ſingle line, which returns into itſelf; having a point in the middle, from which all the lines drawn to its circumference are equal.

Properly ſpeaking, it is the ſpace included within the circumference, or periphery, that is the *circle:* though in the popular uſe of the word, *circle* is frequently uſed for the periphery alone. See the article CIRCUMFERENCE.

The area of a *circle* is found by multiplying the periphery by the fourth part of the diameter; or half the periphery by half the diameter.—The area is alſo had by finding a fourth proportional to 1,000,785, and the ſquare of the diameter: or, to 452,355, or to 14, 11, and the ſquare of the diameter. See DIAMETER.

Circles, and ſimilar figures inſcribed in them, are always as the ſquares of the diameters: ſo that they are in a duplicate ratio of their diameters; and therefore of their radii.

A *circle* is equal to a triangle whoſe baſe is equal to the periphery, and its altitude to the radius. *Circles*, therefore, are in a ratio compounded of the peripheries and the radii: but they are alſo in the duplicate ratio of their radii; therefore the peripheries are to each other as the radii.

To find the proportion of the diameter of a CIRCLE *to its periphery.* See DIAMETER.

To circumſcribe a CIRCLE *about a given regular polygon:* biſect two of the angles of the polygon E and D (*Tab. Geometry, fig.* 28.) by the lines EF and DF; and on the point of concourſe F, as on a centre, with the radius EF, deſcribe a *circle.* See CIRCUMSCRIBING.

To deſcribe any given regular polygon in a CIRCLE: divide 360 by the number of ſides, to find the quantity of the angle EFD; which being made in the centre, apply the chord ED to the periphery, as often as it will go: thus is the figure inſcribed in the *circle.*

Through three given points, not in a right line, A, B, C, *fig.* 7. *to deſcribe a* CIRCLE. On A and C ſtrike arches interſecting in D and E; and others, G and H, from C and B; draw the right lines DE and HG: the point of interſection, I, is the center of the *circle.* Hence, 1ſt. by aſſuming three points in the periphery, or the arch of any *circle*, the center may be found, and the given arch be perfected.

2dly, If three points of any periphery agree, or coincide with three points of another; the whole peripheries agree, and the *circles* are equal.

3dly, Every triangle may be inſcribed in a *circle.*

In *Optics*, it is ſhewn, that a *circle* never appears truly ſuch, unleſs either the eye be directed perpendicularly to its center; or the diſtance of the eye from the center, when directed obliquely, be equal to the ſemidiameter of the *circle:* in every other caſe, the *circle* appears oblong; and to make a *circle* that ſhall appear ſuch, it muſt be oblong.

CIRCLES, *parallel*, or *concentric*, are ſuch as are equally diſtant from each other in every point of their peripheries; or are deſcribed from the ſame center: as, on the contrary, thoſe ſtruck from different centers are ſaid to be *eccentric.*

CIRCLE, *the quadrature of the*, or the manner of making a ſquare, whoſe ſurface is perfectly and geometrically equal to that of a *circle*, is a problem that has employed the geometricians of all ages. See the article QUADRATURE.

Many maintain it to be impoſſible: Des Cartes, in particular, inſiſts on it, that a right line, and a *circle*, being of different natures, there can be no ſtrict proportion between them: and, indeed, we are likewiſe at a loſs for the juſt proportion between the diameter and circumference of a *circle.*

Archimedes is the perſon who has come the neareſt to the quadrature of the *circle:* all the reſt have made paralogiſms. Charles V. offered a reward of 100,000 crowns to the perſon who ſhould ſolve this celebrated problem; and the ſtates of Holland have alſo propoſed a reward for the ſame.

CIRCLES *of the higher kinds*, are curves wherein $AP^m : PM^m :: PM : PB$, or, $AP^m : PM^m :: PM^n : PB^n$. *Tab. Analyſis, fig.* 26. *Cor.* I. Suppoſe $AP = x$, $PM = y$, $AB = a$: then will $PB = a - x$. And conſequently $x^m : y^m :: y : a - x$. Hence we have an equation that defines infinite *circles*, viz. $y^{m+1} = ax^m - x^{m+1}$; and another defining infinite other *circles*, viz. $y^{m+n} = \overline{a-x}^{\,n} x^m$.

Cor. II. If $m = 1$, then will $y^2 = ax - x^2$; and therefore a *circle* of the firſt order is contained under this equation alone. If $m = 2$, $y^3 = ax^2 - x^3$, which equation defines a *circle* of the ſecond order.

CIRCLE *of curvature*, in *Geometry*, that *circle* the CURVATURE of which is equal to that of any curve at a certain point.

It is alſo called the *circle* of equi-curvature.

CIRCLES *of the ſphere*, are ſuch as cut the mundane ſphere, and have their periphery either on its moveable ſurface, or in another immoveable, conterminous, and equidiſtant ſurface.

Hence ariſe two kinds of *circles*, *moveable*, and *immoveable.* The firſt are thoſe whoſe peripheries are in the moveable ſurface, and which therefore revolve with its diurnal motion; as the *meridians*, &c.

The latter, having their periphery in the immoveable ſurface, do not revolve; as the *ecliptic*, *equator*, and its *parallels*, &c.

If a ſphere be cut in any manner, the plane of the ſection will be a *circle*, whoſe center is in the diameter of the ſphere.

Hence the diameter of a *circle* paſſing through the center, being equal to that of the *circle* which generated the ſphere; and that of a *circle* which does not paſs through the center, being only equal to ſome chord of the generating *circle*; the diameter being the greateſt of all chords, there hence ariſes another diviſion of the *circles* of the ſphere, viz. into *great* and *leſſer.*

CIRCLE, *great, of the ſphere*, is that which divides it into two equal parts, or hemiſpheres; having its center in the center thereof.

Hence, all *great circles* are equal, and cut each other into equal portions, or ſemicircles.

The *great circles* are the *horizon*, *meridian*, *equator*, *ecliptic*, the *colures*, and the *azimuths*; which ſee in their places.

CIRCLE, *leſſer, of a ſphere*, is that which divides the ſphere into two unequal parts, and has its center in the axis of the ſphere, but not in the center thereof.

Theſe are uſually denominated from the great *circles* they are parallel to; as, *parallels of the equator*, &c.

CIRCLES *of altitude*, otherwiſe called *almucantars*, are *circles* parallel to the horizon, having their common pole in the zenith, and ſtill diminiſhing as they approach the zenith. They have their names from their uſe; which is to ſhew the altitude of a ſtar above the horizon.

Some have ſuſpected a variation in the apparent ſolſtitial *altitudes* of the ſun. Something of this kind was perceived by M. Caſſini in 1655, by means of the great gnomon in the church of St. Petronius at Bologna; which was further confirmed by other obſervations at the royal obſervatory at Paris. The variation obſerved by M. Caſſini during the courſe of twenty-two years, only amounted to a few ſeconds. And by comparing the obſervation made by Pytheas at Marſeilles three hundred years before Chriſt, with another made by Caſſini in 1672 at the ſame place, it appears, that in two thouſand years time, this difference of *altitude* has only amounted to a few minutes. V. Mem. Acad. Scienc. 1693. p. 180. ſeq. See Ecliptic.

The *altitude* of the ſun, it is ſaid, may be found to a few ſeconds, with an inſtrument of three foot radius. But this is rarely found in fact. A French engineer, M. Hauteſeuille, has propoſed a new inſtrument, whereby he pretends to take *altitudes* even to thirds.

To find the ſun's *altitude* by the globe, ſee the article Globe.

Circles *of declination*, are great *circles* interſecting each other in the poles of the world.

Circle *of diſſipation*, in *Optics*. See the article Dissipation.

Circles, *diurnal*, are immoveable *circles*, ſuppoſed to be deſcribed by the ſeveral ſtars, and other points of the heavens, in their diurnal rotation round the earth; or rather, in the rotation of the earth round its axis.

Thus if a right line be conceived to be continued from the center of a ſtar, perpendicular to the axis of the world, as far as the ſurface of the ſphere of the world, it will deſcribe a diurnal *circle* for it, in making one revolution about its axis.

The *diurnal circles* are all unequal: the equator is the greateſt.

Circle *equant*, in the *Ptolemaic Aſtronomy*, is a *circle* deſcribed on the center of the equant.

Its chief uſe is, to find the variation of the firſt inequality.

Circles *of excurſion*, are *circles* parallel to the ecliptic, and at ſuch a diſtance from it, as that the excurſions of the planets towards the poles of the ecliptic, may be included within them; uſually fixed at 10 degrees.

It may here be added, that all the *circles* of the ſphere above deſcribed, are transferred from the heavens to the earth; and thence come to have a place in geography, as well as in aſtronomy: all the points of each *circle* being conceived to be let fall perpendicularly on the ſurface of the terreſtrial globe, and ſo trace out *circles* perfectly ſimilar to them.

Thus, the terreſtrial equator is a line, conceived preciſely under the equinoctial line, which is in the heavens; and ſo of the reſt.

Circles, *horary*, in *Dialling*, are the lines which ſhew the hours on dials; though theſe be not drawn circular, but nearly ſtrait.

Circle, *horary, on the globe*, a brazen circle fixed to the north pole, and furniſhed with an index, ſhewing the difference of meridians, and ſerving for the ſolution of many problems. The uſual poſition of this *circle* prevents the braſs meridian from moving quite round in the horizon; ſo that globes of the common ſort cannot be applied to the ſolution of many problems. Mr. Harris contrived to remedy this inconvenience, by placing two *horary circles* under the meridian, one at each pole: theſe are fixed tight between two braſs collars placed about the axis, but ſo that they may be eaſily turned by the hand when the globe is at reſt; and when the globe is turned, they are carried round with it, the meridian ſerving as an index to mark out the horary diviſion. The globe, thus prepared, will ſerve for ſolving problems in all latitudes, as well as in places near the equator. Philoſophical Tranſanctions abridged, vol. viii. p. 352. See Globe.

Circle *of illumination*, is that imaginary *circle* on the ſurface of the earth, which is formed by a plane paſſing through the center of the earth, ſo that the line which joins the centers of the ſun and earth may be perpendicular to it, and which ſeparates the illuminated hemiſphere of the earth from the dark. This Mr. Keil calls the illuminated diſc of the earth: and all lines paſſing from the ſun to the earth, which are phyſically parallel, are perpendicular to the plane of this *circle*.

Circles *of latitude*, or *ſecondaries of the ecliptic*, are great *circles* perpendicular to the plane of the ecliptic, paſſing through the poles thereof, and through every ſtar and planet.

They are ſo called, becauſe they ſerve to meaſure the latitude of the ſtars, which is nothing but an arch of one of theſe *circles*, intercepted between the ſtar and the ecliptic.

Circles *of longitude*, are ſeveral leſſer *circles*, parallel to the ecliptic; ſtill diminiſhing, in proportion as they recede from it.

On the arches of theſe *circles*, the longitude of the ſtars is reckoned.

Circle *of perpetual apparition*, one of the leſſer *circles*, parallel to the equator; deſcribed by any point of the ſphere touching the northern points of the horizon, and carried about with the diurnal motion.

All the ſtars included within this *circle* never ſet, but are ever viſible above the horizon.

Circle *of perpetual occultation*, is another *circle* at a like diſtance from the equator, deſcribed by the ſouthern point of the horizon; and contains all thoſe ſtars which never appear in our hemiſphere.

The ſtars ſituate between theſe *circles* alternately riſe and ſet at certain times.

Circles, *polar*, are immoveable *circles*, parallel to the equator, and at a diſtance from the poles equal to the greateſt declination of the ecliptic.

That next the northern pole is called the *arctic*; and that next the ſouthern one the *antarctic*.

Circles *of poſition*, are *circles* paſſing through the common interſections of the horizon and meridian, and through any degree of the ecliptic, or the center of any ſtar, or other point in the heavens; uſed for finding out the ſituation or poſition of any ſtar.

They are uſually made ſix in number; and cut the equator into twelve equal parts, which the aſtrologers call the *celeſtial houſes*. Hence ſome call them *circles of the celeſtial houſes*.

Circle, *antarctic*. See Antarctic.
Circle, *arch of a*. See Arch.
Circle, *arctic*. See Arctic.
Circle, *axis of a*. See Axis.
Circle, *center of a*. See Center.
Circle, *eccentric*. See Eccentric.
Circle, *equal*. See Equal.
Circle, *fairy*. See Fairy.
Circle, *right*. See Right.
Circles, *ſecondary*. See Secondary.
Circle, *ſegment of a*. See Segment.
Circles, *vertical*, or *azimuths*. See Vertical, and Azimuth.

Circle, in *Logic*, that fault of an argument that ſuppoſes the principle it ſhould prove, and afterwards proves the principle by the thing it ſeemed to have proved.

Or, a *circle* in logic, called alſo *ſyllogiſtic circle*, is when the ſame terms are proved, *in orbem*, by the ſame terms; and the parts of the ſyllogiſm, alternately, by each other, both directly and indirectly.

Thus the papiſts argue, when they prove the Scriptures to be the word of God by the infallible teſtimony of their church, and the authority of the church by the Scripture.

There are two kinds of *circles*; the one *material*, the other *formal*.

The *formal* is that which in two reciprocal ſyllogiſms begs the medium, which is the next cauſe of the greater extreme. This kind is by no means to be admitted: otherwiſe, the ſame thing becomes both prior and poſterior; the cauſe and effect of itſelf; which is abſurd.

The *material circle*, called alſo *regreſſus*, conſiſts of two ſyllogiſms, the former whereof proves the cauſe by the effect; and the latter the effect by the cauſe: this may be admitted.

Circle, Circulus, is underſtood among the ſchoolmen, of a viciſſitude of generations, ariſing one out of another.

Thus, good concoction cauſes a good habit of body; a good habit of body produces ſtrength and vigour; theſe occaſion frequent exerciſes; and theſe a good concoction.

It is a celebrated dogma of the Scotiſts, "There is no "*circle* in cauſes of the ſame order, or kind."

Circles *of the empire*, are ſuch provinces, and principalities of the empire, as have a right to be preſent at Diets.

The diviſion of the empire into ſix *circles* was eſtabliſhed by Maximilian I. in 1500, at Augſburg: twelve years afterwards he divided it afreſh, into ten *circles*; which partition was confirmed by Charles V. at the diet of Nuremberg, in 1522.

Though the order of theſe *circles* has never been well regulated; yet, in the imperial matricula, it is as follows: the *circle* of Auſtria, that of Burgundy, of the Lower Rhine, of Bavaria, Upper Saxony, Franconia, Suabia, Upper Rhine, Weſtphalia, and the Lower Saxony.

CIRCOLO *mezzo*, in the *Italian Muſic*, is a diminution of four quavers or ſemiquavers, or notes of equal value, which repreſent a ſemicircle proceeding by conjoint degrees.

CIRCUIT, or **Circuity**, in *Law*, a longer courſe of proceeding, to recover the thing ſued for, than is needful.

Thus, if a man grant a rent-charge of 10*l*. out of his manor, and after, the grantee diſſeiſeth the grantor of the ſame manor, who brings an ASSISE, and recovers the land, and 20*l*. damages; which being paid, the grantee brings his action for 10*l*. of his rent, due during the time of the diſſeiſin, and which he muſt have had, if no diſſeiſin had been: this is called *circuit of action*; becauſe, whereas the grantor was to receive 20*l*. damages, and to pay 10*l*. rent, he might have received but 10*l*. for damages, and the grantee have kept the other.

Circuit is alſo the journey, or progreſs the JUDGES take, twice every year, through the ſeveral counties of England and Wales, to hold courts, and adminiſter juſtice, where recourſe cannot ſo well be had to the king's courts at Weſtminſter.

Theſe were firſt eſtabliſhed, with ſome little difference, by Henry II. and afterwards expreſly ordained by *Magna Charta*.

England is divided into ſix *circuits*; viz. the Home *circuit*, Norfolk *circuit*, Midland *circuit*, Oxford *circuit*, Weſtern *circuit*, and Northern *circuit*. Two judges are appointed to each *circuit*. In Wales there are two *circuits*, North and South Wales.

There are three *circuits* in Scotland, viz. South, Weſt, and North, which the *lords of juſticiary* go twice a year, viz. in May and October. See JUSTICIARY.

Circuit, *electrical*, denotes the courſe of the electric fluid from the *charged* ſurface of an electric body, to the oppoſite ſurface into which the diſcharge is made. Some of the firſt electricians apprehended, that the ſame particles of the electric fluid, which were thrown on one ſide of the charged glaſs, actually made the whole *circuit* of the intervening conductors, and arrived at the oppoſite ſide: whereas Dr. Franklin's theory only requires, that the redundancy of electric matter on the charged ſurface ſhould paſs into the bodies, which form that part of the *circuit* which is contiguous to it, driving forward that part of the fluid which they naturally poſſeſs, and that the deficiency of the exhauſted ſurface ſhould be ſupplied by the neighbouring conductors, which form the laſt part of the *circuit*. On this ſuppoſition, a vibrating motion is ſucceſſively communicated through the whole length of the *circuit*. This *circuit* is always formed of the beſt conductors, let the length of it be ever ſo great. Many attempts were made, both in France and England, at an early period in the hiſtory of electricity, to aſcertain the diſtance to which the electric ſhock might be carried, and the velocity of its motion. The French philoſophers, at different times, made it to paſs through a *circuit* of 900 toiſes, and of 2000 toiſes, or about two Engliſh miles and a half; and they diſcharged the Leyden phial through a baſon of water, the ſurface of which was about an acre. And M. Monnier found, that, in paſſing through an iron wire of 950 toiſes in length, it did not ſpend a quarter of a ſecond; and that its motion was inſtantaneous through a wire of 1319 feet. In 1747, Dr. Watſon, and other Engliſh philoſophers, after many experiments of a ſimilar kind, conveyed the electric matter through a *circuit* of four miles; and they concluded from this and another trial, that its velocity is inſtantaneous. Prieſtley's Hiſt. of Electricity, vol. i. ſect. 2. p. 128. 8vo. ed. 1775. See ELECTRICAL *ſhock*.

CIRCUITORES. See AGONISTICI.

CIRCULAR, any thing that is deſcribed, or moved in a round; as the circumference of a CIRCLE, or the ſurface of a globe.

The *circular* form is of all others the beſt diſpoſed for motion; and the moſt capacious.

The modern aſtronomers ſhew, that the heavenly bodies do not move in *circular*, but in elliptic ORBITS. See PLANET, &c.

Circular *arches*. See ARCH.

Circular *letter*, a letter directed to ſeveral perſons, who have the ſame intereſt in ſome common affair; as in the convocation of aſſemblies, &c.

Circular *lines*, an appellation given by ſome to ſuch ſtrait lines as are divided from the diviſions made in the arch of a circle. Such are SINES, TANGENTS, SECANTS, &c.

Circular *numbers*, are ſuch whoſe powers end in the roots themſelves; whoſe ſquare is 25, and cube 125. See NUMBER.

Circular *parts*, *Neper's*, are the complements of the two oblique angles of a right angled ſpherical triangle, the complement of the hypothenuſe, and the two legs, by having any two of which the third is known. See TRIANGLE and TRIGONOMETRY.

Circular *ſailing*, is that performed in the arch of a great circle.

Circular ſailing, of all others, goes the neareſt or ſhorteſt way; and yet there are ſuch advantages in SAILING by rhumbs, that this latter is generally preferred.

Circular *ſpots* are made on pieces of metal by large electrical exploſions. See experiments and obſervations upon them, in Dr. Prieſtley's Hiſt. of Electricity, vol. ii. ſect. 9. ed. 8vo. and Phil. Tranſ. vol. lviii. p. 68.

Theſe beautiful ſpots produced by the moderate charge of a large BATTERY, diſcharged between two ſmooth ſurfaces of metals, or ſemi-metals, lying at a ſmall diſtance from each other, conſiſt of one central ſpot, and ſeveral concentric circles, which are more or leſs diſtinct, and more or fewer in number, as the metal upon which they are marked is more eaſy or difficult of fuſion, and as a greater or leſs force is employed. They are compoſed of dots or cavities, which indicate a real fuſion. If the exploſion of a battery, iſſuing from a pointed body, be repeatedly taken on the plain ſurface of a piece of metal near the point, or be received from the ſurface on a point, the metal will be marked with a ſpot, conſiſting of all the priſmatic colours diſpoſed in circles, and formed by ſcales of the metal ſeparated by the force of the exploſion. See COLOURS.

Circular *winding ſtairs*. See STAIRS.

Circular *ſegment*, *reſiſtance of a*. See RESISTANCE.

Circular *velocity*, a term in *Aſtronomy*, ſignifying that velocity of a planet, or revolving body, which is meaſured by the arch of a circle: as ſuppoſe by AB (*Tab. Aſtronomy*, *fig*. 10.) deſcribed on the center of attraction S.

The *circular velocity* of a body moving from B to C, is meaſured by the arch BC.

CIRCULATING *Decimals*. See REPETEND.

CIRCULATION, the act of moving round, or in a *circle*. We ſay, the *circulation* of the blood; the *circulation* of the ſap; of the ſpirits, &c.

As in the great world we find a perpetual and orderly *circulation* of waters, conveyed from the ſea by ſubterraneous paſſages, ſprings, &c. and returned thither again by rivers, &c. ſo in the little world, man, a like circuit is obſerved; the blood being continually driven from the heart, by the arteries, to all parts of the body; and brought back again to the heart by the veins.

Circulation *of the blood*. See BLOOD.

Circulation *of the ſap* is a natural motion of the nutritious juice of plants, ſuppoſed to be conveyed from the root to the extreme parts, and thence back again to the root.

The experiments of ſeveral naturaliſts and gardeners, ſeem to prove a *circulation* in the body of plants, by veins and arteries, analogous to that in animals.

M. Perrault ſtarted the *circulation* of the ſap in France, and propoſed it, in 1667, to the Royal Academy; though M. Major, a phyſician of Hamburgh, had publiſhed it, unknown to M. Perrault, two years before. A year and a half afterwards, M. Mariotte propoſed the ſame to the academy as a new thing; not knowing that M. Perrault had been before-hand with him: and the great Malpighi appears to have entertained the ſame thought about the ſame time.

The opinion, however, was not univerſally received: ſome of the ableſt botaniſts, and particularly M. Dodart, proteſted openly againſt it.

That author allows of a juice mounting from the root to the extremities of the branches; and of another deſcending from thoſe extremities to the root: the firſt imbibed from the ſoil, and digeſted in the root, for the nouriſhment of the plant; the ſecond received, from the moiſt parts of the air, at the extremities of the branches. The riſing and deſcending juices, therefore, according to him, are not the ſame; or that which riſes, never deſcends, and reciprocally; i. e. there is no *circulation*.

Dr. Tong, in the Philoſophical Tranſactions, maintains, that the ſap always riſes, and never properly deſcends; having only a ſubſiding, or recidivation, which he can by no means call a *circulation*.

Mr. Switzer owns himſelf at a loſs for the method wherein a *circulation* ſhould be effected; as well as for the parity of reaſon commonly urged for a *circulation* of the ſap, and of the blood. In animals, he obſerves, the degree of growth, or extenſion, is but very ſmall: ſo that the blood, not being employed in any other ſervice, may be eaſily ſuppoſed to circulate: but trees growing to an unlimited tallneſs, it is probable, the great effort of nature is employed in extending them that way; and that the nutritious juice only aſcends. He adds, that, as to the ſwelling or extenſion of trees in bulk, it evidently ariſes from the effuſion of the ſap from the heart of the tree through the pores; which dilates the whole inſenſibly, by accumulating circle on circle; which are annual gradations eaſily obſerved upon cutting a branch, or trunk, acroſs.

On the other hand, it is urged in favour of a *circulation*, that the ſame experiments of ligature, and inciſion, which evince a *circulation* in animals, have been made in plants; particularly in ſuch as abound in ſap; as the ſpurges, &c. and with the ſame ſucceſs: the part between the ligature and the root ſwelling very conſiderably, and the other much leſs.

The ligatures are to be made with metalline rings. Dr. Liſter gives us an inſtance, in the cataputia minor, where the ligature being only a ſilken thread, tied as hard as poſſible without breaking the ſkin; no greater ſwelling aroſe on one ſide the ligature than on the other.

Mr. Lawrence gives us a demonſtration of the *circulation* of the ſap, from an experiment on the yellow-ſtriped jeſſamine.—Upon a branch of a plain jeſſamine, whoſe ſtem ſpreads itſelf in two or three branches, inoculate a bud of the yellow-ſtriped jeſſamine, as in autumn: as the tree comes to ſhoot, the following ſummer, ſome of the leaves will be found tinged here and there with yellow, and this even on the branches not inoculated; till, by degrees, the whole tree, even the very wood of the young branches, will be all variegated, or ſtriped with green and yellow.

Mr. Fairchild confirms this experiment, by a ſimilar one of his own: having inoculated a yellow-ſpotted jeſſamine-tree, into another jeſſamine-tree, he found, that though the bough did not take, yet, in a fortnight's time, yellow ſpots began to appear on a ſhoot which came out of the ground from another part of the plant. But this only proves the receſs of the ſap, as Dr. Hales obſerved.

Blair is of opinion, that there are certain parts of plants which have their peculiar juices, and maintain a *circulation* in themſelves, independent of the reſt of the plant. The fleſhy and thick roots of ſome plants, and the fruits of others, are of this number of peculiar parts. This is analogous to what we ſee in ſome parts of animal bodies alſo. On this ſcheme, the bark, the wood, and the pith of a tree, may be compared to the bones, the ſkin, and the marrow of animals: while the nouriſhment is ſent in abundance to one part of theſe, it is allowed more ſparingly to the reſt. Thus while a young tree ſhoots out its tender boughs in ſpring, the juice aſcends upward to them from the root; but when theſe have acquired their due length, the motion of the ſap is determined upward with leſs violence, and the bark and wood are nouriſhed and increaſed by it. This is the reaſon why in ſpring trees grow in height, and in autumn increaſe in thickneſs.

As to the manner of the *circulation*, Malpighi, Grew, &c. by means of microſcopes, have diſcovered, that the wood of plants conſiſts of fine capillary tubes, which run parallel from the root, through the trunk, and may be looked on as arteries; and on the outſide of theſe, betwixt the wood and the inner bark, are other large tubes, to do the office of veins.

Now, the root having imbibed a ſtock of juice from the earth, that juice will be put in motion by the heat; that is, it will be rarefied, and made to aſcend in form of a ſteam, or vapour: meeting, therefore, with the open mouths of the arterial veſſels, it will paſs through the ſame to the top and extreme parts of the tree, with a force anſwerable to the heat by which it is put in motion: when it is there arrived, meeting with the cold of the external air, it is condenſed into a liquor; and in that form returns, by its own weight, towards the root of the venal veſſels above mentioned.

The ingenious Dr. Hales has clearly ſhewn, by a variety of experiments and obſervations, that there is no *circulation* in vegetables analogous to that of the blood in animals. The motion of the ſap is ſolely occaſioned by the ſtrong attraction of the capillary ſap-veſſels, aſſiſted by the vibrations reſulting from the warmth of the ſun; in conſequence of which the ſap is carried up to the top of the talleſt trees, and perſpired off through the leaves. The aſcent of the ſap is principally promoted by the plentiful perſpiration of the leaves; and this power, he obſerves, does not ſeem well adapted to make the ſap deſcend from the tops of vegetables, by different veſſels, to the root. He allows, indeed, that the ſap has an alternate, progreſſive, and receding motion, occaſioned by the interchanges of day and night, warmth and cold, moiſture and dryneſs. That the ſap does not deſcend between the bark and wood, he concludes from the experiment of taking off the bark of a tree, about three or four inches in breadth quite round; the conſequence of which will be that the bleeding of the tree above this part will much abate; whereas it ought to have the contrary effect, by intercepting the courſe of the refluent ſap, if it deſcended by the bark. But this experiment confirms the opinion which he has adopted, that the ſap aſcends between the bark and the wood, by the vigorous operation of the perſpiring leaves, and attracting capillaries. It is likewiſe alleged, that ſea-plants have no longitudinal capillary ſap-veſſels, but that their whole ſubſtance is compoſed of veſicles, receiving their nouriſhment immediately from the ſurrounding water: ſo that *circulation* is not neceſſary in order to vegetation. M. Muſtel has farther confirmed this opinion. Having placed ſeveral ſhrubs in pots near the windows of his hot-houſe, ſome within, and ſome on the outſide, he contrived to convey a ſingle branch of each through holes in the glaſs; thoſe whoſe trunks were in the open air had a branch in the hot-houſe, and thoſe within the houſe had a branch expoſed to the open air. The conſequence of this diſpoſition was, that the branches within the hot-houſe very ſoon began to diſcloſe their buds, and to put forth leaves, ſhoots, and flowers. Some of the external branches were killed by the intenſe cold; nor was there viſible the leaſt ſign of vegetation: and yet the branches within the houſe were not in the leaſt affected by the chilled ſtate of their trunks. Thoſe trees, on the contrary, that were within the houſe vegetated, and their branches were covered with leaves and flowers, whilſt the ſingle branch that was conveyed to the outſide was in the ſame ſtate with thoſe that grew abroad, and derived no advantage from the heat to which the trunks and other branches were expoſed. From theſe curious and deciſive experiments, M. Muſtel infers, that there is no regular or general *circulation* of the ſap in trees between the trunk and the branches; and that each part of a tree is furniſhed with a quantity of ſap, independent of any ſupply from the trunk or other branches, ſufficient to effect the firſt production of buds, flowers, and fruits, provided that the juices are put into motion by heat. See on this ſubject Hales's Statical Eſſays, vol. i. chap. 4. and vol. ii. Appendix, Obſervation 7. and Phil. Tranſ. vol. lxiii. part 1. art. 15. p. 126. et ſeq. See PERSPIRATION, PLANTS, and VEGETATION.

CIRCULATION *of the ſpirits*, or *nervous juice*. That the ſpirits circulate, is evinced, in the ſame manner as ſome authors chooſe to prove the *circulation* of the blood, viz. that as the heart drives out, every hour, three or four thouſand ounces of blood; whereas, ordinarily, there is not above two thouſand in the whole body; there is a neceſſity for the blood, driven out, to return to the heart, in order to ſupply a fund to be expelled.

In like manner it is ſhewn, that there is formed, each hour, a large quantity of ſpirits, which are nothing but the more ſubtil parts of this blood driven out from the heart; whence it is inferred, that theſe too muſt circulate.

The courſe they are ſuppoſed to take, is this. The moſt ſubtil parts of the arterial blood, being carried from the heart to the brain by the carotid arteries, are thrown violently into the fine net-work wherewith the bottom of the ventricles of the brain is lined; whence the more delicate parts are driven into the mouths of the choroid arteries, where they continue their rapid motion, and diſcharge themſelves at the pores where thoſe veſſels terminate around the pineal gland.

Hence they enter that gland, and there form a conſtant ſpring of ſpirits; which, being here purified, enter the cavities of the brain; and inſinuating into the pores of its ſubſtance, flow into the lymphatics; whence they are carried to the heart by two ways: thoſe from the upper parts by the ſubclavian veins, and the adjacent veſſels; thoſe from the lower, being diſcharged into Pecquet's reſervoir, proceed by the thoracic duct; and at laſt, by the deſcending veins, to the heart; whence they begin their courſe afreſh. See ANIMAL *ſpirits*.

CIRCULATION, *ſubterranean*. Dr. Plott is one of the many authors who have argued for a ſubterranean *circulation* of water, by means of which many ſprings and rivers are ſupplied with that water which they give again to the ſea. It is probable, indeed, that many of the ſmaller ſprings are ſupplied by rains, only where the country and ſituation are favourable: but the larger rivers, and the ſprings which ſupply them, muſt have their origin from ſuch a ſubterranean *circulation*, ſince all the water that falls in a year in the whole earth, is not one five hundredth part the quantity of that diſcharged into the ſea at the mouths of rivers, as appears by careful and moderate calculations. There are ſome ſprings which ebb and flow with the ſea: theſe cannot be doubted as to their origin, which is evidently from that body of water whoſe motions they are influenced by. Nor is the caſe much leſs clear in regard to thoſe lakes which have ſalt water and ſea-fiſh in them, and yet have no communication with any ſea by any known cut or paſſage.

The number of ſhell-fiſh and parts of ſea-animals dug up in ſeveral places, at great depths within land, are alſo urged by ſome as proofs of ſuch ſubterranean paſſages of the ſea-water; but theſe are too univerſally diſtributed through the ſtrata of the earth, to have been brought in this manner, and are therefore rather ſuppoſed to be owing to the great change made in the earth by the flood *in the days of* Noah. See VAPOUR, &c.

CIRCULATION, in *Chemiſtry*, is an operation whereby the ſame vapour, raiſed by fire, falls back, to be returned and diſtilled ſeveral times, and thus reduced into its moſt ſubtil parts.

Circulation is performed by diſpoſing the liquor in a ſingle veſſel, ſtopped at top, called a *pelican*; or in a double veſſel, conſiſting of two pieces, luted on each other; the lower to contain the liquor, and its vapours.

It is performed either by the heat of a lamp, or that of aſhes, or of ſand moderately hot, or in dung, or by the ſun. It uſually demands a continued heat of ſeveral days, ſometimes of ſeveral weeks, or even ſeveral months. By *circulation*, the fineſt part of the fluid mounts to the top of the veſſel; and, finding no iſſue there, falls back again, and rejoins the matter left behind at the bottom, whence it aroſe: and thus, by continuing to riſe and fall, alternately, in the veſſel, there is effected a kind of *circulation*, or remixtion, of the ſpirituous parts with the groſs ones; whereby the former are rendered finer, and more ſubtil, and are better diſpoſed to exert their activity, when ſeparated from the latter.

CIRCULATORY, CIRCULATORIUM, in *Chemiſtry*, the veſſel wherein a fluid is put, to undergo the proceſs of CIRCULATION.

There are two kinds of *circulatories*; the *diota*, or DOUBLE *veſſel*; and the PELICAN.

CIRCULUS, in *Geometry*, *Logic*, &c. See CIRCLE.

CIRCULUS, among *Chemiſts*, is a round iron inſtrument, uſed in cutting off the necks of glaſs veſſels; which they effect thus. The inſtrument, being heated, is applied to the glaſs veſſel, and there kept till the latter grow hot: then, by a few drops of cold water, or a cold blaſt thereon, it flies evenly and regularly off. Thus they cut off the necks of retorts, or cucurbits.

There is another method of doing the ſame; viz. by tying a thread, firſt dipped in oil of turpentine, round the place where the ſection is to be; and then ſetting fire to the thread.

This done, ſome cold water being ſprinkled on the place, the glaſs will be cracked through preciſely where the thread was tied.

CIRCUMAGENTES *muſculi*, in *Anatomy*. See OBLIQUI.

CIRCUMAGENTIUM *femoris primus*, in *Anatomy*, a name given by Spigelius, and ſome others, to a muſcle of the thigh, called by Riolan, and ſome others, the *iliacus externus*, but more generally, from its ſhape, the *pyriformis*, and *pyramidalis*.

CIRCUMAMBIENT, an epithet denoting a thing to inveſt, or encompaſs, another round.

We ſay, the ambient, or *circumambient* air, &c.

CIRCUMCELLIONES, in *Church Hiſtory*, a ſet of illiterate ſavage peaſants, and deſperate ruffians, who adhered to the party of the DONATISTS towards the end of the fourth century. They aſſumed the title of vindicators of juſtice, and protectors of the oppreſſed, and maintained their cauſe by force of arms, and filled the whole province of Africa with ſlaughter and rapine. Conſtantine the Great, in order to quiet the tumults which they occaſioned, aboliſhed the laws that had been enacted againſt the Donatiſts; however, after his death, their aſſaſſinations and maſſacres were renewed, till they were defeated by Macarius at the battle of Bagnia. Many of this frantic mob were afterwards treated with great ſeverity, and the Donatiſts ſhared their ſufferings.

CIRCUMCISION, the act of cutting off the prepuce; or a ceremony, in the Jewiſh and Mahometan religions, wherein they cut away the fore-ſkin of the males who are to profeſs the one, or the other law.

Circumciſion commenced in the time of Abraham; and was, as it were, the ſeal of a covenant ſtipulated between God and him: it was in the year of the world 2178, that Abraham, by divine appointment, *circumciſed* himſelf, and all the males of his family: from which time it became an hereditary practice among his deſcendants.

The ceremony, however, was not confined to the Jews: Herodotus and Philo Judæus obſerve, that it obtained alſo among the Egyptians and Ethiopians. Herodotus ſays, that the cuſtom was very ancient among each people; ſo that there was no determining which of them borrowed it from the other. The ſame hiſtorian relates, that the inhabitants of Colchis alſo uſed *circumciſion*; whence he concludes, that they were originally Egyptians. He adds, that the Phœnicians and Syrians were likewiſe *circumciſed*; but that they borrowed the practice from the Egyptians. And, laſtly, that a little before the time when he wrote, *circumciſion* had paſſed from Colchis, to the people inhabiting near Thermodoon and Parthenius.

Marſham is of opinion, that the Hebrews borrowed *circumciſion* from the Egyptians; and that God was not the firſt author thereof: citing Diodorus Siculus, and Herodotus, as evidences on his ſide. This latter propoſition ſeems directly contrary to the teſtimony of Moſes; who aſſures, Gen. xvii. that Abraham, though ninety-nine years of age, was not *circumciſed* till he had the expreſs command of God for it: but as to the former poſition of Marſham, it will admit of more debate. The arguments, on both ſides, may be ſeen, in one view, in Spencer de Legibus Hebræor. lib. ii. cap. 4.

Be this as it will, it is certain, the practice of *circumciſion*, among the Hebrews, differed very conſiderably from that of the Egyptians. Among the firſt, it was a ceremony of religion, and was performed on the eighth day after the birth of the child; among the latter, it was a point of mere decency and cleanlineſs; and, as ſome will have it, of phyſical neceſſity; and was not performed till the thirteenth year; and then on girls, as well as boys.

Among the Jews, *circumciſion* was performed with a knife of ſtone. They ſet aſide the practice of *circumciſion*, during the forty years of their paſſage through the wilderneſs; becauſe *circumciſion* being intended as a mark of diſtinction between the Jews and the Gentiles, it was unneceſſary to make any mark at all, in a place wherein there was nobody to mix with them. M. Fleury obſerves, that the Jews were not unanimous as to the neceſſity of *circumciſion*; ſome holding it an eſſential, others only as a circumſtance.

The Turks, before the operation of *circumciſion*, ſqueeze the ſkin with little pincers, to deaden the ſenſation; they then cut it off with a razor, and apply a certain powder, which heals the wound, and takes off the pain. They never *circumciſe* till the ſeventh or eighth year; as having no notion of its being neceſſary to ſalvation.

The Perſians *circumciſe* their boys at thirteen years, and their girls from nine to fifteen. Thoſe of Madagaſcar cut off the fleſh at three ſeveral times; and the moſt zealous of the relations preſent catches hold of the preputium, and ſwallows it.

Herrera tells us, there is a kind of *circumciſion* among the Mexicans, though they are very far both from Judaiſm and Mahometaniſm: they cut off the foreſkin of the virile member, and the ears, as ſoon as the child is born, with great ceremony.

There is a kind of *circumciſion* practiſed at Otaheite, one of the newly diſcovered iſlands in the South Seas. The operation is performed by a prieſt, and conſiſts in ſlitting the prepuce through the upper part, to prevent its contracting over the glans. The practice ſeems to have taken its riſe from motives of cleanlineſs. Hawkeſworth's Voyages, vol. ii. p. 241.

Circumciſion is alſo practiſed on women, by cutting off the fore-ſkin of the clytoris, which bears a near reſemblance and analogy to the preputium of the male penis. Strabo ſays, the Egyptian women were circumciſed; Belon ſays the ſame of the Cophtæ; and P. Jovius and Munſter of the ſubjects of Preſter John.

Among the Jews, the father is obliged to have his ſon circumciſed on the eighth day; it may not be ſooner: but the child's weakneſs may allow of its being deferred longer. There is a godfather to hold the child, and a godmother to carry it from the houſe to the ſynagogue, and to preſent it there. He who circumciſes is called, in Hebrew, ***Mohel:*** any perſon is choſen for the purpoſe indifferently; provided he be but capable of the function; which, among the Jews, is a title of great merit. The manner of the ceremony, as related by Leo De Modena, is as follows.—Two ſeats are prepared, in the morning, with ſilken cuſhions; one for the godfather who holds the child; the other, as they ſay, for the prophet Elias, whom they ſuppoſe to aſſiſt inviſibly. The perſon who is to circumciſe, brings the neceſſary utenſils; the razor, ſtyptic, linen, fillet, and oil of roſes; to which ſome add a ſhell full of ſand, to put the preputium in. A pſalm is ſung till the godmother brings the child, attended with a crowd of women, and delivers it to the godfather; none of them entering the door: the godfather, being ſeated, ſets the child on his lap; then the *circumciſer*, taking the razor, and preparing the child for the operation, ſays, *Bleſſed be thou, O Lord, who has injoined us circumciſion*; and in ſo ſaying, cuts off the thick ſkin of the preputium, and with his finger-nails tears off another finer ſkin remaining; ſucking the blood two or three times, as it breaks out, and ſpitting it out into a glaſs full of wine: then he lays dragons-blood on the wound, with powder of coral, and other things, to ſtanch the blood; and, laſtly, a compreſs of oil of roſes; and thus binds up the whole: this done, he takes a glaſs of wine, and, bleſſing it, adds another benediction for the child, and impoſes the name.

The manner of circumciſing among the Turks, differs from that of the Jews: for the former, after they have cut off the ſkin, meddle no further; but the laſt tear off the edge of the remaining ſkin in ſeveral places with their thumb-nails; which is the reaſon why the circumciſed Jews are cured much ſooner than the Turks.

Thoſe among the Jews who perform the operation of *circumciſion*, are diſtinguiſhed by the length of their thumb-nails.

Circumciſion is alſo uſed medicinally, when the prepuce is affected with a gangrene, and becomes black.

CIRCUMCISION is alſo the name of a feaſt celebrated on the firſt of January, in commemoration of the *circumciſion* of our Saviour.

This day was anciently kept a faſt, in oppoſition to the pagan ſuperſtitions, who feaſted on it in honour of the god Janus.

CIRCUMFERENCE, in *Geometry*, the curve line that incloſes a CIRCLE, or circular ſpace; called alſo the PERIPHERY.

The word is formed from *circum*, *about*; and *fero*, *I carry*.

All lines drawn from the center of a circle to the *circumference*, called *radii*, are equal.

Any part of the *circumference* is called an *arch*; and a right line drawn from one extreme of the arch to the other, a *chord*.

The *circumference* of every circle is ſuppoſed to be divided into 360 equal parts, which are called *degrees*.

The angle at the *circumference* is double that at the center.

The *circumferences* of circles are to each other as their radii.

And, ſince the *circumference* of one circle is to its radius, as that of any other circle to its radius; the ratio of the *circumference* to the radius is the ſame in all circles. See DIAMETER.

CIRCUMFERENTOR, an inſtrument uſed in *ſurveying*, to take angles by.

The *circumferentor* is very ſimple, yet expeditious in the practice. It conſiſts of a braſs circle and an index, all of a piece.—See its figure in *Tab. Surveying*, *fig.* 7.

On the circle is a card, or compaſs, divided into 360 degrees; the meridian line whereof anſwers to the middle of the breadth of the index: on the limb, or circumference, of the circle, is ſoldered a braſs ring; which, with another fitted with a glaſs, make a kind of box for the needle; which is ſuſpended on a pivot in the center of the circle: to each extreme of the index is fitted a ſight. The whole is mounted on a ſtaff, with a ball and ſocket, for the conveniency of its motion.

To take an angle by the CIRCUMFERENTOR. Suppoſe the angle required EKG *(Tab. Surveying, fig. 6.)*: place the inſtrument, v. g. at K, with the flower-de-luce in the card towards you; then direct the ſights, till through them you ſpy E; and obſerve what degree is pointed at by the ſouth end of the needle, which ſuppoſe 296: then turn the inſtrument about, the flower-de-luce ſtill towards you, and direct the ſights to G; noting the degree at which the ſouth end of the needle points, which ſuppoſe 182.

This done, ſubtracting the leſſer number 182, from the greater 296, the remainder, 114, is the number of degrees of the angle EKG.

If the remainder happens to be more than 180 degrees, it muſt be again ſubtracted from 360 degrees; the laſt remainder is the quantity of the angle ſought.

To take the plot of a field, wood, park, &c. by the CIRCUMFERENTOR.—Suppoſe ABCDEFGK (*fig.* 8.) an incloſure to be ſurveyed with the *circumferentor*.

1. Placing the inſtrument at A, the flower-de-luce towards you, direct the ſights to B; where ſuppoſe the ſouth end of the needle to cut 191°; and the ditch, wall, or hedge, meaſured with the chain, to contain 10 chains, 75 links; which enter down. See CHAIN.

2. Placing the inſtrument at B, direct the ſights, as before, to C; the ſouth end of the needle, v. g. will cut 279°; and the line BC will contain 6 chains, 83 links, to be noted as before: then move the inſtrument to C; turn the ſights to D, and meaſure CD, as before.

In the ſame manner proceed to D, E, F, G, H, and, laſtly, to K; ſtill noting down the degrees of every bearing, or angle, and the diſtances of every ſide.

Having thus gone round the field, you will have a table in the following form:

Stations.	Degrees.	Min.	Chains.	Links.
A	191	00	10	75
B	279	00	6	83
C	216	30	7	82
&c.				

From this table, the field is to be plotted, or protracted; for the manner whereof, ſee PLOTTING, and PROTRACTOR.

Note, Where ſecurity is to be conſulted, rather than diſpatch, it may be convenient to take back-ſights; i. e. to place the inſtrument ſo, at each ſtation, as that, looking backwards through the ſights to the laſt ſtation, the north end of the needle may point to the ſame degree as the ſouth end did, in looking forwards from the laſt ſtation to this: both which inſtruments are uſed, on occaſion, as *circumferentors*.

CIRCUMFLEX, in *Grammar*, an accent, ſerving to note, or diſtinguiſh, a ſyllable of an intermediate ſound between acute and grave; and generally ſomewhat long.

The Greeks had three accents; the *acute*, the *grave*, and the *circumflex*; formed thus, ´, `, ˜. In Latin, Engliſh, French, &c. the *circumflex* is made thus ^.

The acute raiſes the voice, and the grave falls, or lowers it: the *circumflex* is a kind of undulation, or wavering of the voice, between the two.

It is ſeldom uſed among the moderns, unleſs to ſhew the omiſſion of a letter which made the ſyllable long and open; a thing much more frequent in the French, than among us: thus they write *pâte*, for *paſte*; *tête*, for *teſte*; *fûmes*, for *fuſmes*, &c. They alſo uſe the *circumflex* in the participles; ſome of their authors writing *conneu*, *peu*, others, *connû*, *pû*, &c. Father Buffier is at a loſs for the reaſon of the *circumflex* on this occaſion.

The form of the Greek *circumflex* was anciently the ſame with that of ours, viz. ^; being a compoſition of the other two accents ^ in one.—But the copiſts, changing the form of the characters, and introducing the running-hand, changed alſo the form of the *circumflex* accent; and inſtead of making a juſt angle, rounded it off, adding a daſh, through too much haſte; and thus formed an *s*, laid horizontally, which produced this figure ˜, inſtead of this ^.

CIRCUMGYRATION, the wheeling motion of any body round a center.

CIRCUMINCESSION, in *Theology*, a term whereby the ſchoolmen uſe to expreſs the exiſtence of three divine perſons in one another, in the myſtery of the Trinity. See PERSON.

The ſchool divines are not the firſt authors of this term; Damaſcenus, in the eighth century, having uſed the word περιχωρησις, which ſignifies the ſame thing, in his explication of that text, *I am in my father, and my father is in me.*

CIRCUMLOCUTION, an ambages, or tour of words, uſed either when a proper term is not at hand, to expreſs a thing naturally and immediately by; or when one chooſes not to do it, out of reſpect, or for ſome other reaſon.

The word comes from *circumloquor*, *I ſpeak about.*

CIRCUMLOCUTION, in *Oratory*, is the avoiding of ſomething diſagreeable, or inconvenient, to be expreſſed in direct terms; by intimating the ſenſe thereof in a kind of paraphraſe, ſo conceived as to ſoften, or break, the force thereof.

Thus Cicero, unable to deny that Clodius was ſlain by Milo, owns it, with this *circumlocution*, "Milo's ſervants "being prevented from aſſiſting their maſter, who was "reported to be killed by Clodius; they, in his abſence, "and without his privity, or conſent, did what every "body would expect from their own ſervants on ſuch "an occaſion."

CIRCUM-POLAR *Stars*, are ſuch ſtars as, being pretty near our north-pole, move round it; and in our latitude, never ſet, or go below the horizon.

CIRCUMPOTATIO, in *Antiquity*, a funeral feaſt, provided in honour of the dead.

This was very frequent among the ancient Romans, as well as among the Athenians. Solon, at Athens, and the decemviri at Rome, endeavoured to reform this cuſtom, thinking it abſurd that mirth and drunkenneſs ſhould mingle with ſorrow and grief.

CIRCUMSCRIBED *figure*, in *Geometry*. See CIRCUMSCRIBING.

CIRCUMSCRIBED *hyperbola*, one of the ſecond order, according to Sir Iſaac Newton, which cuts its aſymptotes, and contains the parts cut off within its own ſpace. See HYPERBOLA.

CIRCUMSCRIBING, in *Geometry*, denotes the deſcribing a polygonous figure about a circle, in ſuch manner, as that all its ſides are tangents to the circumference.

The term is ſometimes alſo uſed for the deſcribing of a circle about a polygon; ſo, as that each ſide is a chord. But in this caſe, we more uſually ſay, the polygon is inſcribed, than the circle circumſcribed.

Any regular figure ABCDE, *(Tab. Geometry, fig. 9.)* inſcribed in a circle, is reſolved into equal and ſimilar triangles, by radii drawn from the center of the *circumſcribing* circle F, to the ſeveral angles of the figure; and its area is equal to a rectangled triangle, whoſe baſe is equal to the perimeter of the whole polygon; and its height a perpendicular let fall from the centre F to one ſide AB.

The ſame may be ſaid of the area of the *circumſcribing* polygon *a b c d e* (*fig.* 8.); excepting that the height is to be the radius.

The area of every polygon that can be inſcribed in a circle is leſs, and that of every polygon that can be circumſcribed, greater, than that of the circle: in like manner, the perimeter of the firſt is leſs, and that of the ſecond is greater, than the circumference of the circle.

On this principle Archimedes attempted the quadrature of the circle; which is nothing elſe, in effect, but the meaſuring of the area, or capacity of a circle.

The ſide of a hexagon is equal to the radius of a circumſcribed circle.

To circumſcribe a circle about any given regular polygon, ABCDE (*fig.* 9.); and *vice verſa*. Biſect two of the angles, v. g. A and B; and on the point F, where the two lines of biſection interſect, as on a centre, deſcribe a circle with the radius FA.

To circumſcribe a ſquare about a circle. Draw two diameters, AB and DE (*fig.* 5.), interſecting each other in the centre C, at right angles. From AEBD, with the interval of the radius, make interſections in F, G, H, I. Draw the right lines FG, GH, IH, and IF. Then is FGHI a ſquare circumſcribed about the circle.

To circumſcribe any regular polygon, v. g. a pentagon, about a circle. Biſect the chord AE (*fig.* 8.) by the perpendicular FO, which continue till it cut the arch in *g*. Through A and E, draw the radii AF and EF: and through *g*, draw a line parallel to AE, meeting the radii continued on each ſide in *a* and *e*: and then is *ae* one ſide of the circumſcribed polygon. Produce the radius FB to *b*, till $Fb = a$; and draw *ab*: this is another ſide of the polygon; and in the ſame manner may the reſt of the ſides be drawn.

CIRCUMSPECTE *agatis*, the title of a ſtatute made ann. 13 Edw. I. relating to prohibitions, preſcribing certain caſes to the judges, wherein the king's prohibition lies not.

CIRCUMSTANCES, the incidents of an event, or the particularities that accompany an action.

Divines ſay, the converſion of a ſinner depends on a certain aſſemblage, and a certain management, of external *Circumſtances*, in the midſt whereof he is placed; which arrangement of *Circumſtances* depends on the providence of God: whence converſion alſo depends on him.

The *Circumſtances* of the actions of men, are expreſſed in this Latin verſe:

Quis, quid, ubi, quibus auxiliis, cur, quomodo, quando.

Quis, who, denotes the quality, ſtate, age, &c. of the perſon. *Quid*, what, the greatneſs, ſmallneſs, multitude, fewneſs, &c. of the thing. *Ubi*, where, the place. *Quibus auxiliis*, with what aſſiſtances, the inſtruments, means, &c. *Cur*, why, on what account, with what view. *Quomodo*, how, the quality of the action, as to intention or remiſſneſs, deſignedneſs, or caſualty, ſecrecy, or openneſs. *Quando*, when, the time; as on a holiday, at the hour of prayer, &c.

CIRCUMSTANTIAL *Evidence*, in *Law*, or the *doctrine of preſumption*, takes place next to poſitive proof: circumſtances which either neceſſarily or uſually attend facts of a particular nature, that cannot be demonſtratively evinced are called preſumptions, and are only to be relied on till the contrary be actually proved. See EVIDENCE and PRESUMPTION.

CIRCUMSTANTIBUS, in *Law*, is uſed for the ſupplying, and making up the number of jurors (in caſe any impanelled appear not; or appearing, be challenged by either party), by adding to them ſo many of the perſons preſent, or ſtanding by, as will ſerve the turn. This act of ſupplying is uſually called TALES *de circumſtantibus*.

CIRCUMVALLATION, in *Fortification*, a line or trench, with a parapet, thrown up by the beſiegers, encompaſſing all their camp, to defend it againſt any army that may attempt to relieve the place.

The word is formed from *circum*, *about*; and *vallum*, *wall*. The Romans are thought to have firſt invented lines of *circumvallation* and CONTRAVALLATION at the ſiege of *Veii*.

This line is to be cannon-ſhot diſtant from the place, ordinarily, about twelve feet broad, and ſeven deep. It is bordered with a breaſt-work, and flanked with redoubts, or little forts, erected from ſpace to ſpace. It ſerves both to prevent any ſuccour from being ſent into the place, to keep in deſerters, and to prevent incurſions of the enemy's garriſon.

Care muſt be taken, that the line of *Circumvallation* never paſs by the foot of an eminence; leſt the enemy, ſeizing on the eminence, lodge his cannon, and command the line.

CIRCUMVOLUTIONS, in *Architecture*, the turns of the ſpiral line of the Ionic volute.

The word comes from *circumvolvere*, *to turn around*; and is alſo applied to the turns of a wreathed, or twiſted COLUMN.

CIRCUS, in *Antiquity*, a large building, either round, or oval; uſed for the exhibiting of ſhews to the people.

Some derive the word from *Circe*, to whom Tertullian attributes the invention. Caſſiodorus ſays, *Circus* comes *à circuitu*.—The Romans, Servius obſerves, at firſt, had no other *Circus*, but that made by the Tiber, on one ſide, and a paliſade of naked ſwords on the other. Hence, according to Iſidore, came the term *ludi circenſes*, *quaſi circum enſes*. But Scaliger ridicules that etymology.

The Roman *Circus* was a large oblong edifice, arched at one end; encompaſſed with porticoes, and furniſhed with rows of ſeats, placed aſcending over each other.

In the middle was a kind of foot-bank, or eminence, with obeliſks, ſtatues, and poſts at each end. This ſerved them for the courſes of their *bigæ* and *quadrigæ*.

There were no leſs than ten *Circuſes* at Rome: the largeſt was built by the elder Tarquin, called *Circus Maximus*, between the Aventine and Palatine mounts. It was ſo called, either becauſe of its vaſt circumference, or becauſe the *great* games were celebrated in it, or again, becauſe it was conſecrated to the *great* gods, viz. to Vertumnus, Neptune, Jupiter, Juno, Minerva, and the Dii Penates of Rome. Dionyſius Halicarnaſſenſis ſays that it was three ſtadia and a half in length, and four jugera broad; and theſe meaſures, according to Pliny, allowing to the Roman ſtadia 625 Roman feet, each of which is 12 inches, will give for the length 2187 Roman feet, or ſomewhat more than three Engliſh furlongs; and as to the breadth, allowing for each of the jugera 240 Roman feet, it will be 960 Roman feet. It was beautified and enlarged by the Roman emperors, ſo as to ſeat 250000 ſpectators.

The moſt magnificent *Circuſes* were thoſe of Auguſtus and Nero. There are ſtill ſome remains of the *Circuſes*, at Rome, at Niſmes, and other places.

The Romans were exceſſively fond of the games exhibited in the *Circus*: witneſs that verſe in Juvenal,

——— *Atque duas tantum res anxius optat,*
Panem & Circenſes ———

The Games of the CIRCUS, which ſome call CIRCENSIAN *Games*, were combats celebrated in the *Circus*, in honour of Conſus the god of councils; and thence alſo called *Conſualia*.

They were alſo called *Roman Games*, *Ludi Romani*, either on account of their antiquity, as being coeval with the Roman people, or becauſe eſtabliſhed by the Romans: and the games held there, the great games, *ludi magni*, becauſe celebrated with more expence and magnificence than others; and becauſe held in honour of the great god Neptune, who was their Conſus.

Thoſe who ſay they were inſtituted in honour of the ſun, confound the *pompa circenſis*, or proceſſion of the *Circus*, with the games.

The games of the *Circus* were inſtituted by Evander, and re-eſtabliſhed by Romulus: the pomp, or proceſſion, was only a part of the games, making the prelude thereof; and conſiſting of a ſimple cavalcade of chariots.

Till the time of the elder Tarquin, they were held in an iſland of the Tiber; and were called *Roman Games*: after that prince had built the *Circus*, they took their name therefrom; as being conſtantly held there.

There were ſix kinds of exerciſes in the *Circus*: the firſt was wreſtling, and fighting with ſwords, with ſtaves, and with pikes; the ſecond was racing; the third, ſaltatio, dancing; the fourth, diſci, quoits, arrows, and ceſtus: all which were on foot: the fifth, was horſe-courſing; the ſixth, courſes of chariots, whether with two horſes, or with four.

In this laſt exerciſe, the combatants were at firſt divided into two ſquadrons or quadrils; then into four; each bearing the names of the colours they wore; *factio alba*, *ruſſea*, &c.

At firſt there was only white and red; then green was added, and blue. Domitian added two more colours, but they did not continue.

It was Oenomaus who firſt invented this method of diſtinguiſhing the quadrils by colours. The green was for thoſe who repreſented the earth; the blue for the ſea, &c.

CIRCUS, in *Zoology*, a name by which Bellonius and ſome others have called the MILVUS *æruginoſus*, or moor-BUZZARD.

CIRLUS *ſtultus*, in *Zoology*, the name of a bird of the hortulanus kind, and of the ſize and ſhape of our common *yellow hammer*.

CIRRHOSE *Leaf*, in *Botany*. See LEAF.

CIRRIS, in *Zoology*, the name of a ſmall ſpecies of heron, called by ſome the *ardea hæmatopus*, or the *red-legged* HERON. Its legs and feet are very beautifully red.

CIRRUS, in *Ichthyology*, a name given by authors to certain oblong and ſoft *appendiculæ* hanging from the under jaw of fiſhes, or from other parts about the mouth, in the manner of little worms, and uſually of a cylindric figure, or nearly ſo. Theſe *cirri* are in ſome fiſh hollow at the root; in others they are not ſo: in thoſe which are hollow at the root, the cavity never runs quite thro'. The way of finding it is by introducing a hog's briſtle or a hair into it; but this cannot be forced through to the point, nor can any fluid matter be expreſſed out of them. Theſe *cirri* often afford characters of diſtinction to ſeveral kinds of fiſhes, and differ in the ſeveral ſpecies in regard to number, ſize, and proportion.

The uſe that theſe *cirri* are of to the fiſh, is little more known than that of the antennæ of inſects. If nature had given them only to thoſe fiſhes which had the eyes placed on the upper part of the head, then they might be ſuppoſed to ſerve to diſtinguiſh prey at the bottom, while the eyes were directed to ſuch as offered itſelf nearer the ſurface: but as the ſeveral kinds of fiſhes which have them are of different kinds, and have their eyes in various directions, this uſe cannot be allotted them. It is poſſible they may be of uſe to the fiſh, in giving it the firſt notice of any diſtant motion of the water, which they may perceive by their hanging poſture ſooner than any other part, and thus give notice of the neighbourhood of prey, or of the approach of an enemy.

CIRRUS, in *Antiquity*, an ornament added to the edges and borders of garments, much in the manner of *fimbriæ* or fringes, only that theſe were ſingle, and run along the borders of the dreſs; whereas the *cirri* were knotted together, and hung down from the extremities of the robe

CIRRUS, among *Botaniſts*, expreſſes the little fibres which plants ſend out from their STALKS, and by which they are attached to other bodies.

CIRSIUM. See *gentle* THISTLE.

CIRSOCELE, in *Medicine*, a multitude of varices in the teſticles, which prodigiouſly increaſe their bulk, and hinder the due preparation of the ſeed; ſo as ſometimes to render caſtration neceſſary. This diſorder is otherwiſe called HERNIA *varicoſa*.

The word comes from *κιρσος*, *varix*, *vein*, and *κηλη hernia*.

CIRSOS, in *Medical Writers*, is uſed for VARIX.

CISALPINE, any thing on this ſide the Alps.

The word is formed from the prepoſition *cis*, on this ſide, and *Alpes*; which, though properly confined to the mountains ſeparating Italy and France, yet is uſed by authors for any very high mountains.—Thus, Auſonius ſpeaks of the Alps of the Pyreneans, the Alps of the Apennines, &c.

The Romans divided Gaul, and the country now called Lombardy, into *Ciſalpine* and *Tranſalpine*.

That which was *Ciſalpine* with regard to the Romans, is *Tranſalpine* with regard to us.

CISLEU, the ninth month in the eccleſiaſtical year, and the third in the civil or political year among the Hebrews, containing 30 days: it anſwers to part of our November and December. An annual faſt is obſerved by the Jews to this day on the 18th of this month, in commemoration of the taking of Jeruſalem by Nebuchadnezzar.

CISSAMPELOS, in *Botany*, a genus of the *dioecia monadelphia* claſs: its characters are theſe: it is male and female in different plants; the male flowers have no petals, but a ſingle ſtyle in the centre, which extends beyond the empalement, terminated by a large ſummit having four lobes. The female flowers have four nectariums ſtanding round the oval germen, which is hairy, and after becomes a ſucculent berry encloſing a ſingle ſeed. There are two ſpecies which grow naturally in the warm parts of America.

The firſt ſort is ſuppoſed to be the pareira, whoſe root has been ſo much eſteemed as a diuretic.

CISSITES, in *Natural Hiſtory*, a name given by the ancients to that ſpecies of the flinty *ætites*, or EAGLE-*ſtone*, which is covered with the common white coat of the flints. Pliny mentions it as found principally about Captos, and being externally of a white colour, and rattling when ſhaken.

CISSOID, in *Geometry*, an algebraic CURVE, firſt invented by Diocles; whence it is peculiarly called the *ciſſoid* of Diocles.

The geneſis of the *ciſſoid* may be thus conceived: to the diameter AB (*Tab. Analyſis, fig.* 9.) of the ſemicircle AOB, draw an indefinite line, at right angles, BC: then, draw the right line AH, and make AM = IH; or in the other quadrant, LC = AN. Thus will the points M and L be in a curve line, AMOL; which is the *ciſſoid* of Diocles.

Properties of the CISSOID.—From the geneſis it follows,

1. That drawing the right lines PM and KI, perpendicular to AB; we ſhall have AP : KB :: AM : IH. But AM = IH; conſequently, AP = KB. And therefore, AK = PB; and PN = IK.

2. After the ſame manner, it appears, that the *ciſſoid* AMO biſects the ſemicircle AOB.

3. Again, AK : KI :: KI : KB. That is, AK : PN :: PN : AP. And again, AK : PN :: AP : PM; therefore, PN : AP :: AP : PM. Conſequently, AK, PN, AP, and PM, are four lines in continual proportion. And if PN = v, AP = x, PM = y; $x^2 = vy$. And after the ſame manner it may be ſhewn, that AP, PN, AK, and KL, are in continual proportion.

4. In the *ciſſoid*, the cube of the abciſſe AP is equal to a ſolid ariſing from the ſquare of the ſemiordinate PM, multiplied into the complement of the diameter of the generating circle PB.

Hence, when the point P falls on B, then $x = a$, and BC $= y$; conſequently, $y^2 = \frac{a^3}{0}$. Wherefore, $0 : 1 :: a^3 : y^2$; that is, the value of y becomes infinite: and therefore the *ciſſoid* AMOL, though it continually approach BC, will never meet it.

5. BC, therefore, is an aſymptote of the *ciſſoid*.

The ancients made uſe both of the conchoid and *ciſſoid*, for the finding of two mean continual proportionals between two given right lines.

For the *quadrature*, *ſubnormal*, and *ſubtangent of the* CISSOID: ſee QUADRATURE, SUBTANGENT, &c.

CISSOID *angle*. See ANGLE.

CISSUS. This is properly in the Greek writers the name of the ivy. They write it *κισσος*. But the word *κισθος*, *ciſthus*, when the θ is changed into an σ, by the Cretan and Cyprian dialect, is alſo *κισσος*, *ciſſus*. See CISTUS.

CISSUS, in *Botany*, a genus of the *tetandria monogynia* claſs, with a ſingle-ſeeded berry, and a quadripartite corolla.

CISSYBIUM, in *Antiquity*, a drinking cup, moſt in uſe among country people. It was ſo called, either becauſe it was made of the wood of ivy, or was uſually crowned with its leaves.

CISTERCIANS, an order of religious, reformed from the Benedictines, conſiſting of an hundred monaſteries, and near as many nunneries.

The order took its riſe in 1075, from twenty-one zealous monks in the monaſtery of Moleſme in Burgundy; who, with their abbot Robert, complaining that the rule of St. Benedict was not ſtrictly enough obſerved, obtained permiſſion of Hugh archbiſhop of Lyons, and legate of the holy ſee, to ſettle in a place called *Ciſteaux*, five miles from Dijon.

Here, Eudes duke of Burgundy erected them a houſe, into which they were admitted in 1098; endowing it with a conſiderable revenue. The biſhop of Chalons gave Robert the paſtoral ſtaff, in quality of abbot; and erected the new monaſtery into an abbey.

They were, in about a century after their firſt riſe, diſtinguiſhed by the patronage of St. Bernard, abbot of Clairval, whence they obtained the title of *Bernardin* monks; and in the year 1132, they were exempted from the payment of tythes, and inveſted with other privileges and immunities by Innocent II. In 1152 this order had no fewer than 500 convents, all dedicated to the Bleſſed Virgin. They came into England in the year 1128, and had their firſt houſe at Waverley in Surry. Before their diſſolution they had eighty-five houſes here. Such was the beginning of the *Ciſtercians*, ſo famous in after-times, and now ſo extended throughout all Europe.

CISTERN, is properly uſed for a ſubterraneous reſervoir of rain-water.

The word, according to ſome, comes from *cis*, and *terram*, i. e. *in terram*; others derive it from *ciſta*, *a duct*, &c.

Earthen *ciſterns* muſt be made with good cement, to retain the water. And the bottom ſhould be covered with ſand, to ſweeten and preſerve it.

Authors mention a *ciſtern* at Conſtantinople, the vaults whereof are ſupported by two rows of pillars, 212 in each row; each pillar being two feet in diameter. They are planted circularly, and in radii tending to that in the centre.

Anciently there were *ciſterns* all over the country in Paleſtine. There were ſome likewiſe in cities and private houſes. As the cities for the moſt part were built on mountains, and the rains fell regularly in Judea at two ſeaſons of the year only, in ſpring and autumn, people were obliged to keep water in *ciſterns* in the country, for the uſe of their cattle; and in cities, for the conveniency of the inhabitants. There are *ciſterns* of very large dimenſions to be ſeen ſtill at this day in Paleſtine, ſome whereof are an hundred and fifty paces long, and fifty-four wide. There is one to be ſeen at Ramah of two and thirty paces in length, and eight and twenty in width. Wells and *ciſterns*, fountains and ſprings, are generally confounded in the ſcripture language.

If the farmers of England would fall into the method uſed in Spain, and at Amſterdam, Venice, and other places, of ſaving the rain-water for the whole year, or at leaſt ſo much of it as would be neceſſary, in *ciſterns*, they would have always water for their cattle in the ſummer droughts, and many thouſand acres of land, now left uſeleſs, might be turned to profit.

The beſt way of preſerving the water for the ſervice of the houſe, is in *ciſterns* in the cellars. Theſe may be made with brick or ſtone, joined with plaiſter of Paris, which will keep out the wet very well; or with a kind of mortar made of flaked ſifted lime, with linſeed oil, and tow or cotton. A bed of good ſound clay may be laid at the bottom, and on this the bricks for the floor, and then the walls may be raiſed in the ſame manner, only leaving ſpaces behind them, into which clay is to be rammed in the like manner. Thus it will be a clay *ciſtern*, faced with brick; and the bricks will keep the clay moiſt, and prevent it from cracking, though it be not full of water. This will do in any ſhadowy place, as well as in cellars: and thus may a *ciſtern* be made in a garden, in ſome ſhadowy place, and covered over, which may receive the water running from the walks, and will retain it at hand, for the ſervice of the garden, all the year.

Where there is want of water for the cattle in the fields, the way is to dig a pond in ſome place into which there is a deſcent; then cover the bottom and ſides with a double coat of tough clay, each ſix inches thick, and each very well rammed: then to cover the bottom with large ſtones, which will keep the clay moiſt, and prevents its cracking when not covered with water. But this is a troubleſome thing; for if there happen to be a crack in any part, it is often found neceſſary to go over the whole work again before the pond will hold a drop of water.

Another method of making a pond hold water, is to daub it over with clay and mortar mixed together, and then with mortar alone. This has an advantage over the other way, becauſe if any crack happen, it may be mended by a cement of clean hair and tallow, mixed with ſlacked lime and the yolks of eggs, well beat together. This applied to the crack, will cloſe it ſafely, without the neceſſity of undoing the whole work, as in the other caſe.

In chalky countries it is common to find a low place on the downs, and, digging a hole by way of a pit there, they cover the bottom evenly with the chalk rubbiſh, and when it is wetted by the rain, they ram it well, and afterwards drive cattle into it, and fold ſheep in it: the conſequence of all which trampling is, that the bottom at length becomes ſo firm, that it holds the water perfectly well. By one or other of theſe means, *ciſterns* or reſervoirs may be made in every part of the country: and our farmers, if they would carefully try one or the other of them, as their land moſt required, would not have ſo much to complain of from droughts.

CISTIC. } See { CYSTIC.
CIST-*Hepatic*. } { CYST-*Hepatic*.

CISTIS. See CYSTIS, and HYPOCISTIS.

CISTRUM. See SISTRUM.

CISTULA *Catoptric*. See CATOPTRIC.

CISTUS, the Greeks wrote this word κισθος, and, as the word in the Latin tongue is only the Greek name with a Roman termination, it undoubtedly ought to be ſpelt *ciſthus*, not *ciſtus*. The ancient writers have been ſubject to many miſrepreſentations from the near reſemblance of this word κισθος, *ciſthus*, to κισσος, *ciſſus*: the former being the name of the plant we call *ciſtus*, a ſhrubby herb, with leaves like ſage, and a large flower reſembling a roſe; and the other, the name of the common ivy that climbs upon our walls and trees. Pliny has been deceived by the near reſemblance of the two words, and has given the qualities of ivy to the *ciſtus*, and thoſe of *ciſtus* to the ivy: but he is the more excuſable in this, ſince we find the two names uſed indiſcriminately, tho' certainly by a miſtake of the copyiſts, in the books of Theophraſtus.

CISTUS, in *Botany*. See *Rock* ROSE.

Dwarf CISTUS. See *Dwarf* SUN-*flower*.

Marſh CISTUS. See *Wild* ROSEMARY.

Leſſer marſh CISTUS. See ANDROMEDA.

CITADEL, or CITTADEL, a fort, or place fortified with four, five, or ſix baſtions; built ſometimes in the moſt eminent part of a city, and ſometimes only near the city.

The word is a diminutive of the Italian *citta*, *city*, q. d. little city.

In the firſt caſe, the *citadel* ſerves to defend the city againſt enemies.

In the latter, it ſerves to command it, and to keep the inhabitants in their obedience: for which purpoſe the city is left unfortified on the part toward the *citadel*; but the *citadel* is fortified toward the city.

The moſt uſual form for *citadels* is that of a pentagon: a ſquare being too weak, and a hexagon too large.

There is always a large ESPLANADE between the city and *citadel*.

There are uſually two gates to a *citadel*, one communicating with the town and the other with the country.

The *citadel* ought to be ſo formed and ſituated, that the ditch may either be defended by the faces of the baſtions, or by thoſe of the ravelins, in as direct a manner as poſſible; otherwiſe the enemy may attack the town in that place, as being weakeſt, and likewiſe becauſe the ſame attacks may ſerve to reduce both together. The covert-way of the *citadel* ought to be uninterrupted, ſo that the part next the town may have a free communication with the other.

CITADINESCA, in *Natural Hiſtory*, a name given by ſome writers to the Florentine marble, which is ſuppoſed to repreſent towns, palaces, ruins, rivers, &c. Theſe delineations are merely accidental, and are uſually much aſſiſted by the imagination, though the natural lines of a ſtone may ſometimes luckily enough repreſent the ruins of ſome ancient building, or the courſe of a river. We have in England a kind of ſeptaria, or ludus helmontii, which has ſometimes delineations of this kind conſiderably beautiful, though very irregular. The Florentine marble, as we ſee it wrought up in the ornaments of cabinets, &c. owes a great deal to the ſkill of the workmen, who always pick out the proper pieces from the maſs, and diſpoſe them in the work ſo as to make them repreſent what they pleaſe.

CITATION, in the *Eccleſiaſtical Courts*, a ſummons to appear before an eccleſiaſtical judge, on ſome affair relating to the church.

The word comes from *cito*, of *cieo*, *I ſtir up*.

In the civil and ordinary courts, it is called *ſummoning*.

CITATION is alſo uſed in ſpeaking of military and monaſtic, as well as eccleſiaſtical courts. Such a heretic was *cited* to Rome; to a general council, &c.

Knights are *cited* to the general chapters of their order.

King Edward I. of England, was *cited*, by order of Philip IV. of France, to a court of his peers: the *citation* was publiſhed by the ſeigneur d'Arrablay, ſeneſchal of Perigord and Querci; and was paſted up, by his order, on the gates of the city of Libourne, which then belonged to king Edward. And for default in not appearing all his domains and effects in France were confiſcated.

CITATION is alſo an allegation, or quotation of ſome law, authority, or paſſage.

CITELLUS, in *Zoology*, the name of a ſmall animal of the mouſe kind, which lives in caves and holes of the earth. Its body is of the ſhape of the common weaſels, very long and thin: the tail is very ſhort. Its colour is a pale ſilvery grey, like that of ſome rabbits. It reſembles the mole in its want of external ears; but it has apertures which ſerve it to the ſame purpoſe, in the manner of birds. They live together in communities, great numbers being uſually found in the ſame cave, with a large ſtore of nuts, cheſnuts, and other fruits. Their fleſh is very well taſted, and their ſkin much uſed in cloathing in the cold countries. They are found not only in the very cold climates, but in Bohemia, Auſtria, and Hungary.

CITHARA, an ancient muſical inſtrument, by ſome ſuppoſed the ſame with the *lyra*; or, at leaſt, a particular ſpecies of it; by others different: though its preciſe ſtructure does not appear to be known.

The ancients deſcribe it as being triangular, in form of a Greek delta, Δ: the poets aſcribe the invention of it to Apollo. See CYNIRA.

CITHARA *bijuga*. See THEORBO.

CITHAREXYLON, in *Botany*, *fiddle wood*, a genus of the *didynamia angioſpermia* claſs: its characters are theſe: the flower is of one leaf, funnel ſhaped, and divided at the top into five equal parts. It hath four ſtamina which adhere to the tube, two of them being longer than the other. In the centre is ſituated a roundiſh germen, which afterwards becomes a capſule with two cells, each having a ſingle ſeed. There are two ſpecies, which are natives of the Weſt Indies, and grow to be very large trees, greatly valued for durability in building; whence the French gave them the name of *fidelle* wood, which the Engliſh have rendered *fiddle wood*.

CITHAROEDUS, in *Antiquity*, the ſame with *cithariſta*. The *citharoedi* had the preference of all other muſicians, from whom they were diſtinguiſhed by an embroidered cloak, which was peculiar to them.

CITHARUS, in *Zoology*, the name of a fiſh common in the markets of Rome and Venice, and frequent in the German and Mediterranean ſeas. It is a flat fiſh of the TURBOT kind; but it is covered with large ſcales.

CITIZEN, or CITTIZEN, a native or inhabitant of a city, veſted with the freedom and rights thereof.

The word comes from *civis*; which authors derive from *coeo*, becauſe the *citizens* live together; or rather from *cieo, I call together*.

Auguſtus, upon numbering the Roman *citizens*, found they amounted to upwards of four millions.

To make a good Roman *citizen*, there were three things required: that he was an inhabitant of Rome; that he were inrolled in one of the thirty-five tribes; and that he were capable of dignities.—Thoſe ſtrangers to whom were granted the rights and privileges of Roman *citizens*, were properly only *honorary citizens*.

The ſeventh law, *de incolis*, makes a great deal of difference between a *citizen* and a mere inhabitant. Birth, alone, made a *citizen*; and intitled to all the privileges of burgeſſes: time could not acquire it; but the emperor could beſtow it.

The Romans were anciently ſo particularly careful to preſerve even their common *citizens* from any mixture of ſervile blood, that they prohibited all marriages between them and freed ſlaves, or their children. And it was decreed, as a ſpecial privilege and reward to one Hiſpala, of libertine condition, for her diſcovery of the impieties of the Bacchanalian myſteries, that a *citizen* might take her to wife, without any diſgrace and diminution of his rights. Theſe diſtinctions, indeed, began to be diſregarded towards the end of the republic, with reſpect to the ordinary *citizens*, but were kept up to the laſt, with regard to the ſenate. See SENATOR.

CITIZENS *in parliament*. See BURGESSES.

CITOLE, the name of a muſical inſtrument mentioned by the old Engliſh poet Gower, probably derived from *ciſtella, a little cheſt*, meaning the DULCIMER.

CITRAGO, in *Botany*, a name given by ſome authors to the common garden balm.

CITREÆ *menſæ*, called *thyina* by the Greeks, in *Antiquity*, tables made of the wood of the citrum-tree, very beautiful, and greatly eſteemed by the ancient Romans. See CITRUM.

CITRIL, in *Zoology*, a name given by many to the citrinella, or verzellino, a bird common in Italy, and kept in cages for its beauty and fine notes: called by many authors alſo THRAUPIS.

CITRINE *ſtoechas*, or ELYCHRISIUM, in *Botany*. See CUDWEED.

CITRINELLA, in *Zoology*, the name of a ſmall bird, common in Italy, very much reſembling our common linnet in ſhape. Its head and back are green; its rump of a greeniſh yellow, and its neck, with ſomewhat of the hindmoſt part of the head, grey.

It ſings very finely, and is kept in cages in many parts of Italy.

Linnæus enumerates two birds under this name; one a ſpecies of the EMBERIZA, and the other of the FRINGILLA.

CITRINUS, in *Natural Hiſtory*, the name of a peculiar ſpecies of ſprig cryſtal, which is of a beautiful yellow. Many of the common cryſtals, when in the neighbourhood of lead mines, are liable to be accidentally tinged yellow, by an admixture of the particles of that metal; and all theſe, whether finer, or coarſer, have been too frequently confounded together, under the name *citrine*. It is never found colourleſs, like the other cryſtals, but has a great variety of tinges, from that of deeper ochres to a pale lemon-colour. It is very plentiful in the Weſt Indies, and is found in ſome parts of Bohemia. Our jewellers have learnt from the French and Italians, who are very fond of it, to call it *citrine*, and often cut ſtones for rings out of it, particularly out of the pyramid, which is always finer than the column, and theſe, after they have paſſed through two or three hands, are generally miſtaken for topazes.

CITRON-*tree*, *Citrus*, in *Botany*, a genus of the *polyadelphia icoſandria* claſs: its characters are theſe: the flower hath five oblong thick petals, and ten ſtamina, which are not equal, joining in three bodies at their baſe. The oval germen in the centre afterward becomes an oblong fruit with a thick fleſhy ſkin filled with a ſucculent pulp, having many cells each containing two oval ſeeds.

There are ſeveral varieties of this fruit, with which the Engliſh gardens have been ſupplied from Genoa, where is the great nurſery which ſupplies the ſeveral parts of Europe with this, as well as orange and lemon trees. Their culture and management is the ſame with that of the ORANGE; but they are tenderer, and ſhould have a warmer ſituation in winter, otherwiſe they are ſubject to caſt their fruit; they ſhould alſo continue a little longer in the houſe in ſpring, and be carried ſooner into it in autumn, and have a warmer, and better defended ſituation in ſummer.

The *citron* is an agreeable fruit, in colour, taſte, ſmell, &c. reſembling a lemon; and ſerving, like that, to cool, and quench thirſt.

The *citron* is diſtinguiſhed from the lemon, in that it is bigger, and its pulp firmer; its ſmell briſker, and colour higher. It is held excellent againſt poiſons: and Athenæus relates an inſtance of two perſons ſaid to be preſerved ſafe from the moſt dangerous aſpics, by only eating a *citron*.

The diſtillers, perfumers, confectioners, &c. apply *citrons* to various purpoſes; and obtain from them eſſences, oils, confections, waters, &c.

In Italy they make a liquid with the ſmall *citrons*, which they preſerve entire; and a dry ſweetmeat with the large ones, which they preſerve in quarters.

CITRON-*water*, a well known ſtrong water, or cordial, which may be thus made: take of fine thin lemon-peel eighteen ounces, of orange-peel nine ounces, perfect nutmegs one quarter of a pound, alcohol perfect, that is, the fineſt and beſt rectified ſpirit of wine, two gallons and a half; digeſt in balneo mariæ for one night; draw off with a ſlow fire; then add as much water as will juſt make the mixture milky (which will be about ſeven quarts or two gallons) and add alſo about two pounds of fine ſugar-candy.

This compoſition may be improved by freſh elder-flowers hung in a cloth in the head of the ſtill, ſprinkled with ambergriſe in powder, or its eſſence.

CITRON *wood*, the wood of an American tree, called by the natives candle-wood, becauſe being cut into ſplinters, it burns like a candle. The tree is frequent in the Leeward iſlands, and grows to a conſiderable ſize; the leaves are like thoſe of the bay tree, but of a finer green; the flower is ſweet and much like thoſe of the orange; the fruit ſucceeding theſe is black, and of the ſize of a pepper-corn. The trunk is ſo like the yellow ſaunders in colour, that there was an opinion that it was the ſame tree, and much of it was imported into Europe, and ſold as ſuch; but they were ſoon found to be different, the true ſaunders being of a ſweet ſcent, and but moderately heavy and reſinous, but the *citron* wood is conſiderably heavy, very oily, and of a ſtrong ſmell. It is of no known uſe in medicine, but is uſed in France and Germany by the turners, being a firm fine-grained wood, and taking a fine poliſh, and with age becoming of a very beautiful brown.

CITRUL, *citrullus*, in *Botany*, a name given to a genus of plants otherwiſe called *anguria*. See *Water* MELON.

CITRUM. The *citreæ menſæ* have been ſuppoſed by ſome to be made of the *citron* tree, and by others of the cedar; but it appears plainly that they were made of neither, but of a wood peculiar for its fineneſs, and very different from both. The ancient Greeks have deſcribed the cedar under the name κεδρος, and the *citron* tree under the name *malus medica*; and beſide theſe, they have deſcribed another tree under the name of *thya*.

CITTERN, the old Engliſh name of a muſical ſtringed inſtrument reſembling the LUTE, and now called GUITAR.

CITULA, in *Ichthyology*, the name given by Paulus Jovius, and others, to the fiſh we call the DOREE, and the generality of authors *faber*. Pliny calls it *zeus*, and Artedi has hence made *zeus* the generical name, comprehending this, and ſeveral other ſpecies, under this arrangement. The *faber* is called the *zeus*, with the prickly belly, and with the tail rounded at the end. This is the true ſpecific name of the *citula*.

CITY, or CITTY, *Urbs*, a large town incloſed with a wall.

It is hard to give any juſt definition of a *city*; becauſe cuſtom has reſerved the appellation of towns, to many places which ſeem to have every thing requiſite to conſtitute *cities*.

Formerly *city*, according to ſome, was only underſtood of ſuch towns as were biſhops ſees: which diſtinction ſeems ſtill to hold in England; though no-where elſe. See BISHOP, and DIOCESE.

The term *city* had its riſe, among us, ſince the Conqueſt; for in the time of the Saxons there were no *cities*, but all great towns were called BURGHS.—Thus, London was called *Lunden Burgh*.

And for a long time after the Conqueſt, *city* and *burgh* were uſed promiſcuouſly. Thus, in the charter of Leiceſter, that place is called both *civitas* and *burgus*; which ſhews a miſtake in my lord Coke, where he tells us, that every *city* was, or is, a biſhop's ſee. Nor had Gloceſter any biſhop then; though it is called a *city* in Domeſday. The like may be obſerved of Cambridge; to which it may be added, that Crompton, reckoning up our *cities*, leaves out Ely, though it had a biſhop, and a cathedral.

Yet Chaſſanæus, De Conſuetud. Burgund. ſays, France has within its territories 104 *cities*; and gives his reaſon, becauſe it has ſo many archbiſhops and biſhops.

Cities and villages held formerly, in the time of the feudal government, of ſome great lord, on whom they depended for protection, and to whoſe arbitrary juriſdiction they were ſubject. But the freedom of *cities* was firſt eſtabliſhed in Italy towards the beginning of the fourth century, in conſequence of the prevalence of commerce: and it was thence introduced into France and other countries of Europe. And this eſtabliſhment of communities, ſays Dr. Robertſon, contributed more, perhaps, than any other cauſe to introduce regular government, police and arts, and to diffuſe them over Europe. Hiſt. Charles V. vol. i. p. 36 & ſeq. ed. ii. 8vo. See Charters *of Community*.

City, Civitas, in ſpeaking of antiquity, ſignifies a ſtate, or people, with all its dependencies, conſtituting a particular republic. Such are, ſtill, ſeveral *cities* of the empire, and the Swiſs cantons.

Though the ancient Gauls were, in effect, only one nation; they were yet divided into ſeveral people, which formed as many different ſtates: or, to ſpeak with Cæſar, as many different *civitates, cities*. Beſides that each *city* had its peculiar aſſemblies, it ſent deputies, too, from time to time, to the general aſſemblies held on affairs relating to their common intereſt.

City is particularly uſed to expreſs the heart of the place. At Paris they have the *city* and the *univerſity*; at London we have the *city* and the *ſuburbs*.

It has been obſerved that large *cities* are more liable than other places to peſtilential and putrid diſorders, which is owing to the ſtagnation and corruption of the air. This is always the caſe in thoſe which are low and unprovided with common ſewers; where the ſtreets are narrow and foul, the houſes dirty, water ſcarce, and jails and hoſpitals crowded: alſo, when in ſickly times the burials are within the walls, or when dead animals and offals are left to rot in the kennels or on dunghills; when drains are not provided to carry off any large body of ſtagnating water in the neighbourhood; when fleſh-meats make the greateſt part of the diet, without a proper mixture of greens, bread, wine, or fermented liquors; from the uſe of old mouldy grain. In proportion to the number of theſe and the like cauſes concurring, a *city* will be more or leſs ſubject to peſtilential diſeaſes, or to receive the leaven of the true plague, brought into it by any merchandize. An excellent writer emphatically calls them the graves of the human ſpecies. See *Bills of* Mortality.

However, as great *cities* furniſh many materials for vitiating the air, they likewiſe afford two conſiderable antidotes; the firſt ariſes from the circulation of the air, by means of the conſtant motion of people and carriages, and of the draughts made by fires: the other depends on the great quantity of an acid produced by fuel, the ſtrongeſt reſiſter of putrefaction.

City, *Advocate of the.* See Advocate.

City, *Capital.* See Capital.

Cities, *College of.* See College.

Cities, *Foreſt.* See Forest.

City, *Freedom of a.* See Freedom.

City, *Honours of the.* See Honours.

Cities, *Imperial.* See Imperial.

Cities, *Municipal.* See Municipal.

City, *Provoſt of the.* See Provost.

CIVES, in *Botany*, a very ſmall ſpecies of onion, which never produces any bulbs, and ſeldom grows above ſix inches high in the blade, which is very ſmall and ſlender, and grows in tufts and bunches. This uſed to be in great requeſt for ſallads in ſpring, as being milder than other onions which had ſtood the winter, but at preſent it is not much regarded. The way of propagating it is by parting the roots in autumn, and planting them, at ſmall diſtances, three or four in a hole; they will ſtand the winter very well, and be fit for uſe early in the ſpring. See Allium, Garlick, and Onion.

CIVET, a kind of perfume, bearing the name of the animal whence it is taken.

The word comes from the Arabic *zibet*, or *zebed*, *ſcum, froth.*

The *civet*, or *civet-cat*, *zibeta*, is a little animal, in ſhape reſembling the wolf or dog; its ſnout is long and ſmall; its ears ſmall and roundiſh; its hair is like thoſe of the badger, but very ſoft; its feet ſmall and legs ſhort. See *Tab. Quadrupeds*, N° 17.

Some naturaliſts will have it the ſame with the hyæna of Ariſtotle, and call it *hyæna odorifera*. Others ſuppoſe it the panther of the ancients, while the generality take it for a kind of wild cat, and call it *felis zibetica*, on account of the perfume it yields, which the Arabs call *zibet*. Linnæus makes it a ſpecies of the Viverra, with an annulated tail, with wave-like ſtreaks of pale grey and black along the back. It is a native of Africa, the Indies, Peru, Brazil, Guinea, &c.

An ample deſcription of the *civet-bag*, its glands, the reſervoirs of the perfume, &c. is given by M. Morand, in Mem. Acad. R. Scienc. an. 1728. p. 403. H. 14.

It is gathered from time to time; and ſtill abounds, in proportion as the animal is fed.

There is a very conſiderable traffic of *civet*, from Baſſora, Calicut, and other places, where the animal that produces it is bred: though great part of the *civet* among us is furniſhed by the Dutch; who bring up a conſiderable number of the animals.

Before any of theſe animals were ſeen in Europe, or it had been obſerved how the perfume had been gathered, the common opinion, founded on the relations of travellers, was, that it was the ſweat of that animal, when irritated and provoked into rage. To this effect, it was ſaid, that the animal was incloſed in an iron cage; and after having been a long time beaten with rods, they gathered with a ſpoon, through the bars of the cage, and between the thighs of the animal, the ſweat or foam, which the rage and agitation had produced; and that, without this precaution, the animal would yield no perfume at all, which is undoubtedly falſe.

The proper *civet* perfume is only a thick unctuous humour, ſecreted by certain glands between the two tunics of the bag wherein it is amaſſed, under the creature's tail, beneath the anus, and between it and the ſexual parts of the animal.

Civet muſt be choſen new, of a good conſiſtence, a paliſh colour, and a ſtrong ſmell.

However, the ſweat and foam of the animal provoked by fretting, which are highly perfumed, are likewiſe collected, ſerve to ſophiſticate the perfume, or increaſe its quantity.

Beſides the Indian and Dutch *civet*, there is alſo a *civet* from Braſil, or Guinea, like that of India; and an *occidental civet*, which bears no reſemblance to it: this being only a term uſed to expreſs the human excrements.

Civet is little uſed in medicine, except in a thickneſs of hearing from cold; where a grain or two being put in a little cotton, or wool, and the ears ſtopped therewith, is ſometimes of ſervice. It is much uſed among perfumers and confectioners.

This odoriferous, unctuous animal juice is ſoluble in oils, but not in ſpirit of wine, or in water even by means of ſugar. Neumann.

CIVIC, Civicus, an epithet applied to a kind of crown, made of oaken leaves; anciently beſtowed by the Romans on thoſe who ſaved the life of a fellow-citizen in a battle, or an aſſault. The *civic* crown was exceedingly eſteemed; and was even given as an honour to Auguſtus; who on this occaſion ſtruck coins with this device, ob cives servatos. It was alſo granted to Cicero, after his diſcovery of Cataline's conſpiracy. See Crown.

CIVIL, Civilis, in its general ſenſe, denotes ſomething that regards the policy, public good, or peace of the citizens, or ſubjects of a ſtate.

In this ſenſe, we ſay, *civil* government; *civil* law; *civil* rights; *civil* war, &c.

Civil, in a *Legal Senſe*, is alſo applied to the ordinary procedure in an action relating to ſome pecuniary matter, or intereſt. In which ſenſe it is oppoſed to criminal.

Civil *Action.* See Action.

Civil *Architecture.* See Architecture.

Civil *Corporations.* See Corporations.

Civil *Day.* See Day.

Civil *Death*, any thing that retrenches, or cuts off a man from *civil* ſociety: as, a condemnation to the gallies, perpetual baniſhment, condemnation to death, outlawry, and excommunication; all which make a man ceaſe to be looked on as a citizen.

The term is likewiſe applied to thoſe who are no longer capable of acting in temporal concerns; as thoſe who renounce the world, who retire and make vows in a monaſtery, &c.

Civil *Fruits.* See Fruits.

Civil *Hiſtory.* See History.

Civil *Law*, *Lex* **Civilis**, is defined, in the Inſtitutes, to be the laws peculiar to each city, or each people. But in the modern uſe, it properly implies the Roman law, contained in the Inſtitutes, the Digeſt, the Code, and the Novels; otherwiſe called, *lex ſcripta*, or the *written law*.

The Roman law, at its commencement, was very inconſiderable. Under the kings, the people were governed by certain laws prepared by the ſenate, paſſed by the kings, and confirmed in an aſſembly of the people.

Papirius was the firſt who made a collection of the regal laws; which took its name from its author, and was called *jus Papirianum.*

The republic, after aboliſhing the regal government, ſtill retained the royal laws: to theſe they added the law of the Twelve Tables, drawn by the decemviri, from the laws of twelve of the principal cities of Greece; and the more equitable among the laws hitherto practiſed at Rome.

During the time of the republic, and even under the emperors, there were juriſconſulti; who making public profeſſion of the ſtudy of the law, were conſulted on the different ſenſes of the laws, and gave anſwers to the queſtions propoſed to them hereon; which were called *reſponſa prudentum*, and by Juſtinian, the *juriſprudentia media*.

The law of the Twelve Tables was at length found ſo ſevere, and conceived in ſuch obſcure terms, that it was judged proper to moderate, reſtrain, and aſcertain it, by other laws, propoſed to the ſenate by the conſuls, and paſſed at general aſſemblies of the people; according to the practice that had obtained under the kings themſelves: and theſe were called by way of emphaſis *leges*, or the *laws*. Afterwards, the common people differed with the nobility, and during their ſeceſſion enacted laws of their own, which were called *plebiſcita*; and, upon their ſubſequent reconciliation, theſe were admitted and univerſally enforced. The ſenate was likewiſe intruſted with a legiſlative authority; and new laws were made by them, and called *ſenatus conſulta*, and incorporated with the Roman *civil* law. The prætors, likewiſe, in the abſence of the conſuls, had a power of ſupplying and correcting the *civil* law of the Twelve Tables, and of propoſing edicts, which, when approved by the people, were incorporated into the *civil* law, under the title of *jus prætorium*. And the ædiles curules did alſo in ſome caſes enact and eſtabliſh laws. Theſe ſeveral parts, which have been enumerated, compoſed the Roman *civil* law, during the republic.

In the time of Julius Cæſar, Offilius, a lawyer, began a collection of the edicts of the prætors; but this was not finiſhed till the time of Adrian, by another lawyer; who alſo digeſted the edicts of the ædiles curules, which were made perpetual by the Cornelian law.

In the year of Rome 731, the republic expired; and the whole power of the people was transferred to Auguſtus, who was contented to publiſh his new laws in the aſſembly of the people; to keep up ſome image of the republic by this formality. Tiberius aboliſhed theſe occaſional aſſemblies, on pretence of their being too numerous; and in lieu thereof offered his laws to the ſenate, who never failed to confirm them: inſomuch that the laws of Tiberius, and his ſucceſſors, who kept the ſame meaſures with the ſenate, were eſteemed *ſenatus conſulta*. They were alſo called *imperial conſtitutions*, and ſometimes *placita principum*. The *reſponſa prudentum*, obtained from thoſe to whom the emperors gave commiſſion, and to which the judges were obliged to conform, conſtituted a part of the *jus ſcriptum*, or written law. The *imperial conſtitutions*, after they were become very numerous under ſucceeding emperors, were digeſted into four codes. See Code.

Juſtinian, finding the authority of the Roman law almoſt aboliſhed in the Weſt, by the declenſion of the empire, reſolved to make a general collection of the whole Roman juriſprudence, and committed the care thereof to his chancellor Trebonianus.

That miniſter executed his commiſſion with a great deal of diligence, not to ſay precipitation: a new code was finiſhed in 529, and a digeſt, or pandect, containing an abridgment of the *reſponſa prudentum*, in 533.

The ſame year he publiſhed an abridgment thereof, containing the firſt principles and elements of law, under the title of *Inſtitutes*.

In the courſe of this reign, Juſtinian made 168 conſtitutions, and 13 edicts; which made a conſiderable alteration in the ancient law, and were called *Novels*.

All theſe together, viz. the *Code*, the *Digeſt*, the *Inſtitute*, and the *Novels*, make the *corpus juris civilis*, or body of the *civil law*, as reduced by order of Juſtinian.

For the ſpace of about 300 years, this ſyſtem of law obtained without any innovation. But the new conſtitutions, made by the emperors from time to time, at length occaſioning ſome alterations; the emperor Baſil, and Leo his ſon, compoſed a new body of the Roman law, chiefly from the Juſtinian, in the Greek language; dividing it into ſeven volumes, and ſixty books; under the title of *Baſilica*. From which time, Juſtinian's body had but little credit in the Eaſt; the Baſilica taking place of it.

In the Weſt, the *civil law* had a different fortune: for, though ſome traces of its authority remained in Italy, yet it was little known in Europe, till a copy of Juſtinian's *Digeſts* was accidentally found at Amalfi, in Italy, about the year 1130; and this circumſtance, together with the policy of the Romiſh eccleſiaſtics, contributed to introduce it into ſeveral nations, and occaſioned that inundation of voluminous comments, with which this ſyſtem of law, more than any other, is now loaded.

It is true, however, it was never taught publicly till the twelfth century; when the ſtudy of it was introduced into ſeveral univerſities abroad, particularly that of Bologna; whence it was carried by Irnerius's diſciples into other countries, and in a little time was taught in all the univerſities.

It was firſt brought over into England by Theobald, a Norman abbot, who was elected to the ſee of Canterbury in 1138; and he appointed a profeſſor, viz. Roger, ſirnamed Vacarius, in the univerſity of Oxford, to teach it to the people of this country. Nevertheleſs, it gained ground very ſlowly; king Stephen iſſued a proclamation, prohibiting the ſtudy of it. And though the clergy were attached to it, the laity rather wiſhed to preſerve the old conſtitution. However, the zeal and influence of the clergy prevailed; and the *civil* law acquired great reputation from the reign of king Stephen to the reign of king Edward III. both incluſive. Many tranſcripts of Juſtinian's Inſtitute are to be found in the writings of our ancient authors, particularly of Bracton and Fleta; and judge Blackſtone obſerves, that the common law would have been loſt and over-run by the *civil*, had it not been for the incident of fixing the court of common pleas in one certain ſpot, and the forming the profeſſion of the municipal law into an aggregate body.

It is allowed, that the *civil* law contains all the principles of natural equity; and that nothing can be better calculated to form good ſenſe, and ſound judgment. Hence, though in ſeveral countries it has no other authority but that of reaſon, and juſtice, it is every-where referred to for authority.

It is not received at this day in any nation without ſome alterations: and ſometimes the feudal law is mixed with it, or general and particular cuſtoms; and often, ordinances and ſtatutes cut off a great part of it.

In Turky, the *Baſilics* are only uſed. In Italy, the canon law, and cuſtoms, have excluded a good part of it. In Venice, cuſtom hath almoſt an abſolute government. In the Milaneſe, the feudal law, and particular cuſtoms, bear ſway. In Naples and Sicily, the conſtitutions and laws of the Lombards are ſaid to prevail. In Germany, and Holland, the *civil law* is eſteemed to be the municipal law: but yet many parts of it are there grown obſolete; and others are altered, either by the canon law, or a different uſage.

In Friezeland, it is obſerved with more ſtrictneſs: but in the northern parts of Germany, the jus Saxonicum, Lubecenſe, or Culmenſe, is preferred before it. In Denmark and Sweden it hath ſcarce any authority at all. In France only a part of it is received; and that part is in ſome places as a cuſtomary law: and in thoſe provinces neareſt to Italy, it is received as a municipal written law. In criminal cauſes, the *civil law* is more regarded in France; but the manner of trial is regulated by ordinances and edicts.

The *civil law*, in Spain and Portugal, is connected with the jus regium and cuſtom. In Scotland, the ſtatutes of the ſederunt, part of the regiæ majeſtatis, and their cuſtoms, controul the *civil law*.

In England, it is uſed in the eccleſiaſtical courts; in the high court of admiralty; in the court of chivalry; in the two univerſities; and in the courts of equity: yet in all theſe it is reſtrained and directed by the common law. See Law, Common *Law*, &c.

Civil *Liberty*. See Liberty.

Civil *Liſt*, the money allotted for the ſupport of the king's houſhold, and for defraying certain neceſſary charges of government. See 1 Geo. III. cap. 3.

Civil *Month*. See Month.

Civil *Obligation*. See Obligation.

Civil *State*, conſiſts of the nobility and commonalty, excluſive of the clergy, and of the military and maritime orders.

Civil *Subjection*, in *Law*, is a ſpecies of compulſive obligation, whereby an inferior is conſtrained by a ſuperior to an action contrary to what his own reaſon and inclination would ſuggeſt: as when a legiſlator eſtabliſhes iniquity by a law, and commands a ſubject to do what is inconſiſtent with religion or ſound morality. This excuſe cannot be admitted in *foro conſcientiæ*, but it is a ſufficient extenuation of *civil* guilt before the municipal tribunal. Blackſt. Com. vol. iv. p. 28.

CIVIL *War*, a war between people of the ſame ſtate, or the citizens of the ſame city.

CIVIL *Year*, is the legal year, or *civil* account of TIME, which every government appoints to be uſed wiithin its own dominions.

It is thus called, in contradiſtinction to the natural year; which is meaſured exactly by the revolution of the heavenly bodies.

CIVILIANS *College*. See COLLEGE.

CIVILISATION, a law, or judgment, which renders a criminal proceſs CIVIL.

Civiliſation is performed by turning the information into an inqueſt, or vice verſa.

CLACK *wool*, is to cut off the ſheep's mark, which makes it weigh lighter; as to force wool, ſignifies to clip off the upper and hairy part thereof; and to bard it, is to cut the head and neck from the reſt of the fleece. Stat. 8 H. vi. cap. 22.

CLADEUTERIA, in *Antiquity*, a feſtival celebrated at the time of pruning the vines. It was likewiſe called *biſbæa*.

CLADIUS, in *Natural Hiſtory*, a name given by the ancients to the ſtag, or deer, when four years old; in this year, or at the end of it, it was alſo called *ceraſtes*. The Greeks had names for all the years growth of this animal up to its perfection: in the firſt year they called it *nebrus*; in the ſecond *pattalea*; in the third *dicrotus*; and in the fourth *cladius*, or *ceraſtes* toward the end of that year. This name the creature retained all its life afterwards, it being ſuppoſed at its full maturity at that time.

CLAIM, in *Law*, a CHALLENGE of intereſt in any thing that is in POSSESSION of another; at leaſt of a man's own. See NON-CLAIM.

There are divers ſorts of *claims*; as *claim by charter*, *by deſcent*, *by acquiſition*, &c.

CLAIM, *Continual*, a *claim* made from time to time, within every year and day, to land, or other thing, which, on ſome accounts, cannot be attained without danger.

Thus, if I am diſſeiſed of land, into which, though I have a right, I do not enter for fear of being beaten; I am to hold on my right of entry at my beſt opportunity; by approaching as near as I can, once every year, as long as I live: and thus I leave the right of entry to my heir.

CLAIM *of liberty*, a ſuit or petition to the king in the court of Exchequer, to have liberties and franchiſes confirmed there by the king's attorney-general.

CLAIM, *Falſe*. See FALSE.

CLAIM, *Quit*. See QUIT.

CLAIR-OBSCURE, or CHIARO-SCURO, in *Painting*, the art of diſtributing to advantage the lights and ſhadows of a piece; both with regard to the eaſing of the eye, and heightening the effect of the whole compoſition.

Thus, when a painter gives his figures a ſtrong relievo, looſens them from the ground, and ſets them free from each other, by the management of his lights and ſhadows, he is ſaid to underſtand the *clair-obſcure*.

The *clair-obſcure* makes one of the great diviſions, or branches, of painting; the whole of a picture being reſolvable into light and ſhadow. It was firſt invented in Italy by Hugo da Carpi, in the ſixteenth century.

The doctrine of the *clair-obſcure* will come under the following rules. Light may either be conſidered with regard to itſelf, to its effects, the place wherein it is diffuſed, or its uſe. For the 1ſt, light is either *natural*, or *artificial*.

Natural, either comes immediately from the ſun, which is briſk, and its colour various, according to the time of the day; or it is that of a clear air, through which light is ſpread, and whoſe colour is a little bluiſh; or of a cloudy air, which is darker, yet repreſents objects in their genuine colours with more eaſe to the eye.

Artificial light proceeds from fire, or flame, and tinges the object with its own colour: but the light it projects is very narrow and confined.

For the 2d, the effects of light are either *principal*, as when the rays fall perpendicularly on the top of a body, without any interruption; or glancing, as when it ſlides along bodies; or *ſecondary*, which is for things at a diſtance.

3. For the place, it is either the open champaign, which makes objects appear with great ſoftneſs; or an incloſed place, where the brightneſs is more vivid, its diminution more haſty, and its extremes more abrupt.

4. For the uſe, or application: the light of the ſun is always to be ſuppoſed without, and over-againſt the picture; that it may heighten the foremoſt figures; the luminaries themſelves never appearing, in regard the beſt colours cannot expreſs them. The chief light is to meet on the chief group, and as much as poſſible on the chief figure of the ſubject. The light is to be purſued over the great parts, without being croſſed, or interrupted with little ſhadows. The full force of the principal light to be only in one part of the piece; taking care never to make two contrary lights. Not to be ſcrupulouſly confined to one univerſal light; but to ſuppoſe other acceſſory ones, as the opening of the clouds, &c. to looſen ſome things, and produce other agreeable effects. Laſtly, the light to be different, according to the quality of the things whence it proceeds, and the nature of the ſubjects which receive it.

As for ſhadows, they are diſtinguiſhed, 1°, Into thoſe formed on the bodies themſelves, by their proper relievos: 2°, Thoſe made by adjacent bodies: 3°, Thoſe that make part of an whole: and, 4°, The different effects, according to the difference of places. For the firſt, ſince the different effects of lights only appear by ſhadows, their degrees muſt be well managed. The place which admits no light, and where the colours are loſt, muſt be darker than any part that has relievo, and diſpoſed in the front. The reflex, or return of the light, brings with it a colour borrowed from the ſubject that reflects it; and flies off at a greater or leſs angle, according to the ſituation of the reflecting body with regard to the luminous one: hence, its effects muſt be different in colour, and in force; according to the diſpoſitions of bodies. Deepenings, which admit not of any light, or reflux, muſt never meet on the relievo of any member of any great elevated part; but in the cavities or joints of bodies, the folds of draperies, &c. And to find occaſions for introducing great ſhadows to ſerve for the repoſe of the ſight, and the looſening of things; inſtead of many little ſhadows, which have a pitiful effect.

For the 2d, the ſhadows made by bodies, are either in plain and ſmooth places, or on the earth; wherein they are deeper than the bodies that occaſion them, as receiving leſs reflex light; yet ſtill diminiſh as they depart farther from their cauſe; or they are on the neighbouring bodies, where they are to follow the form of the ſaid bodies, according to their magnitude and poſition, with regard to the light.

For the 3d, in ſhadows that have parts, the painter muſt obſerve to take for a light in a ſhadowed place, the teint, or luſtre of the light part; and, on the contrary, for the ſhadow in the lightened part, the teint or luſtre in the ſhadow: to make an agreeable aſſemblage of colour, ſhadow, and reflex in the ſhadowed part, but without interrupting the great maſſes of ſhadow: to avoid forming little things in the ſhadow, as not being perceived, unleſs cloſely looked at; and to work, as it were, in the general, and at one ſight; never to ſet the ſtrong ſhadows againſt the lights, without ſoftening the harſh contraſt by the help of ſome intermediate colour: tho' the maſs of light may be placed either before or behind that of the ſhadow, yet ought it to be diſpoſed, as to illumine the principal parts of the ſubject.

For the 4th, the effects of ſhadows are different, as the place is either wide and ſpacious; as in thoſe coming immediately from the ſun, which are very ſenſible, and their extremes pretty abrupt: from the ſerene air, which are fainter, and more ſweet; from the dark air, which appear more diffuſed, and almoſt imperceptible; and thoſe from an artificial light, which makes the ſhadows deep, and their edges very abrupt: or as it is more narrow and confined, where the lights coming from the ſame place make the ſhadow more ſtrong, and the reflex leſs ſenſible.

CLAIR-OBSCURE, CHIARO-SCURO and OBSCURO, is alſo uſed for a deſign conſiſting only of two colours; ordinarily black and white, ſometimes black and yellow.

Or, it is a deſign only waſhed with one colour; the ſhadows being of a duſky brown colour, and the lights heightened up with white.

The word is alſo applied to prints of two colours, taken off at twice; whereof there are volumes in the cabinets of the curious in prints.

The word *clair-obſcure*, is compounded of two others. *Clair* is uſed among the French for thoſe parts of a painting which reflects the moſt light; and comprehends not only the lights themſelves, but alſo thoſe colours that are luminous. By *obſcure*, is meant not only all the ſhades, but alſo all the colours that are duſky.

CLAKIS, in *Zoology*, a name given by the people of Lancaſhire, and ſome other places, to the BARNACLE, a ſmall ſpecies of wild gooſe.

CLAMATOR, in *Antiquity*, was uſed to ſignify a domeſtic officer, whoſe buſineſs was to call the gueſts to dinner.

CLAMEA *admittenda in itinere per attornatum*, is a writ whereby the king commands the juſtice in eyre to admit a perſon's *claim* by an attorney, who, being employed in the king's ſervice, cannot come in perſon.

CLAMOR, or CLAMEUR *de Haro*, a popular term in the

French laws, importing a complaint, or cry, whereby any one implores the aſſiſtance of juſtice againſt the oppreſſion of another.

Clamor, *βοη*, in *Medicine*, an intenſeneſs of the voice, a loud outcry, a *clamor*. This is ſometimes the cauſe of a rupture of the veſſels, and ſometimes of a diſorder, like an inflammation about the membranes of the fauces and muſcles; which may be compared to that ulcerous and inflammatory laſſitude, which affects the hands, legs, and loins, after exceſſive hard labour: the ſpirituous and humid particles being exhauſted, and the fibres and membranes dried and contracted. A *clamor* is ſometimes alſo a ſort of remedy, and preſcribed as ſuch in order to rouſe perſons out of a lipothymy, or ſyncope.

Clamor *bellicus*, in *Antiquity*. See Huzza and Shout.

CLAMPS, in *Gunnery*. See Cap-*ſquares*.

Clamps, in *Ship-building*, are thick planks in a ſhip's ſide, uſed to ſuſtain the ends of the beams. They include the whole inner range of the ſide cloſe under each deck, from the ſtem to the faſhion-pice of the ſtern. Thoſe of the lower and ſecond decks ſhould be half the thickneſs of the correſponding timbers in that part, and as broad as they can be procured; and they ſhould be ſo diſpoſed as not to be pierced by the ports.

Clamps, in a *Ship*, are alſo pieces of timber applied to a maſt, or yard, to ſtrengthen it, and prevent the wood from burſting.

Clamp, alſo, denotes a little piece of wood, in form of a wheel; uſed inſtead of a pully in a mortice.

Clamp, is likewiſe the term for a pile of bricks built up for burning.

Clamp-*nails*, are ſuch nails as are uſed to faſten on *clamps* in building and repairing of ſhips.

CLAMPING, in *Joinery*, *&c.* When a piece of board is fitted with the grain, to the end of another piece of board croſs the grain; the firſt board is ſaid to be *clamped*. Thus the ends of large old tables were commonly *clamped*, to preſerve them from warping.

CLAMPONNIER, or **Claponnier**, in the *Manege*, a long-jointed horſe; that is, one whoſe paſterns are long, ſlender, and over-pliant.

The word is obſolete, and is properly applicable only to the ox kind: for *la claponniere* in French, is in them what the paſtern is in a horſe.

CLANCULARII, a ſect of Anabaptiſts, who denied the neceſſity of making an open profeſſion of the faith; and taught that a private one would be ſufficient.

Theſe were alſo called *Hortulani*, and *Gardeners*, from the places they choſe to aſſemble in, inſtead of churches.

CLANDESTINA, in *Botany*. See Lathræa.

CLANDESTINE, any thing done ſecretly, and without the knowlege of ſome of the parties intereſted in it; or without the proper ſolemnities.

The word comes from the prepoſition *clam*, of κλειω, *claudo*, *I ſhut*; or κλεμμα, *furtum*, *theſt*.

Thus, a marriage is ſaid to be *clandeſtine*, when performed without the publication of banns, the conſent of parents, or the knowlege of the ordinary. The council of Trent, and the French ordonnances, annul all *clandeſtine* marriages. See Marriage.

CLANGULA, in *Ornithology*. See Duck.

CLAP, in *Medicine*, the firſt ſtage, or ſtate, of the venereal diſeaſe, called alſo a gonorrhoea.

Dr. Cockburn, and others after him, will have the *clap* to conſiſt in an ulceration of the mouths of the glands of the *urethra* in men, and of the glandular *lacunæ* in women; occaſioned by the inſinuation of an acrimonious, purulent matter, contracted from an infected perſon *in actu coitus*.

From theſe glands, iſſues or gleets a ſharp corroſive matter, accompanied with heat of urine, chordee, &c. which makes what is uſually termed the firſt ſtage of the diſtemper.

A *clap* appears ſometimes ſooner, and other times later, though generally in about three or four days after the infection is received; and diſcovers itſelf by the running, &c. of the *penis*, with inflammation of the *glans*, or nut of the yard.

The heat, or burning, which ſuch perſons feel in making water, is a conſequence of this excoriation of the *urethra*; the ſalts contained in the urine pricking and irritating the nervous *fibrillæ* of the *urethra*, thus diveſted of its natural membrane.

If the perſon be affected with a *phimoſis*, or *paraphimoſis*; if the running be of a thin conſiſtence, a yellow or green colour, and in great quantity, and the teſticles ſwelled; it is uſually termed a *gonorrhœa virulenta*; and the *clap* ſuppoſed to be in its ſecond ſtage.

Some authors think, that in this degree, or ſtage, the infection has reached the maſs of blood, and the *veſiculæ ſeminales*: others inſiſt, that theſe ſymptoms may be accounted for, from the running, or *virus*, being more corroſive; and by that means irritating and inflaming the adjacent parts.

The cure of a *clap* conſiſts in proper evacuations, as calomel purgatives, refrigerant emulſions, powders, &c. turbith emetics, and laſtly, proper terebinths, &c. to which ſome add, decoctions of the *lignum vitæ*. As to externals, they are generally comprehended under the form of fomentations, cataplaſms, liniments, and lotions.

Late authors, and eſpecially Dr. Cockburn, have inſiſted on the cure of a *clap* by a particular injection, without the uſe of any other medicine. This has given a handle to quacks, who, by affecting to do the ſame by their injections, generally check the running, and occaſion a confirmed pox.

Turbith mineral, calomel, &c. given in ſmall doſes, and continued for ſome time, ſo as to take effect by way of alteratives, have been lately much commended as to ſucceſs. Mercurial unguents, uſed in ſmall quantities, ſo as not to raiſe a ſalivation, are ſaid to cure all the ſtages of the venereal diſeaſe: this practice is uſed at Montpelier.

Clap-*board*, a board cut, in order to make caſks or veſſels.

Clap-*net*, in *Birding*, a ſort of net contrived for the taking of larks with the looking-glaſs, by the method called daring, or doring. The nets are ſpread over an even piece of ground, and the larks are invited into the place by other larks faſtened down, and by a looking-glaſs compoſed of five pieces, and fixed in a frame, ſo that it is turned round very ſwiftly, backwards and forwards, by a cord pulled by a perſon at a conſiderable diſtance behind a hedge. See Doring.

CLAR, or **Claer**, in *Metallurgy*, bone aſhes perfectly calcined, and finely powdered, kept purpoſely for the covering the inſides of coppels.

CLARAMONT *powder*, the name of a medicinal powder, very famous in Venice, and ſome other places, for its virtues in ſtopping hæmorrhages of all kinds, and in the cure of malignant fevers. It has its name from the perſon who firſt found out its virtues, and who has written a book expreſsly about it. It is a white earth found near Baira, not far from Palermo, and is thence called alſo by ſome writers, *terra de Baira*.

CLARE, *Nuns of St.* were founded at Aſſiſe in Italy, about the year 1212. Theſe nuns obſerved the rule of St. Francis, and wore habits of the ſame colour with thoſe of the Franciſcan friars: and hence were called *Minoreſſes*; and their houſe, without Aldgate, the *Minories*, where they were ſettled when firſt brought over into England, about the year 1293. They had only three houſes beſides this.

CLARENCIEUX, the ſecond king at arms; thus called from the duke of Clarence, to whom he firſt belonged.

Lionel, third ſon of Edward III. having by his wife the honour of Clare in the county of Thomond, was hereupon created duke of Clarence; which dukedom afterwards eſcheating to Edward IV. he made this herald, who properly belonged to the duke, a king at arms; naming him *Clarencieux* in French, and *Clarencius* in Latin.

His office is to marſhal, and diſpoſe of, the funerals of all the lower nobility; as baronets, knights, eſquires, and gentlemen on the South ſide of Trent: whence he is alſo called *Surroy*, or *Southroy*, in contradiſtinction to Norroy.

CLARENDON, *Conſtitutions of*, in *Antiquity*, a charter or code of laws eſtabliſhed by the parliament at *Clarendon* in Wiltſhire, A. D. 1164; ſixteen articles of which related particularly to eccleſiaſtical matters, and were deſigned by king Henry II. to check the power of the pope and his clergy, and to limit the total exemption which they claimed from the ſecular juriſdiction. They were vehemently oppoſed by Becket: and ten of them were condemned by pope Alexander III. and ſix tolerated.

CLARET, or **Clairet**, *pale red*, a name which the French give to ſuch of their red wines as are not of a deep or high colour. See Wine.

The word is a diminutive of *clair*, *bright*, *tranſparent*. There are various accounts in the Phil. Tranſ. of attempts to improve the operation of tapping, by injecting the *abdomen* after the lymph is drawn off with *claret* and other aſtringents. Ibid. vol. xlix. part ii. Nº 65. an. 1756.

Claret, *Claretum*, in the *Ancient Pharmacy*, was a kind of wine ſweetened with ſugar, and impregnated with aromatics; ſometimes alſo called *Hippocras*, or *vinum Hippocraticum*; becauſe ſuppoſed to have been firſt preſcribed by Hippocrates.

It has its name *claret*, from its being clarified by percolation through a flannel bag, called *manica Hippocratis*.

CLARIAS, or **Clarias** *Nilotica*, in *Zoology*, the name of a fiſh of the *ſilurus* kind, common in the Nile, and brought to market at Memphis, and in many other parts of Egypt, but of an inſipid taſte, and eaten only by the poorer ſort of people. The tail is broad and forked, and has externally two horny appendages of a round figure, and a hand's breadth in length, in which it differs from all other fiſhes.

CLARICORD, or MANICORD, a muſical inſtrument, in form of a ſpinett.

It has forty-nine or fifty keys, and ſeventy ſtrings, which bear on five bridges; the firſt whereof is the higheſt, the reſt diminiſhing in proportion. Some of the ſtrings are in uniſon; their number being greater than that of the ſtops.

There are ſeveral little mortiſes for paſſing the jacks, armed with little braſs hooks, which ſtop and raiſe the chords in lieu of the feather uſed in virginals and ſpinetts. But what diſtinguiſhes it moſt, is, that the ſtrings are covered with pieces of cloth, which render the ſound the ſweeter; and deaden it ſo, as that it cannot be heard to any conſiderable diſtance.

Hence ſome call it the *dumb ſpinett*; whence it comes to be particularly in uſe among the nuns, who learn to play, and are unwilling to diſturb the ſilence of the dormitory.

The *claricord* is more ancient than either the ſpinett or harpſicord; as is obſerved by Scaliger, who, however, only gives it thirty-five ſtrings.

CLARIFICATION, in *Chemiſtry*, the act of clearing, or fining of liquors from their groſſer parts.

Clarification is performed by decantation, ebullition, deſpumation, and colature, or filtration.

The term is chiefly applied to juices, decoctions, and ſyrups, which are *clarified* by filtration, or by paſſing them through a ſtrainer, after having beat them up into a froth with the whites of eggs; the viſcous parts of the eggs, entangling the thick groſs particles of the liquor, retain them in the ſtrainer. Sometimes the mixture is boiled; by which means, the eggs entangle the groſſer parts, and carry them up to the top in a tough ſcum; which is either taken off with a ſpoon, or ſeparated by a flannel bag, as before, called *Hippocrates' ſleeve*. Another method is, by letting the liquor ſtand in a convenient veſſel, till the groſſer particles ſettle.

In diſtilled waters, &c. which have a milky hue, or are turbid, this is generally effected with fine ſugar, mixed with a ſmall quantity of alum; which will bear down the oily parts, and leave the reſt clear.

Many liquors are *clarified* by paſſing them through a thick brown paper; among others, hippocras, hydromel, &c.

The ancients *clarified* their wines by pouring them from off the lees, into another barrel, through a tin ſtrainer.

Fine and delicate wines are uſually *clarified* with ichthyocolla, or fiſh-glue: the thicker wines with omelette, or whites of eggs diluted in water; ſometimes by pouring them through a heap of little chips.

It is an error to ſuppoſe, that either iſinglaſs, or omelette, can be prejudicial to the health; ſince both the one and the other fall down with the lees, without producing any ill effect: though Neumann makes a doubt concerning the wholeſomeneſs of wines thus *clarified*; eſpecially if they are drank too ſoon. That which makes wines unwholeſome, is not the *clarifying* by theſe innocent means, but the mixtures and ſophiſtications of the vintners, to make them briſk, and bring them to life again, after the fret; which is done with *aqua vitæ*, ſpices, pigeons dung, &c.

Bay-ſalt is *clarified* with ox's blood.

Sugar is *clarified* with the whites of eggs, and ſugar beat together; and with ox's blood and other materials. See SUGAR.

For MALT *liquors*, particularly beer, there are various methods of clearing; the beſt is by caſting into it fixed nitre: ſome add the quinteſſence of malt and wine; whites of eggs made into balls with a little flour and iſinglaſs: oil, and quinteſſence of barley, have the ſame effect. It is exceedingly cleared and ſtrengthened, by adding to it, during the time of its fermentation, ſome ardent ſpirit.

CLARIGATIO, in *Roman Antiquity*, a ceremony that always preceded a formal declaration of war. It was performed in this manner; firſt four heralds, crowned with vervain, were ſent to demand ſatisfaction for the injuries done the Roman ſtate. Theſe heralds, taking the gods to witneſs that their demands were juſt, one of them, with a clear voice, demanded reſtitution within a limited time, commonly thirty-three days; which being expired, without any reſtitution made, then the *pater patratus*, or prince of the heralds, proceeded to the enemies frontiers, and declared war.

CLARIGATIO is alſo uſed for apprehending a man, and holding him to bail. The Greeks called this action ANDROLEPSIA.

CLARIGATION, in the *Law of Nations*, denotes a loud, clear call, or ſummons made to an enemy, to demand ſatisfaction for ſome injury received; in defect whereof, recourſe will be had to repriſals.

Clarigation amounts to much the ſame with what the Greeks call ανδροληψια. Though Naude uſes the word in a ſomewhat different manner. "Repriſals," ſays he, "ſignify the ſame as *pignorationes Budæo, aut clarigationes* "*Hermolao*: for, as to the Greek word *androlepſia*, it is "equivalent to the Latin *pignorandi poteſtas*."

CLARINO, in the *Italian Muſic*, ſignifies a TRUMPET; thus, *a duoi clarini*, added to any compoſition, denotes that it was made for two trumpets. See CORNET.

CLARION, a kind of trumpet, whoſe tube is narrower; and its tone acuter and ſhriller, than the common trumpet.

Menage derives the word from the Italian *clarino*, of the Latin *clarus*, by reaſon of the clearneſs of its ſound.

Nicod ſays, the *clarion*, as now uſed among the Moors, and the Portugueſe, who borrowed it from the Moors, ſerved anciently for a treble to ſeveral trumpets, which ſounded tenor and baſs. He adds, that it was only uſed among the cavalry, and the marines.

CLARION, in *Heraldry*, is a bearing repreſented in *Tab. Heraldry, fig.* 36.—He bears ruby, three *clarions* topaz; being the arms of the earl of Bath, by the name of Granville.

Guillim takes theſe *clarions* to be a kind of old-faſhioned trumpets; but others rather think, they repreſent the rudder of a ſhip; and others a reſt for a lance.

CLARISSIMI, among the Romans, a title of honour belonging to the third rank of nobility under the emperors. See SPECTABILES.

CLARK-*gooſe*, in *Natural Hiſtory*, a ſpecies of wild gooſe found in Zetland. Phil. Tranſ. Nº 473. ſect. 8.

CLARO *obſcuro*. See CLAIR *obſcure*.

CLARY, *Sclarea*, in *Botany*; Tourn. Linnæus has joined this genus and the next to the SALVIA. Its characters are theſe: the flower has a tubulous empalement, which widens at the top, and has five acute points at the brim. It is of the lip kind, with one petal, having a crooked tube which enlarges at the chaps, where it is divided into two lips; the upper lips erect and arched, the under lip cut into three ſegments. It has two ſtamina, which are ſituated under the upper lip, terminated by oblong erect ſummits; and a four-pointed germen, ſupporting a forked ſtyle longer than the upper lip, crowned by a bifid ſtigma. The germen afterward becomes four roundiſh ſeeds, which ripen in the empalement.

There are ſixteen ſpecies, natives of different places. The firſt ſort grows naturally in Syria, but has been long cultivated in the European gardens, both for the kitchen and ſhops: it is a biennial plant, which periſhes after it has borne ſeeds. The lower leaves of this are large, rough, wrinkled, oblong, and heart-ſhaped; and are ſawed on the edges.

It is propagated by ſeeds, which ſhould be ſown in the ſpring; and when fit to remove, may be planted in an open ſpot of ground in rows, two feet aſunder. In the winter and ſpring following, the leaves, which are the only part uſed, will be in perfection, and in the ſummer will run up to flower; and after ripening their ſeeds, will decay; ſo that young plants ſhould be annually raiſed for uſe.

Clary is accounted to be of a warming and drying nature. Infuſed in wine, it comforts a cold windy ſtomach; it is particularly commended to ſtrengthen the kidneys, to relieve a *fluor albus*, and invigorate a cold relaxed womb.

CLARY-*water*, is compoſed of brandy, ſugar, clary-flowers, and cinnamon, with a little ambergris diſſolved in it. It helps digeſtion, and is cardiac. This water is rendered either purgative or emetic, by adding reſin of jallap and ſcammony, or *crocus metallorum*. Some make *clary-water* of brandy, juice of cherries, ſtrawberries, and gooſeberries, ſugar, cloves, white pepper, and coriander ſeeds; infuſed, ſugared, and ſtrained.

CLARY, *wild*, *Horminum*, in *Botany*; Tourn. Inſt. R. H. 178. Its characters are theſe: the empalement of the flower is permanent, of one leaf, having two lips; the upper ending in three acute points, the under in two. The flower has one petal, divided into two lips; the upper concave, and incurved with a ſlight indenture at the point; the lower broader, and more indented. It hath two ſhort ſtamina, ſituated in the tube of the flower; and in the bottom of the tube are four roundiſh germina, which become four ſeeds lodged in the empalement.

There are five ſpecies, one of which is ſometimes called *oculus Chriſti*. See OCULUS *Chriſti*.

The Engliſh name of this genus of plants is *clary*; but it is an indeterminate one, becauſe it is alſo uſed as the name for the *ſclarea*, a different genus of plants, though by many authors confounded with the other under the name *horminum.* Tourn. Inſt. p. 178.

Horminum has been much celebrated as a cardiac, but is now leſs uſed than formerly. The dried herb, given in infuſion or decoction, is good in the *fluor albus*, but ſhould be given with other medicines. It is alſo commended in colics, flatulencies, and hyſteric complaints; alſo as an antiſpaſmodic, and in epilepſies.

CLASMIUM, in *Natural Hiſtory*, the name of a genus of foſſils of the claſs of the GYPSUMS; the characters of which are, that they are of a ſoft texture, and of a dull and opake look, being compoſed, like all the other gypſums, of irregularly arranged flat particles.

The word is derived from κλασμος, *a fragment*, or *ſmall particle*, from the flaky ſmall particles of which theſe bodies are compoſed. Of this genus there is only one known ſpecies; this is of a tolerably regular and even ſtructure, though very coarſe and harſh to the touch. It is common in Italy, and is greatly eſteemed there: we have of it alſo in ſome parts of Derbyſhire; but with us it is not particulary regarded, but burnt among the reſt. It neither gives fire with ſteel, nor ferments with *aqua fortis*; but calcines readily in the fire, and affords a very valuable plaſter of Paris.

CLASP-*nails.* See Nails.

CLASPERS, in *Botany*, are tendrils, threads, or ligaments, of a middle nature between thoſe of a root, and trunk; whereby ſhrubs, and other leſſer plants, take hold of trees, or other things near them, for their ſupport, &c.

The wiſdom of the Creator is very conſpicuous, in this proviſion for ſome ſpecies of plants, which need it; as ivy, vines, bryony, &c.

The contrivance is various in various ſubjects. Malpighi obſerves, that the *claſpers* of ivy are roundiſh, and covered with hair; and, what is very remarkable, they yield a glutinous terebinthine humour, by means whereof, they adhere cloſely to ſtones, &c. Nature, he adds, uſes no leſs artifice in the *vitis Canadenſis.*

Claſpers ſerve ſometimes for ſupport only: as thoſe of the vine, bryony, &c. whoſe branches being long, ſlender, and brittle, would be weighed down by their own load, and that of their fruit, but for theſe *claſpers*, which by a natural ſpire, or circumvolution, catch hold of any adjacent body.

Claſpers ſometimes alſo ſerve for a ſupply of juice; as in the trunk-roots of ivy, which being a tall plant, and of a compact ſubſtance, the ſap would not be ſufficiently furniſhed to the upper ſprouts, without this expedient.

Claſpers alſo ſometimes ſerve for ſtabiliment, as thoſe of cucumbers; for propagation, as thoſe of camomile; and for ſhade, ſtabiliment, and propagation all together, as thoſe of ſtrawberries.

CLASS, *Claſſis*, a diſtribution of perſons or things, ranged according to their merit, value, or nature. See Rank, &c.

The word comes from *claſſis*, derived by ſome from the Greek καλεω, *congrego*, *convoco*; a *claſs* being nothing but a multitude, aſſembled apart.

Class, in *Botany*, is defined by Linnæus to be an agreement of ſeveral genera in the parts of fructification, according to the principles of nature diſtinguiſhed by art: and he has divided the whole body of vegetables into twenty-four *claſſes.*

Class is particularly uſed for a diſtinction among ſcholars; who are diſtributed into ſeveral *claſſes* or forms, according to their capacities and attainments.

Quintilian uſes the word *claſſis* in this ſenſe, in the firſt book of his Inſtitutiones.

CLASSIC, Classical, a term chiefly applied to authors read in the *claſſes* at ſchools, and who are in great authority there. In this ſenſe, Aquinas, and the maſter of the ſentences, are *claſſic* authors in the ſchool-divinity; Ariſtotle, in philoſophy; Cicero and Virgil, in the humanities. Aulus Gellius ranks among *claſſic* authors, Cicero, Cæſar, Salluſt, Virgil, Horace, &c.

The term *claſſic* ſeems properly applicable only to authors who lived in the time of the Roman republic, and the Auguſtan age, when the Latin was in its perfection.

It appears to have taken its riſe hence, that an eſtimate of every perſon's eſtate being appointed by Servius Tullius, he divided the Roman people into ſix bands, which he called *claſſes.* The eſtate of thoſe of the firſt *claſſis* was not to be under two hundred pounds: and theſe, by way of eminence, were called *claſſics*, *claſſici.*

Hence, alſo, authors of the firſt rank came to be called *claſſics*: all the reſt were ſaid to be *infra claſſem.*

The firſt *claſſis*, again, was ſubdivided into centuries; making fourſcore centuries of footmen, and eighteen of horſemen.

Each *claſſis* conſiſted, one half of the younger ſort, who were to make war abroad; and the other of old men, who ſtaid at home, for the defence of the city.

Classical *learning* may be underſtood to ſignify ſuch an acquaintance with the beſt Latin and Greek writers, as ſhall enable the reader to perceive and admire the peculiar beauty of their compoſitions, and to adopt their diction and ſentiment. The principal *claſſic* Greek authors are, Homer, Heſiod, Plato, Demoſthenes, Æſchines, Xenophon, Plutarch, Iſocrates, Epictetus, Lucian, Sophocles, Euripides, Longinus, Theocritus, Anacreon, Pindar, Ariſtophanes, &c. The chief Latin writers are, Cicero, Livy, Cæſar, Salluſt, Virgil, Horace, Terence, Plautus, Juvenal, Ovid, Pliny, Valerius Paterculus, Tacitus, &c.

CLATHRI, in *Antiquity*, bars of iron, or wood, uſed in ſecuring doors and windows.

There was a goddeſs that preſided over *clathri*, called *Clathra.*

CLATHRUS, in *Botany*, a name given by Micheli, and continued by Linnæus, to a genus of *fungi* in the claſs of *cryptogamia*; the characters of which are theſe: they are always of a roundiſh figure, and have a reticulated and hollowed body, as if full of windows, with ramifications every where annexed.

Clathrus is alſo the name of a ſpecies of TURBO, in the order of *teſtacea*, belonging to the claſs of worms.

CLATTE, in *Heraldry*, a term borrowed from the French, to expreſs ſuch lines as are ſometimes found in the old paintings, and engravings of arms. Theſe lines are of an irregular kind, and not reducible to any other proper lines of heraldry, as the engrailed, indented, embattled, or the like.

CLAVARIA, in *Botany*, the name given by Vaillant, and continued by Linnæus, to a genus of *fungi* in the claſs of *cryptogamia*; the characters of which are, that they grow perpendicularly, and have a ſimple and uniform ſurface; theſe have been called alſo by the ſame Vaillant, under ſome ſmall varieties in the ſpecies, *corallo-fungus*; and by Tournefort, *coralloides.* Dillenius has called them *fungoides.*

CLAVARIUM, in *Antiquity*, an allowance which the Roman ſoldiers had for furniſhing nails to ſecure their ſhoes with. They raiſed frequent mutinies, demanding largeſſes of the emperors under this pretence.

CLAVATA *veſtimenta*, in *Antiquity*, habits adorned with purple *clavi*, which were either broad or narrow. See Clavus.

CLAUDENDA *curia.* See Curia.

CLAUDENS *palpebras*, in *Anatomy*, a name given by Spigelius, and ſome others, to one of the muſcles of the face, called by Albinus and Winſlow, *muſculus orbicularis palpebrarum*, and by others *ſphincter palpebrarum.*

CLAUDICATION. See Lameness.

CLAVELLATI *cineres.* See Pot-*aſhes.*

CLAVES *inſulæ*, a term uſed in the Iſle of Man, where all ambiguous and weighty caſes are referred to twelve perſons, whom they call *claves inſulæ*, i. e. *the keys of the iſland.*

CLAVICULÆ, *collar-bones*, in *Anatomy*, two ſmall bones, ſituate at the baſis of the neck, and top of the breaſt. See *Tab. Anatomy (Oſteol.)*, *fig.* 3. *n.* 3, 3.

They are about half a foot long, of the thickneſs of a finger, and a little bent at each end, and that different ways, ſomewhat like the letter *S*; and are thus called, as being the keys, *claves*, of the *thorax.*

Their inner ſubſtance is ſpongy, whence they are brittle, eaſily broken, and eaſily coaleſcing again. They are joined to the *acromium* of the *ſcapula per ſynchondroſin*; and on the fore-part, *per arthrodiam*, to a *ſinus* on each ſide of the upper part of the *ſternum.*

Their uſe is, to fix the *ſcapulæ* with the *ſternum* and the arms, and to prevent them from ſlipping too forward upon the *thorax.*

The two *clavicles* are ſituated tranſverſely, and a little obliquely, oppoſite to each other, about the ſuperior and anterior part of the *thorax*, between the *ſcapula* and the *ſternum.* Each *clavicle* reſembles in ſome meaſure an Italic *S*, being a long bone irregularly cylindric, bent forwards near the *ſternum*, and backwards near the *ſcapula*, as if it were made up of two arches joined endwiſe in oppoſite directions, that which lies on the fore-part of the breaſt being the largeſt. The *clavicles* are each divided into a body, or middle part, and two extremities, one anterior, inferior, and internal, which may be termed the pectoral or ſternal extremity; the other ſuperior, poſterior, and external, which may be named the humeral, or ſcapular extremity. The pectoral extremity is the thickeſt, and is of a triangular figure, eſpecially near the end, where it is a little enlarged, and ſhews a cartilaginous ſurface, with three angles, of which the loweſt is the moſt prominent, and is turned a little toward the cavity of the *thorax*; near theſe angles there are ſeveral muſcular and ligamentary impreſſions, one of which, near the inferior angle, is ſometimes raiſed like a tubercle. The humeral extremity is flat and broad, and two ſides may be conſidered in it, one ſuperior, the other inferior; as likewiſe two edges, one anterior, the other poſterior; and a ſmall articular ſurface.

The upper ſide has ſeveral inequalities, and in the lower there is a kind of oblong, rough, oblique tuberoſity. The poſterior edge is convex, thick, and uneven, being that of the ſmall arch of the *clavicle:* the anterior edge is concave, thin, and ſmooth, every where except near the great arch, where it has a rough impreſſion. The articular ſurface terminates this extremity, being cartilaginous, turned obliquely forward, and of an oval figure, like that of the *acromium*, with which it is articulated. The body or middle portion, which, together with the pectoral extremity, forms the great curvature of the *clavicle*, is not ſo thick as the extremities; it is a little flatted both on the upper and lower ſides, and therefore two edges may likewiſe be diſtinguiſhed in it; the upper ſide is pretty even, the lower ſomething rougher, and a little depreſſed by a ſuperficial channel. The edges are rounded, the anterior being convex, the poſterior concave; the inner ſubſtance of the extremities is cellular, the reſt is more ſolid, conſiſting of very thick ſides, with a narrow cavity more or leſs filled with reticular bony filaments. Winſlow.

Mr. Weitbrecht has deſcribed and delineated a ligament, which had not been obſerved by anatomical writers, ſtretched from the poſterior part of the anterior extremity of each *clavicle*, behind the *ſternum*, to the ſame part of the other *clavicle*, which makes the articulation of the *ſternum* and *clavicles* ſtronger. See Comment. Acad. Petrop. tom. iv. p. 255.

CLAVICLE, *fracture of the.* The *clavicle* is extremely ſubject to be fractured, both from its tranſverſe poſition, and from its ſmallneſs. Whether it happens to be broken near the *humerus*, or near the *ſternum*, its end that is next the *humerus* always deſcends lower than the other, from the weight of the arm which was before ſuſtained by the *clavicle* and head of the *ſternum*; and notwithſtanding that part of it next the *ſternum* remains immoveable by the deſcent of its other end, it can ſcarce happen but they will in ſome degree collapſe over one another.

The reduction of a fractured *clavicle* is not very difficult, eſpecially when the fracture is tranſverſe; nor is it uſual for the *humerus*, with the fragment of the *clavicle*, to be ſo far diſtorted as not to be eaſily reduced by the fingers. The difficulty, however, is much greater to keep the bone in its place when the fracture has been reduced; and that moſt of all when the bone has been broken obliquely. For this there are two reaſons; for the circular bandages, with which the bones of the arms, and other extremities are uſually held very firm, cannot be applied here, becauſe of the form and diſorder of the part; and then the weight of the depending arm ſoon pulls to pieces what the ſurgeon has been replacing.

This fracture is to be reduced in the following manner: the patient muſt be placed on a low ſeat, and an aſſiſtant is to thruſt his knee againſt the middle of the patient's back, between his two ſhoulders; then laying hold of the heads of both the patient's arms with his hands, he muſt pull them gently and gradually backwards, by which means the *clavicles* will be properly extended: while this is doing, the ſurgeon muſt ſtand before, and endeavour to replace the bone with both his hands, ordering the aſſiſtant to hold the bone in that poſition; he is then to apply a narrow and thick compreſs, ſo as to fill up the cavities above and below the *clavicle*; upon theſe he is to lay two more narrow compreſſes made in the form of an X; over all theſe he is to apply a piece of paſte-board, accommodated to the ſhoulders and neck, and firſt ſteeped in ſpirit of wine, or oxycrate; then he muſt place a ball under the arm, or elſe bind it ſeveral times with a thick roller, to prevent the *humerus* from ſubſiding; and, laſtly, the whole is to be properly bound up, and the arm ſuſpended by a ſaſh or ſling hung acroſs the ſhoulder, about the neck. The plaſters that have been uſed to be employed on this occaſion, have, of later years, been found to be wholly uſeleſs.

Whenever there are any looſe ſplinters of the bone that are entirely ſeparated, which, though they ſhould not wound, or hurt the fleſh, yet will obſtruct the meeting of the *clavicle*, it ſeems altogether requiſite to open the ſkin, and remove them before the reduction of the bone, treating the wound as uſual: but if there ſhould be any ſplinters which ſtill adhere to the bone, and prick the adjacent parts, and impede the reduction, they muſt be alſo either taken off with forceps, or elſe forced back into their places, by which they may be again united to the bone. But to divide the parts, and remove the fragments, requires great caution, leſt ſome of the large ſubclavian veins or arteries be wounded in the operation, and thereby a fatal hæmorrhage be produced. Heiſter, Surg. p. 120.

CLAVICLE, *luxated.* The *clavicles* are but ſeldom diſplaced, by reaſon of their ſtrong ligaments: but they may be diſlocated, however, either from the top of the *ſternum*, or *proceſſus acromion* of the *ſcapula*, to which they are naturally connected. This may be occaſioned either by a fall or blow, or by lifting ſome great weight. With regard to the cure, the ſooner aſſiſtance is had, the more eaſily may the reduction of the *clavicle* be performed; but loſs of time in this caſe is of the utmoſt conſequence, inveterate luxations of the *clavicle* being found incurable. The *clavicles* may be diſlocated in two manners from the *ſternum*, either internally toward the *larynx*, or externally upon the breaſt. When the firſt caſe happens, a cavity may be generally perceived upon the part affected, and the *trachea*, with the carotid veins, and arteries, and nerves, and the *æſophagus*, which are all together, will be very much diſturbed or compreſſed. On the contrary, when it is luxated forward upon the breaſt, it ſhews itſelf by a preternatural tumour, inſtead of a cavity, in that place.

The *clavicles*, when luxated, are to be replaced by the patient's being ſet in a low ſeat, and an aſſiſtant's thruſting his knee againſt the middle of his back, between his ſhoulders, and laying hold of both his arms, and pulling them gently backwards. By this means the *clavicles* will be extended, and are in that ſtate eaſily replaced. When this is done, it muſt be carefully regarded to remove the injuries of the neck. If any kind of luxation requires an accurate retention by bandage, it muſt certainly be this of the *clavicle*, eſpecially when the luxation has happened ſome time before the reduction; for, beſide that the *clavicles* have ſcarce any muſcles to ſupport them, their ligaments are uſually ſo much ſtretched and weakened in this caſe, that they are in no wiſe ſufficient to ſuſtain the weight of the arms. Such luxations of the *clavicles* as happen near the *proceſſus acromion*, are generally much more difficult to diſcover, and have been too often miſtaken, even by ſurgeons, for luxations of the *humerus*. Whenever this luxation happens, the ſuperior part of the *ſcapula* ſticks up: but in the place, when the *clavicles* are ſeparated from the acromion proceſs, a cavity may be obſerved: moſt acute pains alſo ariſe from this luxation, and the arm can by no means be lifted up. If therefore the luxated *clavicle*, in this caſe, is not timely reduced, it is no wonder that the uſe of the arm is entirely loſt afterwards. A ſtrict bandage continued about the part for forty days, to make the diſunited bones again coaleſce, will be found of great ſervice in theſe caſes, and, indeed, is the principal part of the cure. The bones may be replaced by the before adviſed manner of extenſion, but nothing can keep them ſo but a proper and accurately applied bandage. Heiſter. Surg. p. 158.

CLAVICYMBALUM, in *Antiquity*, a muſical inſtrument with thirty ſtrings, in a perpendicular ſituation.

Modern writers apply the name to our harpſichords.

CLAVIS, a Latin word, ſometimes uſed in Engliſh writers for a key.

CLAUSE, an article, or particular ſtipulation in a contract; a charge, or condition in a teſtament, &c.

We ſay, a *derogatory clauſe*, *penal clauſe*, *ſaving clauſe*, *codicillary clauſe*, &c.

CLAUSIT *extremum diem.* See DIEM.

CLAUSTRAL *prior.* See PRIOR.

CLAUSUM *fregit*, an action of treſpaſs; thus called, becauſe the writ demands the perſon ſummoned to anſwer to *quare clauſum fregit*, of the plaintiff, why he committed ſuch a treſpaſs?

CLAVUM *Veneris*, in *Botany*, a name given by ſome authors to the *water*-LILY, or *nymphæa*.

CLAVUS, in *Antiquity*, a band, or fillet of purple, worn on the breaſt by the Roman ſenators and knights, more or leſs broad, according to the dignity of the perſon; from the proportions of which aroſe the difference of *tunica* ANGUSTICLAVIA, and LATICLAVIA. See TUNICA.

This ornament, according to ſome, was called *clavus*, *nail*, as being ſtudded with little round plates of gold, or ſilver, like the heads of nails. Cantelius maintains, that the *clavus* conſiſted of a kind of purple flowers, ſewed upon the ſtuff.

CLAVUS *annalis*, in *Antiquity*. So rude and illiterate were the Romans towards the riſe of their ſtate, that the driving or fixing a nail was the only method they had of keeping a regiſter of time; for which reaſon it was called *clavus annalis*. There was an ancient law, ordaining the chief prætor to fix a nail every year on the ides of September; it was driven into the right ſide of the temple of Jupiter Opt. Max. towards Minerva's temple.

This cuſtom of keeping an account of time, by means of fixing nails, was not peculiar to the Romans, for the Etrurians likewiſe uſed to drive nails into the temple of their goddeſs Nortia, with the ſame view. Vid. Liv. lib. vii. cap. 3.

Clavus, in *Medicine*, a name phyſicians give to a ſhooting pain in the head, commonly ſituate a little above the eyes, viz. on the *ſinus frontalis*; and ſuppoſed to reſemble a boring of the head through with an augre; whence the name. In ſome it is only in one, and in others in both ſides.

It is generally allowed to be a ſpecies of an ague, or an intermittent fever; its periods of coming or going being uſually regular or ſtated. In ſome it is quotidian, in others tertian.

The cure conſiſts in giving an emetic a little before the fit, and after, confirming it with a proper quantity of the cortex, &c. as in intermitting fevers: though bleeding and diaphoretics ſometimes effect a cure without other aſſiſtants.

A pain like to this, on the top of the head, ſometimes attacks hyſterical perſons; which by Dr. Sydenham is termed *clavus hyſtericus*.

Clavus *hyſtericus*, in *Medicine*, denotes a peculiar ſpecies of head-ach, more frequently attacking women than men, and with them uſually owing its origin to a ſuppreſſion of the menſtrual diſcharges. In ſome caſes, the pain is leſs violent, and only attends people during the three or four firſt days of the menſtrual diſcharge. In others, the pain is more violent, and almoſt continual; and when to the common cauſes of it there is added a venereal taint, which is no uncommon caſe, it becomes then the moſt terrible of all pains in the head.

Signs of it. Theſe are a piercing pain about the forehead or temples, reſembling that of a nail driven into the head: this pain ſometimes alſo extends itſelf over the whole head: with this there generally is a ſenſation of pain about the ſagittal ſuture in particular, and a remarkable coldneſs there: often there is an inflation and redneſs of the face, with a noiſe and ringing in the ears. To theſe there are not unfrequently added a ſlight fever, a chillneſs of the extremities, a remarkable laſſitude, and want of appetite, with frequent eructations and nauſeas, and a coſtiveneſs of the bowels. It generally returns about the time of the menſes; or in caſes where it is continual, it rages with more than ordinary violence at that time. Among the women, thoſe are moſt ſubject to it who live ſedentary lives, and feed high, and who are naturally paſſionate, and of a haſty temper.

Cauſes of it. Among the natural cauſes of this terrible pain, the moſt powerful are, an excretion of blood toward the head, and a ſtoppage of the menſes, and of the diſcharges by the hæmorrhoidal veins, by injudicious treatment.

Prognoſtics from it. Nothing gives phyſicians greater trouble, or more expoſes the inſufficiency of the art of healing, than the head-achs to which women are ſubject. The manner of life of the patient is, however, more in fault in theſe obſtinate caſes, than either the nature of the diſeaſe, or the ſkill of the preſcriber: high living, and idleneſs, have too many charms, to be quitted eaſily by thoſe who can enjoy them; and, therefore, while the cauſe always ſubſiſts, the cure can be only palliative or temporary, the diſorder always returning after a time: yet it is certain by experience, that the moſt terrible and inveterate diſorders of this kind may be removed ſo as not to return, by the uſe of proper medicines, and a thorough change in the diet and manner of life of the patient.

Method of cure. The firſt care in this reſpect is to keep the bowels lax, for they are almoſt always naturally coſtive in this diſeaſe: emollient clyſters are the moſt proper means of doing this; and where purges are required beſide, they muſt always be of the moſt gentle and leaſt vellicating kind. After theſe, the violent emotions of the blood are to be quieted by powders of nitre, antimony diaphoretic, crab's eyes, and cinnabar; and if there be a ſpiſſitude in it, the neutral and diuretic ſalts are to be given, in a ſcruple at a time, every day. Tartarum vitriolatum alone, given in this manner, frequently has a very great effect. If it be found neceſſary, beſide this, a gentle opiate may be ſometimes given, ſuch as a ſmall doſe of the ſtorax pill: and externally, ſpirit of wine and camphor is not a little ſerviceable. By way of prevention, it is extremely proper to bleed at ſpring and autumn every year: and above all things, to keep regular in regard to the menſtrual diſcharges. Gentle purges are to be given at times, and neceſſary exerciſe above all things to be adviſed; and this ſhould always be the more inſiſted upon, the more averſe the patients are to it, and the more they love to indulge in a ſedentary courſe. Junker Conſp. Med.

Clavus is alſo uſed in *Medicine*, for a callus formed on the toes; popularly called a *corn*.

Clavi ariſe from a too great compreſſion of the *cutis*; which by this means hardens, and forms itſelf into a knot. See **Callus**.

The cure is by firſt ſoftening them, as with *emplaſt. de ranis cum mercurio*, or with *galban. crecat.* with *ſal ammoniac*; and then pulling them up. A piece of raw beef, applied in manner of a plaſter, and frequently ſhifted, is often found to diſſipate them in a little time. Whether theſe are removed by the knife, or by application of emollient, cauſtic, or corroding medicines, great caution ſhould be uſed to avoid injuring any of the ſubjacent tendons.

After corns are cut away, Harris ſays the *diachylon ſimplex* will prevent their growing again; as alſo will the *galbanum coctum Mynſicbti*, and alſo that ſoft wax which is uſed by the lawyers. But above all a clean linen rag bound about the toe, after the callus is cut away; this was much recommended by king Charles II.

CLAWS, among *Zoologiſts*, denote the ſharp pointed nails, with which the feet of certain quadrupeds and birds are furniſhed.

Elk's **Claws**. See **Elk**.

Claws is alſo uſed for a cloſe or ſmall meaſure of land.

CLAWING, or **Clawing**-*off*, in *Sea-Language*, ſignifies the act of *beating* or turning to windward from a lee-ſhore, ſo as to eſcape the danger of ſhipwreck.

CLAY, *Argilla*, in *Natural Hiſtory*, a ſoft viſcous earth, found in various places, and uſed for various purpoſes; of ſeveral kinds and properties.

Dr. Liſter, in the Philoſophical Tranſactions, gives us a table of twenty-two ſeveral *clays* found in the ſeveral counties of England; five whereof he calls

Pure, i. e. ſuch as are ſoft like butter, to the teeth, with little or no grittineſs in them; viz. 1. Fuller's-*earth*, which he diſtinguiſhes by its colour into yellowiſh, brown, and white. 2. Boles. 3. Pale yellow *clay*. 4. Cowſhot *clay*. 5. Dark blue *clay*, or MARLE. The other ſeventeen,

Impure; whereof eight are harſh and duſty when dry; as, 1. Creta, chalk, or milk-white *clay*. 2. Potters pale yellow *clay*. 3. Blue potters *clay*. 4. Blue *clay*, wherein is found the aſtroites. 5. Yellow *clay*. 6. Fine red *clay*. 7. Soft chalky blue *clay*. 8. Soft chalky red *clay*. Three are ſtony when dry; viz. 1. A red ſtony *clay*. 2. A blue ſtony *clay*. 3. A white ſtony *clay*.

Three are mixed with ſand, or pebbles; viz. 1. A yellow loam. 2. A red ſandy *clay*. 3. A ſecond ſpecies of the ſame kind.

Laſtly, three are mixed with flat or thin ſand, glittering with mica; viz. 1. Crouch white *clay*. 2. Grey or bluiſh tobacco-pipe *clay*. 3. A red *clay*. But this is a very unartful diſpoſition.

Dr. Hill has diſtinguiſhed them by their colours into white, yellow, brown, blue, green, red, and black *clays*; and enumerated ſeveral particular ſorts of *clay* under each of theſe heads. Mr. Mendes Da Coſta alſo, in his Hiſtory of Foſſils, diſtributes them according to their colour into black, white, aſh and grey, red, yellow, brown, blue, green *clays*; and then ſubdivides each claſs into *clays* which are not acted upon by acids, and alcaline *clays*.

The diſtinguiſhing characters of earths principally uſed in the potter's trade are theſe: they are firmly coherent, weighty and compact; ſtiff, viſcid and ductile to a great degree while moiſt; ſmooth to the touch, and unctuous, not eaſily breaking between the fingers, nor readily diffuſible in water, and when mixed in it, not readily ſubſiding from it. It hardens by fire into a kind of ſtony ſubſtance. It is not known that any kind of earth ſhrinks ſo much as *clay*, and hence the purity of *clay* may be judged from the degree of its contraction. Lewis's Commercium Phil Techn. p. 259.

Such as are curious to know more of this ſubject may be fully gratified by conſulting M. Maquer's Mem. on *clays*, in the Mem. of the A. D. S. an. 1762.

Clay-*lands*. See **Soil**.

CLAYES, in *Fortification*, are wattles made with ſtakes, interwoven with oziers, &c. to cover lodgments.

CLAYING *of land*. See **Manuring**.

CLAYTONIA, in *Botany*, a genus of the *pentandria monogynia* claſs. The characters are: the flower hath a two-leaved oval empalement, with a tranſverſe baſe: it hath five oval indented petals, and five recurved ſtamina, ſhorter than the petals, and terminated by oblong ſummits. In the center is ſituated an oval germen, ſupporting a ſingle ſtyle, crowned by a trifid ſtigma. The germen becomes a roundiſh capſule with three cells, opening with three elaſtic valves, and filled with round ſeeds. This is a native of Virginia, and we have but one ſpecies in our Engliſh gardens.

CLEAR, in *Building*, is ſometimes uſed among the workmen for the inſide work of a houſe, &c.

CLEARING *of liquors*. See **Clarification**.

CLEATS, in *Ship-building*, are pieces of wood of different ſhapes, uſed occaſionally to faſten ropes upon, in a ſhip: ſome have one arm, ſome two, and others have no arms but are hollowed in the middle, and nailed to the deck or ſides of the ſhip.

CLEAVERS, Clivers, or Gooſe-*graſs*, *aparine*, in *Botany*, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is bell-faſhioned, very wide, open at the mouth, and divided into ſeveral ſegments; the cup becomes a fruit, which is dry, covered with a very thin ſkin, and compoſed of two round bodies, which contain an umbilicated ſeed. The leaves of this plant are rough and hairy, and ſtand in rundles round the ſtalk.

The ſpecies of *cleavers* enumerated by Mr. Tournefort, are eleven.

The *cleavers* are known from the madders, by their having a dry fruit; and from croſſwort, by having five or more leaves at a joint; and finally, from galium, or ladies bed-ſtraw, by the leaves being rough or hairy. However, Linnæus has claſſed the gooſe-graſs with ſmooth ſeed under GALIUM, and the low trailing gooſe-graſs with a blue flower under *valantia*. It is very common on banks under hedges.

The vulgar have an opinion of this plant as an antiſcorbutic, and eat it in ſpring with nettle-tops and the reſt of that tribe, to ſweeten their blood. It ſtands recommended by many authors as a remedy for the king's evil; and others have aſcribed a very powerful diuretic virtue to it; but theſe have in general ordered a very bad preparation of it for theſe purpoſes, the diſtilled ſimple water; doubtleſs a good decoction muſt be greatly preferable. We have the aſſurance of Dr. Palmer, from his own knowlege, that it is an excellent remedy in a *gonorrhœa ſimplex*.

CLECHE, or Clechy, in *Heraldry*, is explained by Guillim as an ordinary open to the light, or pierced through with another inner one of the ſame figure; e. gr. when a croſs appears as if charged with another croſs of the ſame colour with the field; or as if the field appeared through the apertures thereof.

The word is French, ſuppoſed to be formed of *clef*, *key*; the ends of the croſs being thought to bear ſome reſemblance to the bowls of the ancient keys.

But Colombiere, and ſome other writers, will have this piercing to be only a circumſtance of the croſs *cleché*, and call it by the name *vuide*, voided. The thing that denominates it *cleché*, is its ſpreading from the centre towards the extremities, which are very wide, and end in an angle in the middle; as in the figure repreſented *Tab. Herald. fig.* 37.

CLEDGE, a name given by miners to the upper part of the ſtratum of fuller's-earth. See Fuller's-*earth*.

CLEDONISM, Cledonismus, a kind of divination, in uſe among the ancients.

The word is formed from κληδων, which ſignifies two things, *rumor*, a report, and *avis*, a bird: in the firſt ſenſe, *cledoniſm* ſhould denote a kind of divination drawn from words occaſionally uttered.—Cicero obſerves, that the Pythagoreans made obſervation not only of the words of the gods, but of thoſe of men; and accordingly believed the pronouncing of certain words, v. g. *incendium*, at a meal, very unhappy.—Thus, inſtead of priſon, they uſed the word *domicilium*; and to avoid *erinnyes*, furies, ſaid *eumenides*.

In the ſecond ſenſe, CLEDONISM ſhould ſeem a divination drawn from birds; the ſame with ornithomantia.

CLEF, or Cliff, in *Muſic*, a mark at the beginning of the lines of a ſong, which ſhews the tone, or key, in which the piece is to begin. Or, it is a letter marked on any line, which explains and gives the name to all the reſt.

Anciently, every line had a letter marked for a *clef*; now a letter on one line ſuffices; ſince by this all the reſt are known; reckoning up and down, in the order of the letters.

It is called the *clef*, q. d. *key*, becauſe hereby we know the names of all the other lines and ſpaces; and conſequently the quantity of every degree, or interval.

But becauſe every note in the octave is called a *key*, though in another ſenſe, this letter marked is called in a particular manner the *ſigned clef*; becauſe being written on any line, it not only ſigns and marks that one, but it alſo explains all the reſt.

By *clef*, therefore, for diſtinction-ſake, we mean that letter ſigned on a line, which explains the reſt; and by *key*, the principal note of a ſong, in which the melody cloſes.

There are three of theſe *ſigned clefs*, *c*, *f*, *g*. The *clef* of the higheſt part in a ſong, called *treble*, or *alt*, is *g* ſet on the ſecond line counting upwards. The *clef* of the *baſs*, or the loweſt part, is *f* on the fourth line upwards: for all the other mean parts, the *clef* is *c*, ſometimes on one, ſometimes on another line. Indeed, ſome that are really mean parts, are ſometimes ſet with the *g clef*.

It muſt, however, be obſerved, that the ordinary ſignatures of *clefs* bear little reſemblance to thoſe letters. Mr. Malcolm thinks it would be well if we uſed the letters themſelves. Kepler takes great pains to ſhew, that the common ſignatures are only corruptions of the letters they repreſent. See their figures among the other Characters *of muſic*.

The *clefs* are always taken fifths to one another: that is, the *clef f* is loweſt, *c* a fifth above it, and *g* a fifth above *c*.

When the place of the *clef* is changed, which is not frequent in the *mean clef*, it is with deſign to make the ſyſtem comprehend as many notes of the ſong as poſſible, and ſo to have the fewer notes above or below it. If then there be many lines above the *clef*, and few below it, this purpoſe is anſwered by placing the *clef* in the firſt or ſecond line: if there be many notes below the *clef*, it is placed lower in the ſyſtem. In effect, according to the relation of the other notes to the *clef* note, the particular ſyſtem is taken differently in the ſcale, the *clef* line making one in all the variety.

But ſtill, in whatever line of the particular ſyſtem any *clef* is found, it muſt be underſtood to belong to the ſame of the general ſyſtem, and to be the ſame individual note or ſound in the ſcale. By this conſtant relation of *clefs*, we learn how to compare the ſeveral particular ſyſtems of the ſeveral parts; and know how they communicate in the ſcale, i. e. which lines are uniſon, and which not: for it is not to be ſuppoſed, that each part has certain bounds, within which another muſt never come. Some notes of the treble, v. gr. may be lower than ſome of the mean parts, or even of the baſs. To put together therefore into one ſyſtem all the parts of a compoſition written ſeparately, the notes of each part muſt be placed at the ſame diſtances above and below the proper *clef*, as they ſtand in the ſeparate ſyſtem; and becauſe all the notes that are conſonant (or heard together) muſt ſtand perpendicularly over each other, that the notes belonging to each part may be diſtinctly known, they may be made with ſuch differences as ſhall not confound, or alter their ſignifications with reſpect to time, but only ſhew, that they belong to this or that part. Thus we ſhall ſee how the parts change and paſs through one another; and which, in every note, is higheſt, loweſt, or uniſon. The uſe of particular *ſigned clefs* then, is an improvement with reſpect to the parts of any compoſition; for unleſs ſome one key in the particular ſyſtems were diſtinguiſhed from the reſt, and referred invariably to one place in the ſcale, the relations could not be diſtinctly marked.

It muſt here be obſerved, that for the performance of any ſingle piece, the *clef* only ſerves for explaining the intervals in the lines and ſpaces: ſo that we need not regard what part of any greater ſyſtem it is; but the firſt note may be taken as high or low as we pleaſe. For as the proper uſe of the ſcale is not to limit the abſolute degree of tone; ſo the proper uſe of the *ſigned clef* is not to limit the pitch, at which the firſt note of any part is to be taken; but to determine the tune of the reſt, with relation to the firſt; and conſidering all the parts together, to determine the relation of their ſeveral notes by the relations of their *clefs* in the ſcale: thus, their pitch of tune being determined in a certain note of one part; the other notes of that part are determined by the conſtant relations of the letters of the ſcale, and the notes of the other parts by the relations of their *clefs*.

In effect, for performing any ſingle part, the *clef* note may be taken in an octave, i. e. at any note of the ſame name; provided we do not go too high, or too low, for finding the reſt of the notes of a ſong. But in a concert of ſeveral parts, all the *clefs* muſt be taken, not only in the relations, but alſo in the places of the ſyſtem above mentioned; that every part may be comprehended in it.

The difference of *clefs* in particular ſyſtems makes the practice of muſic much more difficult and perplexed, than it would otherwiſe be; both with reſpect to inſtruments, and to the voice. This occaſioned Mr. Salmon to propoſe a method of reducing all muſic to one *clef*; whereby the ſame writing of any piece of muſic ſhould equally ſerve to direct the voice, and all inſtruments; which he calls an *univerſal character*.

The natural and artificial note expreſſed by the ſame letter, as *c* and *c* ♯, are both ſet on the ſame line or ſpace. When there is no character of flat or ſharp, at the beginning with the *clef*, all the notes are natural: and if in any particular place the artificial note be required, it is ſignified by the ſign of a flat or ſharp, ſet on the line a ſpace before that note.

If a ſharp or flat be ſet at the beginning in any line or ſpace with the *clef*, all the notes on that line or ſpace are artificial ones; i. e. are to be taken a ſemitone higher or lower than they would be without ſuch ſign. And the ſame affects all their octaves above and below, though they be not marked ſo. In the courſe of the ſong, if the natural note be ſometimes required, it is ſignified by this character ♮.

The marking of the ſyſtem thus by flats and ſharps, Mr. Malcolm calls the *ſignature of the clefs.*

CLEFT, in *Grafting*. See Engrafting.

Clefts, or Cracks, in the heels of horſes, are occaſioned by hard labour, unwholeſome food, want of exerciſe, and waſhing them when hot. They are cured by cutting off the hair, and anointing with the oil of hempſeed, or linſeed, and keeping them clean.

CLEIDION, in *Antiquity*, the ſame with *clavicula.* See Claviculæ.

CLEIDOMASTOIDEUS, in *Anatomy*, a name given by Albinus to a muſcle, called by others ſimply mastoidæus, and by Euſtachius *ſeptimus caput moventium.*

CLEMA, in *Antiquity*, a ſpecies of vine, a twig of which was the enſign of a centurion's office.

CLEMATIS, in *Botany*. See Virgin'*s bower.*

CLEMENT, *Conſtitutions of.* See *Apoſtolical* Constitutions.

Clement, *Recognitions of.* See Recognitions.

CLEMENTINA, a ſpurious work attributed to Clement.

CLEMENTINE, a term uſed among the Auguſtins, who apply it to a perſon, who, after having been nine years a ſuperior, ceaſes to be ſo, and becomes a private monk, under the command of a ſuperior.

The word has its riſe hence, that pope Clement, by a bull, prohibited any ſuperior among the Auguſtins from continuing above nine years in his office.

Clementines, in the *Canon Law*, are the conſtitutions of pope Clement V. and the canons of the council of Vienne.

CLENCH-*nails*. See Nails.

CLEOME, in *Botany*, a name given by ſome to the ſea-holly, or eringo. Ger. Emac. Ind. 2.

Cleome, *ſinapiſtrum* of Tournefort, is a genus of the *tetradynamia ſiliquoſa* claſs. The characters are; the flower hath a four-leaved empalement, which ſpreads open: it hath four petals, which incline upward, and ſpread open; the lower being leſs than the other: in the bottom there are three mellous glands, which are roundiſh, and ſeparated by the empalement: it hath ſix or more ſtamina, which are incurved, having riſing ſummits fixed to their ſide: it hath a ſingle ſtyle, ſupporting an oblong germen, which is of the ſame length with the ſtamina, and crowned by a thick ſtigma: the germen becomes a long cylindrical pod, having one cell opening with two valves, and filled with round ſeeds.

CLEPSYDRA, a kind of water-clock, or an hour-glaſs ſerving to meaſure time by the fall of a certain quantity of water.

The word comes from κλεπτω, *condo*, and ὕδωρ, *aqua, water.*

There have likewiſe been *clepſydræ* made with mercury.

The Egyptians, by this machine, meaſured the courſe of the ſun. Tycho Brahe, in modern days, made uſe of it to meaſure the motion of the ſtars, &c. and Dudley uſed the ſame contrivance in making all his maritime obſervations.

The uſe of *clepſydræ* is very ancient: they were probably invented in Egypt under the Ptolemies; though ſome authors aſcribe the invention of them to the Greeks, and others to the Romans. Pliny informs us, that Scipio Naſica, about one hundred and fifty years before Chriſt, gave the firſt hint for the conſtruction of them; and Pancirollus has particularly deſcribed it. According to his account, the *clepſydra* was a veſſel made of glaſs, with a ſmall hole in the bottom of it edged with gold: in the upper part of this veſſel a line was drawn, and marked with the twelve hours: the veſſel was filled with water, and a cork with a pin fixed in it floated on the ſurface, and pointed to the firſt hour; and as the water ſunk in the veſſel, by iſſuing out of the ſmall hole, the pin indicated the other hours in proportion to its decreaſe. Their uſe was chiefly in the winter; ſun-dials ſerved in the ſummer. They had two great defects; the one, that the water ran out with a greater or leſs facility, as the air was more or leſs denſe: the other, that the water ran out more readily at the beginning, than towards the concluſion.

M. Amontons has invented a *clepſydra* free from both theſe inconveniences, and which is ſaid to have the three grand advantages, of ſerving the ordinary purpoſe of clocks; of ſerving in navigation for the diſcovery of the longitude; and of meaſuring the motion of the arteries.

Clepsydra, *conſtruction of a.* To divide any cylindric veſſel into parts to be emptied in each diviſion of time; the time wherein the whole, and that wherein any part is to be evacuated, being given.

Suppoſe, v. gr. a cylindric veſſel, whoſe charge of water flows out in twelve hours, were required to be divided into parts to be evacuated each hour. 1. As the part of time 1 is to the whole time 12, ſo is the ſame time 12 to a fourth proportional, 144. 2. Divide the altitude of the veſſel into 144 equal parts: here, the upper diviſion will fall to the laſt hour; the three next above to the laſt part but one; the five next to the tenth hour, &c. Laſtly, the twenty-three laſt to the firſt hour.

For, ſince the times increaſe in the ſeries of the natural numbers, 1, 2, 3, 4, 5, &c. and the altitudes, if the numeration be in retrograde order from the twelfth hour, increaſe in the ſeries of the unequal numbers, 1, 3, 5, 7, 9, &c. the altitudes computed from the twelfth hour, will be as the ſquares of the times 1, 4, 9, 16, 25, &c. Therefore the ſquare of the whole time 144, comprehends all the parts of the altitude of the veſſel to be evacuated. But a third proportional to 1 and 12, is the ſquare of 12; and conſequently it is the number of equal parts into which the altitude is to be divided, to be diſtributed according to the ſeries of the unequal numbers, through the equal intervals of hours. Since, in lieu of parts of the ſame veſſel, other leſs veſſels equal thereto may be ſubſtituted; the altitude of a veſſel emptied in a given ſpace of time being given, the altitude of another veſſel to be emptied in a given time may be found; viz. by making the altitudes as the ſquares of the times.

Hence we ſee the method of conſtructing the *clepſydræ* uſed by the ancients.

The honourable Mr. Charles Hamilton has deſcribed a curious *clepſydra* of a new conſtruction. An open canal *e e*, (ſee *Tab. Horology*, *fig.* 1.) ſupplied with a conſtant and equal ſtream by the ſyphon *d*, has at each end *f*, *f*, open pipes of exactly equal bores, which deliver the water that runs along the canal *e*, alternately into the veſſels *g* 1, *g* 2, in ſuch a quantity as to raiſe the water from the mouth of the tantalus *t* exactly in an hour. The canal *e e* is equally poiſed by the two pipes *f* 1, *f* 2, upon a center *r*; the ends of the canal *e* are raiſed alternately, as the cups *z z* are depreſſed, to which they are connected by lines running over the pullies *l*, *l*. The cups *z z*, are fixed at each end of the balance *m*, *m*, which moves up and down upon its center *v*. *n* 1, *n* 2, are the edges of two wheels or pullies, moving different ways alternately, and fitted to the cylinder *o* by oblique teeth both in the cavity of the wheel and upon the cylinder, which, when the wheel *n* moves one way, that is, in the direction of the minute-hand, meet the teeth of the cylinder and carry the cylinder with it; and when *n* moves the contrary way, ſlip over thoſe of the cylinder, the teeth not meeting, but receding from each other. One or other of theſe wheels *n n* continually moves *o* in the ſame direction, with an equable and uninterrupted motion. A fine chain goes twice round each wheel, having at one end a weight *x*, always out of water, which equiponderates with *y* at the other end, when kept floating on the ſurface of the water in the veſſel *g*, which *y* muſt always be; the two cups *z*, *z*, one at each end of the balance keep it in equilibrio, till one of them is forced down by the weight and impulſe of the water, which it receives from the tantalus *t t i*: each of theſe cups *z*, *z*, has likewiſe a tantalus of its own *b h*, which empties it after the water has done running from *g*, and leaves the two cups again in equilibrio: *q* is a drain to carry off the water. The dial-plate, &c. needs no deſcription. The motion of the *clepſydra* is effected thus: as the end of the canal *e e*, fixed to the pipe *f* 1, is, in the figure the loweſt, all the water ſupplied by the ſyphon runs through the pipe *f* 1, into the veſſel *g* 1, till it runs over the top of the tantalus *t*; when it immediately runs out at *i* into the cup *z*, at the end of the balance *m*, and forces it down; the balance moving on its center *v*. When one ſide of *m* is brought down, the ſtring which connects it to *f* 1, running over the pulley *l*, raiſes the end *f* 1 of the canal *e*, which turns upon its center *r*, higher than *f* 2; conſequently, all the water which runs through the ſyphon *d* paſſes through *f* 2 into *g* 2, till the ſame operation is performed in that veſſel, and ſo on alternately. As the height the water riſes in *g* in an hour, viz. from *s* to *t*, is equal to the circumference of *n*, the float *y* riſing through that height along with the water, lets the weight *x* act upon the pulley *n*, which carries with it the cylinder *o*; and this, making a revolution, cauſes the index *k* to deſcribe an hour on the dial-plate. This revolution is performed by the pulley *n* 1; the next is performed by *n* 2, whilſt *n* 1 goes back, as the water in *g* 1 runs out through the tantalus; for *y* muſt follow the water, as its weight increaſes out of it. The axis *o* always keeps moving the ſame way; the index *p* deſcribes the minutes; each tantalus muſt be wider than the ſyphon, that the veſſels *g g* may be emptied as low as *s*, before the water returns to them. See drawings of this inſtrument in different poſitions, with a deſcrip-a deſcription of it in the Phil. Tranſ. vol. xliv. art. xiv. p. 171.

CLEPSYDRA is alſo uſed for an HOUR-*glaſs* of ſand.

CLEPSYDRA is alſo applied to a chemical veſſel perforated in the ſame manner.

CLERGY, CLERUS, the aſſembly or body of clerks, or eccleſiaſtics; in contradiſtinction to the LAITY. See CLERK.

In the Romiſh church there are two kinds of *clergy:* the one *regular*, comprehending all the religious of both ſexes: the other *ſecular*, comprehending all the eccleſiaſtics that do not make the monaſtic vows.

Among the Reformed, there are none but ſecular *clergy*. The Roman *clergy* forms a monarchical ſtate, under the pope, as its ſupreme head.

The *clergy* in the firſt century were diſtinguiſhed by the title of PRESBYTERS or BISHOPS; and ſome maintain that they were of equal rank and authority. But towards the cloſe of the ſecond century, a notion prevailing, that the miniſters of the Chriſtian church ſucceeded to the character, rights, and privileges of the Jewiſh prieſthood, this produced a ſubordination of rank among them. The biſhops aſſumed a rank and character ſimilar to thoſe of the Jewiſh high-prieſt, the preſbyters repreſented the prieſts, and the deacons the levites. This diſtinction was ſtill farther promoted towards the end of the third century, and a new ſet of eccleſiaſtical officers was eſtabliſhed, ſuch as ſub-deacons, acolythi, door-keepers, readers, exorciſts, &c. The powers of the *clergy* were conſiderably extended under the patronage of Conſtantine the Great, about the cloſe of the fourth century.

The *clergy* was anciently divided into three orders; viz. prieſts, deacons, and inferior CLERKS; and each order had its chief: the arch-prieſt was the head of the firſt order, the arch-deacon of the ſecond, and the dean of the third.

Under the name of *clergy*, were alſo formerly compriſed all the officers of juſtice; as being ſuppoſed to be men of letters.

Though the *clergy* formerly claimed an exemption from all ſecular juriſdiction, yet Matt. Paris tells us, William the Conqueror ſubjected the biſhops and abbeys who held *per baroniam*, and who, till then, had been exempt from all ſecular ſervice; and ordered they ſhould be no longer free from mortuary ſervices. To this purpoſe he preſcribed arbitrarily what number of ſoldiers every abbey and biſhoprick ſhould provide, to ſerve him and his ſucceſſors in war, and laid up the regiſters of eccleſiaſtical ſervitude in his treaſury.

But, in effect, the *clergy* were not exempt from all ſecular ſervice till then; as being bound by the laws of king Edgar to obey the ſecular magiſtrate in ſome things; viz. upon an expedition to the wars, and in contributing to the building and repairing of bridges, &c. See TRINODA *neceſſitas*.

The privileges of the Engliſh *clergy*, by the ancient ſtatutes, are very conſiderable: their goods are to pay no toll in fairs or markets; they are exempt from all offices, but their own; from the king's carriages, poſts, &c. from appearing at ſheriffs tourns or frank-pledges; and are not to be fined or amerced, according to their ſpiritual, but their temporal means.

A *clergyman* acknowleging a ſtatute, his body is not to be impriſoned: if he be convicted of a crime, for which the benefit of *clergy* is allowed, he ſhall not be burnt in the hand. See *Benefit of* CLERGY.

The *clergy*, by common law, are not to be burdened in the general charges with the laity; nor to be troubled or incumbered, unleſs expreſly named, and charged by the ſtatute; for general words do not affect them. Thus, if a hundred be ſued for a robbery, the miniſter ſhall not contribute; though the words are, *gentes demorantes:* neither are they aſſeſſed to the highway, to the watch, &c. But theſe privileges are in a great meaſure loſt; the *clergy* being included under general words in later ſtatutes: ſo that they are liable to all public charges impoſed by act of parliament, where they are not particularly excepted. They are not now required to bear temporal offices, as thoſe of ſheriff, conſtable, &c. nor to ſerve on juries, nor to appear at tourns and leets, nor to ſerve perſonally in wars. Their bodies are not to be taken on ſtatutes merchant or ſtaple, &c. nor are they liable to an arreſt by *capias*; but a writ ſhould be addreſſed to the biſhop, compelling them to appear: nevertheleſs, when execution is obtained, a ſequeſtration of the profits of their benefices may be had. *Clergymen* are not liable to be arreſted in the church or church-yard, while attending on divine ſervice; and he that beats a *clergyman*, may be obliged to do penance in the ſpiritual court. See BATTERY.

The revenues of the *clergy* were anciently more conſiderable than at preſent: Ethelwolph, in 855, gave them the tythe of all goods, and the tenth of all the lands in England; free from all ſecular ſervices, taxes, &c.

The charter whereby this was given them, was confirmed by ſeveral of his ſucceſſors; Edmund, Edgar, Ethelred, Alfred, and William the Conqueror; the laſt of whom, finding the biſhopricks ſo rich, erected them all into baronies; each barony containing thirteen knights fees, at leaſt. But ſince the Reformation, the biſhopricks are much impaired. See BISHOP.

The revenues of the inferior *clergy*, in the general, are ſmall; a third part of the beſt benefices being anciently, by the pope's grant, appropriated to monaſteries; upon the diſſolution whereof they became lay-fees.

Indeed, an addition was made, 2 Annæ; the whole revenue of FIRST-FRUITS and tenths being then granted, to raiſe a fund for the augmentation of the maintenance of the poor *clergy:* purſuant to which, a corporation was formed, by the name of the governors of the bounty of queen Anne, for the augmentation of the maintenance of the poor *clergy*; to whom the ſaid revenues were conveyed in truſt, &c. See AUGMENTATION.

CLERGY, *articles of the*. See ARTICLES.

CLERGY, *proctors of the*. See PROCTORS.

CLERGY, *Privilegium Clericale*, or *Benefit of Clergy*, denotes an ancient privilege of the church, conſiſting in this, that places conſecrated to religious duties were exempted from criminal arreſts, whence proceeded SANCTUARIES; and that the perſons of *clergymen* were exempted from criminal proceſs before the ſecular judges in particular caſes. This, at firſt, was an indulgence granted by the civil government, but it was afterwards claimed as an inherent, indefeaſible, and *jure divino* right: and the *clergy* endeavoured to extend the exemption not only to almoſt all kinds of crimes, but to a variety of perſons, beſides thoſe who were properly of their own order. In England, though this privilege was allowed in ſome capital caſes, it was not univerſally admitted. The method of granting it was ſettled in the reign of Henry VI. which required, that the priſoner ſhould firſt be arraigned, and then claim his *benefit of clergy*, by way of declinatory plea, or, after conviction, by way of arreſt of judgment; which latter mode is moſt uſually practiſed. This privilege was originally confined to thoſe who had the *habitum & tonſuram clericalem:* but in proceſs of time every one was accounted a clerk, and admitted to this *benefit*, who could read; ſo that, after the invention of printing, and the diſſemination of learning, this became a very comprehenſive teſt, including laymen as well as divines; and, therefore, the ſtat. 4 Henry VII. cap. 13. diſtinguiſhes between lay-ſcholars, and clerks in holy orders; and directs, that the former ſhould not claim this privilege more than once, and, in order to their being afterwards known, that they ſhould be burnt with a hot iron in the brawn of the left thumb. This diſtinction was aboliſhed by 28 Hen. VIII. cap. 4. and 32 Hen. VIII. cap. 3. but was virtually reſtored by 1 Ed. VI. cap. 12. in conſequence of which ſtatute peers of the realm, and lords of parliament, were entitled to an equal privilege with the *clergy*, for the firſt offence, though they could not read, and for all offences *clergyable* to commoners, and ſome others therein ſpecified. When thoſe, admitted to the privilege of their *clergy*, were thus diſcharged from the ſentence of the law in the king's courts, they were delivered over to the ordinary for *canonical* PURGATION. But by ſtat. 18 Eliz. cap. 7. all ſuch perſons, inſtead of being committed to the ordinary, are delivered out of priſon, provided the judge does not think fit to continue them in goal for a limited time, not exceeding a year.

Some alterations were made in the law reſpecting this privilege, by 21 Jac. I. cap. 16. and by 3 and 4 W. and M. cap. 9. and 4 and 5 W. and M. cap. 24. in conſequence of which all women, all peers, and all commoners, who could read, were diſcharged in *clergyable* felonies, abſolutely, if clerks in orders; and for the firſt offence, upon burning in the hand, if lay; all, however, except peers, liable to impriſonment, as before mentioned; and thoſe who could not read, if under the degree of peerage, were hanged. By 5 Ann, cap. 6. the *benefit of clergy* was indiſcriminately granted to all who had a right to aſk it, without the condition of reading. Again, by 4 Geo. I. cap. 11. and 6 Geo. I. cap. 23. it is enacted, that where any perſons ſhall be convicted of larceny, either grand or petit, and ſhall be entitled to the *benefit of clergy*, or liable only to the penalties of branding or whipping, the court in their diſcretion may direct ſuch offenders, inſtead of burning or whipping, to be tranſported to America for ſeven years; and if they return within that time, it ſhall be felony *without benefit of clergy*.

It appears, from the above account, that the perſons to whom this privilege now extends, are clerks in orders, without branding or tranſportation; lords of parliament and peers of the realm, for the firſt offence; and all commoners, not in orders, whether male or female, for *clergyable* felonies, upon being burnt in the hand, or impriſoned at the diſcretion of the judge; and in caſe of larceny, on being tranſported for ſeven years, or ſuffering the puniſhment more lately ſubſtituted in the room of tranſportation.

This privilege is allowed only in petit treaſon and felonies; though not in all felonies, as lying in wait on the highway, deſtroying and ravaging the country, and Arson. Petit treaſon, and other acts of felony, beſides theſe, are excluded by particular acts of parliament; the operation of which reſtores the law to the ſame rigour of capital puniſhment in the firſt offence, which it exerted before the privilege was allowed, and which it ſtill exerts on a ſecond offence in almoſt all kinds of felonies, unleſs committed by clerks in actual orders. By the marine law, declared in ſtat. 28 Hen. VIII. cap. 15. the *benefit of clergy* is not allowed in any caſe whatever.

Thoſe who are entitled to claim this privilege, are for-ever diſcharged of all felonies, committed before conviction, within its extent; and reſtored to all capacities and credits, and the poſſeſſion of their lands, as if they had never been convicted. But, by conviction, they forfeit all their goods to the king, which are not afterwards reſtored, and are ſubject to all the diſabilities of felons, till they have received either the judgment of the law or a pardon. Blackſt. Com. vol. iv. p. 358, &c.

CLERICAL *Crown*. See Crown.

Clerical *Title*. See Title.

CLERICI *non elegantur in officio*. See Quod *Clerici*.

Non-reſidentia pro Clericis *Regis*. See Non *reſidentia*.

Clerico *admittendo*, a writ directed to the biſhop, for the admitting a clerk to a benefice upon a *ne admittas* tried, and found for the party who procured the writ.

Clerico *capto per ſtatutum mercatorum*, is a writ for the delivery of a clerk out of priſon, who is impriſoned upon the breach of ſtatute-merchant.

Clerico *convicto commiſſo gaolæ in defectu ordinarii deliberando*, is a writ for the delivery of a clerk to his ordinary, that was formerly convicted of felony; by reaſon his ordinary did not challenge him according to the prilege of clerks.

Clerico *intra ſacros ordines conſtituto non eligendo in officium*, is a writ directed to the bailiffs, &c. that have thruſt a bailiwick or beadleſhip upon one in holy orders; charging them to releaſe him.

CLERK, Clericus, a word formerly uſed to ſignify a learned man, or man of letters.

The word comes from κληρος, uſed for *clergy*, but more properly ſignifying *lot*, or *heritage*; becauſe the lot and portion of *clerks* or eccleſiaſtics is to ſerve God. Accordingly, *clerus* was at firſt uſed to ſignify thoſe, who had a particular attachment to the ſervice of God. The origin of the expreſſion is derived from the Old Teſtament, where the tribe of Levi is called the *lot*, *heritage*, κληρος; and God is reciprocally called their portion; becauſe that tribe was conſecrated to the ſervice of God, and lived on the offerings made to God, without any other ſettled proviſion, as the reſt had.

Thus, Paſquier obſerves, the officers of the counts *(comites)* were anciently created under the title of *clerks of accompts*; and ſecretaries of ſtate were called *clerks of the ſecrets*. So, *Clericus domini regis*, in the time of Edward I. was rendered in Engliſh, the *king's ſecretary*, or *clerk of his council*.

The term was applied indifferently to all who made any profeſſion of learning; or who knew how to manage the pen: though, originally, it was appropriated to eccleſiaſtics.

As the nobility and gentry were uſually brought up to the exerciſe of arms; there were none but the clergy left to cultivate the ſciences: hence, as the clergy alone made any profeſſion of letters, a very learned man came to be called a *great clerk*, and a ſtupid ignorant man, a *bad clerk*.

Ronſard, in his old language, uſes the word femininely, *clergeſſe*, for a learned woman. "*Mais trop plus eſt à* "*craindre une feme clergeſſe.*"

Clerk (in general) is uſed for all thoſe of the eccleſiaſtical ſtate, who are in holy orders, of any degree, or kind; from the deacon, to the prelate.

Yet, in its utmoſt latitude, the word *clerk* alſo includes chantors, acolythi, exorcistæ, and ostiarii. The canons excommunicate all thoſe who lay hands on a *clerk*. A council held in Africa prohibited the appointing any *clerk* to be a tutor, guardian, or curator, by teſtament. The council of Elvira enjoins continence on all *clerks*, biſhops, prieſts, or deacons, on pain of being ſtripped of their clericature.

Clerk, *acephalous*, in the ſixth century, was a name given to thoſe *clerks* who ſeparated from the biſhop, and choſe not to live any longer in community with him; in contradiſtinction to

Clerks *canonic*, who continued to live with the biſhop, according to the canons.

Clerk, in the way of trade and buſineſs, is one who exerciſes any function with the pen.

Clerk is alſo a title given to ſeveral officers of this kind in the royal palace, the courts of juſtice, revenue, army, navy, &c. The principal of theſe are as follow.

Clerk *of the Acts*, is an officer of the navy, who receives and enters the commiſſions and warrants of the lord admiral; and regiſters the acts and ordinances of the commiſſioners of the navy.

Clerk *of Affidavits*, in the court of chancery, an officer who files all affidavits made uſe of in court.

Clerk *of Aſſiſe*, is he that writeth all things judicially done by the juſtices of aſſiſe, in their circuits.

Clerk *of the Bails*, an officer belonging to the court of king's bench. Stat. 22 and 23 Car. II. He files the bail pieces taken in that court, and attends for that purpoſe.

Clerk *of the Check*. See Check.

Clerk *of the Cloſet*, is a divine, otherwiſe called *confeſſor to his majeſty*; whoſe office is to attend at the king's right hand during divine ſervice, to reſolve all doubts concerning ſpiritual matters, to wait on the king in his private oratory, &c.

Clerk *of the Crown*, or *Crown-Office*, in the king's bench court, an officer whoſe buſineſs is to read, frame, and record all indictments againſt traitors, felons, and other offenders there, arraigned upon any public crime.

Clerk *of the Crown*, in chancery, is an officer, who, by himſelf, or deputy, is continually to attend the lord-chancellor, or lord-keeper, for ſpecial matters of ſtate, by commiſſion, or the like, either immediately from his majeſty, or by order of his council; as well ordinary as extraordinary. All general pardons, upon grants of them at the king's coronation, or in parliament; the writs of parliament, with the names of the knights, citizens, and burgeſſes, are alſo returned into his office: beſides which, he has the making of ſpecial pardons, and writs of execution upon bonds of ſtatute ſtaple forfeited.

Clerk *of the Declarations*, an officer in the court of king's bench that files all declarations in cauſes there depending, after they are engroſſed.

Clerk *of the Deliveries*, is an officer in the Tower, who takes indentures for all ſtores iſſued thence.

Clerk *of the Errors*, in the court of common pleas, tranſcribes, and certifies into the king's bench, the tenor of the records of the cauſe, or action, upon which the writ of error, made by the curſitor, is brought there, to be determined.

Clerk *of the Errors*, in the king's bench, tranſcribes and certifies the records of ſuch cauſes in that court into the exchequer; if the cauſe, or action, is by bill.

Clerk *of the Errors*, in the exchequer, tranſcribes the records certified thither out of the king's bench; and prepares them for judgment in the court of exchequer, to be given by the juſtices of the common-pleas, and barons, there.

Clerk *of the Eſſoins*, in the court of common pleas, keeps the eſſoin-roll, or enters eſſoins. He alſo provides parchment, cuts it into rolls, marks the number on them; delivers out all the rolls to every officer, and receives them again when written. See Essoin.

Clerk *of the Eſtreats*, belongs to the exchequer; and, every term, receives the eſtreats out of the lord-treaſurer's remembrancer's office, and writeth them out to be levied for the king. He alſo maketh ſchedules of ſuch ſums eſtreated as are to be diſcharged. See Estreat.

Clerks *of the Green-Cloth*. See Green-Cloth.

Clerk *of the Hamper*, or *Hanaper*, is an officer in chancery, whoſe buſineſs is to receive all money due to the king for the ſeals of charters, patents, commiſſions, and writs: as alſo fees due to the officers for inrolling and examining the ſame. He is obliged to attend on the lord-chancellor, or lord-keeper, daily, in term-time; and at all times of ſealing.

Clerk *Comptroller of the King's Houſe*, an officer of the court, who has place and ſeat in the compting-houſe; with authority to allow or diſallow the charges and demands of purſuivants, and meſſengers of the green-cloth, purveyors, &c. He has alſo the overſight of all defaults and miſcarriages of inferior officers; and ſits in the compting-houſe with the ſuperior officers, viz. the lord-ſteward, treaſurer, comptroller, and cofferer, for correcting and redreſſing things out of order.

Clerk *of the Inrollments of Fines and Recoveries*, in the court of common pleas, is an officer under the three elder judges of that court, and removeable at their pleaſure, who inrols all fines and recoveries, and returns writs of entry, &c. See INROLLMENT.

CLERK *of the Juries*, or *curata writs*, is an officer belonging to the court of common-pleas, who makes out the writs called *habeas corpus*, and *diſtringas*, for the appearance of juries, either in court, or at the aſſizes; after the panel is returned upon the *venire facias*. See JURY.

CLERK *of the Market*, is an officer of the king's houſe, whoſe duty is to take charge of the king's meaſure, and to keep ſtandards of them, that is, examples of all the meaſures that ought to be uſed through the land.

CLERK *Marſhal* of the king's houſe, ſeems to be an officer who attends the marſhal in his court, and records all his proceedings. See MARSHAL.

CLERK *of the Nichils*, or *Nihils*, is an officer in the exchequer, who makes a roll of all ſuch ſums as are *nic hilled* by the ſheriffs upon their eſtreats of green-wax; and delivers the ſame into the lord-treaſurer's remembrancer's office, to have execution done upon them for the king. See NIHIL.

CLERK *of the Ordnance*, is an officer in the Tower, who regiſters all orders relating to the king's ordnance. See ORDNANCE.

CLERK *of the Outlawries*, is an officer belonging to the court of common-pleas; being a deputy to the king's attorney-general, for making out the writs of *capias utlagatum*, after outlawry; and the king's attorney's name is to every one of thoſe writs.

CLERK *of the Paper-Office*, is an officer of the king's bench, who makes up the paper-books of ſpecial pleadings and demurrers in that court.

CLERK *of the Papers*, an officer in the court of common-pleas, who keeps the papers of the warden of the Fleet, enters commitments and diſcharges of priſoners, delivers out day-rules, &c.

CLERK *of the Parcels*, an officer of the exchequer. See PARCEL-*Makers*.

CLERK *of a pariſh*. See PARISH *Clerk*.

CLERK *of the Parliament*, is an officer who records all things done in parliament; and engroſſes them fairly into parchment rolls, for the better preſervation of them to poſterity. Of theſe there are two: one of the houſe of lords, and the other of the houſe of commons.

CLERK *of the Patents*, or letters patent under the great ſeal. See PATENT.

CLERK *of the Peace*, is an officer belonging to the ſeſſion of the peace, whoſe duty is at the ſeſſion to read the indictments, to inrol the acts, and draw the proceſſes; to inrol proclamations of rates for ſervants wages; to inrol the diſcharge of apprentices; to keep the counterpart of the indenture of armour, &c. Alſo to certify in the king's bench tranſcripts of indictments, outlawries, attainders, and convictions, had before the juſtices of the peace within the time limited by ſtatute. He is appointed by the *cuſtos rotulorum* of the county, and liable to be diſcharged for miſdemeanour by the juſtices of peace in quarter-ſeſſions.

CLERK *of the Pells*, belongs to the exchequer: his buſineſs is, to enter the tellers bill into a parchment roll, called *pellis receptorum*; and alſo to make another roll of payment, called *pellis exituum*, wherein he ſets down by what warrant the money was paid. 22 and 23 Car. II.

CLERK *of the Petty Bag*, is an officer in chancery, whereof there are three; the maſter of the rolls being their chief. Their office is to record the return of all inquiſitions out of every county, all liveries granted in the court of wards, all oſter les mains; to make all patents of cuſtomers, gaugers, comptrollers, and aulnagers; congé d'elires for the creations of biſhops; ſummonſes of the nobility, clergy, and burgeſſes, of parliament; commiſſions directed to the knights and others, of every ſhire, for raiſing of ſubſidies; writs for nomination of collectors for the fifteenths; and all traverſes upon any office, bill, or otherwiſe; and to receive the money due to the king for the ſame. See PETTY-*Bag*.

CLERK *of the Pipe*, belongs to the exchequer. See PIPE-*Office*.

CLERK *of the Pleas*, is an officer in the exchequer, in whoſe office the officers of the court, upon ſpecial privilege belonging to them, ought to ſue, and be ſued, upon any action.

CLERKS *of the Privy-Seal*, are four officers who attend the lord-keeper of the privy-ſeal, or, if there be none ſuch, the principal ſecretary of ſtate; and write, or make out, all things ſent by warrant from the ſignet to the privy-ſeal, and to be paſſed to the great ſeal: as alſo to make out privy-ſeals upon any ſpecial occaſion of the king's affairs; as for loan of money, or the like.

CLERK *of the Rolls*, in *Chancery*, an officer who ſearches for, and copies deeds, offices, &c.

CLERK *of the Rules*, in the court of king's bench, an officer who draws up and enters all the *rules* and orders made in court, and gives rules of courſe in divers writs.

CLERK *of the Sewers*, is an officer belonging to the commiſſioners of the ſewers, who writes down all things they do by virtue of their commiſſion, and the authority given them by 13 El. cap. 9.

CLERK *of a Ship*, is an officer appointed to take care that nothing be ſquandered, or ſpent needleſly.

He is obliged to keep a regiſter, or journal, containing an exact inventory of every thing in the loading of the veſſel; as the rigging, apparel, arms, proviſion, munition, merchandizes; as alſo the names of the paſſengers, if there be any; the freight agreed on; a liſt of the crew, their age, quality, wages; the bargains, purchaſes, ſales, or exchanges the ſhip makes from its departure; the conſumption of proviſion; and, in ſhort, every thing relating to the expence of the voyage. He alſo regiſters the conſultations of the captains, pilots, &c. He alſo does the office of a regiſter in all criminal proceſſes; and of a notary, to make and keep the wills of thoſe who die in the voyage; takes inventories of their effects, &c. The *clerk* is not allowed to quit the veſſel during the voyage, on forfeiture of all his wages, &c. In ſmall veſſels, the maſter, or pilot, does the office of *clerk*.

CLERK *of the Signet*, is an officer continually attending on the king's principal ſecretary; who has cuſtody of the privy-ſignet, as well for ſealing the king's private letters, as for ſuch grants as paſs his majeſty's hands by bills ſigned. Of theſe there are four, who attend in their turn, and have their diet at the ſecretary's table.

CLERK *of the King's Silver*, is an officer belonging to the common-pleas; to whom every fine is brought, after it has been with the *cuſtos brevium*; and by whom the effect of the writ of covenant is entered into a paper-book; and according to that note, all the fines of that term are alſo recorded in the rolls of the court. See QUEEN *Gold*.

CLERK *of the Superſedeas*, is an officer in the court of common pleas, who makes out writs of *ſuperſedeas* (upon the defendants appearing to the exigent on an outlawry) whereby the ſheriff is forbid to return the exigent.

CLERK *of the Treaſury*, an officer of the common pleas, who has charge of the records of the *niſi prius*, the fees due for all ſearches, and the certifying of all records into the king's bench, when a writ of error is brought. He alſo makes out all writs of *ſuperſedeas de non moleſtanda*, which are granted for the defendants while the writ of error is depending; and all exemplifications of records, being in the treaſury.

CLERK *of the King's great Wardrobe*, keeps an account or inventory, in writing, of all things belonging to the king's wardrobe. See WARDROBE.

CLERK *of the Warrants*, is an officer belonging to the court of common-pleas, who enters all warrants of attorney for plaintiff and defendant; and inrols all deeds of indentures of bargain and ſale, which are acknowleged in the court, or before any judges out of the court; and it is his office to eſtreat into the exchequer all iſſues, fines, and amerciaments, which grow due to the king in that court, for which he has a ſtanding fee or allowance.

CLERKS, *miſpriſion of*. See MISPRISION.

CLERK, *riding*. See RIDING.

CLERKS, *ſix*. See SIX.

CLERKS, *Apoſtolic*, in *Eccleſiaſtical Hiſtory*. See JESUATES.

CLERKS, *Regular*, a general denomination, comprehending ſeveral diſtinct religious orders, and aſſumed to denote a reformation attempted to be introduced among them. See THEATINS and FATHERS.

CLERKS, *Regular*, *of the company of Jeſus*. See JESUITS.

CLERKS, *Regular*, of *St. Maieul*. See FATHERS *of Somaſquo*.

CLERKS, *Regular*, *of St. Paul*. See BARNABITES.

CLERMONT *Manuſcript*, is a copy of St. Paul's Epiſtles, found in the monaſtery of Clermont in France, and uſed by Beza, together with the Cambridge MS. in preparing his edition of the New Teſtament. This copy is in the octavo form, and is written on fine vellum in Greek and Latin, with ſome mutilations. Beza ſuppoſes that it is of equal antiquity with the Cambridge copy; but both were probably written by a Latin ſcribe in a later period than he aſſigns to them. The various readings of this MS. were communicated to archbiſhop Uſher, and they are preſerved by Walton. The MS. itſelf was in the poſſeſſion of Morinus; and after his death depoſited among the MS. copies of the Royal Library at Paris, Nº 2245. See the references under CAMBRIDGE *MS.*

CLERODENDRUM, in *Botany*, the name of a genus of plants of the *didynamia angioſpermia* claſs, the characters of which are theſe: the calyx is bell-ſhaped, and divided into five ſegments; the tube of the corolla is ſlender and long, and its limb divided into five equal ſegments. The ſtamina are very long, and the fruit is a ſingle-ſeeded berry.

CLEROMANCY, a kind of divination performed by the throwing of dice, or little bones; and obſerving the points, or marks, turned up.

The word comes from κληρος, *lot*, and μαντεια, *divination.*

At Bura, a city of Achaia, was a temple, and a celebrated oracle of Hercules; where ſuch as conſulted the oracle, after praying to the idol, threw four dies, the points whereof being well ſcanned by the prieſt, he was ſuppoſed to draw an anſwer from them.

Something of this kind ſeems to have been practiſed with regard to Jonah. See Jonah, i. 7.

CLEROTI, among the Athenians, a kind of public arbitrators. See DIÆTETÆ.

CLETHRA, in *Botany. Gronov. Fl. Virg.* 43. a genus of the *decandria monogynia* claſs. Its characters are theſe: the flower hath five oblong petals, and ten ſtamina, which are as long as the petals. In the center is ſituated a roundiſh germen, which afterward becomes a roundiſh capſule encloſed by the empalement, having three cells, which are full of angular ſeeds. We know but one ſpecies of this genus of ſhrubs, which is a native of Virginia and Carolina.

It is hardy enough to bear the open air of England; and is one of the moſt beautiful ſhrubs at its flowering ſeaſon. It thrives beſt in moiſt land, and in a ſheltered ſituation.

CLETHRITES *lapis*, a name given by the ancients to ſuch pieces of foſſile wood as ſhewed a grain reſembling that of the wood of the alder.

CLEW *of the ſail of a ſhip*, is the lower corner of it which reaches down to that earing where the tackles and ſheets are faſtened; ſo that when a ſail is made goring, or ſloping by degrees, ſhe is ſaid to have a *great clew*: and a ſhip is ſaid to have a *great clew*, when ſhe has a very long yard, and ſo has much canvas in her ſails.

CLEW-*garnet*, in *Ship-Building*, a rope faſtened to the *clew* of the ſail, and from thence running in a block ſeized to the middle of the main and fore-yard. Its uſe is to hale up the *clew* of the ſail cloſe to the middle of the yard, in order to its being furled.

CLEW-*line* is the ſame to the top-ſails, top-gallant-ſails, and ſprit-ſails, that the *clew-garnet* is to the main-ſail and fore-ſail, and has the very ſame uſe. In a guſt of wind, when a top-ſail is to be taken in, they firſt hale home the lee *clew-line*, and by that means the ſail is taken in much eaſier.

CLIDOMANCY, from κλεις, a *key*, and μαντεια, *divination*, a ſpecies of divination performed by means of keys. See DATYLIOMANCY.

CLIENT, CLIENS, among the Romans, a citizen who put himſelf under the protection of ſome great man, who in that relation was called his patron, *patronus*.

The patron aſſiſted his *client* with his protection, intereſt, and eſtate; and the *client* gave his vote for his patron, when he ſought any office for himſelf, or his friends. *Clients* owed reſpect to their patrons, as theſe reciprocally owed them their protection.

This right of patronage was appointed by Romulus, to unite the rich and poor together, in ſuch manner, as that one might live without contempt, and the other without envy. But the condition of a *client*, in courſe of time, became little elſe but a moderate kind of ſlavery.

By degrees, the cuſtom extended itſelf beyond Rome; and not only families, but cities, and entire provinces, even out of Italy, followed the example. Thus Sicily, v. gr. put itſelf under the clientela, or protection of Marcellus.

Lazius and Budæus refer the origin of fiefs, and tenures, to the patrons and *clients* of ancient Rome: but the difference is pretty conſiderable between the relation of vaſſals and their lords, and that of *clients* and their patrons. See VASSAL.

The *clients*, beſide the reſpect they bore their patrons, and the vote they gave them, were obliged to aſſiſt them in all affairs; and even to pay their ranſom, if they ſhould be taken priſoners in war, in caſe they were not able to do it of themſelves.

CLIENT is now uſed for a party in a law-ſuit, who has turned over his cauſe into the hands of a counſellor, or ſollicitor.

CLIFFORTIA, in *Botany*, a genus of the *dioecia polyandria* claſs. Its characters are theſe: it hath male and female flowers in different plants; the male flowers have a ſpreading empalement, compoſed of three ſmall oval concave leaves, but no petals, with a great number of hairy ſtamina. The female flowers have a permanent empalement, compoſed of three leaves ſitting upon the germen: theſe have no petals; but the oblong germen, which is ſituated below the empalement, ſupports two long, ſlender, feathered ſtyles. The germen afterward becomes an oblong taper capſule, with two cells, crowned by the empalement, including one narrow taper ſeed. There are three ſpecies, natives of the Cape of Good Hope.

CLIFT, in the *Manege*, a deficiency in the new, ſoft, and rough uneven hoof that grows in horſes feet, upon the hoof caſt.

It is alſo called *chink*, *crack*, or *chop*, and by the French *avalure*. See CLEFT.

CLIFTS, in timber. See TIMBER.

CLIMACIDES, among the Greeks, were women ſervants who aſſiſted their miſtreſſes to get on horſeback, by ſerving as ſteps for them to aſcend by.

CLIMACTERIC, *Annus* CLIMACTERICUS, a critical year, or period, in a man's age, wherein, according to aſtrologers, there is ſome very notable alteration to happen in the body; and a perſon is expoſed to great danger of death.

The word comes from κλιμακτηρ, or κλιμακτηρικος, of κλιμαξ, κλιμακος, *ſcala*; q. d. *by a ſcale*, or *ladder*.

The firſt *climacteric* is, according to ſome, the ſeventh year of a man's life; the reſt are multiples of the firſt, as 14, 21, 49, 56, 63, and 84; which two laſt are called the *grand climacterics*, and the dangers here are ſuppoſed more imminent.

The opinion has a great deal of antiquity on its ſide. Aulus Gellius ſays, it was borrowed from the Chaldeans; who might probably receive it from Pythagoras, whoſe philoſophy turned much on numbers; and who imagined an extraordinary virtue in the number 7.

Marc. Ficinus gives us the foundation of the opinion: he tells us, there is a year aſſigned for each planet to rule over the body of man, each in his turn: now Saturn being the moſt maleficent planet of all, every ſeventh year, which falls to his lot, becomes very dangerous; eſpecially thoſe of 63 and 84, when the perſon is already advanced in years.

Some hold, according to this doctrine, every ſeventh year an eſtabliſhed *climacteric*; but others only allow the title to thoſe produced by the multiplication of the climacterical ſpace by an odd number, 3, 5, 7, 9, &c. Others obſerve every ninth year as a *climacteric*.

Hevelius has a volume under the title of Annus Climactericus, deſcribing the loſs he ſuſtained in the burning of his obſervatory, &c. which it ſeems happened in his firſt *grand climacteric*.

Suetonius ſays, Auguſtus congratulated his nephew upon his having paſſed his firſt *grand climacteric*, whereof he was very apprehenſive.

Some pretend that the *climacteric* years are alſo fatal to political bodies; which perhaps may be granted, when it is proved that they are ſo to natural ones.

Authors on this ſubject, are Plato, Cicero, Macrobius, Aulus Gellius, among the ancients; Argol, Magirus, and Salmaſius, among the moderns. And St. Auguſtine, St. Ambroſe, Beda, and Boetius, countenance the opinion.

CLIMATARCHÆ, Κλιματαρχαι, were governors of provinces to the Greek emperors.

CLIMATE, CLIMA, or CLIME, in *Geography*, a part of the ſurface of the earth, bounded by two circles parallel to the equator, and of ſuch a breadth, as that the longeſt day in the parallel near the pole, exceeds the longeſt day in that next the equator by ſome certain ſpace; viz. half an hour.

The word comes from κλιμα, *inclinamentum*, an *inclination*; becauſe the difference of *climates* ariſes from the different inclination or obliquity of the ſphere.

CLIMATE, *the beginning of the*, is the parallel circle wherein the day is the ſhorteſt.

CLIMATE, *the end of the*, is that wherein the day is the longeſt. The *climates* therefore are reckoned from the equator to the pole; and are ſo many bands, or zones, terminated by lines parallel to the equator: though, in ſtrictneſs, there are ſeveral *climates* in the breadth of one zone.

Each *climate* only differs from its contiguous ones, in that the longeſt day in ſummer is longer or ſhorter by half an hour in the one place than in the other.

As the *climates* commence from the equator, the firſt *climate*, at its beginning, has its longeſt day preciſely twelve hours long; at its end, twelve hours and an half: the ſecond, which begins where the firſt ends, viz. at twelve hours and an half, ends at thirteen hours; and ſo of the reſt, as far as the polar circles, where thoſe, which the geographers call *hour-climates* terminate, and *month climates* commence.

As an *hour-climate* is a ſpace compriſed between two parallels of the equator, in the firſt of which, the longeſt day exceeds that in the latter by half an hour; ſo the *month climate* is a ſpace terminated between two circles parallel to the polar circles, whoſe longeſt day is longer or ſhorter than that of its contiguous one by a month, or thirty days.

The ancients, who confined the *climates* to what they imagined the habitable parts of the earth, only allowed of ſeven. The middle of the firſt they made to paſs through Meroe; the ſecond through Sienna; the third through Alexandria; the fourth through Rhodes; the fifth through Rome; the ſixth through Pontus; and the ſeventh through the mouth of the Boryſthenes. To theſe were added two other *climates*; the eighth paſſing through the Riphæan mountains, and the ninth through Tanais. The moderns, who have ſailed farther toward the poles, make thirty *climates* on each ſide: and in regard the obliquity of the ſphere makes a little difference in the length of the longeſt day; inſtead of half an hour, ſome of them only make the difference of *climates* a quarter.

In fixing the *climates*, there ordinarily is no regard had to the refraction.

Vulgarly, the term *climate* is beſtowed on any country or region differing from another, either in reſpect of the ſeaſons, the quality of the ſoil, or even the manners of the inhabitants; without any regard to the length of the longeſt day.

Monteſquieu, in his Spirit of Laws, examines the influence of different *climates* on the manners, characters, and laws of nations. See vol. i. book xiv. xv. xvi. xvii.

Abulfeda, an Arabic author, diſtinguiſhes the firſt kind of *climates* by the term *real climates*; and the latter by that of *apparent climates*.

Varenius gives us a table of thirty *climates*; but without any regard to the refraction. Ricciolus furniſhes a more accurate one, wherein the refractions are allowed for: an abſtract of which follows.

A Table of CLIMATES.

Middle of *Clim.*	Longeſt Day		Latit.		*Climates.*	Longeſt Day		Latit.		Middle of *Clim.*	Latit.		N. Lat.		S. Lat.	
													Cont. Day.	Cont. Night.	Cont. Day.	Cont. Night.
I	12^h	30	7°	18	VIII	16^h	0	48°	15	XV	66°	53	31^d	27^d	30^d	28^d

CLIMATE *for plants*. See TEMPERATURE.

CLIMAX, or *gradation*, in *Rhetoric*, a figure, whereby the diſcourſe aſcends, as it were, by degrees. Such is that of Cicero to Catiline: *Nihil agis, nihil moliris, nihil cogitas; quod ego non audiam, quod etiam non videam, planeque ſentiam: thou doſt nothing, moveſt nothing, thinkeſt nothing; but I hear it, nay ſee it, and perfectly underſtand it.* Thus, the ſame Cicero to Atticus: *Si dormis, expergiſcere; ſi ſtas, ingredere; ſi ingrederis, curre; ſi curris, advola.* See ANTICLIMAX.

CLIMBER, in *Botany*. See VIRGIN'*s Bower*.

CLIMIA of the Arabs. See KLIMIA.

CLIMING *Fumitory*, in *Botany*. See FUMITORY, and Phil. Tranſ. vol. xlix. part 2. p. 841.

CLINCH *of a cable*, is that part of it which is bent about the ring of the anchor, and then ſeized or made faſt.

CLINCH-*bolts*, in a ſhip, are ſuch as are *clinched* with a rivetting hammer at thoſe ends which come through.

CLINCHER-*work*, in *Sea-Language*, the diſpoſition of the planks in the ſide of any veſſel, by which the lower edge of every plank overlays the next under it, like the ſlates on the top of a houſe.

CLINCHING, in *Sea Language*, a kind of ſlight calking uſed about the ports, on a proſpect of foul weather: it is done by driving a little oakum into their ſeams, that the water may not come in at them.

CLINIC, CLINICUS, a term applied by ſome church-hiſtorians to thoſe among the ancients, who received baptiſm on their death-bed.

The word κλινικος is formed from κλινη, a *bed*.

It was the doctrine of many of the fathers, that baptiſm abſolutely waſhed away all previous ſins, and that there was no atonement for ſins committed after baptiſm. On this account, many deferred that ſacrament till they were arrived at the laſt ſtage of life, and were pretty ſafe from the danger of ſinning any more; and ſuch were called *clinici*.

Magnus, in the third century, made a doubt whether or no *clinics* were truly baptized, in regard the ceremony was only performed by aſperſion, inſtead of immerſion: he conſulted St. Chryſoſtom on the point, who replied to him, that the ſacrament does not waſh away ſin after the manner of a corporal bath; and ſhews from ſcripture that aſperſion is ſufficient. See BAPTISM.

CLINIC is alſo uſed, in *Antiquity*, for a patient, or perſon merely ſick, even without keeping his bed; as appears from the life of Charlemagne, in Caniſius.

CLINICUS is alſo uſed for a phyſician: becauſe phyſicians are much converſant about the beds of the ſick.

It was, however, principally the phyſicians of emperors that were called by this title.

CLINIC is now ſeldom uſed but for a quack; or rather for an empirical nurſe, who pretends to have learned the art of curing diſeaſes by attending on the ſick.

CLINICA, *medicina*, was particularly uſed for the method of viſiting, and treating ſick perſons in bed, for the more exact diſcovery of all the ſymptoms of their diſeaſe.

Le Clerc obſerves, that Eſculapius was the firſt who exerciſed the *clinic medicine*.

CLINKERS, among *Brick-Makers*. See BRICK.

CLINOIDES, in *Anatomy*, an epithet given to the four ſmall proceſſes of the *os* SPHENOIDES, one of the bones of the cranium; ſo called, ſay ſome, from their reſembling the feet of a bed.

The word is formed of the Greek κλινη, a *bed*, and ειδος, *form*; either from the reſemblance which the three bones bear to the feet of a bed; or from the cavity they form, which reſembles a bed itſelf.

Theſe together form a little cavity, from its ſhape called *ſella turcia*, or *equina*; wherein is placed the pituitary gland.

CLINOPODIUM, in *Botany*, *Field Baſil*, a genus of the *didynamia gymnoſpermia* claſs. Its characters are theſe: the flower is of the lip kind, with a ſhort tube enlarging to the mouth; the upper lip is erect, and indented at the top; the under lip is trifid, the middle ſegment being broad and indented. It hath four ſtamina under the upper lip, two of which are ſhorter than the other: in the center is ſituated the quadripartite germen, which afterward becomes four oval ſeeds, ſhut up in the empalement. There are ſix ſpecies.

The firſt ſort grows naturally by the ſides of hedges in moſt parts of England.

CLIO, one of the MUSES. In the portraits of Apollo and the Muſes, dug out of Herculaneum, Clio appears ſeated, and her head is crowned with laurels. In her left hand ſhe holds an open volume, in which ſhe is reading. On the outſide is written KLEIΩ ICTOPIAN, *Clio the Hiſtorian*; though it ſhould rather be tranſlated, *Clio invented Hiſtory*. At her feet are ſix other rolls, or antique volumes, incloſed in a cylindrical caſe. Burney's Hiſt. of Muſic, vol. i. p. 294.

CLIO, in *Zoology*, the name of a genus of worms, belonging to the order of *mollusca*: the body of which is oblong, and formed for ſwimming, and furniſhed with two oppoſite *alæ* of a membranaceous ſtructure. They are found in the ocean.

CLIPEUS, in *Natural Hiſtory*, the name of a claſs of the *echinodermata*, which are very depreſſed and flat, and in ſome meaſure reſemble a ſhield. Of this claſs there are only two known ſpecies.

The firſt is the diſcoide echinites of Plot, and the ſecond that of Langius, which has a little higher top.

CLIPPING *the coin*. See COIN.

CLITONES, the eldeſt, and all the ſons of kings. This word is often met with in our ancient authors.

CLITORIA, in *Botany*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: the flower is of the butterfly kind, having a large ſpreading ſtandard, which is erect; the two wings are oblong, and ſhorter than the ſtandard. The keel is ſhorter than the wings, and is hooked. It hath ten ſtamina, nine of which are joined, and one ſtands ſeparate. In the center is ſituated an oblong germen, which afterward becomes a long, narrow, compreſſed pod, with one cell, opening with two valves, encloſing ſeveral kidney-ſhaped ſeeds. There are four ſpecies.

CLITORIDIS *muſculus*, a name given by Verheyen to the muſcle of the female *pudenda*, uſually called *erector clitoridis*. This is the only muſcle that is proper to this long, and its limb divided into five equal ſegments. The ſtamina are very long, and the fruit is a ſingle-ſeeded berry.

CLEROMANCY, a kind of divination performed by the throwing of dice, or little bones; and obſerving the points, or marks, turned up.

The word comes from κληρος, *lot*, and μαντεια, *divination.*

At Bura, a city of Achaia, was a temple, and a celebrated oracle of Hercules; where ſuch as conſulted the oracle, after praying to the idol, threw four dies, the points whereof being well ſcanned by the prieſt, he was ſuppoſed to draw an anſwer from them.

Something of this kind ſeems to have been practiſed with regard to Jonah. See Jonah, i. 7.

CLEROTI, among the Athenians, a kind of public arbitrators. See DIÆTETÆ.

CLETHRA, in *Botany. Gronov. Fl. Virg.* 43. a genus of the *decandria monogynia* claſs. Its characters are theſe: the flower hath five oblong petals, and ten ſtamina, which are as long as the petals. In the center is ſituated a roundiſh germen, which afterward becomes a roundiſh capſule encloſed by the empalement, having three cells, which are full of angular ſeeds. We know but one ſpecies of this genus of ſhrubs, which is a native of Virginia and Carolina.

It is hardy enough to bear the open air of England; and is one of the moſt beautiful ſhrubs at its flowering ſeaſon. It thrives beſt in moiſt land, and in a ſheltered ſituation.

CLETHRITES *lapis*, a name given by the ancients to ſuch pieces of foſſile wood as ſhewed a grain reſembling that of the wood of the alder.

CLEW *of the ſail of a ſhip*, is the lower corner of it which reaches down to that earing where the tackles and ſheets are faſtened; ſo that when a ſail is made goring, or ſloping by degrees, ſhe is ſaid to have a *great clew*: and a ſhip is ſaid to have a *great clew*, when ſhe has a very long yard, and ſo has much canvas in her ſails.

CLEW-*garnet*, in *Ship-Building*, a rope faſtened to the *clew* of the ſail, and from thence running in a block ſeized to the middle of the main and fore-yard. Its uſe is to hale up the *clew* of the ſail cloſe to the middle of the yard, in order to its being furled.

CLEW-*line* is the ſame to the top-ſails, top-gallant-ſails, and ſprit-ſails, that the *clew-garnet* is to the main-ſail and fore-ſail, and has the very ſame uſe. In a guſt of wind, when a top-ſail is to be taken in, they firſt hale home the lee *clew-line*, and by that means the ſail is taken in much eaſier.

CLIDOMANCY, from κλεις, a *key*, and μαντεια, *divination*, a ſpecies of divination performed by means of keys. See DATYLIOMANCY.

CLIENT, CLIENS, among the Romans, a citizen who put himſelf under the protection of ſome great man, who in that relation was called his patron, *patronus*.

The patron aſſiſted his *client* with his protection, intereſt, and eſtate; and the *client* gave his vote for his patron, when he ſought any office for himſelf, or his friends. *Clients* owed reſpect to their patrons, as theſe reciprocally owed them their protection.

This right of patronage was appointed by Romulus, to unite the rich and poor together, in ſuch manner, as that one might live without contempt, and the other without envy. But the condition of a *client*, in courſe of time, became little elſe but a moderate kind of ſlavery.

By degrees, the cuſtom extended itſelf beyond Rome; and not only families, but cities, and entire provinces, even out of Italy, followed the example. Thus Sicily, v. gr. put itſelf under the clientela, or protection of Marcellus.

Lazius and Budæus refer the origin of fiefs, and tenures, to the patrons and *clients* of ancient Rome: but the difference is pretty conſiderable between the relation of vaſſals and their lords, and that of *clients* and their patrons. See VASSAL.

The *clients*, beſide the reſpect they bore their patrons, and the vote they gave them, were obliged to aſſiſt them in all affairs; and even to pay their ranſom, if they ſhould be taken priſoners in war, in caſe they were not able to do it of themſelves.

CLIENT is now uſed for a party in a law-ſuit, who has turned over his cauſe into the hands of a counſellor, or ſollicitor.

CLIFFORTIA, in *Botany*, a genus of the *dioecia polyandria* claſs. Its characters are theſe: it hath male and female flowers in different plants; the male flowers have a ſpreading empalement, compoſed of three ſmall oval concave leaves, but no petals, with a great number of hairy ſtamina. The female flowers have a permanent empalement, compoſed of three leaves ſitting upon the germen: theſe have no petals; but the oblong germen, which is ſituated below the empalement, ſupports two long, ſlender, feathered ſtyles. The germen afterward becomes an oblong taper capſule, with two cells, crowned by the empalement, including one narrow taper ſeed. There are three ſpecies, natives of the Cape of Good Hope.

CLIFT, in the *Manege*, a deficiency in the new, ſoft, and rough uneven hoof that grows in horſes feet, upon the hoof caſt.

It is alſo called *chink*, *crack*, or *chop*, and by the French *avalure*. See CLEFT.

CLIFTS, in timber. See TIMBER.

CLIMACIDES, among the Greeks, were women ſervants who aſſiſted their miſtreſſes to get on horſeback, by ſerving as ſteps for them to aſcend by.

CLIMACTERIC, *Annus* CLIMACTERICUS, a critical year, or period, in a man's age, wherein, according to aſtrologers, there is ſome very notable alteration to happen in the body; and a perſon is expoſed to great danger of death.

The word comes from κλιμακτηρ, or κλιμακτηρικος, of κλιμαξ, κλιμακος, *ſcala*; q. d. *by a ſcale*, or *ladder*.

The firſt *climacteric* is, according to ſome, the ſeventh year of a man's life; the reſt are multiples of the firſt, as 14, 21, 49, 56, 63, and 84; which two laſt are called the *grand climacterics*, and the dangers here are ſuppoſed more imminent.

The opinion has a great deal of antiquity on its ſide. Aulus Gellius ſays, it was borrowed from the Chaldeans; who might probably receive it from Pythagoras, whoſe philoſophy turned much on numbers; and who imagined an extraordinary virtue in the number 7.

Marc. Ficinus gives us the foundation of the opinion: he tells us, there is a year aſſigned for each planet to rule over the body of man, each in his turn: now Saturn being the moſt maleficent planet of all, every ſeventh year, which falls to his lot, becomes very dangerous; eſpecially thoſe of 63 and 84, when the perſon is already advanced in years.

Some hold, according to this doctrine, every ſeventh year an eſtabliſhed *climacteric*; but others only allow the title to thoſe produced by the multiplication of the climacterical ſpace by an odd number, 3, 5, 7, 9, &c. Others obſerve every ninth year as a *climacteric*.

Hevelius has a volume under the title of Annus Climactericus, deſcribing the loſs he ſuſtained in the burning of his obſervatory, &c. which it ſeems happened in his firſt *grand climacteric*.

Suetonius ſays, Auguſtus congratulated his nephew upon his having paſſed his firſt *grand climacteric*, whereof he was very apprehenſive.

Some pretend that the *climacteric* years are alſo fatal to political bodies; which perhaps may be granted, when it is proved that they are ſo to natural ones.

Authors on this ſubject, are Plato, Cicero, Macrobius, Aulus Gellius, among the ancients; Argol, Magirus, and Salmaſius, among the moderns. And St. Auguſtine, St. Ambroſe, Beda, and Boetius, countenance the opinion.

CLIMATARCHÆ, Κλιματαρχαι, were governors of provinces to the Greek emperors.

CLIMATE, CLIMA, or CLIME, in *Geography*, a part of the ſurface of the earth, bounded by two circles parallel to the equator, and of ſuch a breadth, as that the longeſt day in the parallel near the pole, exceeds the longeſt day in that next the equator by ſome certain ſpace; viz. half an hour.

The word comes from κλιμα, *inclinamentum*, an *inclination*; becauſe the difference of *climates* ariſes from the different inclination or obliquity of the ſphere.

CLIMATE, *the beginning of the*, is the parallel circle wherein the day is the ſhorteſt.

CLIMATE, *the end of the*, is that wherein the day is the longeſt. The *climates* therefore are reckoned from the equator to the pole; and are ſo many bands, or zones, terminated by lines parallel to the equator: though, in ſtrictneſs, there are ſeveral *climates* in the breadth of one zone.

Each *climate* only differs from its contiguous ones, in that the longeſt day in ſummer is longer or ſhorter by half an hour in the one place than in the other.

As the *climates* commence from the equator, the firſt *climate*, at its beginning, has its longeſt day preciſely twelve hours long; at its end, twelve hours and an half: the ſecond, which begins where the firſt ends, viz. at twelve hours and an half, ends at thirteen hours; and ſo of the reſt, as far as the polar circles, where thoſe, which the geographers call *hour-climates* terminate, and *month climates* commence.

As an *hour-climate* is a ſpace compriſed between two parallels of the equator, in the firſt of which, the longeſt day exceeds that in the latter by half an hour; ſo the *month climate* is a ſpace terminated between two circles parallel to the polar circles, whoſe longeſt day is longer or ſhorter than that of its contiguous one by a month, or thirty days.

The ancients, who confined the *climates* to what they imagined the habitable parts of the earth, only allowed of ſeven. The middle of the firſt they made to paſs through Meroe; the ſecond through Sienna; the third through Alexandria; the fourth through Rhodes; the fifth through Rome; the ſixth through Pontus; and the ſeventh through the mouth of the Boryſthenes. To theſe were added two other *climates*; the eighth paſſing through the Riphæan mountains, and the ninth through Tanais.

The moderns, who have ſailed farther toward the poles, make thirty *climates* on each ſide: and in regard the obliquity of the ſphere makes a little difference in the length of the longeſt day; inſtead of half an hour, ſome of them only make the difference of *climates* a quarter.

In fixing the *climates*, there ordinarily is no regard had to the refraction.

Vulgarly, the term *climate* is beſtowed on any country or region differing from another, either in reſpect of the ſeaſons, the quality of the ſoil, or even the manners of the inhabitants; without any regard to the length of the longeſt day.

Monteſquieu, in his Spirit of Laws, examines the influence of different *climates* on the manners, characters, and laws of nations. See vol. i. book xiv. xv. xvi. xvii.

Abulfeda, an Arabic author, diſtinguiſhes the firſt kind of *climates* by the term *real climates*; and the latter by that of *apparent climates*.

Varenius gives us a table of thirty *climates*; but without any regard to the refraction. Ricciolus furniſhes a more accurate one, wherein the refractions are allowed for: an abſtract of which follows.

A Table of Climates.

								N. Lat.		S. Lat.

Climate *for plants*. See Temperature.

CLIMAX, or *gradation*, in *Rhetoric*, a figure, whereby the diſcourſe aſcends, as it were, by degrees. Such is that of Cicero to Catiline: *Nihil agis, nihil moliris, nihil cogitas; quod ego non audiam, quod etiam non videam, planeque ſentiam: thou doſt nothing, moveſt nothing, thinkeſt nothing; but I hear it, nay ſee it, and perfectly underſtand it.* Thus, the ſame Cicero to Atticus: *Si dormis, expergiſcere; ſi ſtas, ingredere; ſi ingrederis, curre; ſi curris, advola.* See Anticlimax.

CLIMBER, in *Botany*. See **Virgin**'s *Bower*.

CLIMIA of the Arabs. See Klimia.

CLIMING *Fumitory*, in *Botany*. See **Fumitory**, and Phil. Tranſ. vol. xlix. part 2. p. 841.

CLINCH *of a cable*, is that part of it which is bent about the ring of the anchor, and then ſeized or made faſt.

Clinch-*bolts*, in a ſhip, are ſuch as are *clinched* with a rivetting hammer at thoſe ends which come through.

CLINCHER-*work*, in *Sea-Language*, the diſpoſition of the planks in the ſide of any veſſel, by which the lower edge of every plank overlays the next under it, like the ſlates on the top of a houſe.

CLINCHING, in *Sea Language*, a kind of ſlight calking uſed about the ports, on a proſpect of foul weather: it is done by driving a little oakum into their ſeams, that the water may not come in at them.

CLINIC, **Clinicus**, a term applied by ſome church-hiſtorians to thoſe among the ancients, who received baptiſm on their death-bed.

The word κλινικος is formed from κλινη, a *bed*.

It was the doctrine of many of the fathers, that baptiſm abſolutely waſhed away all previous ſins, and that there was no atonement for ſins committed after baptiſm. On this account, many deferred that ſacrament till they were arrived at the laſt ſtage of life, and were pretty ſafe from the danger of ſinning any more; and ſuch were called *clinici*.

Magnus, in the third century, made a doubt whether or no *clinics* were truly baptized, in regard the ceremony was only performed by aſperſion, inſtead of immerſion: he conſulted St. Chryſoſtom on the point, who replied to him, that the ſacrament does not waſh away ſin after the manner of a corporal bath; and ſhews from ſcripture that aſperſion is ſufficient. See Baptism.

Clinic is alſo uſed, in *Antiquity*, for a patient, or perſon merely ſick, even without keeping his bed; as appears from the life of Charlemagne, in Caniſius.

Clinicus is alſo uſed for a phyſician: becauſe phyſicians are much converſant about the beds of the ſick.

It was, however, principally the phyſicians of emperors that were called by this title.

Clinic is now ſeldom uſed but for a quack; or rather for an empirical nurſe, who pretends to have learned the art of curing diſeaſes by attending on the ſick.

Clinica, *medicina*, was particularly uſed for the method of viſiting, and treating ſick perſons in bed, for the more exact diſcovery of all the ſymptoms of their diſeaſe.

Le Clerc obſerves, that Eſculapius was the firſt who exerciſed the *clinic medicine*.

CLINKERS, among *Brick-Makers*. See Brick.

CLINOIDES, in *Anatomy*, an epithet given to the four ſmall proceſſes of the *os* SPHENOIDES, one of the bones of the cranium; ſo called, ſay ſome, from their reſembling the feet of a bed.

The word is formed of the Greek κλινη, a *bed*, and ειδος, *form*; either from the reſemblance which the three bones bear to the feet of a bed; or from the cavity they form, which reſembles a bed itſelf.

Theſe together form a little cavity, from its ſhape called *ſella turcia*, or *equina*; wherein is placed the pituitary gland.

CLINOPODIUM, in *Botany*, *Field Baſil*, a genus of the *didynamia gymnoſpermia* claſs. Its characters are theſe: the flower is of the lip kind, with a ſhort tube enlarging to the mouth; the upper lip is erect, and indented at the top; the under lip is trifid, the middle ſegment being broad and indented. It hath four ſtamina under the upper lip, two of which are ſhorter than the other: in the center is ſituated the quadripartite germen, which afterward becomes four oval ſeeds, ſhut up in the empalement. There are ſix ſpecies.

The firſt ſort grows naturally by the ſides of hedges in moſt parts of England.

CLIO, one of the Muses. In the portraits of Apollo and the Muſes, dug out of Herculaneum, Clio appears ſeated, and her head is crowned with laurels. In her left hand ſhe holds an open volume, in which ſhe is reading. On the outſide is written KLEIΩ ICTOPIAN, *Clio the Hiſtorian*; though it ſhould rather be tranſlated, *Clio invented Hiſtory*. At her feet are ſix other rolls, or antique volumes, incloſed in a cylindrical caſe. Burney's Hiſt. of Muſic, vol. i. p. 294.

Clio, in *Zoology*, the name of a genus of worms, belonging to the order of *molluſca*: the body of which is oblong, and formed for ſwimming, and furniſhed with two oppoſite *alæ* of a membranaceous ſtructure. They are found in the ocean.

CLIPEUS, in *Natural Hiſtory*, the name of a claſs of the *echinodermata*, which are very depreſſed and flat, and in ſome meaſure reſemble a ſhield. Of this claſs there are only two known ſpecies.

The firſt is the diſcoide echinites of Plot, and the ſecond that of Langius, which has a little higher top.

CLIPPING *the coin*. See Coin.

CLITONES, the eldeſt, and all the ſons of kings. This word is often met with in our ancient authors.

CLITORIA, in *Botany*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: the flower is of the butterfly kind, having a large ſpreading ſtandard, which is erect; the two wings are oblong, and ſhorter than the ſtandard. The keel is ſhorter than the wings, and is hooked. It hath ten ſtamina, nine of which are joined, and one ſtands ſeparate. In the center is ſituated an oblong germen, which afterward becomes a long, narrow, compreſſed pod, with one cell, opening with two valves, encloſing ſeveral kidney-ſhaped ſeeds. There are four ſpecies.

CLITORIDIS *muſculus*, a name given by Verheyen to the muſcle of the female *pudenda*, uſually called *erector clitoridis*. This is the only muſcle that is proper to this part; the other, called the *inferior clitoridis*, being properly a *ſphincter vaginæ*, or, as Albinus calls it, *conſtrictor cunni.*

CLITORIS, in *Anatomy*, a long round body in the forepart of the vulva, or natural parts of a woman, where the *nymphæ* form an angle with each other; being one of the organs of generation in that ſex. See *Tab. Anat.* (*Splanch.*) *fig.* 9. *lit. o. p. fig.* 11. *lit. m. fig.* 13. *lit. a.* Its figure repreſents that of a glans or acorn: ordinarily it is pretty ſmall, but in ſome women thick, and long. In many reſpects, it repreſents the penis of a man; whence ſome call it *mentula*, or *penis muliebris*, the woman's yard.

In effect, it is compoſed of the ſame parts; it has, like it, two cavernous or ſpongious bodies; and a glans at the extremity, covered with a preputium; but it is not pierced through like the penis.

This is thought by ſome to have been firſt diſcovered by modern anatomiſts; but Dr. Tronchin quotes ſeveral ancient authors who knew the *clitoris*, and proves that Bonaciolus mentioned it before Columbus or Fallopius.

It has two muſcles which erect it in coition; on which occaſion it ſwells, and grows hard. Some anatomiſts pretend too, that it has two *muſculi ejaculatores.* See *Tab. Anat.* (*Splanch.*) *fig.* 13. *lit. f. f.*

Its ſenſation is exquiſite; and it is found the chief ſeat of pleaſure; ſo that ſome call it *æſtrum Veneris.* And hence it is ſaid, ſome women are apt to abuſe it. See POLLUTION.

The extremity of this part is ſometimes cut off; as in circumciſion, where it advances out too far. It is ſometimes ſo large and prepondent, that it bears a full reſemblance to the virile member; whence the perſons in whom it is ſo found, frequently paſs for hermaphrodites.

The ſpongious bodies of the *clitoris* ariſe diſtinctly from the lower parts of the *os pubis*; and approaching one another, unite, and form the body of the *clitoris.* Before their union they are called the *crura clitoridis*; and are twice as long as the body of the *clitoris.*

Its muſcles ariſe from the protuberance of the iſchium, and are inſerted into its ſpongious bodies. It has veins and arteries from the hæmorrhoidal veſſels, and pudenda; and nerves from the intercoſtals.

CLIVERS, in *Botany.* See CLEAVERS.

CLOACA, among the *Ancients*, was a ſubterraneous aqueduct, or common-ſewer, for the reception and diſcharge of the filth of a city, or houſe.

The word is formed from κλυζω, *I waſh away.*

Tarquinius Priſcus is ſaid to have been the firſt who contrived *cloacæ* in ancient Rome; to which end, a canal was firſt dug through the mountains whereon the city ſtood, and divided into three branches, called the *great cloaca.*

The care and inſpection of the *cloacæ* belonged to the cenſors, till the time of Auguſtus, who appointed *curatores cloacarum* on purpoſe. The Romans had alſo their *Cloacina*, or goddeſs, who preſided over the *cloacæ.*

CLOACA, in *Comparative Anatomy*, imports that canal in birds, through which the egg deſcends from the ovary in its exit. In this it is remarkable, that the part which is next the ovary is jagged, like the *morſus diaboli*, and fluctuates in the abdomen without any attachment to the ovary: hence anatomiſts have been ſomewhat puzzled to comprehend by what means the egg falls into the ovary. See EGG.

CLOATHS, or CLOTHES. See HABIT.

CLOCK, a kind of movement, or machine, ſerving to meaſure, and ſtrike time.

The uſual chronometers are watches and *clocks*: the former, in ſtrictneſs, are ſuch as ſhew the parts of time; the latter, ſuch as publiſh it by ſtriking: though the name watch is ordinarily appropriated to pocket *clocks*; and that of *clocks* to larger machines, whether they ſtrike or no.

The parts common to both kinds of movements, ſee under the article MOVEMENT. Thoſe peculiar to watches and *clocks*, ſee under WATCH-WORK, and CLOCK-WORK.

The invention of *clocks* with wheels, is referred to Pacificus, archdeacon of Verona, who lived in the time of Lotharius, in the ninth century, ſon of Lewis the Debonnair; on the credit of an epitaph quoted by Ughelli, and borrowed by him from Panvinius. Others aſcribe the invention to Boethius, about the year 510.

They were at firſt called *nocturnal dials*; to diſtinguiſh them from ſun-dials, which ſhewed the hour by the ſun's ſhadow.

Mr. Derham makes *clock-work* of a much older ſtanding; and ranks Archimedes's ſphere, mentioned by Claudian, and that of Poſidonius, mentioned by Cicero, among machines of this kind; not that either their form or uſe were the ſame with thoſe of ours: but that they had their motion from ſome hidden weights, or ſprings, with wheels, or pullies, or ſome ſuch *clock-work* principle. Thus he underſtands the *incluſus variis famulatur ſpiritus aſtris; & vivum certis motibus urget opus.*

But be this as it will, it is certain the art of making *clocks*, ſuch as are now in uſe, was either firſt invented, or at leaſt retrieved, in Germany, about two hundred and fifty years ago.

Clock-makers were firſt introduced into England in 1368, when Edward III. granted a licence for three artiſts to come over from Delft in Holland, and practiſe their occupation in this country.

The *water-clocks*, or *clepſydræ*, and ſun-dials, have both a much better claim to antiquity.

The French annals mention one of the former kind, ſent by Aaron king of Perſia to Charlemagne, about the year 807, which ſeemed to bear ſome reſemblance to the modern *clocks*: it was of braſs, and ſhewed the hours by twelve little balls of the ſame metal, which fell at the end of each hour, and in falling, ſtruck a bell, and made it ſound. There were alſo figures of twelve cavaliers, which at the end of each hour come forth at certain apertures, or windows, in the ſide of the *clock*, and ſhut them again, &c.

Among the modern *clocks*, the moſt eminent for their furniture, and the variety of their motions and figures, are thoſe of Straſburg, and of Lyons. In the firſt, a cock claps his wings, and proclaims the hour; the angel opens a door, and ſalutes the Virgin; and the Holy Spirit deſcends on her, &c. In the ſecond, two horſemen encounter, and beat the hour on each other; a door opens, and there appears on the theatre the Virgin with Jeſus Chriſt in her arms; the magi, with their retinue, marching in order, and preſenting their gifts; two trumpeters ſounding all the while to proclaim the proceſſion.

The invention of PENDULUM *clocks* is owing to the happy induſtry of the laſt age: the honour of it is diſputed between Huygens and Galileo. The former, who has a volume on the ſubject, declares it was firſt put in practice in the year 1657, and the deſcription thereof printed in 1658. Becher, De Nova Temporis dimetiendi Theoria, anno 1680, contends for Galileo; and relates, though at ſecond-hand, the whole hiſtory of the invention: adding, that one Treſler, *clock-maker* to the father of the then grand duke of Tuſcany, made the firſt pendulum *clock* at Florence, by direction of Galileo Galilei; a pattern of which was brought into Holland.

The academy del Cimento ſay expreſly, that the application of the pendulum to the movement of a *clock* was firſt propoſed by Galileo, and firſt put in practice by his ſon Vincenzo Galilei, in 1649.

Be the inventor who he will, it is certain the invention never flouriſhed till it came into Huygens's hands, who inſiſts on it, that if ever Galileo thought of ſuch a thing, he never brought it to any degree of perfection.

The firſt pendulum *clock* made in England, was in the year 1662, by Mr. Fromantil, a Dutchman.

Pendulum CLOCK, *Pocket* CLOCK, and *Repeating* CLOCK. See WATCH, and PENDULUM *clock.*

CLOCK-WORK, is that part of the movement which ſtrikes the hour, &c. on a bell. See *Tab. Horology, fig.* 2.

The wheels it conſiſts of are the great or firſt wheel H; which is moved by the weight or ſpring at the barrel G: in ſixteen or thirty-hour *clocks*, this has uſually pins, and is called the *pin-wheel*; in eight-day pieces, the ſecond wheel I is commonly the pin-wheel, or ſtriking-wheel, which is moved by the former. Next the ſtriking-wheel, is the detent-wheel, or hoop-wheel, K, having a hoop almoſt round it, wherein is a vacancy at which the *clock* locks. The next is the third, or fourth wheel, according to its diſtance from the firſt, called the *warning-wheel* L. The laſt is the flying pinion Q, with a fly, or fan, to gather air, and ſo bridle the rapidity of the *clock's* motion. To theſe muſt be added the pinion of report; which drives round the locking-wheel, called alſo the *count-wheel*; ordinarily with eleven notches in it, unequally diſtant, to make the *clock* ſtrike the hours. See WHEEL.

Beſides the wheels, to the *clock* part belongs the raſh, or ratch; a kind of wheel with twelve large fangs, running concentrical to the dial-wheel, and ſerving to lift up the detents every hour, and make the *clock* ſtrike: the detents, or ſtops, which being lifted up, and let fall, lock and unlock the *clock* in ſtriking; the hammer, as S, which ſtrikes the bell R; the hammer-tails, as T, by which the ſtriking pins draw back the hammers; latches, whereby the work is lifted up and unlocked; and lifting-pieces, as P, which lift up and unlock the detents.

For the mechaniſm of the various parts of a *clock* that ſerve to move the hands, and ſhew the time, ſee WATCH-*work.*

CLOCK-*work, theory and calculation of.* The method of calculating the numbers of a piece of *clock-work* having ſomething in it very entertaining, and at the ſame time very eaſy and uſeful, we ſhall give the readers the rules relating thereto: referring, for the general rules that obtain in the calculation of all movements of watch as well as *clock-work*, to the article **Movement**; and, for the particular rules of watch-work, to the article **Watch-work**.

For the ſtrict calculation itſelf, it bears that affinity to the calculation of watch-work, that, to avoid repetitions, we ſhall refer to that head: what *clock-work* has peculiar to itſelf will be conceived from what follows.

Clock, *rules for calculating the ſtriking part of a.* Firſt then, obſerve, that regard here needs only be had to the counting-wheel, ſtriking-wheel, and detent-wheel, which move round in this proportion: the count-wheel commonly goes round once in 12 or 24 hours: the detent-wheel moves round every ſtroke the *clock* ſtrikes, or ſometimes but once in two ſtrokes; wherefore, it follows, that,

Secondly, As many pins as are in the pin-wheel, ſo many turns hath the detent-wheel in one turn of the pin-wheel; or, which is the ſame, the pins of the pin-wheel are the quotients of that wheel divided by the pinion of the detent-wheel. But if the detent-wheel move but once round in two ſtrokes of the *clock*, then the ſaid quotient is but half the number of pins.

Thirdly, As many turns of the pin-wheel as are required to perform the ſtrokes of 12 hours (which are 78), ſo many turns muſt the pinion of report have, to turn round the count-wheel once: or thus, the quotient of 78, divided by the number of ſtriking-pins, ſhall be the quotient for the pinion of report, and the count-wheel; and this is in caſe the pinion of report be fixed to the arbor of the pin-wheel, which is commonly done.

An example will make all plain: the locking-wheel being 48, the pinion of report 8, the pin-wheel 78, the ſtriking-pins are 13, and ſo of the reſt. Note alſo, that 78 divided by 13 gives 6, the quotient of the pinion of report. As for the warning-wheel, and fly-wheel, it matters little what numbers they have; their uſe being only to bridle the rapidity of the motion of the other wheels.

8) 48 (6.
6) 78 (13.
6) 60 (10.
6) 48 (8.

The following rules will be of good ſervice in this calculation.

1. *To find how many ſtrokes a clock ſtrikes in one turn of the fuſee, or barrel.* As the turns of the great wheel, or fuſee, are to the days of the *clock's* continuance; ſo is the number of ſtrokes in 24 hours, viz. 156, to the ſtrokes of one turn of the fuſee.

2. *To find how many days a clock will go.* As the ſtrokes in 24 hours are to thoſe in one turn of the fuſee; ſo are the turns of the fuſee to the days of the *clock's* going.

3. *To find the number of turns of the fuſee, or barrel.* As the ſtrokes in one turn of the fuſee are to thoſe of 24 hours; ſo is the *clock's* continuance to the turns of the fuſee, or great wheel.

4. *To find the number of leaves in the pinion of report on the axis of the great wheel.* As the number of ſtrokes in the *clock's* continuance is to the turns of the fuſee; ſo are the ſtrokes in 12 hours, viz. 78, to the quotient of the pinion of report fixed on the arbor of the great-wheel.

5. *To find the ſtrokes in the clock's continuance.* As 12 is to 78, ſo are the hours of the *clock's* continuance to the number of ſtrokes in that time.

By ſtat. 9 and 10. W. III. cap. 28. § 2. no perſon ſhall export, or endeavour to export, out of this kingdom, any outward or inward box-caſe or dial-plate, of gold, ſilver, braſs, or other metal, for clock or watch, without the movement in or with every ſuch box, &c. made up fit for uſe, with the maker's name engraven thereon; nor ſhall any perſon make up any clock or watch, without putting their name and place of abode or freedom, and no other name or place, on every clock or watch; on penalty of forfeiting every ſuch box, caſe, and dial-plate, clock and watch, not made up and engraven as aforeſaid; and 20 l. one moiety to the king, the other to thoſe that ſhall ſue for the ſame.

The ingenious Dr. Franklin has contrived a *clock* to ſhew the hours, minutes, and ſeconds, with only three wheels and two pinions in the whole movement. The dial-plate (*Fig.* 8. *Tab.* II. *Horology*,) has the hours engraven upon it in ſpiral ſpaces along two diameters of a circle containing four times 60 minutes. The index A goes round in four hours, and counts the minutes from any hour by which it has paſſed to the next following hour. The time, therefore, in the poſition of the index ſhewn in the figure is either $32\frac{1}{2}$ minutes paſt XII. III. or VIII; and ſo in every other quarter of the circle, it points to the number of minutes after the hours which the index laſt left in its motion. The ſmall hand B, in the arch at top, goes round once in a minute, and ſhews the ſeconds. The wheel-work of this *clock* may be ſeen in (*fig.* 9.) A is the firſt or great wheel, containing an hundred and ſixty teeth, and going round in four hours with the index A in *fig.* 8. let down by a hole on its axis. This wheel turns a pinion B of ten leaves, which therefore goes round in a quarter of an hour: on the axis of this pinion is the wheel C of an hundred and twenty teeth, which goes round in the ſame time, and turns a pinion D, of eight leaves, round in a minute, with the ſecond-hand B of *fig.* 8. fixed on its axis, and alſo the common wheel E of thirty teeth, for moving a pendulum (by pallets) that vibrates ſeconds, as in a common *clock*. This *clock* is wound up by a line going over a pulley on the axis of the great wheel, like a common thirty-hour clock. Many of theſe admirably ſimple machines have been conſtructed, which meaſure time exceedingly well. It is ſubject, however, to the inconvenience of requiring frequent winding by drawing up the weight; and likewiſe to ſome uncertainty as to the particular hour ſhewn by the index A. Mr. Ferguſon has propoſed to remedy theſe inconveniences by the following conſtruction. In the dial-plate of his *clock* (*fig.* 10.) there is an opening *a b c d*, below the center; through which appears part of a flat plate, on which the 12 hours with their diviſions into quarters, are engraved: this plate turns round in twelve hours, and the index A points out the true hour, &c. B is the minute-hand which goes round the large circle of 60 minutes, whilſt the plate *a b c d* ſhifts its place one hour under the fixed index A. There is another opening *e f g h*, through which the ſeconds are ſeen on a flat moveable ring at the extremity of a fleur-de-lis engraved on the face of the dial-plate. A, in *fig.* 11, is the great wheel of this clock, containing an hundred and twenty teeth, and turning round in twelve hours. The axis of this wheel bears the plate of hours, which may be moved by a pin paſſing through ſmall holes drilled in the plate, without affecting the wheel-work. The great wheel A turns a pinion B of ten leaves round in an hour, and carries the minute-hand B on its axis round the dial-plate in the ſame time: on this axis is a wheel C of an hundred and twenty teeth, turning round a pinion D of ſix leaves in three minutes; on the axis of which there is a wheel E of ninety teeth, that keeps a pendulum in motion, vibrating ſeconds by pallets, as in a common *clock*, when the pendulum-wheel has only thirty teeth, and goes round in a minute. In order to ſhew the ſeconds by this *clock*, a thin plate muſt be divided into three times ſixty, or an hundred and eighty equal parts, and numbered 10, 20, 30, 40, 50, 60, three times ſucceſſively; and fixed on the ſame axis with the wheel of ninety teeth, ſo as to turn round near the back of the dial-plate; and theſe diviſions will ſhew the ſeconds through the opening *e f g h*, *fig.* 10. This *clock* will go a week without winding, and always ſhew the preciſe hour; but this *clock*, as Mr. Ferguſon candidly acknowleges, has two diſadvantages of which Dr Franklin's *clock* is free. When the minute-hand B is adjuſted, the hour-plate muſt alſo be ſet right by means of a pin; and the ſmallneſs of the teeth in the pendulum wheel will cauſe the pendulum ball to deſcribe but ſmall arcs in its vibrations; and therefore the momentum of the ball will be leſs, and the times of the vibrations will be more affected by any unequal impulſe of the pendulum-wheel on the pallets. Beſides, the weight of the flat ring on which the ſeconds are engraved will load the pivots of the axis of the pendulum-wheel with a great deal of friction, which ought by all poſſible means to be avoided. To remedy this inconvenience, the ſecond plate might be omitted.

A **clock** ſhewing the apparent diurnal motions of the ſun and moon, the age and phaſes of the moon, with the time of her coming to the meridian, and the times of high and low water; by having only two wheels and a pinion added to the common movement, was contrived by Mr. Ferguſon, and is deſcribed in his Select Exerciſes. The dial-plate of this *clock*, (ſee *Tab.* II. *Horology*, *fig.* 12.) contains all the twenty-four hours of the day and night. S is the ſun, which ſerves as an hour index, by going round the dial-plate in twenty-four hours; and M is the moon, which goes round in twenty-four hours, fifty minutes and a half, the time of her going round in the heavens from one meridian to the ſame meridian again. The ſun is fixed to a circular plate, (ſee *fig.* 13.) and carried round by the motion of that plate, on which the twenty-four hours are engraven; and within them is a circle divided into twenty-nine and a half equal parts for the days of the moon's age, reckoning from new moon to new moon; and each day ſtands directly under the time, in the twenty-four hour circle, of the moon's coming to the meridian; the XII. under the ſun ſtanding for noon, and the oppoſite XII. for midnight. The moon, M, is fixed to another circular plate (*fig.* 12.) of the ſame diameter with that which carries the ſun, part of which may be ſeen through the opening, over which the ſmall wires *a* and *b* paſs in the moon-plate. The wire *a* ſhews the moon's age and time of her coming to the meridian, and *b* ſhews the time of high-water for that day, in the ſun-plate. The diſtance of theſe wires anſwers to the difference of time between the moon's coming to the meridian and high-water at the place for which the *clock* is made. At London their difference is two hours and a half. Above the moon-plate there is a fixed plate N, ſupported by a wire A, fixed to it at one end and fixed at right angles into the dial-plate at the midnight XII. This plate may repreſent the earth, and the dot L London, or the place to which the *clock* is adapted. Around this plate there is an elliptic ſhade on the moon plate, the higheſt points of which are marked *high-water*, and the loweſt *low-water*. As this plate turns round below the plate N, theſe points come ſucceſſively even with L, and ſtand over it at the times when it is high or low water at the given place; which times are pointed by the ſun, S, on the dial-plate; and the plate H, above XII. at noon riſes or falls with the tide.

As the ſun, S, goes round the dial-plate in twenty-four hours, and the moon, M, in twenty-four hours fifty minutes and a half, it is plain that the moon makes only twenty-eight revolutions and a half, whilſt the ſun makes twenty-nine and a half: ſo that it will be twenty-nine days and a half from conjunction to conjunction. And thus the wire *a* ſhifts over one day of the moon's age on the ſun-plate in twenty-four hours.

The phaſes of the moon for every day of her age may be ſeen through a round hole *m* in the moon plate: thus, at conjunction or new-moon the whole ſpace ſeen through *m* is black; at oppoſition or full moon, this ſpace is white: at either quadrature half black and half white; and at every poſition, the white part reſembles the viſible part of the moon for every day of her age. The black ſhaded ſpace N*f*F*l*, (*fig.* 13.) on the ſun-plate ſerves for theſe appearances. N repreſents the new moon, F the full moon, and *f* her firſt quarter, and *l* her laſt quarter, &c.

The wheel-work and tide-work of this *clock* are repreſented in *fig.* 14. A and B are two wheels of equal diameters: A has fifty-ſeven teeth, with an hollow axis that paſſes through the dial of the *clock*, and carries the ſun-plate with the ſun S. B has fifty-nine teeth, with a ſolid ſpindle for its axis, which turns within the hollow axis of A, and carries the moon-plate with the moon M: both wheels are turned round by a pinion C of nineteen leaves, and this pinion is turned round by the common clock-work in eight hours; and as nineteen is the third part of fifty-ſeven, the wheel A will go round in twenty-four hours; and the wheel B in twenty-four hours fifty minutes and a half: fifty-ſeven being to twenty-four as fifty-nine to twenty-four hours fifty minutes and a half very nearly. On the back of the wheel B is fixed an elliptical ring D, which, in its revolution, raiſes and lets down a lever E F, whoſe center of motion is on a pin at F; and this, by the upright bar G, raiſes and lets down the tide plate H, twice in the time of the moon's revolving from the meridian to the meridian again: this plate moves between four rollers R, R, R, R.

A *clock* of this kind was adapted by Mr. Ferguſon to the movement of an old watch: the great wheel of a watch goes round in four hours; on the axis of this he fixed a wheel of twenty teeth, to turn a wheel of forty teeth on the axis of the pinion C; by which means that pinion was turned round in eight hours, the wheel A in twenty-four, and the wheel B in twenty-four hours fifty minutes and a half.

See alſo a deſcription and drawing of an *aſtronomical* CLOCK, ſhewing the apparent daily motions of the ſun, moon, and ſtars, with the times of their riſing, ſouthing and ſetting, the places of the ſun and moon in the ecliptic, and the age and phaſes of the moon for every day of the year, in Ferguſon's Select Exerciſes, p. 19.
